Fireproof Vault Fronts

Specifications—Sides and top No. 16, bottom ⅛-in. sheet steel. Front frame formed of 3⅞x⅜-in. open

hearth steel bars, riveted at the bottom into 2½x¼-in. sill bars, fastened at the top by bar clips.

The rear frame is formed of 1¼x1¼x⅜-in. open hearth angles, securely fastened to the vestibule. Removable bars 4x⅜ in. are fastened on the back of the rear angles. These bars may be removed until the vestibule is set into the wall, after which they are to be replaced, thus holding the vestibule securely in position.

Outer door plate formed of ⅜-in. open hearth steel, reinforced on sides, top and bottom by 2x¼-in. bars, making doors 7⅞ in. thick on edge.

No. 7830 Certified Fireproof Vault Door Bearing the Six-hour Label of the Underwriters' Laboratories, Inc.

Door is 5½ in. thick with pressed steel jambs, containing the fireproof insulation. Jambs are built with two flanges and one tenon and groove at top, front and bottom and have an interlocking flange with patented spring seal at rear. Clear opening through vestibule is 77 in. high by 30 in. wide. Shipping weight approximately 1650 lb.

SAFES AND VAULTS:

Fireproof Safes, Burglarproof Safes, Chests, Bank Vaults, Safe Deposit Boxes, Book Vaults, Record Vaults, Silver and Fur Storage Vaults; Safes and Vaults for hotels, clubs, jewelers, residences, oil and service stations, etc.

Fireproof Vault Doors

The type shown as No. 51 is made in various sizes and thicknesses. Especially constructed for book vaults, record vaults, storage and office buildings. Right or left swing.

Specifications—The contractor shall furnish and install a Mosler No. 51 Vault Front for a wall opening, 77 in. high, 27½ in. wide and 13½ in. deep. Clear opening of this door, 74 in. high x 23½ in. wide. The outer door plate to be ⅝ in. thick of open hearth steel, reinforced with ⅝-in. angle bolt frames, making the door ¾ in. thick on all edges and across center for lock protection. This door to have three single acting locking bolts 1 in. in diameter, operating across the door through the angle bolt frames mentioned above and controlled by a Mosler Combination Lock and Lever handle. The door to be equipped with an antidynamite device to protect the combination lock and bolts against explosives or external violence. The door swings to the right on pintle hinges.

The inner doors to be ⅝ in. thick, of open hearth steel. The right-hand door to overlap the left-hand door and have flat bolt work at top and bottom and interlocking at the center, controlled by a patent key lock. Vestibule to have removable flange bars secured to the rear frame, so that this vault front can be placed in position after the walls are built and plastered. Outer door and inner doors to be finished in black and varnished—outer doors striped; inner vestibule finished in gray. Bolt work, hinge tips, handles, trimmings, heavily plated, nickel rubbed to satin finish.

Mosler No. 51 Vault Front

To fit finished masonry opening 77 in. high, 27½ in. wide, 13½ in. deep. Wall thicknesses can be increased or reduced, if desired

Counter Height Safe

Designed especially for use in banks, with or without wheels

Fireproof Safes

For books, filing, etc.

We manufacture and have for immediate delivery

fireproof safes bearing the Underwriters' Class A and Class B Label for fire protection, and T 20 for burglar protection.

These safes equipped with metal interiors to suit requirements. Built in all sizes including counter height as shown.

Engineering Service

Any of our branches will cheerfully furnish you with competent engineering service to aid you in preparing plans and specifications for burglarproof bank or safe deposit vaults.

Write, or wire our factory collect, and our nearest representative will call on you.

We build these vaults in various sizes and thicknesses; in each case to meet the particular requirements.

Burglarproof Vault Front

INSURANCE REQUIREMENTS

Class	Minimum thickness of door, in.	Thickness reinforced concrete walls, in.	Thickness non-reinforced concrete walls, in.	Note
1	Fireproof			
2	1½	12	12	The floors and roofs of vaults must coincide with walls. Reinforcing can be of any practical type such as ¾-in. bars, 6 in. on centers, railroad rails, etc.
3	1½	12	12	
4	2½	12	18	
5	3½	12	18	
6	3½	18	36	
7	5½	18	36	
8	6	18	36	
9	7	18	36	
10	9½	27	54	

Explanation—No. 10 Class is the best rating given. The wall thicknesses above mentioned can be reduced if the inside walls, floor and ceiling are lined with a continuous steel lining equivalent. These equivalents are as follows:

Non-reinforced Concrete	Reinforced Concrete
12 in. equals ¼-in. lining	12 in. equals ½-in. lining
18 in. equals ½-in. lining	18 in. equals 1-in. lining
Each additional 3 in. equals ¼-in. lining	27 in. equals 1½-in. lining

Catalogue will be sent on request, without obligation.

Schwab Insulated Vault Doors (Underwriters' 2-Hour Label)

Specified where maximum fire protection is required.

Schwab's 2-hour Vault Doors have a wide extra margin of safety—the equivalent to approximately a $3\frac{1}{2}$ -hour door. No greater protection will ever be needed. The strain on a vault door, where only one side is exposed to the fire and heat, is not nearly so great as on a safe where all four sides are exposed. And on an insulated safe, a 4-hour label is maximum.

Both the No. 2674B (single door) and the No. 3674B (double door) are of

TRADE-MARK

new type, with interlocking tongue and groove, insulated doors and joint.

It has been tested at the Underwriters' Laboratories, Inc., for:

- (1) Ease and practicability of installation.
- (2) Fire endurance test.
- (3) Fire and hose stream test.

The official Underwriters' report says:

"At the close of the test the papers were found to be in good condition with no traces of heat and no discoloration from smoke."

In every Schwab insulated vault door or safe, there is a substantial extra margin of safety.

Send for our complete Architect's Portfolio, containing architects' specifications and details of vault doors, vault construction, underwriters' requirements, and contractors' and engineers' specifications.

Locking Mechanism—

On inside of door are four double acting horizontal bolt bars $\frac{7}{8}$ -in. diameter cold rolled steel, operated by a cam working forward and backward and two $\frac{7}{8}$ -in. diameter bolt bars, one up and one down, all extending $\frac{3}{4}$ in. into jamb, checked by a 4-tumbler combination lock. Lock fastened to reinforcing strip on inside of door, engaging cam operated by handle on outside face of door.

No. 2674B, Schwab 2-Hour Vault Door

No. 3674B is the same with double door

NOTATIONS

JAMBS AND HEADS GROUTED WITH CEMENT AS INDICATED ON DRAWINGS.

PLAN OF SINGLE DOOR

PLAN OF DOUBLE DOOR

ELEVATION

VERTICAL SECTION

Elevation, Section and Plan of Schwab Insulated Vault Door

Foot Bridge—A $\frac{1}{4}$ -in. thick safety tread steel plate foot bridge, hinged to turn inside when vault door is closed.

Day Gate—The day gate, complete with lock and alarm bell, as illustrated in the open view on this page, can be furnished at additional cost.

Hardware and Finish—Dark olive green lacquer, gold striped. All trimmings and bolt work heavily nickelplated.

Size—Vault doors bearing Underwriters' label can not exceed clear door opening size 38 in. in width, 78 in. in height, nor less than 10 in. in depth. The same fireproof construction can be furnished in larger size doors or in doors with narrower vestibule, but without Underwriters' label attached.

STOCK SIZES SCHWAB 2-HOUR VAULT DOORS

Door No.	Clear opening, in.	Wall opening, in.	App. shipping weight, lb.
Single door No. 2674-B...	26 $\frac{1}{2}$ x74x18	39x85 $\frac{1}{2}$	1500
Double door No. 3674-B...	36 $\frac{1}{2}$ x74x18	49x85 $\frac{1}{2}$	1800

Architect's Specification—No. 2674-B, or No. 3674-B—For the convenience of the architect the following specification to cover the New Type Insulated Door Vault is furnished:

The contractor shall furnish and install a No. 2674-B (or 3674-B) Schwab Insulated Fireproof

[Single] [Double] Vault Door with interlocking tongue and groove, drawn steel frame and door flanges and jambs, as manufactured by THE SCHWAB SAFE COMPANY, Lafayette, Ind. Outside door shall have four double acting horizontal bolt bars operating on a cam working forward and back and two vertical bolt bars, one operating up and one down, $\frac{7}{8}$ -in. in diameter, cold rolled steel, checked by 4-tumbler combination lock. The outer door shall be insulated with $3\frac{1}{2}$ in. of insulating material tested by the Underwriters' Laboratories, Inc., and bearing the Underwriters' Laboratories 2-hour heat label. The frame and door jambs with interlocking tongue and groove shall be No. 16 U. S. gauge cold drawn steel and interlocked perfectly, one within the other. Vault shall be finished in dark olive green lacquer finish and striped. All trimming and bolt work shall be heavily nickelplated.

The masonry wall shall be * in. thick with opening for vault door [39] [49] in. wide and 85 $\frac{1}{2}$ in. high.

Rear flange of vault frame shall be removable so that door can be installed after the building is completed.

Inside clearance of door shall be [26 $\frac{1}{2}$] [36 $\frac{1}{2}$] in. wide, 74 in. high.

Note: Masonry wall must not be less than 10 in. thick in order to obtain Underwriters' approval.

Note:—Our complete Architect's Portfolio, containing specifications and details on vault doors, vault construction, Underwriters' requirements, contractors' and engineers' specifications, will be sent you on request.

Schwab Standard Fireproof Vault Doors

These vault doors do not bear the Underwriters' Label, but will meet the requirements of the majority of installations.

DIMENSIONS STANDARD FIREPROOF VAULT DOORS

Style	Clear opening through vestibule		Rough wall opening		Weight, lb.
	Width, in.	Height, in.	Width, in.	Height, in.	
No. 10	25	74	32	77	580
No. 20	25	74	32	77	620

Carried in stock sizes with 18-in. vestibule, and can be made proper size to fit any wall opening.

No. 10

No. 20

Schwab Standard Fireproof Vault Doors

Installation Requirements, No. 10—For installation, the clear opening in the vault wall should be 77 in. high, 32 in. wide, and 18 in. deep. The vestibule can not be made less than 16 in. for our standard width vault for the inside doors to pocket in the vestibule.

A vault 2 in. less in width will allow the inside doors to pocket in a 15-in. vestibule; 4 in. less in width will allow inside doors to pocket in a 14-in. vestibule, and so on.

Locking Mechanism—Outside door has three cross bolts 1-in. diameter cold rolled steel and checked

by a 4-tumbler lock. Inside doors have one up and one down bolt checked by a heavy key lock.

Hardware and Finish—The handles, hinge tips, lock dials, cross bolt and carrying bars are polished and heavily nickelplated. Door handsomely finished in dark olive green with gold striping.

Installation Requirement No. 20—This style is similar in construction to the No. 10 vault door. Bolt work on this door, however, consists of four horizontal bolts, and one up and one down bolt 1-in. diameter of cold drawn steel.

Estimates—We can build any vault door to specification or duplicate any vault door specified in your plans, regardless of construction. Allow us to figure with you. It will be a pleasure.

Dimension Diagram, Schwab Vault Doors Nos. 10 and 20

Architects' Specifications, No. 10—The contractor shall furnish and install Schwab's No. 10 Fireproof Vault Door manufactured by THE SCHWAB SAFE COMPANY, Lafayette, Ind. Outside door to have three cross bolts, 1-in. diameter cold rolled steel, checked by a 4-tumbler combination lock. Inside doors to have heavy flat bolts and key locks. Vault to be finished in dark olive green with gold striping. All trimmings and bolt work heavily nickelplated. The vault wall opening to be 77 in. high, 32 in. wide, 18 in. deep and must be built square, plumb and level; rear flange of vault frame to be removable so contractor can install vault door after building is completed and

not mar the finish. Inside clearance of vault door, 74 in. high and 28 in. wide. Approximate weight, 580 lb.

Architects' Specifications, No. 20—The same as No. 10, with this change in bolt work: "Outside door to have four cross bolts, one up and one down bolt, 1-in. diameter cold rolled steel, checked by a 4-tumbler combination lock."

We can furnish special vault doors in either double or single door, with any desired number of bolts and any thickness of door plate up to ½ in. thick.

Can be made with either right or left-hand swing doors and proper size to fit any vault wall opening.

Schwab Safes and Burglar Proof Chests

We will gladly furnish specifications or measurements upon request and assist beforehand on any built-in features contemplated in any of your plans.

Safes—Schwab builds perhaps the most complete line of safes of any manufacturer in this field. For maximum protection against fire Schwab builds the "A Label Safe" (4-hour Underwriters' Label); for a slightly lesser degree of protection, the "B Label Safe" (2-hour Underwriters' Label); and for ordinary protection the standard line of medium walled and heavy walled safes.

Insulated Filing Safes—For the protection of valuable records Schwab's Insulated Filing Safes give complete protection; complies with the Underwriters' requirements and carry their label for insulated cabinets. These safes can be equipped with any filing arrangement to fit the requirements of the purchaser.

Fur Safes—In addition to building a very comprehensive line of standard single type and multiple type fur safes, we build fur safes to any specification.

Besides the added protection, fur safes beautify the modern display room, create an impressive atmosphere and effect a considerable saving in burglary insurance rates. We would be pleased to have you refer to any number of notable installations we have made. Confer with our engineering and designing staff.

Jeweler's Safes—These safes afford maximum burglary protection combined with an attractiveness that will add beauty to any jewelry establishment. The inside may be arranged in any manner to suit the requirements of the jeweler. The standard safe, however, is ready equipped with cabinets, drawers, etc. We will be pleased to submit suggestions for the interior arrangements of these safes.

Burglarproof Chests—Filling stations, chain stores, theaters, etc., where considerable moneys or valuables are carried at all times, need, or rather are practically forced, to provide the protection of a burglarproof chest.

Schwab's Burglarproof Chests are built to install in the wall, anchor in a cement block or to place inside a regular safe. The line includes a circular door chest, a heavy steel chest and a lighter semisteel chest. Send for details.

Schwab No. 10 Wall Safe (Phantom View)

Detail of No. 10 Wall Safe

Wall Safes—This fireproof wall safe No. 10 is especially adapted for installation in homes, apartment houses, offices and hotels. Placed in the wall, it releases for other uses floor space otherwise occupied by a floor safe and, at the same time, affords greater secrecy together with protection and safety.

The interior of this wall safe is most conveniently arranged for utmost service and facility of use.

This safe is sturdily constructed throughout. The door is insulated 2½ in. thick. It has regular T-handle and combination lock, and tongue and grooved door and frame. There is a ¾-in. back plate to anchor in the wall and to prevent tampering from the back. The approximate weight of the safe is 75 lb.

Schwab's Architectural Service

Engineering Staff

We maintain a most competent staff of engineers to assist you with any problems within our scope.

Literature

Upon request we will gladly send you a copy of a recent set of specifications and details on vault doors and vault construction. This is prepared in letter file size and the entire series sent enclosed in a jute file folder with cross filing cards—A.I.A. 18 G. This series has been heartily endorsed by hundreds of architects.

We also would be pleased to send you data on fur safes, filing safes, wall safes, or our general catalogue.

The Company

The Schwab Safe Company has been building quality safes for more than 55 years. We have a very modern up-to-date plant with all modern manufacturing facilities.

Shipments

Shipments are made promptly, due to the large capacity of our plant and the excellent railroad connections.

YORK SAFE AND LOCK COMPANY

FACTORY AND HOME OFFICE

YORK, PA.

BRANCH OFFICES AND SALESROOMS IN PRINCIPAL CITIES

Products

High grade BANK and SAFE DEPOSIT VAULTS; SAFES; SAFE DEPOSIT BOXES, and general Vault Equipment; special BURGLAR CHESTS and SAFES for theaters, gas stations and furriers.

York No. 402 Vault Entrance

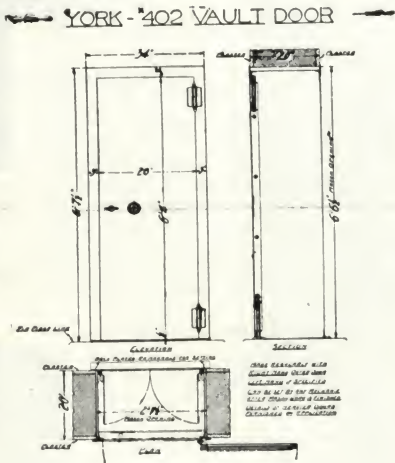

Standardized to fit opening 78½ in. high and 31½ in. wide for wall 20 in. thick. Can be furnished for walls of greater or lesser thickness when required.

No. 402 Vault Entrance

The illustration shows one of a type of York vault entrances which can be furnished in a variety of sizes and designs. The No. 402 has outer door ¾ in. thick equipped with four horizontal and two vertical locking bolts, checked by a high grade combination lock. The inside doors are ⅜ in. thick and locked by a flat key lock. The back frame of the entrance is detachable, permitting the entrance to be set after the walls are finished. The entrance is handsomely finished in black with gold striping. Bolt-work, handle and hinge tips are heavily nickelplated.

Illustrations and complete specifications of other sizes of entrances will be sent on request.

Insulated Doors

When walls cannot be made of sufficient thickness to accommodate an entrance with both outer and inner doors the York No. 423 vault entrance with single insulated door 4½ in. thick is recommended.

Descriptive pamphlet will be mailed on application.

Round Door Burglary Chests

A thoroughly modern and up-to-date receptacle for safeguarding money and valuables with a splendid record for protecting its contents.

Round Door Chest

Made in five sizes from 14 to 30 in. high; 14½ to 24 in. wide; 14¾ to 24 in. deep. Body and door are solid steel castings hardened by special process. The door is ground to a perfect fit with the jambs and is equipped with a specially designed combination lock and auxiliary locking device.

Installed in York fireproof safes these chests are especially adapted to the requirements of theaters and amusement parks.

For use in gas stations and garages they are provided with lugs, anchor bars and leveling post as shown in the accompanying illustration and embedded in a concrete block.

The top of the concrete block may be left exposed or be provided with a wood or metal desk top.

Chest in Concrete Block

Bank and Safe Deposit Vaults

We are designers and builders of bank and safe deposit vaults, large and small; safes, safe deposit boxes and other vault equipment. Established standard sizes and styles usually in stock for quick shipment. Especially constructed vaults in minimum time.

Bank Vault Door
15 in. thick

York bank vaults have been installed in many of the largest banks and financial institutions including the principal Federal Reserve Banks. Plans and specifications for any requirement will be submitted on request without charge or other obligation.

SARGENT & GREENLEAF, INC.

Bank Locks and Hardware

GENERAL OFFICES AND WORKS

Norton Street and Joseph Avenue, ROCHESTER, N. Y.

NEW YORK OFFICE, 79 Fifth Avenue

BOSTON OFFICE, 62 Summer Street

CHICAGO OFFICE, 166 West Lake Street

Products

TIME, COMBINATION, SAFE DEPOSIT and KEY LOCKS for Banks: Locks for Vault Doors and Gates, Cashiers' Lockers, Grille Gates and Tellers' Cages.

Also manufacturers of Lavatory Hardware, Door Pulls, Push Plates, and Locks and Bolts for all purposes.

For Reversible Panic Locks, see page B2034.

Standard Bank Lock Specifications

(1) Sargent & Greenleaf locks shall be furnished unless written permission for substitution is granted the contractor before his bid is submitted.

Main Vault Door

Time Lock—(2) Furnish one 72-hour quadruple movement time lock, all parts including the movement to be made by lock manufacturer in its own factory. Hair springs shall be non-corrosive and non-magnetic. Each movement shall have a reserve power to lift at least 15 lb. when movement is at zero. Strength of "train" to be proportioned to spring power.

Quadruple Movement Time Lock

Manufacturer shall furnish guaranty against defects in material or workmanship for one year, after which period an inspection and cleaning service is to be maintained. Finish of all exposed parts of the lock shall match the bolt work.

(3) *Note:* Should a triple or double movement be desired, substitute the one desired in preceding paragraph.

Combination Lock—(4) Furnish two four-wheel, key-changing combination locks having a minimum of one hundred million changes and having extension bolts of positive actuating mechanism and outside spindle drive. Wheels shall be of "positive locking" type. Bolt actuating mechanism to have no springs or friction tubes. Dials and dial rings shall be cast bronze with black enamel finish and with 100 numbers and graduations filled with white enamel. Finish of all exposed parts of the lock shall match the bolt work.

Vault Emergency Door

Time Lock—(5) Same as paragraph 2.

(6) Same as paragraph 3. Covers shall be locked in place by either the combination or by separate key locks set in the covers.

Combination Locks—(7) Same as paragraph 4.

Vault Day Gate

(8) Furnish one spring bolt lock No. 57. Lock shall be steel bushed and operative by push knob from inside and by key from outside. Lock shall be mounted back of frame and covered by finish plate outside. Bolt shall pass through frame. Lock case finish shall match polished steel gate.

No. 57 Iron Workers' Lock

Cashiers' Lockers

Combination Locks—

(9) Same as paragraph 4, except that first line shall read "Furnish two C-71 E key changing combination locks."

Safe Deposit Boxes

Locks for Boxes 2 in. Deep and Larger—(10) Furnish changeable key locks 4140 for single horn, 4340 for double horn; or 4240 for single horn, 4440 for double horn. Case shall be cast bronze.

Locks for 1½ and 1¾ in. Boxes—(11) Furnish changeable key locks 4120 for single horn, 4320 for double horn; or 4220 for single horn, 4420 for double horn. Case shall be cast bronze.

(12) *Note:* When installation contains large and small boxes use both paragraphs 10 and 11 and add to paragraph 11, "These locks shall be set to same preparatory key as the lock specified in paragraph 10—No. 4140, 4340, etc."

Note: For full line of safe deposit locks see catalogue, Safe Deposit Lock section.

Grille Gates

Swinging Gates—(13) Furnish one spring bolt lock No. 57 which shall be steel bushed with key operative both sides. Locks shall be master-keyed as instructed.

Lock shall be mounted back of frame and covered by finish plates both sides. Bolt shall pass through the frame. Case finish shall match polished steel gate.

Sliding Gates—

(14) Furnish spring bolt lock No. 57½ steel bushed. Locks shall be operated by key both sides and master-keyed as instructed.

Locks shall be attached back of frame with bolt passing through frame. Bolt shall be guarded against lifting with any thin instrument inserted in jamb. Finish plates on both sides. Key horns shall extend through the plates.

Tellers' Cages

Sliding Gates—(15) Furnish spring bolt lock No. 222 operating by sunken handle from inside and by key from either side, master-keyed as instructed.

Locks shall be attached back of frame with finish plates each side and with bolt passing through frame. Bolt shall be guarded against lifting with any thin instrument inserted in jamb. Finish plates both sides.

Alternate—(16) Furnish lock No. 226 with self-locking flush bolt operating by sunken handle from inside and key from either side, master-keyed as directed. Bolt shall be guarded against lifting with any thin instrument inserted in jamb. Finish plates on both sides.

Swing Gates—(17) Furnish mortise latch No. 11 with spring bolt operating by knob from inside and key from outside, master-keyed as instructed. Finish plates on both sides of gate.

Tellers' Wickets

Swing Wickets—(18) Furnish spring latch No. 310½ key operating inside only.

Alternate—(19) Furnish one lock No. 310-R with interlocking striker and key operating inside only.

Product

"STEELCRETE" EXPANDED METAL for the construction of burglarproof and mob-proof vaults.

For "Steelcrete" Expanded Metal Concrete Reinforcement see page A128; for "Steelcrete" Expanded Metal Plastering Lath, Stucco Binder, Corner Beads and Cold Rolled Channels, see page B1293.

"Steelcrete" Armor Vaults

The new principle on which vaults are now constructed is namely—"Given sufficient time and tools—any vault can be penetrated." The question of comparative resistance is, therefore, one of comparative time. The weight and size and number of tools required to penetrate are also factors and should be considered. The most accessible and most dangerous tools are: (1) explosives; (2) the cutting flame.

Concrete resists the cutting flame, hence the new principle of embedded Armor Mat is to so place the steel that it can not be attacked with a flame. Armor Mat Construction has been shown to be practically drill-proof and by almost inconceivable tenacity to resist attacks by explosives.

Vault designing has always been many years ahead of the tools of penetration. It is, therefore, only vaults in new buildings that are being designed to provide this "new safety." One of the oldest principles of protection which has never been surpassed is that of entanglement. "Steelcrete" Armor Mats are entanglements embedded in flintlike concrete. The design of these entanglements on account of their structural character are problems for engineers familiar with the application and design of concrete.

Construction Details

The high, uniform grade of steel, cold drawn, possesses great unit strength and high elastic limit. In mass, as used in vault construction, it is admirably suited to resist the force of powerful explosives. A grille work of chiselproof rods is closely threaded through the mat and binds it on all sides.

Specifications

Complete specifications and typical details furnished any architect on request.

Services

We furnish all Steelcrete and bars necessary to construct the Steelcrete Mats complete.

We furnish all necessary working drawings.

We give lump sum estimates.

We (by arrangement) supervise the installation of the "Steelcrete."

Send for "Protection Book."

TRADE MARK

Installations

Probably the largest and strongest vault man ever attempted to construct is the new stronghold installed in the Federal Reserve Bank of New York. This financial institution was the first to use "Steelcrete" as vault protection. The vault has walls several feet in thickness, is three stories in height and an entire city block in length.

"Steelcrete" Armor Vault Protection has been used in the New Federal Reserve Branch Banks at Nashville, Tenn., Oklahoma City, Okla., New Orleans, La., Birmingham, Ala. and Jacksonville, Fla., Royal Bank of Canada, Bank of England and Mitsui Bank of Japan.

Steelcrete Vaults in the following buildings:

Products

RIVET-GRIP BANK VAULT REINFORCEMENT.

For Rivet-Grip Steel Joists, see pages A576-577.

Also manufacturers of Rivet-Grip rigid, shop-fabricated truss bridge roadway reinforcement. (Description on request.)

Rivet-Grip Vaults

The high regard which bank architects and engineers have for Rivet-Grip vaults, and the prestige which the system has attained, is evidenced by the fact that the Rivet-Grip System has been installed in nearly twice as many Federal Reserve vaults as any other type of vault reinforcement offered on the market since the Federal Reserve vault tests. It is significant, that in every instance where Rivet-Grip was purchased by a Federal Reserve Bank, either an official of the bank, its architect, or vault engineer represented the bank at the Federal Reserve tests, and the sale of Rivet-Grip was due to recommendations carried back by eye witnesses, after seeing the efficient performance of Rivet-Grip in these severe tests.

Rivet-Grip Reinforcement—
Vertical Type

As a result of the Sandy Hook tests, Rivet-Grip System was adopted for nine Federal Reserve bank buildings, including the banks of Cleveland, St. Louis, Minneapolis and San Francisco, and the Federal Reserve branches at Cincinnati, Louisville, Pittsburgh, Little Rock and Salt Lake City. The Rivet-Grip System has also been used in several hundred national and state banks. (See brief list on following page.)

Balanced Protection for Bank Vaults

The first requisite for security in a bank vault is *balanced protection*—equal protective strength throughout. In other words, the walls, floor and roof should be no less secure than the vault door.

In the Rivet-Grip System, this balanced protection is obtained through a new system of steel reinforcement, which is fabricated in various sizes to give the walls and slabs a protective value equivalent to that of any particular door from 4 to 48 in. in thickness.

Why Rivet-Grip Insures Balanced Protection

To penetrate a vault wall reinforced with Rivet-Grip steel frames requires a long period of time, a great variety of equipment and frequent changes in the attacking operations.

Drills must be used to penetrate the concrete, explosives are required to break up the concrete, chipping tools are necessary to separate the concrete from the steel, and torches must be used to cut the heavy Rivet-Grip sections. Moreover, the disposition of steel in a Rivet-Grip wall is such that all these operations must be repeated many times through the thickness of the wall.

There are no weak points in a Rivet-Grip protected vault. The frames interlock at all corners. The door connections are as strong as the vault door itself. The scientific design of Rivet-Grip reinforcement insures balanced protection throughout.

Design

The Rivet-Grip System consists of an interlocking network of heavy shop-fabricated frames and plain round bars, embedded and interlocked through practically the full thickness of the concrete work.

The Rivet-Grip frames are composed of two parallel, heavy Rivet-Grip main sections, joined at close intervals by lighter diagonals, which form the web of the frames. The joint, or Rivet-Grip, is formed under a 30-ton pressure which forces the metal in the main sections around the knobs on the diagonals, joining these members so securely that the diagonals will break in tension before loosening at the Rivet-Grip.

The loose bars are laced through the frames perpendicular to the plane of the web members. They are held in position automatically and need not be wired.

All Rivet-Grip reinforcement is accurately fabricated and comes to the job true to detail. There are two types of installations; *vertical*, for use in walls from 12 to 30 in. thick, and *horizontal type*, for use in walls from 27 to 60 in. in thickness.

Structural and Economic Advantages

In addition to its protective value, many structural and economic advantages help to explain the wide choice of Rivet-Grip System.

Lowest Insurance Ratings—Rivet-Grip walls and slabs receive the lowest insurance ratings.

Flexibility of Arrangement—The spacing and general arrangement of the frames may be varied to give the exact degree of protection desired.

Structural Strength—Rivet-Grip frames form an efficient structural reinforcing, and allow vault walls and slabs to be designed for carrying heavy building columns, or with clear spans up to 40 ft.

Ease of Installation—All material is completely shop-fabricated and ready to place before shipment. To unload the reinforcement from trucks and place it in its proper position in the vault requires only five to eight man hours per ton.

Lower Cost—The Rivet-Grip System of vault reinforcement costs less than any other adequate and effective system, and the ease with which it is installed materially lowers construction cost.

Designing and Estimating Service

The drawings on the following page will prove useful as a guide for selecting the proper type of Rivet-Grip reinforcement to use with any particular vault door. However, if the types shown do not fit your problem, our engineering department will gladly make a study and submit a layout and we will recommend the most economical solution of your problem without incurring any obligation on your part, if plans or dimension sketches of the vault are submitted to us. Whenever available, thickness of doors and linings should also be given.

Lump sum estimates, either for material only or including erection for any vault, gladly furnished to architects upon request.

Torch Resisting

The special Rivet-Grip channel sections are hard to burn as concrete adheres firmly to the steel within the channel.

Tool Resisting

Rivet-Grip Reinforcement is not only torch resisting but tool resisting. Its multiplicity of heavy members cannot be pierced with cold cutting tools and drills as is possible with lighter members and fabrics.

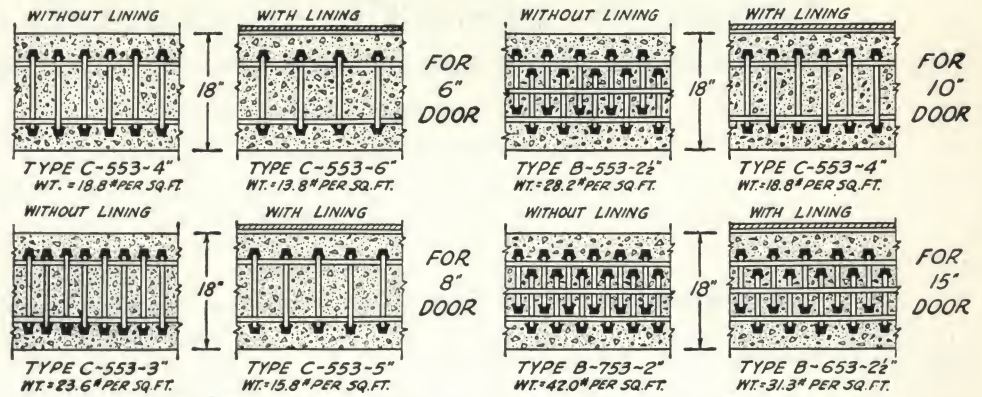

Resists Explosives

The large proportion of heavy steel members and the rigid attachment of ties or stirrups to main bars at close intervals, keeps Rivet-Grip units intact even after severe detonations.

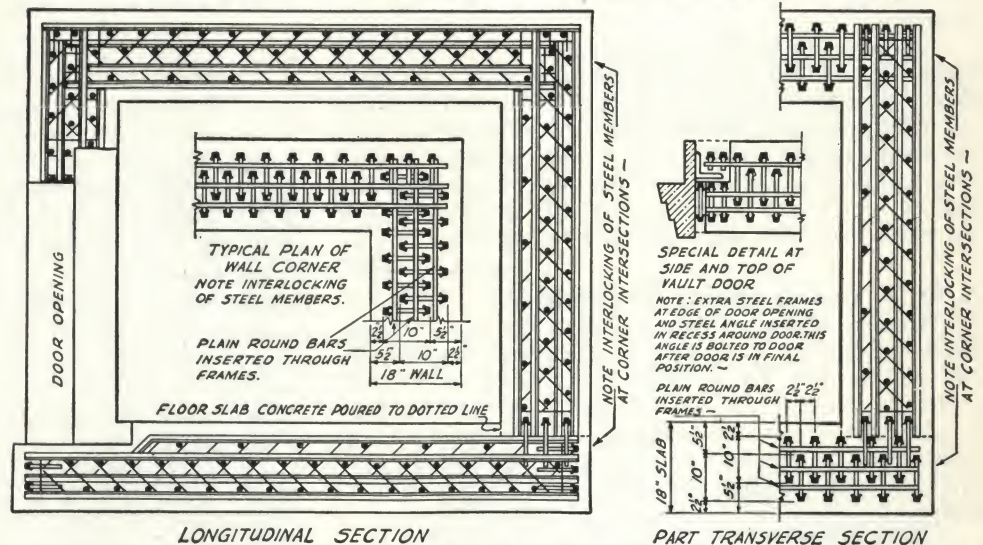

Structurally Strong

Rivet-Grip Bank Vault Reinforcement is not only impregnable to burglarious or riotous attack, but is strong enough structurally to resist breaking or crushing due to a collapse of the building from fire or other causes.

Suggested Types of Rivet-Grip System Reinforcement to Balance Various Thicknesses of Vault Doors

TYPICAL DETAILS OF RIVET-Grip TYPE 'B' VAULT REINFORCEMENT—2½" OC. SPACING OF FRAMES.

Diagrams Above Show the General Method of Detailing Rivet-Grip Reinforcement When the Most Popular Type, Namely Type B-553—2½-in. Spacing of Units, Is Used

Vaults with 18-in. concrete walls and slabs with this type of reinforcement get the best, or No. 10 insurance rating without the use of steel lining in the vaults. Complete typical details and specifications for types of Rivet-Grip other than those illustrated will be furnished upon request.

Specifications

Reinforcement—The reinforcement shall be the "Rivet-Grip System bank vault reinforcement" as produced by THE RIVET-Grip STEEL CO., Cleveland, Ohio.

The arrangement of Rivet-Grip frames and plain round bars shall conform to that shown on page A577 of SWEET'S ARCHITECTURAL CATALOGUE, Twenty-second Edition, for Type spacing of frames. The reinforcement shall be detailed for walls in., floor slab in., and roof slab in. thick.

All units shall interlock at all intersections of walls, and of walls and slabs, and special provision shall be made for door openings to strengthen connections between door frames and vestibules and reinforced concrete walls.

All units shall be completely shop-fabricated and shipped ready to place. They shall be tagged with an erection mark corresponding to the marks on the drawings furnished by the manufacturer.

Note: This specification applies only to the vertical type. Specifications covering our horizontal type are especially written for each individual vault.

Drawings—THE RIVET-Grip STEEL CO. shall furnish complete placing drawings showing the exact location of each frame and spacer bar. Two sets of prints of approved placing plans and details shall be furnished for use in placing steel.

Rivet-Grip Reinforcement—Horizontal Type

Concrete—Shall be proportioned of 1 part portland cement, 2 parts clean, siliceous sand, and 3½ parts ¾-in. gravel or ¾-in. crushed stone.

AMERICAN DISTRICT TELEGRAPH COMPANY

Central Station Protection Service and Electric Signaling Systems

EXECUTIVE OFFICE

183 Varick Street, NEW YORK, N. Y.

For complete list of A. D. T. Service and Central Offices, see page C3016

For A. D. T. Watchman's Compulsory Tour, Fire Alarm, Sprinkler Supervision and Proprietary Systems, see pages C3016-3017

Phonetalarm—A. D. T. Bank Vault Protection Systems (Approved Grade-A)

The Phonetalarm provides a system of bank vault protection operating on the sound detection principle. Protection is provided by means of microphones or detectors installed on the ceiling of the vault. Any attempt to force an entrance into the vault necessarily results in certain noise. This causes the diaphragms of the detectors to vibrate with a resulting effect upon certain instruments which cause the alarm to operate.

The system is effective against attack by means of hammering, drilling, burning or explosion. A sharp blow on the vault wall or any part of the vault structure will cause the alarm to sound; it will not operate from sounds originating elsewhere on the premises. Vault door and bolts are provided with protection contacts so that an alarm will be given upon any attempt to open the vault prior to the prescribed opening time.

A. D. T. Central Station Phonetalarm

Under Central Station operation the Phonetalarm System is given continuous supervision. All alarms are responded to immediately by men especially trained for this service. A careful check is maintained on the opening and closing of the vault and it cannot be left open or be reopened after the usual closing hour without causing an investigation.

Each Phonetalarm System is connected to the Central Station by means of an individual wire. This is under constant supervision and cannot be opened, shorted or grounded without detection by Central Station operators.

The Phonetalarm detectors are tested periodically during the closed period by means of a sounding device within the vault which is operated from the Central Station. This simulates an alarm condition and the signal received in the Central Station is identical with one originating from an attack on the vault.

Service is an important item in Central Station operation and all systems are carefully inspected and tested periodically in order to assure perfect operation. Skilled repair men are constantly on duty to render service in the event repairs are necessary.

Central Station Phonetalarm may be secured in all cities where A. D. T. Central Stations are maintained.

For complete list, see page C3016.

The simplicity of phonetalarm construction makes it possible to install a system without inconvenience in vault already erected as well as in vaults under construction. The devices are always accessible, so that repairs and adjustments can be made at any time without difficulty. The Phonetalarm is less expensive to install than any other type of system, yet it has an unusual value from a protection standpoint.

The A. D. T. Phonetalarm is the original sound detection system, the first system having been installed by A. D. T. engineers in 1914. Since that date, scores of banks throughout the country have installed the Phonetalarm, including many Federal Reserve Banks and other large banking institutions. This system has the endorsement of the Underwriters Laboratories, Inc., and is listed as Grade "A," thus securing the maximum discount on burglary insurance premiums.

Local Bank Vault Phonetalarm

Phonetalarm can be furnished as a local system and installed anywhere without restriction as to location. The equipment includes the Phonetalarm devices together with the necessary apparatus for providing a local alarm. The latter consists of a powerful motor driven siren located in a protected housing on the outside of the building. The protection is under the control of a time clock within the vault which is applied to release the protection at the end of a predetermined period. A visual signaling device is installed outside of the vault to indicate the condition of the alarm at all times. Means are provided for making a sound test after the vault is closed.

The equipment inside the vault occupies a minimum of space, a valuable feature, especially in the case of safe deposit vaults. The system is energized from long-life storage batteries charged automatically. In the event of an alarm the system automatically restores itself.

Local Phonetalarm Systems are serviced through A. D. T. Central Stations located at 117 points in the United States. Periodic inspections are provided and prompt service may be obtained in event it is necessary to make repairs or replacements.

Other Protection Systems for Banks

In addition to the Phonetalarm System described above, the AMERICAN DISTRICT TELEGRAPH COMPANY also furnishes laced systems for both Central Station and local operation. Systems are also supplied for protection against "hold-up."

ELECTRICAL TUBULAR CHIME and CLOCK SYSTEMS.

Organization and Scope of Operation

The officers of this company have been engaged in the business of electrical bank vault protection for more than 25 years and the company has an enviable record for service with thousands of customers throughout the United States and Canada.

Facilities and Service

In addition to the branch office and headquarters staffs, the company maintains a large corp of field experts—so located that any portion of the United States can be reached on a few hours notice.

Approved Grade "A" Burglar Alarm Systems

Installation of a McClintock Grade "A" System secures for the bank a discount of 65% from burglary insurance premiums upon a vault of any classification.

Automatic Control—By virtue of exclusive patented features of automatic control and operation, this system provides the bank with a positive guarantee that the vault which it protects will be properly closed, locked and electrically protected every night.

Daylight Holdup Alarm—Holdup alarm stations are provided for cages and other locations as desired.

Inspection and Maintenance—Annual inspection by field experts is provided for in the contract.

Specifications and Description—Complete specifications, plans and proposals for the protection of a vault of any size will be gladly furnished.

After Hour Depositories

Extending the convenience of a desirable service to bank patrons after regular banking hours.

Control Cabinet of Alarm System

After Hour Depository

Vault Ventilator (West Patents)

This vault ventilator is designed to be embedded in the walls of a bank vault for the purpose of safeguarding the lives of patrons and employees who may be imprisoned maliciously or by accident.

It provides scientifically correct ventilation by forced draft—affording an abundance of air for all who may be locked within a vault.

Draws in fresh air—expels foul air.

It is fireproof and liquidproof; offers greater resistance against burglarious attack than the wall in which it is embedded, and does not affect insurance rates.

Vault Ventilator

Sectional View of Vault Ventilator

Clock and Chime Systems

McClintock Clock and Chime Systems are specified for use where accuracy and long life are desired—particularly outside clocks.

The systems include the master clock, secondary clocks, storage battery and charger.

Tubular chimes are a special feature of our clock system if desired.

Styles of outside clocks include bracket clocks with two, three and four dials, also pedestal style. Regular construction is a steel frame covered by fabricated copper plates, but cast iron, bronze, or wrought iron can be furnished.

THE CINCINNATI MFG. CO.

Ornamental Bronze and Iron Work

MAIN OFFICE AND FACTORY
Corner Evans and Gest Streets
CINCINNATI, OHIO

Products

High grade ARCHITECTURAL and ORNAMENTAL WORK in BRONZE, BRASS and IRON, including:

Metal Work for Banks; Mausoleum Bronze; Memorial Tablets and Bronze Signs; Wire and Iron Work; Railings; Wickets and Grilles; Tubular Railings; Window Guards; Machinery Guards; Collapsing Gates; Wire Partitions.

For Kalamein and Hollow Metal Doors and Elevator Enclosures and Cars, see pages A814-815.

Experience

This company, organized in 1844, has had extensive experience in ornamental bronze and iron work. We are in position to handle any proposition in this field regardless of the size or the requirements of speed in delivery.

Facilities

Our plant and equipment is entirely modern and complete in every detail. It consists of foundry, machine shop, pattern shop, blacksmith shop, plating and polishing plants, baking and japanning ovens, drafting department, modeling and sculpture department, iron and wire working department, and chasing department.

Also compressed air and air brush equipment, sand blast, spot and acetylene welding, wood finishing on steel, draw bench work, heavy press work and heavy brakes and shears.

In addition, there is a large stock of materials, ample capital and skilled workmen at your service.

Bank Work

This is a big department with us. We can furnish everything in the way of bronze and iron ornamental work that is used in bank construction. Some of the

work executed from architects' drawings and our designs is as follows: bronze doors and transoms, counter screens, grilles, railings, counter rails, deposit rails and grilles, vault rails, gates, wickets, hand rails and railings, guard rails, clock faces, calendars and check racks, desks and tables, directory boards, desk guards, teller cages, name plates, cast bronze signs and tablets and window guards.

Our illustrated bank catalogue No. 50 gladly sent on request.

Fourteenth Avenue and Baker Street
(Post Office Box 574)

DETROIT, MICH.

Products

BRONZE DOORS for Public and Private Mausoleums.

CAST BRONZE TABLETS and HONOR ROLLS.

CAST BRONZE LETTERS for Building Exteriors in any style, size or shape.

Also manufacturers of Window Grilles and Frames for Glass; Catacomb Handles and Rosettes; Ceiling Hangers; Ventilators; Gates and all Bronze Equipment used in mausoleum construction; Decorative Bronze Work of all kinds; Bas-reliefs.

Bronze Mausoleum Doors

Construction—Doors are all of the "built-up" type construction. Standard thickness is 1 in., although they can also be made $1\frac{1}{8}$, $1\frac{1}{4}$ and $1\frac{3}{8}$ in., or thicker.

Bronze sheets not lighter than No. 14 gauge are riveted with $\frac{3}{16}$ -in. bronze rivets placed 3 in. on centers to each side of a substantial core or framing of *solid bronze*. Rivet heads are perfectly countersunk on both sides and hand finished smooth with door surface.

Equipment—Cast bronze door frames or jambs are used occasionally, but doors are usually hung direct to granite jambs. Arranged to swing inward or outward as may be required. Hinges are of heavy cast bronze of the pivotal type.

Cast bronze threshold at bottom. Slam bar over center joint. Slide bolts at top and bottom of left-hand door. Heavy handle on each door.

Rear of grille openings is fitted with plate glass shutters fitted with hinges and turn button lockers. A

device at bottom of shutters holds them securely at any angle when opened for ventilation.

Lock is of special heavy type, all-bronze, four tumblers, operating with flat german silver keys. Three keys are furnished.

All screws, bolts and expansion jackets are furnished by us.

Finish—Doors are usually finished in a light statuary bronze finish. The door stiles and all flat parts are hand rubbed with fine emery and pumice to a soft satin finish. The cast ornate parts are given a sanded finish with crevices and recessed portions in a darker tone. All outlines are hand tooled clean and sharp.

Workmanship—Doors are constructed by carefully trained skilled mechanics in a thorough, painstaking manner. Miters, joints, and all connections are neat and accurate. Applied ornaments are all secured from rear of door or "blind screwed."

Guarantee—These doors are constructed of best U. S. Standard Bronze. They are absolutely rigid, level and true, and beautifully finished. They are guaranteed to endure practically for all time.

All work is carefully boxed to insure safe delivery.

Service—All work is made to order, in any size or shape. Architects' special designs and ideas will be carefully followed. The usual time required for execution is 4 to 6 weeks.

Our many years' experience in this field is at your service.

Catalogue—On application.

Illustration No. SW1327

U. S. Standard Bronze Doors for Mausoleums

Cast Bronze Letters

The style letter illustrated is most generally used and we have adopted it as our standard.

When writing for prices send a scaled sketch showing size of letters desired and length of space where the letters are to be set.

Letters can be made flat face, rounded face, incised face, convex or with any other section.

Usually bronze letters are

fitted with bronze washers on the rear, so the backs of letters set $\frac{1}{2}$ to 1 in. from surface of wall.

Architects' details for special designs and shapes will be carefully followed.

General Specifications for Architects—Letters to be cast of best U. S. Standard Bronze of size indicated on plans. To be finished in fine sanded statuary bronze and fitted with substantial bronze anchors on rear for cementing to brick, stone, tile, etc. Special cement and liquid to be furnished for setting.

Spacing of letters to be approved by architect before setting.

BRONZE LETTERS

Illustration No. SW1292

Individual Cast Bronze Letters for Buildings
Standard Roman architectural style. Pyramid section

Cast Bronze Tablets

We make a specialty of bronze memorial tablets. These are furnished in stock patterns or are made from architects' details.

General Specifications for Architects—Tablets to be cast in one piece of best genuine U. S. Standard Bronze averaging not less than $\frac{3}{8}$ -in. thickness in body. Lettering to be heavily raised and of appropriate size and arrangement.

Design No. SW1215

Typical Design for Bronze Tablet

Made in any shape or size desired. This tablet is 24x15 in.

Rubbing or full size detail to be furnished for architect's approval.

Face and edge of border and face of lettering to be finished in a fine satin hand finish. Background or lettering field to have a finely pebbled surface, finished in dark statuary bronze. The outlines of all lettering and borders to be carefully hand tooled clean and sharp. Furnish bronze expansion screws with non-corroding lead expansion jackets for attaching tablet to wall. Heads of screws to be covered with neat rosette with threaded stem entering head of screw.

Note: If tablet is placed indoors, specify "To be heavily lacquered with best quality lacquer." If placed outdoors, specify "To be waxed or oiled."

Note: Background of tablet can be finished in a "Hand Hammered" surface at slightly additional cost.

Illustration No. SW1211

Typical Design of Bronze Tablet for Subway

Moulded border and Roman stock style raised lettering. Made in any shape or size desired. This tablet is 30x18 in.

Illustration No. SW1261

Typical Design of Bronze Tablet for Public Building

Ornate leaf design, Roman stock style raised lettering. Made in any shape or size desired. This tablet is about 21x32 in.

Bronze Tablet

Gift of Architectural League of New York—Unveiled at York Cathedral, London

Estimating and Advisory Service

Architects and contractors may secure desired information regarding bronze and its uses, suggested treatments, prices, et cetera, upon request.

We will gladly incorporate our standard construction on any layouts sent to us.

Special Service

Architects are invited to use the great Gorham collection of die shapes and ornamental patterns from which desired effects may be secured without cost for special tools and models—usually from metal in stock.

Bronze Tablets

Gorham Bronze Tablets are made to a single standard of excellence. Each tablet is an example of true craftsmanship in bronze.

Fine Bronze Statuary

The Gorham Foundries are the largest in the world devoted to production of sculptural and ornamental bronze.

The Gorham Tablet Book

Contains much helpful information for the tablet designer and full data on colors, letters, borders, fastenings, and the care of bronze. A valuable book for the architect's library. Sent on request.

Logan Iron Fencing

Logan Folding Gate

Logan Spiral Stairs

Logan Threshold
Made of iron, brass or bronze

Logan Sidewalk Grating and
Window Guard

Wire Work

Wire Door and Window Guards—Are made any size and of either round iron or channel iron frames.

A special booklet showing different size meshes with wire shown to full size, sent on request.

Wire Partitions—These standard partitions, of No. 10 wire in 1½-in. mesh woven to 1-in. channel frames, are 4x8 ft. in size and are adapted principally to stockroom enclosures. Special sizes can be made.

Standard Step Fire Escapes

These fire escapes are made to comply with any city or state law. Give a sketch of arrangement and give location of windows to be connected.

Special catalogue and specifications of many types sent on request.

Logan Spiral Slide Fire Escapes

This escape, made entirely of steel, consists of a smooth galvanized spiral slide enclosed in a cylinder 5 ft. in diameter, equipped with automatic entrance and exit doors.

It rests on its own foundation and does not depend on the building walls for support. It may be erected either on the exterior of a building, as shown in the accompanying illustration, or incorporated within the walls of the building as detailed below.

Advantages—It has no steps; consequently there is no stumbling or falling.

Being wholly enclosed, it is impossible for rain or snow, smoke or fire to enter.

Capacity—Over 150 persons a minute, which is the equal of 3 ordinary stairways.

Specifications—The fire escape shall be the Logan Spiral Slide made by LOGAN Co., Louisville, Ky., or equal. It shall be placed on a concrete foundation.

The escape proper shall be entirely of steel, 5 ft. diameter, placed as shown on plans, and shall have one entrance at each floor above the first.

The cylinder shall be of No. 12 U. S. Standard gauge sheet steel, for the first 18 in.; the next 6 ft. of No. 14 gauge, and the remainder of No. 16. The spiral slide shall be of No. 16 gauge galvanized sheet securely attached to a center core of 3-in. inside diameter standard black pipe.

An enclosed vestibule shall be provided at each entrance with entrance doors in two leaves each, arranged to swing in, and provided with torsion springs of phosphor bronze. Doors shall be set away from cylinder far enough to clear same when swung open.

Exit doors shall be in two leaves opening outward and provided with brass automatic inside latch with touchplate to operate by pressure by the smallest child.

The entire escape shall be manufactured in assembled sections about 7 ft. high, with an angle ring at the top and bottom of each section. It shall be set up at the factory to insure proper fitting, and each section properly marked to correspond with a setting diagram to be furnished by manufacturers.

Bronze Memorial Tablet Makers

3942 Forbes Street — PITTSBURGH, PA.

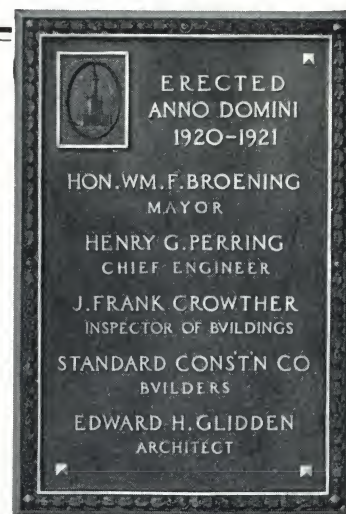

Products

Statuary Bronze Building Tablets; Memorial Tablets, Overhead Letters; Commercial Signs; Bronze Building Directories; Bronze bas-relief Portraits and Studies, Bronze Statuary. Rare artistry, craftsmanship, and hand chasing are distinguishing features of each Matthews Tablet.

Facilities

We have on our staff the highest type of designing and sculptural talent. We work either from the architect's design, our own design, or from a combination of our many "master" border and letter designs. Sketches and photographs, and full size lay-outs furnished without obligation.

ARCHITECTURAL BRONZE OVERHEAD LETTERS

Bronze Overhead Letters are preferred by architects because of their great legibility and absolute permanence. Unlike incised letters on stone, statuary bronze letters stand out with continued beauty and with great effectiveness. Unusual grace and charm of contour make these letters especial favorites for bank buildings and large public buildings. The design shown is our standard sharp face roman letter. Made in sharp face or flat face in almost any desired size. Or letters may be made to the architect's specifications. Blue prints furnished promptly on request.

Makers of Fine Architectural Cast Iron

925 to 939 Broadway
ALBANY, N. Y.

Products

Architectural Gray Iron Castings; Front Work, Entrance and Window Frames; Spandrels; Fascias; Cornices; Marquises, Frames and Pendants; Stairwork; Balusters, Newels, ornamental and plain, Risers and Treads; Columns; Pilasters; Panels; Saddles, Door and Elevator; Cast Iron Grille Work.

Also miscellaneous Castings, such as: Cleanouts, Coalhole Covers, Wheel Guards, Gratings.

Also Ornamental Wrought Iron required in architectural treatment of building as well as in connection with cast iron work.

Facilities

Fully equipped plant including drafting, engineering and designing department. Pattern department and foundry familiar with all kinds of carved pattern work, intricate cored work for all architectural purposes. Complete fabricating plant for fitting cast iron work with all necessary steel and iron work for shipping work ready for erection if required.

Service

Private siding and location of Albany on direct over-night water route to New York and South, and direct rail routes to New England, West, Southwest and South make delivery convenient and prompt to customers.

Large pattern stock of ornamental details effects economies in design. Ability to furnish plain and carved patterns, fitted as well as unfinished castings make for completeness of service.

Estimates from adequate blue prints quickly furnished and solicited.

Reputation

Seventy years of experience, and pattern makers, moulders and fitters trained for this special work, have made our products well known for the quality of their ornamentation and finish.

Three Examples Where Architectural Cast Iron Combines Beauty, Character and Permanence

THE MIDWEST METAL ART CO.

244-250 Butler Street
CINCINNATI, OHIO

Products

Designers and makers of FINE LIGHTING FIXTURES, GRILLES, GATES, STAIRCASES and other Architectural Metal Work of Character.

Equipment and Experience

We specialize in the finer types of architectural metal work and are thoroughly equipped to create and produce designs from simple hand forged hinges to the most elaborate and ornamental chandelier or grille.

We maintain a designing department, bronze and brass foundry, modeling department, pattern shops, plating rooms, blacksmiths' forges, assembly shops, decorating rooms, etc., all operated by skillful, competent craftsmen.

These facilities assure architects and decorators of the finest type of service in producing work from their own designs or from plans and designs created by our craftsmen.

Booklets of our recent installations and references from architects will be sent on request.

Doors and Entrances

THE NEWMAN MANUFACTURING Co. specializes in solid, kalamein and hollow bronze and steel doors and complete entrances for mausoleums, banks, public buildings, theaters, office buildings, etc. They gladly will send blue prints of stock designs, estimates of cost and complete suggested specifications, free of obligation.

Thresholds and Door Hardware

Also they feature a fine line of extruded brass and bronze thresholds, including interlocking and carborundum-filled types. These are carried in stock for immediate shipment. Ask for Blue Print No. 90.

They issue a separate sheet devoted to brass and bronze kick plates, push and pull plates, and door bars.

Brass and Bronze Railings

For 45 years the House of Newman has participated in railings of every description. They manufacture complete rails and gates of seamless brass tubing, extruded bronze and brass stair rails and balustrades, ornamental bronze altar gates, bronze balconies, and special rails such as velour ropes, tray slides, pool ladders, slide poles, etc.

Building Directories

Newmanco building directories and bulletin boards are made in a wide range of designs, with kalamein brass, extruded bronze, cast bronze and mahogany frames. These are fitted with grooved boards to receive six different kinds of interchangeable characters.

Write for the Newman Building Directory Catalog.

Eagle Savings & Loan Association, Cincinnati, Ohio

Bank Installations

Newmanco bank fixtures of brass, bronze and electro-plated steel are famous for quality the world over.

Upon request THE NEWMAN MANUFACTURING Co. will send blue prints of stock design counter screens, with suggestions and estimates of cost. Or they will quote in accordance with specifications, on such separate items as grilles, wickets, rails and gates, check desks, doors, safety deposit vault enclosures, cages and signs.

Send for General Catalog No. 2, and their Grille and Wicket Bulletin, Check Desk Bulletin, and Marquise Bulletins, all of which contain a wealth of ideas for architects and general contractors.

Ask about their new white bronze tablets and bank fixtures.

Bronze Tablets

Write for Newman's Bronze Tablet Catalog, illustrating and pricing cast bronze memorial tablets, bank signs, school tablets, letters, nameplates, etc. A gold mine of suggestions and data for your files. As specialists the House of Newman is prepared to work to splendid advantage with architects who specify bronze tablets and letters.

Theater Fixtures

Brass rails, plush covered rails, velour ropes with brass posts, ornamental bronze ticket offices, extruded bronze and kalamein brass lobby frames, vent grilles, marquise of copper and galvanized steel.

In the manufacture of these stock and special fixtures Newman has specialized for nearly half a century.

Bank of California, Seattle, Wash.

Products

N.A.I.W. ELEVATOR DOORS and FRONTS.
Also Stairs, Railings, Fences, Entrance Doors, Sidewalk Doors, Access Doors, Store Fronts, Marquises, Art Smithing, Lamp Posts, Flag and Radio Antennae Poles, Coal Doors and Chutes, Fountains, Stable and Barn Equipment, Garden and Park Furniture, Tree Guards, Pipe Railings, Racks, special Pipe Bends, Steel Partitions and Radiator Inclosures.

N.A.I.W. Elevator Doors

These doors are made of substantial material to resist heavy duty, are of good architectural design and are sold at a price conforming with the purpose for which they are to be used.

N.A.I.W. Doors are manufactured by a special process from a single plate of steel $\frac{1}{8}$ in. thick, formed with stiles, rails and panels to conform with architect's designs.

Made of One Basic Piece

N.A.I.W. Doors are made in one basic section as shown in Section W, and in 3 basic styles.

Style A, flat face.

Style B, single panel.

Style C, double panel.

These styles can be varied in section to suit architect's designs:

(1) By applying a moulding on the inside face (Section X); (2) by attaching two sections back to back, panel lined with asbestos and stiles with cork (Section Y); (3) by applying, on the inside face, a steel panel with asbestos lining (Section Z). Some other variations are shown in elevation in styles D, F and G.

N.A.I.W.

TRADE-MARK

N.A.I.W. Elevator Doors
Warwick Hotel, New York, N. Y.
A 36-story building

STANDARD STYLES OF N.A.I.W. DOORS

Features of the N.A.I.W. Doors

No parts to separate.
No screws to loosen.
No tin to peel off.
No warping or blistering.
No ugly, wavy surfaces.
No wooden cores.
No thin gauge metal.

Elevator Fronts

Complete elevator fronts can be supplied including N.A.I.W. doors, heavy gauge steel bucks arranged with hanger box and cover, also hanger, facias and saddles.

Finish, Hardware and Arrangement

N.A.I.W. Doors are made to receive any decorative treatment desired.

They are arranged to receive standard hardware applied so that no screws show on the outside face.

Arrangement—Single sliding doors, slide and swing doors, two-speed or three-speed doors or any other arrangement required.

They can be made to any size or thickness.

Suitable for Heavy Service

N.A.I.W. Doors are recommended for passenger, service or freight elevators for hotels, apartment, club, office, loft and industrial buildings, warehouses, schools and hospitals.

N.A.I.W. Doors can also be used for all purposes where ordinary doors are used and where heavy duty is required.

Service to Architects

Our engineering department will gladly assist architects by making a study of special conditions and submitting sketches for elevator fronts and other doors.

OSTERKAMP-MEAD CORPORATION

Artistic Sculptural Castings and Fine Wrought Metal Work
International Foundry Service

551 Fifth Avenue
NEW YORK, N. Y.

Products

ARTISTIC SCULPTURAL CASTINGS and FINE WROUGHT METAL WORK, including Executions in Bronze, Brass, Iron, Lead, Silver, Gold and other metals, from sculptors' and other original models.

COLOSSAL MONUMENTS, RELIEFS and STATUARY.

Also Electrolytic Impressions (Galvanoplastic); Fire Gilding and all technical accessory functions; Ecclesiastical Fixtures requiring special finishes, enamels, etc.

Facilities

Resources of craftsmanship embracing five centuries of bronze founding experience. Models of every known sculptured work and ornament available for reproduction, and the largest extant collection of bronze replicas for every purpose, enable us to supply from stock or to-order at the same minimum cost. Drafting and modeling departments. Modern European design.

Service

We execute from your drawings through all stages to the finished product, or freely co-operate in working up designs in part or as a whole; supervise sculptural commissions, effect contacts with the architect and sculptor, furnish information and conduct researches on technical problems.

Prompt and helpful estimates on any actual or contemplated work cheerfully made without obligation.

NATIONAL ENAMELING & STAMPING CO., Granite City, Ill.	WHEELING STEEL CORP., Wheeling, W. Va.
	YOUNGSTOWN SHEET & TUBE CO., Youngstown, Ohio

For Sheet Steel Roofs, see page A440
For Sheet Steel Cornices, see page A558

Advantages

The following characteristics of sheet steel for interior uses are of particular appeal to the architect:

Its toughness and strength permit of joints of everlasting tightness impossible to brittle and thick materials.

Its freedom from shrinkage and warping makes precise construction dependable.

Its incombustibility minimizes fire hazard both by reducing the combustible present and by confining fire.

Its thinness with its strength, and its ductility make possible fine dimensions unattainable in any other economical material.

Sheet Steel Used for the Decoration of Ceilings and Sidewalls

Sheet Steel can be obtained in a wide variety of designs, greatly enhancing interior attractiveness. Where sanitation and cleanliness is an item of great importance, porcelain enameled sheets can be applied

Its perfect surface takes and holds the most durable and beautiful finishes, making available a great variety of colors, textures and designs and insuring life beyond demand.

Its workability and ease of incorporation insure economy in installation and in alterations.

Its strength and close similarity of expansion to that of plastering prevent cracks.

Its entire and permanent lack of hospitable openings and its hardness prevent vermin, mice and accumulations of dirt.

Its moderate first cost, great serviceability and negligible maintenance make it most economical.

Specifications

The SHEET STEEL TRADE EXTENSION COMMITTEE will furnish gratis, any desired information upon request.

Service

The research and engineering facilities of the SHEET STEEL TRADE EXTENSION COMMITTEE are at the instant service of any architect upon request and without obligation.

Articles of Interior Use

The following articles in which the architect frequently is interested are only a partial list covering the more important items:

Base	Door	Partitions
Moulding	Jamb	Bath
Conduit	Trim	Dwarf
Bins	Doors	Folding
Bookstacks	Elevator	Full height
Booths	Entrance	Toilet
Picture	Fire	Pilasters
Ticket	Hollow	Placques and ornaments
Cabinets	Kalamein	Radiator covers
Broom	Revolving	Refrigerators
Clothes	Dryers	Safes
Display	Laundry	Sash
Filing	Ducts	Casement
Fruit	Blower	Sliding
Food	Ventilator	Ventilating
Ironing	Warm air	Screens
Kitchen	Elevator Enclosures	Seating
Medicine	Grills	Shelving
Storage	Heaters	Stair
Ceilings	Warm air	Risers
Chair rails	Humidifiers	Treads
Chutes	Lath	Stairs complete
Clothes	Metal	Tanks
Delivery	Expanded metal	Tiling
Columns	Mail boxes	Wall
Corner beads	Mail chutes	Ceiling
Cornices	Moulding	Transoms
Counters	Picture	Wainscoting
		Window trim

TIFFANY STUDIOS

Ornamental Bronze and Iron, Lighting Fixtures, Interior Decorations,
Fine Furniture, Oriental Rugs

391 Madison Avenue, NEW YORK, N. Y.

Products

ORNAMENTAL BRONZE and IRON WORK.
LIGHTING FIXTURES.
SMALL BRONZE ARTICLES.
INTERIOR DECORATIONS and FURNISHINGS.
FINE FURNITURE.
ORIENTAL RUGS.
LAMPS and LAMP SHADES.

Fine Furniture

Reproductions of English, Italian and French originals. A complete stock of fine furniture for all requirements.

Ornamental Bronze and Iron Work

A complete factory and bronze foundry equipped with modern machinery, efficient drafting and designing departments with an organization of experts, enable this company to execute all requirements of architects or sculptors in ornamental bronze and iron work. This includes doors, gates, bank screens, marquises, check desks, entrances, tablets, clocks, stair railings, elevator fronts and cars, etc.

Polished Steel Grille Gate, First National Bank of Detroit

ALBERT KAHN, Architect
Executed by TIFFANY STUDIOS, New York, N. Y.

Lighting Fixtures and Small Bronze Articles

Lighting fixture schemes and estimates prepared from architects' drawings for banks, hotels, public buildings and residences, including entrance torcheres, standards, chandeliers, wall brackets, TIFFANY STUDIOS' bronzes, lamps, desk sets, portrait frames, candlesticks, cigarette boxes, ash trays, etc.

Interior Decorations and Contract Work

TIFFANY STUDIOS are equipped to submit estimates, suggestions and complete schemes for all interior decorations including lighting effects, draperies, wall hangings, painting and woodwork for banks, public buildings, hotels and residences. Church work a specialty.

Cast Bronze Lantern

Spread 32 inches. Height 7 feet

Oriental Rugs and Tapestries

A large collection of unusual Oriental rugs, antique and modern, including early Spanish pieces.

Prices

An opportunity is solicited to estimate, in proof that our prices compare favorably with those of other firms doing work of a like quality.

THE TYLER COMPANY

Elevator Entrances and Cars

CLEVELAND, OHIO

BRANCH OFFICES

NEW YORK, N. Y., 247 Park Avenue
CHICAGO, ILL., 310 South Michigan Avenue
DETROIT, MICH., 535 Griswold Street

BOSTON, MASS., 20 Providence Street
PHILADELPHIA, PA., 260 South Broad Street
ATLANTA, GA., 133 Luckie Street

Products

FIREPROOF ELEVATOR ENTRANCES and CARS.

Also Bronze Tablets; Bank, Office, Vault, Stair, Balcony, Altar, Veranda and Counter Railings; Stairs; Store Fronts; Marquises; Counter Screens; Lamp Standards and Brackets; Window Guards and Grilles; Porte-cochères; Corridors; Fencing; Gates; Wickets; Signs; Electroliers; Self-closing Folding Gates; Bronze and Iron Entrance Doors; Mausoleum Doors.

Elevator Entrances and Cars

Made of all-metal fireproof construction throughout.

Can be supplied to suit the hatchway conditions in new or old buildings.

Two-panel Front, Two-speed Doors Open, Showing Car

Furnished in a wide variety of finishes, including: electroplate, enamel bronzes, solid baked colors or grained to match any kind of wood.

Also made in solid bronze.

We build all parts entering into the construction of entrances and cars, including all hardware and mechan-

ism, in our own factory.

This insures perfect operation and undivided responsibility.

Door Construction

Made in single sliding, two-speed, center-opening and other types as required; capable of quiet, high speed operation.

Door panels are made of heavy gauge material, reinforced to withstand the peculiar strains and stresses to which they are subjected.

Engineering Service

The Company's engineers will gladly assist architects and owners in selecting the type of equipment best suited to any type of building. Designs and estimates will also be submitted when requested.

ART METAL CONSTRUCTION COMPANY

Hollow Metal Doors and Trim

HOME OFFICE AND FACTORIES
JAMESTOWN, N. Y.

For Branch Offices, see page B2176

Products

HOLLOW METAL DOORS and BUILDING TRIM; ELEVATOR, STAIR and DUMBWAITER ENCLOSURES; CORRIDOR and OFFICE PARTITIONS and CABINET WORK in STEEL and BRONZE.

For Steel and Bronze Interior Equipment, see pages B2176-2179.

Facilities

Largest and most modernly equipped plants devoted to the manufacture of hollow metal products and building equipment.

Service

Main and branch offices maintain competent engineers, whose services are free to architects, engineers, and builders.

Materials

All materials used in Art Metal products are the best of their respective kinds, for their particular purposes. All steel and ingot iron are the best grades commercial furniture stock of U. S. standard gauge. All bronze is best grade commercial stock Brown and Sharpe gauge, of suitable hardness and uniform color.

Workmanship

The work is executed by craftsmen, employing the latest principles of construction and the most modern methods of manufacture.

General Description of Steel Products

Doors and Sash—Stiles and rails are formed of No. 18 gauge stock with cold drawn panel mouldings securely keyed thereto. Stiles are provided with compressed cork inserts.

Joints are fitted, reinforced, welded and dressed to produce invisible connections.

Metal panels consist of two plates of No. 20 gauge stock and $\frac{1}{4}$ -inch heat retarding insulation.

Glass panels are retained by removable cold drawn moulding frames closely fitted and secured to panel mouldings by No. 6-32 countersunk oval head screws.

Muntins are constructed of cold drawn interlocking shapes fitted and welded to panel mouldings.

Astragals are of cold drawn interlocking shapes welded to stiles.

Jambs—For openings in walls up to $7\frac{1}{2}$ inches thick, jambs are formed of No. 18 gauge stock; over $7\frac{1}{2}$

inches No. 16 gauge with $\frac{1}{2}$ -inch plain or moulded stops for regular units and $\frac{3}{4}$ -inch for Fire Underwriters' units. Jambs are secured to bucks by No. 8-32 screws.

Casings—Of No. 18 gauge cold drawn shapes, corners accurately mitered, welded and dressed to produce invisible joints.

Casings are secured to jambs by concealed method.

Pressed Steel Bucks—Of No. 14 gauge stock provided with anchor retainers and plaster bonds, corners accurately fitted, reinforced and provided with interlocking screw connections. Spreaders of $2 \times 2\frac{3}{4}$ -inch by No. 14 gauge channels with No. 12 gauge gussets are secured to bottoms. No. 18 gauge corrugated adjustable anchors are furnished for each 25 inches of opening height.

Bucks for walls of plaster block construction are furnished with struts when called for. Struts are of $\frac{1}{4} \times 3$ -inch bars having No. 12 gauge flanged gusset ceiling connections.

Bucks for opening more than 3 feet 6 inches wide in tile or brick walls are furnished with arched masonry supports when called for where lintels are not provided. Supports are of 4-inch by No. 12 gauge stock welded to head at ends.

Frames—Combination buck and jamb frames are formed of No. 10, 12, 14 or 16 gauge stock. Corners accurately fitted, welded and dressed to produce invisible rigid joints. Trim members are pressed into frames or of drawn shapes applied by concealed method. Frames are provided with spreaders, anchors, struts and masonry supports as specified for bucks.

Trim Mouldings—Chair rail, staff or scribe, picture and wire mouldings are of No. 18 gauge cold drawn shapes, secured to walls by concealed method.

Bases—Constructed of No. 18 gauge stock with plain or moulded profiles, and secured to walls by concealed method. When called for, bases are fitted with bronze sanitary coves.

Window Trim—Jambs and mullions are of No. 18 gauge stock, plain or paneled, and provided with adjustable moulded stops secured by No. 6-32 countersunk oval head screws.

Stools—Of No. 16 gauge stock with returns accurately mitered, welded and dressed. Stools are secured by No. 8-32 countersunk oval head screws.

Art Metal Bronze Doors, Buckeye Savings & Loan Association, Columbus, Ohio

Casing and Aprons—Of No. 18 gauge cold drawn shapes with corners and returns accurately mitered, welded and dressed, and secured by concealed method.

Partitions—Of sectional type with units of sizes allowing for flexibility of arrangement. Units proper are constructed of formed and drawn shapes reinforced and so assembled as to produce invisible connections.

Owing to the perfected construction, installation is simple and can be performed economically and expeditiously.

Hardware—Hollow metal work is prepared and reinforced for the proper reception of all hardware and appliances. Ordinarily the hardware is furnished under separate contract, but applied at our plant.

Bronze Work

The foregoing description covers our standard products in steel. Bronze work is executed similarly, except that materials are two gauges heavier, joints are made by riveting, screwing and brazing, and finish is produced in accordance with standard methods for durability and desired effects.

Finish

Material is thoroughly cleaned, primed and filled, followed by subsequent coats as required to produce a durable finish of color selected. Each coat is uniformly applied, baked, and sanded, with final coat rubbed to an eggshell gloss.

The following finishes are standard and grouped according to class:

STANDARD FINISHES OF ART METAL DOORS

Class	Finish	Class	Finish
No. 1	Olive "F"	No. 3	White Ivory Cream
No. 2	No. 29 Brewster green	No. 4	No. 36 Dark mahogany, crotch grain
	No. 30 Stone green		No. 61 Brown mahogany
	No. 51 Medium green	No. 5	No. 57 Plain oak, medium
	No. 52 Brown		No. 58 Quartered oak, medium
No. 2½	No. 53 Tan	No. 6	No. 59 Light American walnut
	Maroon		No. 60 Dark American walnut
No. 3	Black	No. 7	No. 56 Verdigris green, stippled
	No. 1 Dull bronze, light		No. R-228 Mottled green, stippled
	No. 2 Dull bronze, medium		
	No. 3 Dull bronze, dark French gray		
	No. 36 Dark mahogany, straight grain		
	No. 36B Light mahogany, straight grain		
	No. 54 Gold bronze		
	No. 55 Silver bronze		

Fire Underwriters' Requirements

The National Board of Fire Underwriters have tested and approved Art Metal products, authorizing their labels for the following situations:

Class "A," Units in Division Walls Between Separate Buildings or Sections of Buildings—

Limitations: swinging type; single doors for openings not exceeding 4x7 feet, and doors in pairs not exceeding 5x7 feet, all steel with approved hardware.

"Class B," Units in Enclosures to Vertical Communications Through Buildings—

Limitations: swinging type; single doors for openings not exceeding 4x10 feet, and doors in pairs not exceeding 8x10 feet, all steel with approved hardware.

Class "C," Units in Corridor and Room Partitions—

Limitations: swinging type; single doors for

openings not exceeding 4x10 feet, and doors in pairs not exceeding 8x10 feet, with or without panels of standard wire glass. Exposed area of individual lights not exceeding 1296 square inches.

Class "D," Units in Exterior Walls Subject to Severe Fire Exposure—Limitations: swinging type; single doors for openings exceeding 4x10 feet, and doors in pairs not exceeding 6x10 feet, with or without panels of standard wire glass. Exposed area of individual lights not to exceed 720 square inches, lights not to exceed 54 inches in height.

Kalamein and Hollow Metal Doors

CINCINNATI, OHIO

Products

HOLLOW METAL and KALAMEIN DOORS and TRIM, all types and designs.

HOLLOW METAL DOORS, bearing Underwriters' Laboratories, Inc., label of approval.

ELEVATOR ENCLOSURES, DOORS and CARS.

For Ornamental Iron and Bronze Work, see pages A752-753.

Kalamein Doors

These doors are constructed with a wood core over which sheet metal is applied. This kalamein will not warp or bulge, as expansion and contraction are allowed for in a special lock seam.

They can be furnished in a variety of stock designs.

Catalogue No. 53 sent on application.

In addition to doors, kalamein trim, mouldings, muntin bars, astragals, and stop strips are manufactured by this company in either stock or special designs.

Specification Data—Core of thoroughly kiln dried lumber, tongue and groove joined, and clinch nailed. Stamp panels and rails in separate pieces, of metal specified. All joints are blind nailed and lock seamed securing covering to core in a manner which allows for expansion and contraction of metal. Doors exposed to weather covered with galvanized steel or sheet copper. Interior doors covered with Armco steel, bronze or copper. Steel doors finished with one coat gray priming paint, or baked enamel in imitation of wood, to be specified.

Style B

Style E

Style F

Kalamein Doors, with Glass Panels

Hollow Metal Doors

Made to architect's designs in special finishes permitting a wide range of individual expressions, or in stock patterns and standard finishes. Thoroughly insulated throughout to insure an efficient fire retardant and to prevent metallic sound. The construction obviates necessity of installing jamb during erection of walls, and permits hanging and adjusting of doors independently of frames. The Underwriters' Laboratories, Inc., have tested and approved these doors and their label is affixed to them, for all classes of openings.

Complete information should be given when asking for estimates, as they are based on the requirements of each particular installation.

Catalogue No. 53 sent on request.

Specification Data—Doors of highest grade No. 18 gauge Armco open hearth steel specially treated. All surfaces true, level, and free from all imperfections. Parts interlocked and welded with invisible seams and joints. Insulate stiles, rails, and panels throughout with asbestos. Apply baked enamel finish in imitation of wood specified. Frames of No. 14 gauge steel, welded at joints to form one piece. Attach to walls by means of adjustable anchor plates. Jambs, furnished in separate pieces, fit over frames.

Elevator Enclosures, Doors and Cars

Many years' experience and a completely equipped plant enables us to produce any type of elevator enclosure in bronze, or steel. Several of our stock designs are shown here. Our engineering department is ready at all times to assist and co-operate with you in designing enclosures for special conditions.

We make enclosures of steel diamond mesh, steel square mesh, kalamein and hollow steel construction with polished wire, glass or steel bar panels, made in any wood finish desired.

Standard doors are made in the following types: single sliding, two-speed sliding, two-thirds opening sliding, and combination sliding and swinging. Doors furnished complete with hardware.

Catalogue No. 54 on request.

Elevator Enclosure—Push Button Type with Collapsing Gates

Design No. 757 Elevator Enclosure

Made of No. 14 gauge sheet steel, hollow construction. Panels fitted with 1/4-in. polish wire glass

Two-thirds Opening Sliding Door

Estimates furnished on receipt of dimensions A, B, C and D

Combination Slide and Swing Door

Desirable where elevator is used for both passenger and freight service. Estimates furnished on receipt of dimensions A, B and C

TRADE-MARK

tion for their superior quality. Only expert workmanship and first-class materials enter into their manufacture.

Undoubtedly a semblance of Dahlstrom products can be produced at lower cost, but any inferiority makes the substitution dear at any price.

Dahlstrom Metal Doors and Trim

Design—Originators and largest manufacturers of metal doors and trim in the world. Dahlstrom metal doors were originated by the founder of this Company and perfected by us. Twenty years of designing and manufacturing doors and trim to meet various conditions have given our product the well earned title of "The Specified Standard."

Construction—Dahlstrom metal doors and trim do not contain a combustible core, which is evidence in itself that they are fire retarding. No portion of the product can burn.

All joints are carefully welded. Reinforcements are also welded to the construction members. The whole design of Dahlstrom metal doors is for rigidity, stability, fire protection and elegance.

Door frames are fabricated from Nos. 10 to 14 gauge metal, according to the size of the opening and the service required.

Finish—All surfaces are thoroughly cleaned before finish is applied. Each coat of paint or enamel is carefully baked and properly treated to secure the superior finish for which Dahlstrom products are noted. The same care and attention is given all finishes whether plain colors, stipples or reproduction of wood graining.

Quality—Dahlstrom products enjoy a good reputa-

Hardware—To facilitate delivery and avoid undue delay, we keep on file in our hardware department a large number of templates of standard pieces of hardware. This permits us in most instances to proceed with our work immediately after we receive the architect's approval and schedule of hardware.

Three-point Lock—One of the requirements of the Board of Fire Underwriters is that swinging fire doors for stair halls and similar locations must be locked at not less than three points, to prevent the doors from warping away from the frames in case of fire, which would allow the flames to pass through.

The multiple gravity latch is another Dahlstrom product of unusual merit, entirely contained within the metal doors. This locking device is approved by the Underwriters' Laboratories, Inc.

Panic Bar and Checking Device—An improved panic bar can be furnished in connection with the three-point locking device; also a checking device for use on automatically closing double doors to prevent the service door from closing until the opposite door is in place in the opening. Both of these devices are Dahlstrom developments.

Classification of Finishes—In order to make it clearly understood that the kind of finish required will affect prices, a list of standard classifications is given below:

Class A—Plain color finishes such as: No. 10 dark green; No. 11 olive green; No. 15 maroon; No. 17 chocolate; No. 19 black; No. 30 sea green; No. 33 statuary brown; No. 47 bottle green; No. 48 slate; No. 49 navy gray; No. 50 dark gray; No. 51 quaker drab; No. 52 medium brown.

Class B—Plain color finishes such as: No. 13 white; No. 18 French gray; No. 34 pearl gray, cream and light blue.

Class C—Stipple enamel finishes such as: No. 26A verve antique stipple; No. 28 green; No. 42 medium brown.

Class D—Grained and stipple finishes such as: No. 1 light mahogany; No. 2 tuna mahogany; No. 3 dark mahogany; No. 8 birch; No. 36 bronze stipple, statuary; No. 38 bronze stipple, black; No. 46 mottled Egyptian green; No. 53 gumwood; No. 54 American walnut.

Class E—Grained and stipple finishes such as: No. 4 medium oak; No. 5 light oak; No. 6 dark oak; No. 7 circassian walnut, light; No. 9 ash; No. 31 circassian walnut, dark; No. 35 natural bronze stipple; No. 37 bronze stipple, mottled; No. 40 bronze stipple, mottled verdigris; straight oak and pine.

Class G—Grained and special finishes such as: fumed oak, silver oak; special crotch mahogany, Australian mahogany; teakwood; burl walnut; also marble, inlay work and special bronzes.

Specifications

Complete specifications have been prepared covering the entire field of hollow metal. Separate specifications covering elevator entrance inclosures are also available. We shall be glad to send these specifications to architects on request.

Emigrant Bank Building, New York, N. Y.

THOS. E. MURRAY, INC., Designing and Constructing Engineers
Equipped with Dahlstrom metal doors and trim

Conduo-Base

Conduo-Base is a combination metal base and electric conduit for high and low tension wires, in the form of a continuous electric outlet box.

As a base, it is handsome, sanitary and fireproof. It can be finished to match any wood, marble or metal and is provided with a natural bronze floor moulding to prevent rubbing off the finish of the base from cleaning.

As an electrical device, it is provided with two large concealed raceways for high and low tension wires. These raceways are easily accessible by removing the face plate.

Conduo-Base will more than pay for its cost in the saving it makes by eliminating extensive conduits and wiring for prefixed base outlets and by eliminating changes of wiring for tenants.

There is no damage to the walls and floors, as the wires are all carried in the base. It is an easy, simple, clean matter to remove the face of the base, pick out the required wires, make the connections and notch the face for the receptacle. The face of the base is then re-attached and the work is completed. The Conduo method is the only way to provide convenient outlets, conveniently located, no matter what the tenant's requirements may be.

Design—Conduo-Base is so designed as to make it possible to place

Quarter Size Cross Section of Conduo-Base

High and low tension receptacle and bushings in place

a number of electric receptacles and low tension current outlets along any point of the base, and at any time desired, with extreme ease, instead of extending numerous conduits to a number of prefixed base outlets, none of which may suit each tenant's requirements. By installing Conduo-Base and extending in the floor-fill one low tension wiring conduit from main wiring shaft to any convenient point in Conduo-Base, and extending 1/2-in. conduit from wall switch box to Conduo-Base, any number of high and low tension wires can be extended at any time in the Conduo-Base raceways, and any number of outlets for fans, desk lights, dictaphones, motors, telephones, intercommunicating telephones, district telegraph call bells, buzzers, etc., can be installed and connected at any desired points whenever wanted.

Conduo-Base Eliminates—

(1) Guesswork as to each future tenant's electric outlet requirements.

(2) The necessity of predetermining the exact location of outlets before the offices are rented.

(3) The cost of extensive conduits and wires, outlet boxes, etc., required for all prefixed outlets.

(4) The cost of large wire moulds for low tension wires.

(5) Unsightly exposed wires tacked along all wall trim and hanging in a maze of network.

(6) The cost of constant changes for each new tenant's requirements, and the cost of cutting and patching of floors and walls for each change.

Conduo-Base Provides—(1) A safe, fireproof and concealed raceway for all wires needed in a modern building.

(2) All the outlets each tenant wants, just when and where he wants them, with minimum cost and without marring the building.

Metal Elevator Inclosures

Just as the internal combustion engine made the automobile possible, so the development in elevator engineering made the skyscraper possible. With the skyscraper came apprehension as to safety from fire hazards, and attention was drawn to the menace of the open elevator shaft as a means of rapidly spreading a fire from floor to floor and providing a veritable chimney draft. The timely appearance of the Dahlstrom door provided a solution to this problem, and it is a pleasure to check up at this time the efficient service still rendered by the early elevator inclosures of twenty years ago. In fact, ninety per cent of the early installations were for elevator inclosures, which speaks well for the adaptability of the then new Dahlstrom construction.

The weight of the door permitted easy operation, while the general design gave fire protection and beauty. With these features the problem on inclosing elevator shafts was solved.

The years of experience in designing and manufacturing these doors for many hundreds of buildings have given this Company valuable data and information as to

the proper type of inclosure for various types of openings. Standard types and designs have been worked out which will suit practically any type of opening. Should special designs be desired our Engineering Department will gladly work with you in designing inclosures to meet special conditions.

Dahlstrom elevator inclosures receive that same high standard of workmanship and finish for which Dahlstrom products are noted.

GROSS METAL PRODUCTS COMPANY

Manufacturers of Architectural Hollow Metal Doors, Frames and Trim

2575 Como Avenue
ST. PAUL, MINN.

3325 Como Avenue
MINNEAPOLIS, MINN.

REPRESENTATION IN ALL PRINCIPAL CITIES

Products

GROSS STEEL SLAB DOORS, HOLLOW STEEL and BRONZE DOORS, FRAMES and TRIM, ELEVATOR ENCLOSURES and CABS.

Also special Sash and Frames; Steel Partitions.

Service

Competent engineers at all times are at the disposal of architects and contractors for special information or assistance.

Gross Hollow Metal Doors

The panel doors are built according to the best practice, and quality is at all times the first consideration.

Labels—Underwriters' labels can be furnished when required.

Material—Doors are constructed of No. 1 furniture steel, full pickled, full cold rolled and stretcher leveled.

Frames are constructed of pickled cold rolled steel.

General Description—All doors and frames have gas or electric welded joints, all perfectly ground after welding.

Rails and stiles are constructed of No. 18 gauge steel properly reinforced for hardware, with compressed cork inserted to deaden metallic sound. Panels are two thicknesses of No. 20 gauge steel, with $\frac{5}{16}$ -in. asbestos between. Mouldings are of one piece and firmly locked to stiles and rails, or separate mould on each side, no screws being used except for loose glass mould.

Frames are constructed of No. 16 gauge pickled cold rolled steel, true to profile with clean sharp lines; mortised and reinforced for all hardware, then joints properly welded. Six anchors are regularly furnished with each frame without transom, and eight for frame with transom.

Finish—All surfaces of metal are first thoroughly cleaned to be free from all grease and other foreign material, then each coat as applied is baked and sanded. Any finish can be applied whether primed, enameled solid color, or grained to match woodwork adjacent to metal doors or trim.

The personnel of our finishing department is composed of highly skilled metal finishers, and all work is given expert attention.

In asking for quotations, the color and nature of finish should be carefully described.

Installations of Hollow Metal Doors

Following is a partial list of installations executed by us:

St. Luke's Hospital, Aberdeen, S. D., John H. Wheeler, Architect.

House of Good Shepherd, Milwaukee, Wis., Eschweiler & Eschweiler, Architects.

National Tea Co., Milwaukee, Wis., Herbst & Kuenzli, Architects.

W. I. Cook Memorial Hospital, Fort Worth, Tex., W. G. Clarkson & Co., Architects.

Library Building, University of Illinois, Urbana, Ill., Chas. A. Platt, Architect.

Various Types of Gross Hollow Metal Doors

Gross Hollow Metal Slab Doors

Gross Hollow Metal Slab Doors being spot-welded on both sides every $2\frac{1}{2}$ in. both vertically and horizontally, become so rigid that they cannot be twisted or warped by any reasonable pressure.

In making a careful examination of Gross Hollow Metal Slab Doors, architects and engineers are astounded at the complete absence of any metallic ring.

The surface of the door is perfectly flat and smooth and can never become unsightly, as in the case of wood doors, by gradual peeling of veneer; or buckling of steel covering applied on kalamein doors.

They can be finished in either solid color enamels, or beautiful wood grain effects baked on in carefully tempered ovens. Unless otherwise specified, however, all doors leave the factory with a prime coat of paint.

All hardware is fitted to the doors at our factory from templates and, after delivery to the building, are ready for erection as soon as hardware is attached.

A careful survey of erection costs proves that a complete unit of Gross frame and door can be installed at a cost very little above a complete wood unit. When estimating the cost of installation, the fact should not be overlooked that there is no future annoyance caused by swelling or warping, or expense of refitting due to climatic conditions, as is the case with wood doors.

Specifications—

All flush slab doors, where shown on plans or schedule, shall be Gross Hollow Metal Slab Doors constructed with a single No. 20 gauge steel sheet for each side; each side spot-welded to a web-formed reinforcing extending full width and length; approximately $2\frac{1}{2}$ in. on centers. Butts shall be recessed into door and lock properly mortised.

After doors are finished they shall be coated with paint; dipped so that the inside, as well as the outside, is thoroughly coated and left perfectly flat.

Underwriters' Labeled Doors—Where required, our Slab doors can be furnished with Underwriters' labels except for fire walls.

Guarantee

Gross Metal Products are guaranteed to be of the highest quality both in materials and workmanship.

They are absolutely fireproof.

Elevation of Gross Slab Door

- (1) Reinforcement for door check, placed in all doors.
- (2) Reinforcement for lock and trim. Lock fitted and all holes drilled and tapped for screws by templates.
- (3) Reinforcement for hinges or butts. Doors recessed and all screw-holes drilled and tapped by templates to receive butts.
- (4) Formed web stiffener full length and width of door. Spot-welded to both cover sheets approximately $2\frac{1}{2}$ in. on centers, vertically and horizontally.
- (5) Closing channel $\frac{1}{2}$ in. deep and spot-welded to cover sheets top and bottom of door.
- (6) Cover sheets of No. 20 gauge highly finished stock blanked for hardware, and formed to size.

Products and Services

HOLLOW STEEL DOORS; ELEVATOR ENCLOSURES, consisting of Doors, Frames, Trim, Saddles, Hardware, etc.; COMBINATION BUCKS, JAMBS and TRIM; CABINET JAMBS and TRIM; BORROWED LIGHTS.

Also Railway Car Doors; Drawn Mouldings from stock dies or made to special details, including extensive lines of Panel Moulding; Metal Base; Wire Moulding; Picture Moulding; Chair Rail; Trim; Automobile Moulding; Channels; Angles, and Special Shapes of various kinds adapted to the manufacturer's special requirements.

The LAWTON-STEPHENS CO., INC. cordially invites architects and engineers to use its Sales Department Services. Without obligation of any kind, it will be glad to submit tentative designs and specifications, and co-operate in any way regarding methods of construction or problems where products of this nature are contemplated.

Doors

The LAWTON-STEPHENS CO., INC., hollow metal doors are made in any variety of styles and sizes as de-

manded by architects and builders—embracing solid panel, glass panel, raised panel, louver, or flush doors.

Lawton-Stephens hollow steel doors are constructed with care, and represent years of study in this field. They are adapted to meet all conditions where the best and most durable type of fireproof construction is required, such as in hotels, hospitals, apartment houses, office buildings, residences, etc.

Specifications for Standard Hollow Doors—All doors to be of size and design as shown on door schedule and drawings, of LAWTON-STEPHENS CO., INC. manufacture, or equal, constructed throughout of open hearth, cold rolled, patent leveled, furniture steel. They shall be of 1¼ in. thick, 5-in. stiles and rails, except bottom rail which shall be 10 in. in height, and be welded at all points of intersection. Stiles and rails to be of No. 18 gauge steel, with suitable asbestos or cork filler; panels to comprise two sheets of No. 18 gauge steel with suitable asbestos or other filler, or to be a single sheet of No. 12 gauge patent leveled furniture steel, and mouldings to be cold drawn of No. 20 gauge steel. Mouldings to be interlocked with and into these stiles and rails and, where doors are glazed, to be provided with loose steel stops arranged to receive the glass.

Note: If Underwriters' doors are required, they should be so specified—in which event, stiles and rails are lined with asbestos with Z-bar or other suitable spreader.

HOLLOW METAL DOORS & TRIMDRAWING
NO. 1

Elevator Enclosures

THE LAWTON-STEPHENS CO., INC., is a pioneer in this field of endeavor and has completed extensive installations where the full responsibility for the elevator enclosure has been entrusted to the door manufacturer. The entire opening, including doors, bucks, jamb, sill, glass, glazing and hardware is installed as one contract, thereby doing away with divided responsibility and faulty operation. Particular attention has been given to push button installations for apartment houses and this company has developed a special standard installation for this type of enclosure.

LAWTON-STEPHENS CO., INC., will be pleased to forward to architects and builders complete data, including specifications, photographs and sketches, on request.

Special Hospital Construction

This door was developed specially for hospitals and institutions to take the place of the old and costly flush door. As shown in detail on preceding page, it is rigidly constructed and has a slight $\frac{1}{8}$ -in. inset paneling. This adds character to the door and still retains all the desirable sanitary features of the flush door.

Over 2500 doors of this construction are used in the Columbia-Presbyterian Foundation, New York City.

Jambs

Jambs may be No. 12, 14, or 16 gauge integral combination buck, jamb and trim, or No. 18 gauge cabinet jambs installed with rough steel bucks. With cabinet jamb installation, trim is separate, either clipped on or screwed on, and both jamb and trim can be finished to match the door.

Finish

All surfaces are thoroughly cleaned of all grease and foreign matter before finish is applied. Each coat is then applied and baked.

This Company has an enviable reputation for the quality and durability of its finish and is prepared to furnish a large variety of enamels in plain colors, grained to match wood, or metallic finishes of various shades such as bronze, copper, verde antique or any other finish desired.

Where a prime coat finish is specified, the final coat is applied at the building by the painting contractor.

Mouldings

This Company specializes in drawn metal mouldings, made from either stock dies, or to special detail.

Our service includes a complete machinshop, to make either new dies or to keep old dies in first class condition. A large number of dies are in stock, including such shapes as panel mouldings, trim, automobile mouldings, channels, angles, and special shapes of many kinds. These may be specified in either hot or cold rolled strip steel, galvanized steel, bronze, copper, monel metal or various other metals, as desired.

Other Products

This company manufactures various types of pressed or stamped metal shapes for a large number of different purposes.

HOLLOW METAL DOORS and TRIM.

ELEVATOR ENCLOSURES.

Also Furniture and Metal Desks.

For Sectional Office Partitions, see pages B2146-2147.

General Description

The stiles and rails are formed from a single sheet of No. 18 gauge steel. All joints and miters are made a continuous weld with acetylene gas process. Panel mouldings electric welded to the stiles and rails, insuring perfect alignment and rigidity. Cork insulation strips are inserted in the stiles and rails to deaden the metallic ring of hollow metal. Panels are insulated with 1/4-in. thick asbestos.

Reinforcing plates are placed inside, backing up all hardware. Drilling and tapping for hardware is done at factory. Combination bucks and jambs are made of No. 18, 16, 14 or 12 gauge steel as required. Corners are mitered and gas welded and provided with anchors. Trim is made of No. 18 gauge steel drawn cold through rolls. Mitered corners are gas welded. Trim is secured with concealed fasteners or with special oval head screws.

All finished products are thoroughly cleaned, primed and filled, followed by required coats to produce a durable finish of color desired. Each coat is uniformly applied, baked, and sanded with final coat rubbed as required.

THE McCOY BRONZE COMPANY, INC.

Manufacturers of Pyramid Bronze Doors

FACTORY AND GENERAL OFFICES

Forsythe and Holden Streets, DETROIT, MICH.

Products

PYRAMID EXTRUDED BRONZE DOORS.

For Pyramid Extruded Bronze Casements and Architectural and Ornamental Bronze Work, see page A1048.

have carefully tested, and have had many prominent architects and engineers pass upon our construction, and we have yet to find anything but words of praise for Pyramid construction.

Pyramid Bronze Doors through their novel construction may be purchased at a price that

will astound the most skeptical buyer.

They are standard in many thicknesses and widths of rail. On the following pages are shown a few of the standard types, made in many sizes. Pyramid Doors are no heavier than the ordinary type of hollow bronze doors.

Facilities

A complete modern plant manned with experienced and capable workmen in their several lines.

Service

Estimates will be furnished from architects' plans and specifications. Suggestions and designs or models will be furnished when desired. We solicit your inquiries.

Pyramid Bronze Doors

Suitable for all types of buildings.

The Pyramid Bronze Door is superior in appearance and many times as strong as the ordinary type of bronze door generally built of No. 14 gauge sheet bronze with rivets, screws, or solder to hold members together. Pyramid Doors have no screws or rivets to loosen up, no welds, brazes nor solder to break. The thickness of material is $\frac{1}{8}$ in. which eliminates wavy effects and is heavy enough so that reinforcing is not necessary. Pyramid Doors are made of special extruded bronze members dovetailed and locked together, making a door one hundred per cent more rigid than heretofore obtainable in any other type of construction. Our Pyramid Doors are made in many types and sizes due to this novel construction.

Before placing Pyramid Doors on the market we

Hardware

Our prices include the application of all hardware as selected and furnished by the owner. Our factory is equipped with templates of standardized hardware, which will facilitate delivery and avoid undue delay.

Finish

All work is hand rubbed, removing all scratches and discolor marks. Many beautiful finishes may be obtained on Pyramid Doors.

Door Bucks

Bucks are made of extruded bronze, structural steel or heavy bent plates and are ordinarily erected before the walls.

Bucks are anchored into the walls with either the legs outstanding or turned into walls.

The frames are securely anchored to these bucks.

Products

SOLID CAST BRONZE DOORS and FRAMES.

EXTRUDED (BUILT-UP) BRONZE DOORS and ENTRANCES.

KALAMEIN BRONZE and STEEL DOORS, WINDOWS, TRIM, PARTITIONS, and ELEVATOR ENCLOSURES and CARS.

HOLLOW BRONZE and STEEL DOORS and TRIM, PARTITIONS and ELEVATOR ENCLOSURES.

For Cast and Extruded Thresholds, Architectural and Ornamental Brass, Bronze, Steel and Iron Work, see pages A784-786.

Facilities

New and modern plant with kalamein and hollow metal departments second to none. Competent engineers always at the service of architects and contractors requiring special data, stock details or estimates of cost. Can furnish standard design and construction doors, as well as special types.

Kalamein Doors

Newmanco Kalamein Doors are made of galvanized Armco steel for outdoor use, and of Armco steel or genuine bronze for interior use. Sheet metal is applied over kiln-dried wood cores, tongue and groove joined, and nail clinched. Positively no bulging or warping out of shape.

Metal panels and rails in separate pieces. All joints blind nailed and lock seamed to prevent expansion and contraction.

Finishes—Steel doors finished in one coat of gray priming. Or completely finished in baked enamel of any color, either plain or stippled, or in grained wood effects.

Extruded Bronze Doors

Solidly constructed of 1/8-in. genuine sheet bronze, with extruded bronze members applied, forming heavy, rigid doors of undoubted class. Made in both standard and special types in all sizes. Write for details and estimates of cost.

Sheet Bronze Mausoleum Doors and Solid Bronze Entrances

Likewise we make sheet steel and bronze vault doors, with or without applied ornaments, and the very finest hand-tooled entrances for public buildings, banks, etc., including vestibules, transoms, side grilles and sills.

Hollow Doors

Newmanco Hollow Doors are made of 18 gauge Armco open hearth steel or 10 gauge bronze, with panel mouldings securely affixed. Joints are reinforced, welded or brazed and hand finished to perfect levels. Stiles have compressed cork or asbestos inserts.

Metal panels are made of two plates of 20 gauge steel or 18 gauge bronze, and 1/4-in. thick heat-retarding insulator. Glass panels fitted in removable metal frames. Muntins made of interlocking shapes welded or brazed to mouldings. Astragals of interlocking shapes, welded or brazed to stiles. Hardware customarily furnished by others.

Frames of 14, 12 or 10 gauge steel, or 12 gauge bronze, welded or brazed, and attached to walls by adjustable anchor plates, and reinforced for hardware.

Finishes—Same as kalamein doors.

Hollow Doors, Clarksburg, W. Va.

THE RIESTER & THESMACHER COMPANY

Hollow Metal Doors and Trim

1514-1526 West 25th Street
CLEVELAND, OHIO

Products

HOLLOW METAL DOORS, PARTITIONS, ELEVATOR FRONTS, COMBINATION BUCKS and JAMBS, METAL BASE and PICTURE MOULD.

For Steel Stairs, see page A643.

Construction

The R & T hollow metal door with its interlocking joint construction has been developed through fifteen years in the door business. The doors are constructed of first grade No. 18 gauge furniture steel, full pickled, full cold rolled, re-annealed, patent leveled, re-squared and oiled. Jambs and casings are of same gauge material. Bucks or frames are fabricated from No. 10 to 14 gauge material in accordance with size of opening and service required. All joints in construction are electric process welded, practically making the door one continuous piece of metal. Proper reinforcements are welded within the door to take care of all hardware requirements and the entire design makes for rigidity, stability, fire protection and neat appearance. These doors can be fitted to either the cabinet jamb design or combination buck and jamb. R & T hollow metal doors, having no combustible material within the door, are fire retarding and fully meet the requirements of the National Board of Fire Underwriters and bear their label, when specified.

Finish

Before assembly, all parts are paint dipped in order to protect the interior of the door. Before final finish, all surfaces are thoroughly cleaned to remove grease or oil.

Each coat of paint or enamel is carefully baked and properly treated to secure the highest possible finish. Doors are finished in prime coat, plain color enamels, stipples and wood graining reproductions.

Hardware

Hardware, as selected and furnished by the owner, is applied at the factory, and we have a good selection of templates of standardized hardware which facilitates delivery and avoids undue delay.

Upon request we are glad to furnish typical details and stock mouldings in order to assist in designing metal trim.

Plant and Facilities

U.M.P. doors are made in the largest plant in the world devoted exclusively to the manufacture of hollow metal doors, frames and trim. We are equipped to handle contracts of any magnitude, and, as our plant is located in the heart of the steel producing industry, we enjoy unusual facilities in deliveries of raw material. Our plant is equipped with the very latest machinery and our methods of producing the finest type of interior metal trim are most modern.

U.M.P. Standard Hollow Metal Doors and Trim

Stiles and Rails—Formed from U. S. Std. No. 18 gauge steel, thoroughly pickled, double annealed, patent leveled, free from blisters, pits or other imperfections. Stiles are formed of one piece and rails of two pieces, all interlocked with continuous channels constructed to form a reinforcing binder, a deep groove for panel and an interlocking clip for panel moulding (see illustration). All stiles and rails have cork inserts of suitable size to prevent metallic sound.

Doors are 1 $\frac{3}{4}$ in. thick.

Panels—Constructed of two sheets of U. S. Std. No. 18 gauge steel between which two sheets of asbestos and one sheet of felt are inserted to make panel $\frac{1}{8}$ in. thick over all. Panels are inserted in the groove provided by the interlocking channels. (An exclusive feature of this product.)

Panel mouldings are neatly mitered or coped at corners and intersections and clipped into interlocking member as described above.

All seams and joints connecting stiles and rails are oxy-acetylene welded their entire length. All joints are made perfectly level and invisible. Steel channels, placed at top and bottom of door full width, are spot-welded in place. Reinforcing bars of sufficient length and thickness are welded in hinge stile at all cut-outs, and are drilled and tapped for butts. Reinforcing plates are spot-welded in lock stile to receive locks, and additional reinforcements are placed in door to receive the hardware specified. All doors are reinforced for door checks, whether specified in hardware schedule or not.

No bolts or rivets are used and no screws are allowed, except where glass panels occur and then oval head machine screws are used to hold glass moulds or beads in place.

This construction has merited the approval of the Underwriters' Laboratories, Inc., it having withstood a fire test of unusual severity without the slightest indication of failure.

We invite investigation and inspection of the U.M.P. standard door and with special reference to the panel construction. Investigation will show as fire tests have proven, that the U.M.P. standard hollow metal door is a fire retardant without equal.

Jambs—Made of the same quality steel as described for doors—U. S. Std. No. 18 gauge for walls $7\frac{1}{2}$ in. thick or less; No. 16 gauge for walls exceeding $7\frac{1}{2}$ in. thick. Notched and reinforced for all necessary hardware. Jambs are formed to detail and made to fit accurately over buck. All intersecting members are neatly coped and fitted before shipment.

Casings—Made from cold rolled strip steel of not less than .050 in. thick. A large assortment of sizes and profiles designed by architects is available for trimming the opening. All casing corners and miters are neatly welded and ground to insure invisible joints.

Transom Sash—Constructed of U. S. Std. No. 18 gauge steel, similar to doors, and properly reinforced for necessary hardware.

Rough Bucks—Usually made of U. S. Std. No. 14 gauge blue annealed steel. Intersecting joints are acetylene-welded and steel spreaders placed in bottom of all bucks. With rough bucks, we furnish adjustable crimped or corrugated anchors which can be built into the walls. Depth of buck is determined by thickness of wall, including plaster. Rough bucks receive a dip coat before shipment.

Unit Frames (Combined Buck, Jamb, Stop and Casing)—Made from U. S. Std. No. 12, 14, 16 or 18 gauge steel of the same quality described for doors (No. 16 gauge is standard). Hospital type bucks are No. 12 or 14 gauge, as required. All bucks and frames prepared for hardware and heavily reinforced where necessary. Unit frames receive one dip coat and one filler coat. Both coats baked on, after which a prime coat is applied and baked. Finishing coats of paint are applied at building by painting contractor.

Standard Finish—Inside of panels are painted before assembling. After fabrication the door is immersed in enamel. Enamel is then allowed to drain off, after which doors are thoroughly baked. A filler coat is then applied and baked, and the surface sanded or ground perfectly smooth. Two coats of high grade mineral paint are then applied, each baked on separately. All grained finishes receive two coats of best baking varnish, each coat baked on separately. All finished work is rubbed to an eggshell gloss.

Detail Showing Construction of U.M.P. Door

Jambs, casings and mouldings are finished in the same manner as the doors.

Hardware—Applied to doors at factory before shipment, except where crating of materials might be interfered with. Drilling and tapping for such items as doors and transom closers are done at the building by the erector after materials are installed.

Underwriters' Labels—The standard U.M.P. construction has been tested and approved by the Underwriters' Laboratories, Inc., and we have been granted the privilege of applying the Underwriters' label to all doors for corridor, room partition and fire escape openings.

We have also been granted the right to label fire wall doors made from No. 18 gauge steel and of hollow construction. Such doors are of the all-metal type and, while of special construction, they can be divided into any number of panels and grained to match any finish desired.

The U.M.P. fire wall door displaces the old fashioned tin clad type. It can be hung with ordinary butts to a regular standard No. 16 gauge jamb attached to a No. 10 gauge buck. The only item of hardware needed on the U.M.P. inspected fire wall door in excess of what is required on any other door is a 3-point lock.

We furnish labeled doors and frames in any size up to and including 4 ft. wide by 8 ft. high for single doors, and up to 8 ft. wide by 8 ft. high for a pair of doors.

Shop Drawings—These illustrate all work in detail and are prepared and submitted for architect's approval before materials are fabricated.

Samples—We will furnish a corner section of this door

and suggest that a comparison be made of its construction with the old system of a tubular stile and rail with the panel mouldings simply screwed or spot-welded to it.

Samples of finish are submitted for approval before materials are finished.

Architects' Handbook—Full size sections of all standard U.M.P. door mouldings and casings are shown in our Architects' Handbook, which will be sent on request, without charge.

Standard U.M.P. Hollow Metal Doors

Details of U.M.P. Standard Buck and Jamb Construction

Type U 1—Rough buck, cabinet jamb and casing construction.
 Type U 2—Wood buck, cabinet jamb and casing construction.
 Type U 3—Combination buck and jamb, with applied casing.
 Type U 4—Channel iron buck, cabinet jamb and casing construction.
 Type U 5—Inverted buck. Cabinet jamb and scribe mould construction.
 Type U 6—Unit frame (combined buck, jamb and casing).
 Type U 7, U 8, U 9 and U 10—Combination frames suitable for hospital or school construction.

Note: When materials must be finished before shipment, constructions shown for Types U 1, U 2, U 4 and U 5 may be used. Rough bucks can be set, walls built and plastered and finished materials installed after all other work is in place.

Type U 3 permits of a more flexible casing design than is possible in a standard unit frame. Casing can be made to match any design required. A considerable saving can be effected in cost by specifying construction shown for Types U 6, U 7, U 8, U 9 and U 10.

Unit frames must be built into masonry and should not be shipped to job with finishing coats applied. This work should be done by painting contractor.

We can furnish Underwriters' labels for all types of construction shown with the exception of U 2 and U 5.

Crimped plate anchors furnished with all combination frames.

Standard U.M.P. Hollow Metal Door Sections

Metal Mouldings

We manufacture a complete line of metal mouldings, including picture moulding, wire moulding, scribe enclosure moulding, muntin moulding, chair rail, base, cornices and handrails, which can be furnished promptly in any quantity. These are made from .050-in. cold rolled strip steel.

Special steel or bronze shapes, cold rolled or pressed, can also be furnished.

A large assortment of styles is shown in full size sections in our Architects' Handbook, a copy of which will be sent on request, without charge.

Elevator Enclosures

Doors—Construction of United elevator doors is the same as that of the standard U.M.P. hollow metal doors described on the two preceding pages, except that they are 1½ in. thick and are provided with special noiseless easy-sliding guides at bottom of door to run in sill groove.

Frames—May be of either rough buck, cabinet jamb construction, or of the combination frame type, heavily reinforced for attachment of hardware. Crimped plate anchors furnished with all combination frames and rough steel bucks.

Trim—Made from No. 18 gauge strip steel of stock design or profile, and fastened to frame with concealed clips.

Cover Plates—Protect hangers from dirt and dust. Made of No. 14 or 12 gauge steel, depending on size. Provided with hinges and latches for easy access.

Facia Plates—When specified, Nos. 14 or 12 gauge facia plates are furnished, extending from top of cover plate to sill above and 6 in. wider on each side than jamb opening. Numerals furnished when specified.

Sills—Furnished in either cast iron with fluted surface, or Feralun sills with grooves milled straight and true, in order that the friction of guide pin and groove be reduced to the minimum.

Hanger and Closing Device—Furnished in the type specified. We suggest careful choice in this specification, as poor equipment of this nature will ruin an otherwise perfect installation.

Underwriters' Labels—United elevator enclosures, including doors, bucks and jambs, can be furnished with Underwriters' labels, except enclosures having glass paneled doors.

Owing to varying construction, it is necessary to mention distinctly in the specification that the elevator doors are to bear the Underwriters' label and be manufactured in accordance with the standard construction of UNITED METAL PRODUCTS COMPANY.

Elevator Specifications—Complete elevator specifications and list of prominent United installations will be mailed on request.

Standard Types of United Elevator Doors

Where two designations are shown for one type, the following applies to panel arrangement:

- | | |
|----------------------------|----------------------------|
| E 1—Two-panel, all metal | E 5—Two-panel, all metal |
| E 2—Two-panel, upper glass | E 6—Two-panel, upper glass |
| E 3—One metal panel | E 7—Two-panel, all metal |
| E 4—One glass panel | E 8—Two-panel, upper glass |

Conduo-Base—Combined Base and Conduit

Conduo-Base serves both as a baseboard and as a raceway or conduit for electric light, telephone and other wires. Conduo-Base is not intended to replace the entire conduit system in a building, but is an extension of that system.

High and low tension feeder conduits located in the floor fill and running from cable shaft or panelboard, are extended to and connected with the Conduo-Base at any convenient point. The wires are then carried around the room in the Conduo-Base and are accessible for outlets at any point along the base. Outlet boxes for the reception of feeder conduits are attached to the raceway, knockouts being provided in these boxes to receive feeder conduits.

Strictly fireproof—every section bears the Underwriters' label. One standard height, 8¼ in. over all.

Raceway—Made of one piece of No. 18 gauge steel and formed into two separate compartments. The upper compartment is used exclusively for light or power wires up to 300 volts; lower compartment for telephone or other low tension signal or communicating wires. Shipped in 10-ft. lengths.

Cover Plate—Made of No. 18 gauge furniture stock steel. Easily removed when additional outlets are required or when access to raceway is desired. Shipped in 10-ft. lengths.

Plaster Mould or Top Member—Made of .050-in. strip steel. Easily clipped in place. No screws or other visible fixing required. Shipped in random lengths of about 15 ft.

Mop Mould or Bottom Member—Made of .050-in. drawn strip bronze. Rests on floor and provides protection against damage to base when floors are swept or scrubbed. Drilled on 15-in. centers and fixed to raceway with round head machine screws (drilling and tapping of raceway done at building). Shipped in random lengths of about 15 ft.

Fittings—Grounding clips, end closers and plaster mould clips are furnished by us with each order.

Finish—All exposed surfaces of Conduo-Base are finished to match sample furnished by architect.

Especially Desirable for Subdivision—When United Metal partitions are used for the subdivision of space, Conduo-Base is especially desirable in that it serves both as a neat, artistic and sanitary base for the

partition and as a conduit for distribution of light and telephone wires within the rooms. The combined use of *United Metal Partition* and *United Conduo-Base* simplifies the task of the architect and the building manager in providing for future tenant wiring requirements. The convenience and economy resulting make the use of *Conduo-Base* desirable and necessary.

How to Specify—Furnish and install *Conduo-Base* in all rooms and spaces throughout the building where base of other types is not shown or specified. Base shall be *UNITED METAL PRODUCTS COMPANY*'s standard patented *Conduo-Base*, each section bearing the Underwriters' label. All exposed surfaces shall be finished to match sample furnished by the architect.

Conduit Work for Conduo-Base—Extend from each light switch outlet box, one $\frac{3}{4}$ -in. feeder conduit to the upper section of special outlet box which is attached to and forms part of raceway. This box shall be furnished by the *Conduo-Base* manufacturer. Extend from the nearest low tension panel or junction box at least one $\frac{3}{4}$ -in. feeder conduit to each suite of rooms, connecting same to the lower raceway of outlet box mentioned above.

Note: It is recommended that the above conduit feeders be made at columns, outside walls or permanent partitions where same are not likely to be removed by changes or rearrangements of suites of rooms. Feeder conduits of both light wire and low tension wires to *Conduo-Base* should be made of number and size so that each isolated run of *Conduo-Base* or each suite of rooms has ample and independent feeder capacity.

At every door opening, low-set radiator and every other point where the continuous run of *Conduo-Base* is intercepted by an opening or otherwise, "jumper" both raceways of *Conduo-Base* with $\frac{3}{4}$ -in. conduits

Section Through
Conduo-Base

across the opening or interception so that each isolated run of *Conduo-Base* in every suite of rooms is properly connected with the section of *Conduo-Base* equipped with the feeder conduits.

Note: Where "jumper" conduits terminate in partitions that are likely to be removed at a future date, we recommend the use of cast elbows and nipples, with the conduit proper finishing at floor level so that it can be capped.

For each light or low tension wire floor outlet shown, extend one $\frac{3}{4}$ -in. conduit "jumper" from the nearest *Conduo-Base* run, and from its proper potential raceway, terminate same at floor with its axis perpendicular to same, with one adjustable floor outlet fitting with blind cap.

Conduo-Base Installation—After completion of plastering and floor work, install *Conduo-Base* in the following manner. Attach raceway to plaster ground with round head wood screws through clips which are spot-welded to raceway, special care being exercised to maintain true alignment, elevation from floor and projection from plaster line, in strict accordance with manufacturer's full size details.

When all raceways are installed, wiring in same completed and approved, install *Conduo-Base* finishing members in accordance with manufacturer's standard directions, with all exposed joints well made, corners neatly fitted and finished surfaces kept unmarred in strict cabinet quality of workmanship.

Electrical Requirements—The entire installation of *Conduo-Base* shall be made in strict accordance with the Underwriter's rules and regulations, with continuous unbroken grounding of every isolated run of base, with all wiring within free from grounds.

United Metal Partitions

We have perfected and patented an inexpensive metal partition for subdividing office and warehouse space.

Panels are made from two sheets of furniture stock steel, with a layer of asbestos between and joined together under hydraulic pressure. Mullions, and top, bottom and intermediate rails are of hollow construction, all drawn to detail with sharp reveals and pleasing architectural profiles.

Bottom member of partition can be fitted to receive *Conduo-Base* where desired, so that electric and telephone wires may be distributed throughout the rooms without the necessity of floor conduits, thus enabling the contractor to install finished floors and ceilings throughout the entire floor, subdividing the floor space afterward to suit tenant requirements.

United partitions can be set up and taken down without dam-

age to walls, floors or ceilings. Parts can be moved and stored in a very small space and reset without damage to finish or waste of material. Adjustment to varying conditions is a special feature.

The high cost and scarcity of building labor, together with the inconvenience and expense of pulling down and rebuilding tile and plaster walls in an occupied office or warehouse building, make it imperative that the architect and owner investigate the United partition before deciding on the type of subdividing wall material to be used.

United partitions are made from cold rolled shapes, the members of which are fabricated at our factory and shipped to the job knocked down. The various members are prepared so they can be easily and quickly locked together on the job.

Universal Passenger Elevator Doors

Type V. U.—VARIETY FIRE DOOR COMPANY'S "Universal" Type V. U. passenger elevator doors are constructed of No. 18 gauge furniture metal throughout, with all connections between stiles and rails formed by continuous lock joints and solidly welded over entire length of joint. Finish is either air dried, baked enamel in any color, or grained to match any kind of wood finish.

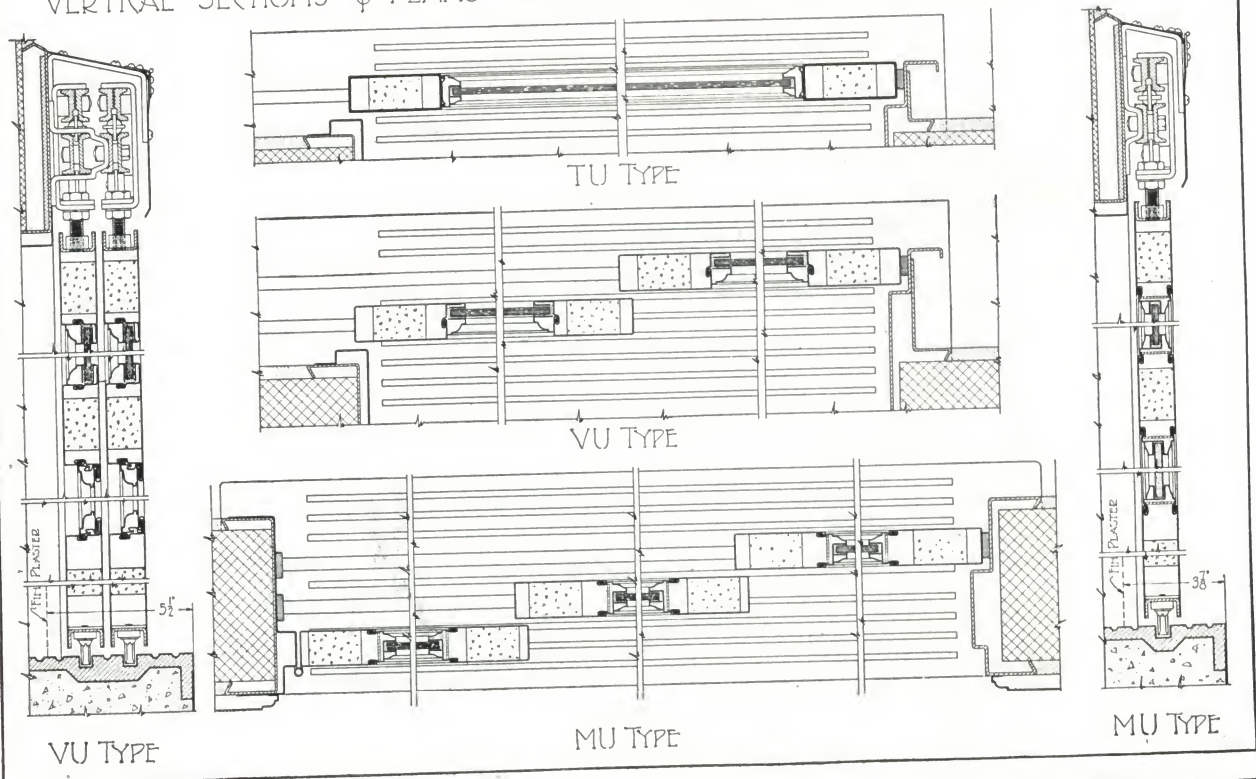

Type M. U.—VARIETY FIRE DOOR COMPANY'S "Universal" Type M. U. passenger elevator door construction is similar to V. U. type except that both shaft and corridor sides of door have recessed panels finished against stiles and rails with drawn mouldings mitered and welded. Finish is either air dried, baked enamel

in any color, or grained to match any kind of wood finish.
Type T. U.—VARIETY FIRE DOOR COMPANY'S "Universal" Type T. U. passenger elevator doors are constructed of rectangular tubes drawn from No 14 gauge cold rolled strip stock and welded. All connections between stiles and rails are formed by continuous lock joints and solidly welded over the entire length of joint. Finish is either air dried, baked enamel in any color, or grained to match any kind of wood finish.

Variety Steel Rolling Doors

Recommended for use in the following openings: Construction No. 20 Non-labeled, on exterior openings, mounted on face of wall. Construction No. 41 Non-labeled, shutter mounted under the lintel.

These types are most frequently used on exterior openings not exposed to fire hazards, and are not automatic, unless so specified. They are made in all gauges according to the openings and are operated manually or with chain hoist. Construction No. 20 can also be operated with crank arrangement or by chain hoist from opposite side of wall.

Construction No. 60 and 61 Labeled for exterior openings. No. 33 Labeled for vertical hatches. No. 33-33 Labeled for firewalls.

Construction No. 60 is not automatic and is generally used on exterior openings, adjacent to fire hazards which are not sufficiently close to necessitate the use of automatic shutters.

All the requirements of the Underwriters' Laboratories, Inc. have been met and the door bears their label.

Construction No. 61 is equipped with automatic closing device. This type is generally used on exterior openings where fire hazards occur sufficiently close to cause the Underwriters to demand automatic closing device.

Construction No. 33 is made in No. 20 gauge or heavier, according to size of opening. It is labeled by the Underwriters for use on vertical hatches and corridor and room partitions and is always automatic. It must have continuous end locks and baffle plate and governor if needed. Shutter mounted either under the lintel or on the face of wall, and is operated manually or by means of chain hoist from either side of wall as desired.

Construction No. 33-33 is similar in construction to No. 33, except that it is always made of No. 16 gauge material and is labeled by the Underwriters for use on fire walls. This type is mounted on face of wall only, and is operated either manually or by means of chain hoist as desired.

No. 20DH—Non-labeled, Chain Operated

No. 20DM—Non-labeled, Manually Operated

No. 33DM—Labeled, Manually Operated, Automatic Closing

No. 33-33—Labeled, Fire Wall, Manually Operated

Motor Control

No. 41UH—Non-labeled, Exterior, Chain Operated

Variety Steel Rolling Doors

Specifications for Counterbalanced Freight Elevator Doors—Vamanco Varclad Doors

(1) **Freight Elevator Doors**—All door openings to freight elevator, except penthouse doors, shall be counterbalanced doors as sold by VARIETY FIRE DOOR COMPANY and shall be type known as [Vamanco] [Vamanco Hollow Metal] [Varclad] [Varclad Kal-O-Mine].

(2) **Work Furnished by Manufacturer**—The manufacturer shall furnish, freight allowed to freight station nearest building site: (a) all doors complete with guides, roller bearing sheaves, bar locks, trucking sills, bolts, anchors and all necessary hardware to properly secure doors to walls of shaft; (b) drawings and full directions required for erection; (c) all parts to receive priming coat of metallic paint at factory.

(3) **Underwriters' Label**—All doors shall be approved and labeled by Underwriters' Laboratories, Inc., for "Fire Door for Vertical Shaft."

(4) **Special Lock**—Special lock shall be provided at (ground) floor to permit access to elevator shaft when all doors are closed.

(5) **Operation**—Doors to be manually opened and closed: (a) If electric interlocks are desired add: Each door to be provided with a Varlock operated by bar locks so that when door is *unlocked* the current will be cut off from the car and it will be impossible to run the car until all doors are closed and locked. (b) If full automatic operation is desired add: Door contractor to furnish mechanical operating device to open and close doors automatically by simply pressing button when car is at landing. This device to be full circuit type and to contain interlocks cutting current from car when door is unlocked.

(6) **Trucking Sills**—All doors shall be provided with special design trucking sills (state if for heavy or light duty) so that no part of load passing over doors will be sustained by door mechanism or guides, but will be carried entirely by sill of building.

(7) **Glass Panels**—Each door shall be equipped with a panel 12 in. square, arranged to receive 1/4-in. wire glass (glass by glazing contractor). The glass panels are to be backed by a sliding metal panel, with fuse link for automatic closing and doors must bear the Underwriters' label.

Elevation and Plan of Vamanco Door

(8) **Clearance**—There shall be not more than 1 1/2-in. clearance between door and elevator car at all floors. In case there is any inequality of construction of shaft that will not allow this, the architect will decide whether to cut the masonry or put extension on doors to make correction of same, which is to be charged to contractor who built the shaft.

(9) **Erection**—The manufacturer shall erect the entire equipment in a substantial manner and shall leave the installation in perfect working order.

(10) **Painting**—The contractor shall apply 2 coats lead and oil paint to all parts exposed to view, in colors selected by the architect, as specified under "painting."

THE SYKES COMPANY

Manufacturers of Hollow Metal Doors and Trim, and Metal Moldings

2302 West 58th Street

CHICAGO, ILL.

REPRESENTATIVES IN PRINCIPAL CITIES

Products

HOLLOW METAL FIRE RESISTING DOORS; INTEGRAL STEEL DOOR BUCK and TRIM; and DRAWN, PRESSED and ROLLED METAL MOLDINGS.

Sykes Hollow Metal Doors for Every Purpose

Sykes Hollow Metal Doors are made in all sizes, styles and finishes to suit the most exacting conditions where appearance, sanitation, and fire resisting qualities are of prime consideration. There are thousands in use on stairways and elevator enclosures, corridors, rooms and offices, in office buildings, hotels, hospitals, apartments, schools, dormitories, clubs, and other buildings.

Sykes Hollow Metal Doors are made of satin finish, cold rolled steel, welded in all joints to form a rigid unit that will not warp or sag under any atmospheric conditions, or under any abuse to which they may be subjected.

All Sykes Fire Resisting Doors are insulated with asbestos and deadened with cork. When fire resisting qualities are not necessary, insulation and deadening material may be eliminated.

Each Sykes Door is thoroughly examined before leaving our factory and every fireproof door carries the underwriter's label.

Sykes Hollow Metal Door

Sykes Integral Steel Door Buck and Trim

The Sykes Steel Door Buck and Trim is made in all sizes from a single piece of steel, formed through roller dies, and drawn into shape from the flat metal with one operation.

The material used is No. 16 gauge ($\frac{1}{16}$ in.) thick, cold rolled, drawn steel, with smooth finished surface which is sufficiently strong to resist damage by abuse. The miters are butt-welded so that the outside surface is always true and smooth; being of steel, they do not sag, shrink or warp. Dampness does not affect them. They are sanitary, fireproof, and do not become distorted by the weight of masonry. The standard finish is a shop coat of paint, air dried. Special finish can be furnished, consisting of a primary coat baked on as a base, followed by any finishing coat required.

The door bucks are set up and fastened in the partition by insertion of tile or macolite clear into the back of the jamb. Adjustable anchors are provided so as to be inserted at intervals in the points of the tile, thereby insuring a permanent rigid installation. Special designs to conform with other trim can be made if desired, although we have many standard designs which conform to architectural practice.

Economy—We claim a great saving of field labor over the practice followed in the installation of wood jambs, buck and trim. When the steel buck is satisfactorily built in, all work in connection with the door opening is completed.

Sykes Integral Door Buck and Trim costs approximately 20% less to install. It is cheaper than wood, more easily installed, fireproof, sanitary, rigidly built, made in one piece, no molding or strips to attach.

Sykes Integral Steel Door Buck and Trim

Sykes Cold Drawn Steel Moldings and Shapes

Sykes Cold Drawn Steel Moldings and Shapes are manufactured for a variety of purposes, and used by the metal and building trades, as well as by manufacturers of metal specialties.

Sykes Moldings are cold drawn from high grade steel, being either sharp or rounded. The surfaces have a bright and smooth finish that will accept paint or enamel coats perfectly.

Our factories are equipped to furnish mullion, pilaster, window and miscellaneous casings, panel and stop moldings, coves, base or foot molds, picture moldings, cornices, cornice friezes, chair rails, sills and in fact, we produce a metal trim for building purposes that takes the place of wood, being more sanitary, substantial and fireproof.

Special shapes and moldings can be manufactured, and drawings will be submitted to architects and others interested for their approval, from any rough sketches furnished to us. Quotations furnished upon request.

Service

THE SYKES COMPANY has representatives in the principal cities. Wherever an architect may be located, the Sykes Engineering Department is always glad to be of service in the way of details, drawings and suggestions. Send for bulletins specially designed for your files.

ARCHITECTURAL METAL PRODUCTS, INC.

FORMERLY THE PROBERT SHEET METAL CO.

Manufacturers of "Leedor" and A.M.P. Metal Covered Doors

FACTORY AND MAIN OFFICE

COVINGTON, KY.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products

METAL COVERED DOORS, FRAMES and TRIM.

BRONZE and COPPER COVERED DOORS.

HOLLOW METAL FRAMES.

Also Elevator Doors, Metal Covered Partitions and Smoke Screens.

For Marquise, see page A744.

"Leedor" (Pat. applied for), an Improved Metal Covered Door

The "Leedor" is an innovation in metal covered door construction and has been pronounced one of the greatest improvements made since the inception of metal covered doors. Note illustration below showing stile covering and panel moulding formed from one piece of metal—the whole being so formed that when it is slipped over the wood core the moulding is forced tightly against the panel.

Specifications—The metal covered doors shall be "Leedor" as manufactured by the ARCHITECTURAL METAL PRODUCTS, INC., Covington, Ky.

Cores—The wood core shall be of the best grade white pine, thoroughly seasoned and free from loose

knots, resin, shakes and dry rot. All core members to be run through a size moulder to insure absolute uniformity. The core members shall then be assembled with the rails offset into the stiles and all members shall be securely fastened together in such a way as to eliminate the possibility of the core warping or twisting.

Metal Coverings—The metal covering shall be of No. 26 gauge galvanized iron sheets. The stile and rail coverings shall be formed with the panel moulding as an integral part thereof. These coverings shall then be neatly fitted over the cores and the panel moulding shall be securely fastened to the panel by means of bolts concealed under the face of the moulding. No fastenings, such as nails, screws, etc., shall appear on the face of the panel moulding.

Gluing—After assembling the cores they shall be thoroughly covered with special glue before the metal covering is applied. After applying the metal covering the doors shall be put under heavy pressure, which is to be maintained for at least eight hours, so that all surfaces of the finished door will be absolutely free of buckles, blisters or waves. All finished doors to have perfectly flat and smooth surfaces and the metal covering must adhere securely and permanently to the cores.

Seams—Metal covering to be securely fastened together at the joints by flat locked seams, sweated with solder and scraped smooth to a flat even surface. In no case shall a seam in the metal occur over a joint in the core.

Painting—All finished doors to receive a shop coat of special gray primer sprayed on.

Isometric Drawing Showing Concealed Bolts and Double Locked Seams of "Leedor"

Bolts are inserted in holes drilled through face of the moulding and afterward soldered over and scraped smooth to the contour of the moulding. This process produces a door neat in appearance and eliminates all visible panel moulding fastenings

SECTION OF STILE WITH A SOLID PANEL

Construction of the "Leedor"

Patent applied for
This detail shows construction of the "Leedor." In case of fire, the air space in the moulding permits gases from the burning core to expand and escape through holes in the moulding after solder has melted away

Underwriters' Label Service—The "Leedor" can be furnished either with or without the Underwriters' Label.

A. M. P. Doors

We also manufacture the A.M.P. Door which has the drawn kalamein moulding applied to the panels with nails or screws. These can be supplied when so specified, but we recommend the "Leedor" as it makes for better appearance.

Continued on next page

Our Gluing Process

A special casein glue has been made for us which makes a perfect bonding agent between the metal covering and the wood core. All metal coverings are glued to the cores under a pressure of over 2000 lb. per sq. ft. maintained for at least 8 hours. This insures perfectly smooth flat surfaces, free from buckles, blisters or waves.

Gluing Press in Operation

Copper and Bronze Covered Doors

We are especially equipped to produce copper and bronze covered doors of the highest grade.

Intelligent and careful workmen are in charge of this department and they take pride in producing excellent products. These men are thoroughly experienced in the handling and fabricating of copper and bronze with the result that only the finest finished products are produced.

We have manufactured many entrance doors for some of the finest buildings to the complete satisfaction of the most particular architects.

Hollow Metal Frames

We are producing formed steel frames and can supply them in connection with our doors when required. These can be furnished either with or without the Underwriters' labels.

Estimates

Estimates will be cheerfully and promptly given upon receipt of proper information. Special designs will be given particular and careful attention.

Engineering Service

We maintain an efficient engineering department which will prepare drawings for approval on all orders.

An Unretouched Photograph

Showing metal covering pulled away from core. Note the perfect bond accomplished by our exclusive gluing process. The light spots are the galvanizing which has been pulled from the metal. The dark spots are pieces of the wood core pulled away.

A. C. CHESLEY CO.

Manufacturers of Standardized Fireproof Metal Covered Doors

MAIN OFFICE AND FACTORY

704 East 133rd Street
NEW YORK, N. Y.

TELEPHONE

LUDLOW 1321, 1322

Products

CHESLEY STANDARDIZED FIREPROOF METAL COVERED DOORS, DOOR TRIM, DOOR FRAMES and CHESLEY BUCK.

Also, Metal Covered Work of the Highest Quality in Bronze, Brass, Copper, Long Terne (Kalamein) and Galvanized Iron; Tin Clad Fire Doors.

Chesley Standardized Fireproof Doors

Shipped from Stock—These doors are produced in large quantities, thus cutting cost to a minimum. Large stocks are carried in various distributing points throughout the country, giving the advantage of *immediate delivery*.

Standardized—Chesley fireproof doors are standardized as to construction, sizes and styles.

Construction—Cores are made of well seasoned, kiln dried white pine with stiles and rails mortised and tenoned and glued together. Solid panels are lined with asbestos compo. Panel moulds are integral with the

stiles and rails. All joints are *lock joints* with no bolts, rivets or screws (excepting for muntins) used in the construction. Every part of the wood core is covered, and there is no possibility of water or moisture getting into contact with the wood to cause swelling. In glazed construction the glazing strips are placed on the interior with the integral mouldings on the exterior, thus preventing mouldings becoming loose due to exposure. Joints between stiles and rails are *lock joints* with the surface joint soldered and smoothed off, producing practically an invisible connection (see detail showing the superiority of the Chesley lock joint over the ordinary method of construction). The mouldings are clean cut, producing a neat, light, strong door.

Uses and Approval—Chesley doors are for use wherever fireproof doors are required for the following locations: From corridors to rooms; staircase enclosures; elevator shafts. When required, the Underwriters' Laboratory, Inc. label can be furnished.

These doors have been extensively used in office

TYPE FS

CHESLEY STANDARD FIREPROOF (METAL COVERED) DOORS

buildings, apartment houses, hospitals, schools, industrial plants, etc..

Appearance—In appearance, Chesley doors when painted or grained differ hardly at all from wood doors but afford the absolute fire protection of solid steel doors. Cost less than one-third more than the common wood door and from 50% to 100% less than hollow metal doors.

Types—Made in 8 standard types (see illustrations). Detached astragals which can be easily applied at the job are furnished for double doors (see detail).

Sizes—Made in 8 standard sizes as indicated in the following table. The dimensions given are the actual out and out sizes of the door. *Allowance should be made for saddles in setting door frames.*

Door size 2 ft. 6 in. x 6 ft. 8 in. or 7 ft. x 1 $\frac{3}{4}$ in.

Door size 2 ft. 8 in. x 6 ft. 8 in. or 7 ft. x 1 $\frac{3}{4}$ in.

Door size 2 ft. 10 in. x 6 ft. 8 in. or 7 ft. x 1 $\frac{3}{4}$ in.

Door size 3 ft. 0 in. x 6 ft. 8 in. or 7 ft. x 1 $\frac{3}{4}$ in.

Material of Covering—Chesley doors are covered with No. 26 gauge long terne plate (commonly known as kalamein iron) or with No. 26 gauge galvanized iron. Galvanized iron work is recommended for exterior work only.

Hardware and Glazing—Any type of hardware can be easily fitted at the job by any competent carpenter.

No glass is furnished by the Chesley Co. Any type of glass can, of course, be easily set at the job.

Priming—Chesley doors (also stock trim and door frames) are primed at the factory with the best quality metallic priming coat.

Chesley Buck

This is a new metal covered, standardized one-piece

fireproof buck, that saves time and money. It is carried in stock in sizes to fit the Chesley standardized fireproof doors, sizes of which are listed in opposite column.

The Chesley buck is sealed by machinery in a sheathing of laminated metal—no nails in its one-piece construction. Highly rated by the National Board of Fire Underwriters and built to conform to requirements of all building laws.

A non-corrosive metal of 26 gauge is used over a white pine core. Metal takes any kind of paint and saves at least one coat.

Chesley buck has reduced building costs tremendously. It is handled and set as one piece. It saves time in delivery, handling, cutting and mitering and assembling.

It makes a better job and costs considerably less. Open miters are avoided as miters are welded at factory. Costs about the same as wood frames. Every stock size immediately available. It is used throughout the building in place of wood frames as wood doors may be hung to same as easily as metal door.

A variety of unusual attractive patterns. Special patterns to architects' specifications.

Specifications

Fireproof Doors—All fireproof doors throughout (mention location) (or marked "FP" on drawings) shall be metal covered doors as manufactured by A. C. CHESLEY Co., 704 East 133rd Street, New York, N. Y., of dimensions indicated on the drawings. (Architect should refer to table for stock sizes.) Doors marked "GL" on drawings shall be Type (mention type). Solid doors shall be Type (mention type). Interior doors shall be covered with long terne plate. Exterior doors shall be covered with galvanized iron. Doors to be hung by and all hardware to be furnished and fitted by the (carpenter contractor). All glazing and painting, excepting priming coat, to be done by the (painting and glazing contractor).

EMPIRE FIREPROOF DOOR CO.

EMPIRE KALAMEIN CO., INC., SUBSIDIARY

Metal Covered Doors, Windows and Trim; Steel Clad Portable Office Partitions

Southern Boulevard at 145th Street
NEW YORK, N. Y.

Products

METAL COVERED KALAMEIN DOORS (Underwriters' Labeled), WINDOWS, DOOR FRAMES and TRIM, ELEVATOR FRONTS, SMOKE SCREENS; STEEL CLAD PORTABLE OFFICE PARTITIONS.

Also manufacturers of Underwriters' Labeled Tin Clad Fire Doors.

"Empire Commercial" Metal Covered Doors

Through years of specialization in the manufacture of metal covered work, we have evolved a product in which we take just pride—the "Empire Commercial" metal covered door, suitable for any class of fireproof work.

Details—Cores—Sound kiln dried white pine milled in one piece, sanded and finished accurately, for cores of stiles and rails.

Covering—Long terne or galvanized or furniture steel of No. 24 gauge. Drawn on through steel dies; sharp angles and arrises; tight and free from waves and buckles.

Panels—To be three-ply laminated pine meeting requirements of all city and state building departments.

Assembly—Doors are mortised and tenoned, wedged and glued or doweled. Seams soldered and scraped by our own process, producing a perfect and smooth surface. Under ordinary use seams are guaranteed not to split.

Finish—All material receives one coat of special metallic primer.

Underwriters' Labeled Doors

Paneled metal clad swinging doors may be used for openings in vertical shafts, corridor or room partitions, exterior walls, and fire escape exits when provided with special hardware. Size when mounted singly, not exceeding 4 ft. x 8 ft. In pairs, not exceeding 7x8 ft. Doors must be hung to angle iron, channel iron or hollow metal jambs.

Empire Metal Covered Windows

Double hung or casement type windows are made in our standard design, or they will be manufactured to meet special conditions. The construction follows, in general, the strictest standard requirements. Great care is taken to secure tight seams and joints to counteract the natural effects of exposure.

Empire Integro Window—Details are the same as described for the standard window, with the addition of special interlocking features which combine to produce all the effect of a weatherstripped window.

Empire Bronze Doors

Bronze doors are now built in a more substantial and more attractive manner by using extruded bronze panel mouldings and edge pieces. These solid bronze pieces, which are 1/8 in. thick, are used around both sides, the top and bottom of the door and for all panels, both solid and glass. They are put on with concealed brass screws in all places except the moulding on the removable side.

The stiles and rails of the doors, which are kiln dried white pine 1 1/4 in. thick, are covered with No. 18 gauge bronze. The cores of the panels are 3-ply laminated pine. The seams between the stiles and rails are invisible.

Empire Copper Doors

It is wise to use an "Empire Copper Kalamein Door" for exterior openings as the chemical composition of copper is such that will enable it to withstand the elements far better than iron or steel.

Empire Metal Covered Smoke Screens

For enclosing stair halls, and corridors, we manufacture in any design to meet any condition.

Empire Metal Covered Elevator Fronts

Kalamein elevator fronts are being used more extensively now than ever before, because the solid core feature makes it practically the only fireproof elevator door which can be operated quietly.

The tinny metallic rattling sound so common in metal sliding doors is absent in kalamein as the wood core acts as a sound deadener.

Empire Steel Clad Portable Office Partitions

Made of standardized interchangeable units, assembled with screws and adjustable to meet ceiling conditions. It is portable, and can be readily taken down and relocated by a carpenter or maintenance man.

It is sold knocked down or completely erected.

Details and specifications on request.

Empire Service

"We can duplicate in kalamein any door that can be designed in wood."

This company is always ready to co-operate with the architectural profession.

We are ready at all times to suggest details or to furnish technical information in relation to our products.

Catalogues sent on request.

Manufacturers of Fireproof Doors

2229-2233 South Ogden Avenue, CHICAGO, ILL.

Products

We manufacture a complete line of FIREPROOF DOORS of every description.

All doors are approved by the National Board of Fire Underwriters' and Factory Mutuals. All doors are labeled by the Underwriters' Laboratories, Inc.

"Firecraft" Type Numbers

Hollow metal doors, Nos. 100 to 199.
Kalamein doors, Nos. 200 to 299.
Steel fire doors, Nos. 300 to 500.
Freight elevator doors, Nos. FB1 to FB50.
Dumbwaiter doors, Nos. FDW1 to FDW10.
Passenger elevator doors, No. PE1 to PE99.
Tin clad doors, Nos. 550 to 599.
Steel plate doors, Nos. 600 to 650.
Storeroom doors, No. 900.

Various Types of "Firecraft" Hollow Metal Doors

Type No. 100, single panel door with "C" finish.

Type No. 195, two raised center octagon panels with corner and side depressed panels. Finish "D" weathered English oak, ornamented with flowers in depressed side panels.

Type No. 136, hollow metal entrance doors to school; has raised panels and recessed mouldings.

Type PE88A, passenger elevator door; single sliding 8 glass panel. We make these doors in all types and designs.

Type No. 136 "Firecraft" Door

Type No. 100 "Firecraft" Door

Type 195 "Firecraft" Door

Type PE88A "Firecraft" Door

"Firecraft" Type No. 500 Stair Door
Made of galvanized steel with mortised hardware

Section Through Door and Jamb, "Firecraft"
Door Type 500

"Firecraft" No. 900 Door Open, Inside View
Note clear, smooth, easily cleaned surfaces

"Firecraft" Single Sliding Gravity Type Door No. 400
Overlapping wall 4 in. at sides and top. Automatic hardware

"Firecraft" Type Nos. 300 to 500 Doors (Patented)

Construction—Doors are constructed of two layers of cross-layed steel sheets, galvanized and corrugated, interlined with asbestos. The edges are riveted to heavy galvanized steel stiles and rails. Made in all types—swinging, sliding, slide-up and turn-over, etc.

Advantages—"Firecraft" 300 to 500 doors are fireproof, strong, rigid, and comparatively light in weight, and as easily operated as ordinary wood doors.

Not subject to dry rot, as in case of tin clad doors.

"Firecraft" Type No. 900 Doors Underwriters' Labeled

"Firecraft" Type No. 900 doors are designed particularly for storerooms of storage warehouse, but may be used for penthouse and exterior openings. They are a distinct departure from the customary storeroom doors as they are rigid and yet not unwieldy. The outside is ruggedly protected with heavy strap hinges, butts, latches, etc., while the inside surface is clear and easily cleaned with no projecting cross bars to catch dust.

**"Firecraft" No. 900 Door Closed
Outside View**
Note strong hinges, etc.

Products

High grade KALAMEIN (METAL COVERED) WOODWORK for fireproof and sanitary purposes, including Doors and Trim, Windows, Partitions, etc., in Kalamein, Copper, Bronze and Steel; FIREPROOF HOLLOW METAL WINDOWS with Underwriters' label.

Also manufacturers of a general line of Building Sheet Metal Work.

Facilities and Workmanship

Our factory is especially well equipped to produce any design in high grade metal covered woodwork or hollow metal windows, suitable for buildings such as banks, public office and school buildings.

This work can be executed promptly and efficiently.

High Grade Metal Covered Entrance Doors

The manufacturing of highest grade metal covered entrance doors is our specialty. They are made in copper or commercial bronze.

Finish

All bronze and copper work is properly cleaned with acid and oiled or oxydized before it leaves the factory to prevent corrosion, or finished to comply with architect's requirements.

TRADE-MARK

Kalamein products are cleaned and painted with one coat of special metal primer.

Metal Covered Mouldings

In order to economize in designing metal covered work, a number of standard stock mouldings for panels, trim, etc., have been shown at the scale of 3 in. to the foot.

By using these mouldings the cost of special dies is saved.

Kalamein Elevator Doors

We make a specialty of metal covered elevator doors in kalamein, copper or bronze.

These are furnished in three types: swing, slide, or combination slide and swing, and in any design. Mouldings to be standard to fit our dies.

Doors can be furnished complete with hardware.

Specifications for Kalamein Doors and Smoke Screens

Where indicated on plans, doors, jambs, trim, side lights, transoms, etc., shall be kalamein.

All metal used for covering shall be "Keystone" copper steel. No. 26 gauge to be used for stiles, rails, jambs and panels, and for all sash and trim, and No. 28 for all moulding.

Note:--Special Designs made to order

DETAILS SHOWING STOCK KALAMEIN DOOR DESIGNS

All cores shall be made up from clear kiln dried white pine, free from loose knots, sap and shakes.

All cores shall be milled true to form. All stiles over 6 in. wide shall be built up of small strips glued together. All door stiles and rails shall be mortised, tenoned, and glued together.

All door stiles, sash, jambs, mouldings, muntins and trim shall be drawn through steel dies. All mouldings and edges shall be clean, sharp and true to detail with metal fitting closely to wood cores.

Special care must be used in assembling to avoid bench marks as much as possible.

All joints between metal shall be filled with solder and scraped flush.

After work is assembled all metal surfaces shall be thoroughly cleaned, with oxide of iron, of grease and all foreign substances, and given one coat of special metallic primer sprayed on even and smooth.

Hollow Metal Windows

A complete line of hollow metal windows, underwriters' label, of all types is manufactured by this company.

This includes double hung stationary, pivoted, and combinations of these types.

All windows are made with cutting and forming dies which insure the fitting of every member when assembled and a perfect operating window. Made in standard No. 24 gauge, also Heavy Type No. 20 gauge.

Specifications and details sent on request.

THE R. C. MAHON COMPANY

Manufacturers of Kalamein Doors

8650 Mt. Elliott Avenue
DETROIT, MICH.

Products

KALAMEIN DOORS.

For Mahon Roof Sumps, see page C2338.

Underwriters' Labeled Doors

Mahon Underwriters' Labeled Doors are manufactured from the finest selected kiln-dried white pine, covered with No. 24 gauge sheet steel. All joints are welded, making a sturdy, fire-safe fine appearing door.

Each Mahon Underwriters' Labeled Door must pass the rigid inspection conducted by a representative of the Underwriters' Laboratories, Inc., in addition to the regular shop inspection. This double O. K. insures permanence and absolute fire safety.

Mahon Type 1
Kalamein Door

Standard Fireproof Doors

Mahon Standard Fireproof Doors are of the same general design and high quality as Mahon Underwriters' labeled doors. The standard door is a satisfactory fire door but should not be used where labeled doors are specified.

Standardization of sizes and facilities for quantity production in the Mahon plant make it possible to quote unusually low prices on this type of door.

Service

Mahon designers are available at all times to co-operate on special conditions where standard doors can not be used. They will gladly give the benefit of their specialized experience.

Standard Mahon Kalamein Doors

Mahon Kalamein Doors are manufactured in the following sizes. Type 1 is carried in stock for immediate delivery in sizes marked * only

2'0"x6' 6"	2'2"x6' 6"	2'4"x6' 6"	2'6"x6' 6"	2'8"x6' 6"	2'10"x6' 6"	3'0"x6' 6"

2'0"x6' 10"	2'2"x6' 10"	2'4"x6' 10"	* 2'6"x6' 8"	* 2'8"x6' 10"	* 2'10"x6' 10"	* 3'0"x6' 10"
2'0"x7' 0"	2'2"x7' 0"	2'4"x7' 0"	* 2'6"x7' 0"	* 2'8"x7' 0"	* 2'10"x7' 0"	* 3'0"x7' 0"

Fireproofed Jambs, Trim and Moulding

Several standard jambs, trim and moulding sections in attractive designs, manufactured from the same high

grade white pine, and fireproofed in the same manner as Mahon Kalamein Doors, are carried in stock ready for immediate delivery.

STANDWELL METAL COVERED DOORS.

ALL STEEL COMBINATION BUCKS, JAMBS and TRIM, plain or moulded.

ELEVATOR FRONTS, all-steel and metal covered.

ALL-STEEL and METAL COVERED JAMBS and TRIM.

Also manufacturers of Metal Covered and Steel Base Picture and Wire Moulding; Tubular Steel Elevator Doors; Metal Covered Doors of bronze and copper; Hollow Steel Doors; Standwell Steel Unit Partitions.

Standwell Metal Covered Doors (Patented)

In the Standwell construction, the metal covering is of Nos. 22 and 24 gauge selected steel, made in tubular form entirely covering the wood cores. The metal is joined together and to the panels by welding, making the basic construction of the door one piece, which insures effective fire retardation.

The joints between stiles and rails are locked by a patented process (section AA below). This method makes the strongest joint possible to produce, also insuring that the metal surfaces of stiles and rails are flush and smooth without the use of a plastic filler. The joints, being filled with solder in the process, are polished over and are practically invisible.

The white pine cores used in the Standwell door serve a double purpose: making an absolute sound deadener (there being no metallic rattle to a Standwell door), also preventing any warping if door is subjected to fire. It also makes the application of hardware a simple matter, as templates are not required in advance as on all-steel doors.

Standwell doors are particularly suited for vertical shaft protection such as stairs and elevators where Underwriters' labels are required.

Doors of types 1, 3 and 4, will be carried in stock for immediate delivery in sizes as shown by schedule.

When ordering by schedule, note that jamb opening size is between jambs and from head jamb to finished floor. Allowance on finished door size is made for joint and for saddle.

Architects can, by using Standwell doors of sizes and designs shown, make a distinct saving for their clients, and owing to the H. F. G. standardized methods of manufacture be assured always of a uniform high quality and quick delivery.

Standard Designs for Standwell Doors

All-steel Combined Bucks, Jambs and Trim

Bucks of Design 26, 27DT, 27DF, 28 and 29, made from No. 16 gauge steel, are suitable for all interior openings in the best types of buildings. Being of steel they are fireproof, and when used for fireproof openings, in conjunction with Standwell Steel Covered Doors, procure the lowest insurance rate.

They are suitable for non-fireproof openings where wood doors are used, being more economical than wood jambs and trim. The steel buck being erected as a unit, eliminates the extra cost of erecting separate bucks, jamb and trim.

All trim miters are welded, which eliminates the shrinkage and opening of miters found in wood trim.

All trimmed members are formed with sharp, clean corners, that for architectural beauty can not be excelled.

Note: In order to produce the best results in all-steel bucks, architects should specify that when partition blocks are laid, all open spaces between the end and sides of partition blocks and the steel buck should be slushed with mortar. If this is done there will never be any cracking of plaster around the buck.

METAL CLAD DOORS, INC.

685 Concord Avenue, CAMBRIDGE, MASS.

Products

METCLA METAL COVERED DOORS, FRAMES, TRIM, ENTRANCES and WINDOWS; TIN CLAD FIRE DOORS and SHUTTERS.

Kalamein and Tinclad Doors are furnished either with or without Underwriters' label.

Metcla Metal Covered Doors, Frames and Trim

Made by drawing sheet metal through steel dies over a wood core of white pine. This process practically welds the metal covering to its core, eliminates buckles and brings out all moulding members in clear relief.

Made in kalamein iron, galvanized steel, copper or low brass; in sections, tongued, grooved and pinned together, and finished with a priming coat of paint. Glass is not furnished by us.

Standard styles in kalamein iron are illustrated below. Special styles and sizes will be furnished on short notice.

Metcla metal covered doors, frames and trim are approved by leading architects and engineers, and have been used under the most severe conditions. In specifying Metcla doors, frames and trim the architect is assured of the utmost in quality, workmanship and durability, upheld by continuous service and a high reputation for materials and workmanship.

No. 102G
Metcla Metal
Covered Door

types and sizes, either from our own or architects' details and to conform with special requirements.

Furnished glazed or unglazed, with or without hardware, as required.

Metcla Metal Covered Entrances of Copper, Bronze or Kalamein

Metcla entrances are made in accordance with the architect's details to meet every requirement. They are a striking feature of many prominent public and private buildings and have all the advantages and the appearance of cast metal doors, without their extreme weight or cost.

Mill Entrance
Metcla Copper Kalamein

Metcla Kalamein Elevator Fronts

Metcla kalamein elevator fronts are specified for durability, ease of operation and appearance, where sheet steel doors are not desired, or where hollow metal doors would be too expensive.

Facilities

Our new and modern manufacturing plant, containing 50,000 sq. ft. of working space and 25,000 sq. ft. of storage space, is equipped with the latest and most improved metal and wood working machinery, most of which has been specially designed to meet every requirement of producing only the highest standards of quality in all-metal fireproof products. All orders, large or small, can be promptly executed.

Prices furnished on receipt of schedule covering the following data (unless plans and specifications are furnished to us):

Doors: Size and style of each.

Jambs: Width and thickness required.

Casings: Moulded or flat; state width and whether one or both sides of opening, with or without plinths.

Specifications for Metal Covered Doors, Jambs and Trim

Metal Covering—All wood forming parts of doors, jambs and trim to be covered with metal as follows:

Kalamein Iron Covered—Doors and jambs, Nos. 22 to 26 gauge and trim No. 26 gauge.

Furniture Steel Covered—Doors and jambs, Nos. 20 to 24 gauge and trim No. 26 gauge.

Copper Covered—Doors and jambs, 16 to 32 oz.; mouldings and trim, 14 or 16 oz.

Bronze Covered—Doors and jambs, 14 to 20 gauge; mouldings and trim, No. 23 gauge.

Cores—All wood in doors, jambs and trim shall be clear white pine and shall be thoroughly seasoned, kiln dried and free from shakes, sap, loose or large knots, or any defects impairing strength or durability. Doors to be made, $1\frac{1}{8}$, $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, $2\frac{1}{4}$ in., or heavier, if required. If doors are either $1\frac{1}{8}$ or $2\frac{1}{4}$ in. thick, stiles, top and cross rails are to be 5 in. wide and bottom rail is to be 10 in. high.

Jambs to be made $1\frac{1}{8}$ or $1\frac{1}{4}$ in. thick, by width shown on drawings, if rabbeted; or $\frac{7}{8}$ or $1\frac{1}{8}$ in. with loose stop applied.

Trim moulded or plain as shown.

Finishing—All kalamein or galvanized iron material to receive a priming coat of paint in our shop before delivery.

If finish painting is desired, finish to be solid or grained in colors as selected, in air dried enamel finish.

Bronze and copper work to receive an oxidized finish of color as selected.

Underwriters' Labels—Underwriters' labels can be secured for doors leading to stairways, corridors and partitions, fire escapes and fire tower openings, which, when installed in accordance with the following specifications, will procure minimum insurance rate for building and contents.

Stair and Elevator Doors—Labeled for single doors up to 48 in. wide and in pairs up to 96 in. wide; made with solid panels hung on channel iron or combination steel frames with 5x5-in. full surface butts, mortise cylinder locks with $\frac{3}{4}$ -in.

throw bolt; stair doors should be made self-closing either by coil spring or door check.

Fire Escape and Tower Doors—Labeled for the same size openings as stair and elevator doors, and can be constructed to receive wire glass, not exceeding 5 sq. ft.; hung in the same manner as stair doors.

Corridor and Partition Doors—Constructed to receive 8 sq. ft. of wire glass and bearing the Underwriters' label; may be hung to metal covered jambs when stair and elevator doors are labeled.

Specifications for Metal Covered Frames and Sash

Metal Covering—All wood forming parts of window frames and sash to be covered with metal. Each member covered with metal is to be drawn through steel dies before assembling and all mouldings and edges are to be sharp and true as detailed.

Kalamein Iron Covered—No. 28 gauge for glass mouldings; No. 26 gauge for all other parts of frame and sash, except sill which will be No. 24 gauge.

Copper Covered—14 oz. for glass mouldings; 16 oz. for all other parts of frame and sash, except sill which will be 20 oz.

Bronze Covered—No. 27 gauge for glass mouldings; No. 23 gauge for all other parts of frame and sash, except sills, which will be No. 20 gauge.

Wood Cores—Cores of all window frames and sash shall be thoroughly seasoned dry white pine, free from loose or large knots.

Cores shall be milled and constructed in the best manner, built up in strict accordance with the details, all mouldings shown on drawings being accurately followed.

Members of Window Frames—Unless otherwise shown on drawings, sizes of different members shall be as follows:

Sills, $2\frac{3}{8}$ in. in thickness; pulley stiles and outside casings, $1\frac{1}{8}$ in.; inside casings, $\frac{7}{8}$ in.; back linings, $\frac{3}{4}$ in.; parting strips $\frac{3}{4}$ x $1\frac{1}{8}$ in.; staff beads, sizes vary. Sills shall be double rabbeted. Inside stops shall be $\frac{1}{2}$ in. by width desired. Sections of pulley stiles to be removable to give access to weights.

Frames for double hung sash to be box frames provided with weight separators. Sills to be plowed out on underside and provided with $\frac{1}{2}$ x2 in. galvanized iron water bar.

Note: All of our windows are equipped with our integral weather strips, which are made part of the construction.

Members of Sash—Unless otherwise shown on drawings, sizes shall be as follows: Stiles and top rails, $1\frac{1}{8}$ x $2\frac{3}{8}$ in. Bottom rails, $1\frac{1}{8}$ x $3\frac{3}{4}$ in. Meeting rails, $1\frac{1}{4}$ in. thick. Rails shall be coped to stiles and screwed together with 5-in. screws for sash up to 4 ft. wide and with 6-in. screws for sash over 4 ft. Joints to be well filled with solder and filed smooth.

Specifications for Furniture Steel Door Frames

Frames to be made of furniture steel of not lighter than No. 16 gauge U. S. Standard with all miters and joints to be welded and made smooth. Reinforcement for application of necessary hardware to be electrically welded and of proper size to insure rigid construction. Wall anchors to be provided and spaced approximately 2 ft. apart to insure rigidity. Each frame to be provided with spreaders for parallel alignment. Templates for all hardware will be furnished in reasonable time prior to the manufacture of these frames.

All frames to receive one shop-coat of the best metallic primer and applied in a first-class workmanlike manner to ensure a complete covering on all surfaces, inside and outside.

Note: If required, Underwriters' labels can be secured for openings in vertical shafts, exterior walls; and for openings in corridor and room partitions.

Architectural Bronze Products

We have ample facilities to produce all items of architectural and ornamental bronze work required in the building and allied industries. We have a sales and engineering force competent to handle work in this line of any scope, and our products are built by a force of skilled artisans. Our castings are produced in French sand from highly chased metal patterns or in the lost wax process, reproducing in minute detail ornament from models approved by architects; and we use drawn and extruded sections of heavy gauges only in the working of our architectural bronze products.

We have developed over a period of years types of windows, doors and store fronts, which we manufacture in heavy gauges of bronze and extruded metal and we specialize in the production of the following items:

"Reliance" Extruded Double Hung Windows "Reliance" Extruded Doors and Frames
 "Reliance" Extruded Casement Windows "Reliance" Extruded Store Fronts

Detail of a Hollow Metal Elevator Front

Elevator Fronts, Hollow Metal

Frames—No. 12, 14 or 16 gauge steel combination buck and jamb trim, either pressed or rolled and applied by means of spot-welding. Dust covers and struts to ceiling where so specified.

Saddles—Cast iron or bronze provided with cast stiffener ribs, grooves milled, so as to provide perfect, noiseless operating of doors.

Doors—Furniture steel of No. 18 gauge for stiles and rails. The stiles on front and back are reinforced with No. 16 gauge bumper channels full height of door.

Mouldings No. 20 gauge cold rolled strip steel formed so as to interlock with stile. Intersections of stiles and rails are welded.

Panels of No. 12 gauge furniture steel are inserted in groove of moulding. Reinforcements are provided for door closer and hangers.

Painting—All work is finished in our standard primer, ready to receive final finish at the building after erection.

Erection—We have a staff of competent men engaged in erection of elevator fronts.

Special Service Department—We are prepared to furnish and design elevator fronts in all metals and finishes.

Products

DRAWN METAL COVERED WOOD DOORS, WINDOWS, ELEVATOR FRONTS, PARTITIONS and TRIM in Steel, Copper and Bronze.

Sound Construction

In the manufacture of our products we follow old established methods, which have been found through long use to be the most satisfactory. Doors are of mortise and tenon construction. No dowels or corrugated fasteners are used. No parts are covered by hand, the doors are strictly a machine made product.

All parts of doors, windows and trim are separately kalameined before assembly. This not only produces the highest class of work, but places us in a position to render a very wide service to users of all classes of metal covered woodwork.

Specification Data for Standard Metal Covered Doors

Cores, Stiles and Rails—Wood used in cores, stiles and rails is sound, kiln dried white pine, milled solid, and free from large and loose knots and sap.

Covering—All parts are covered with No. 24 gauge furniture steel, No. 24 gauge terne plate or No. 26 gauge galvanized iron by die process before assembly.

If doors are to be covered with copper, 16 oz. is

recommended; if bronze is used, 20 gauge is recommended.

Panels—Panels are built up as in veneer process, under pressure of 2 sheets of metal, cemented on to approved board.

Assembly—Stiles are mortised and rails blind tenoned. Panel is inset into stiles and rails. Surface seams are soldered and scraped smooth. The top and bottom edge seams have underlaid strips of metal making the joints practically waterproof.

Painting—All material is given a priming coat of paint before leaving the factory.

Metal Covered Windows

Metal covered windows of double hung or casement type can be furnished in our own standard designs, or we will build them to specifications. Other types of windows will be manufactured to meet special conditions. All windows are of sturdy construction. Special care is taken to have the joints and seams tight to withstand the action of the weather.

Service

We are prepared to design special metal covered woodwork to fit openings with unusual contours. Upon receipt of drawings or sketches we shall be glad to submit for approval designs for filling any shape or size window opening.

THE PHILIPP MANUFACTURING COMPANY

Manufacturers of Kalamein Doors, Sliding Door Hardware and Hardware Specialties

EAST HAMPTON, MASS.

Products

METAL COVERED KALAMEIN DOORS, WINDOWS, DOOR FRAMES, TRIM, UNDERWRITERS' LABELED KALAMEIN DOORS; SMOKE SCREENS; ELEVATOR FRONTS; DUMBWAITER DOORS; BRONZE and COPPER KALAMEIN DOORS.

Metal Covered Doors

Wood cores are made of No. 1 sound, kiln dried white pine, free from loose or large knots, dry rot, sap or shake. Machine sized to accurate dimensions.

Stiles and rails mortised and tenoned, are glued with waterproof glue, doweled and wedged, grooved to receive panels.

Metal covering for stiles, rails and panels is 26 gauge galvanized or kalamein 16 to 32 oz. copper, No. 20 gauge bronze. Floor mouldings and trim, 26 gauge kalamein, 14 oz. copper or 24 gauge bronze.

Panels are composition board with metal glued to surfaces with waterproof glue, under pressure.

Special care is taken in assembling to avoid bench marks as much as possible.

All joints between metal filled with solder and scraped smooth. All material has shop coat of special metal primer.

Underwriters' Labeled Kalamein Door

Our Underwriters' labeled kalamein doors are built to requirements of National Board of Fire Underwriters and bear their labels. Single doors not to exceed 4x8 ft., pairs not to exceed 8x8 ft. These must be hung in channel, angle or hollow metal frames. We recommend consulting your local requirements to obtain minimum rates on building and contents.

Hardware

We are in position to fit for all mortised hardware on receipt of hardware schedule and samples.

Metal Covered Windows

Double hung or casement type windows are made in our standard design. All metal drawn on core to give neat and serviceable window.

Kalamein Elevator Fronts

Combined slide and swing, two-speed and three-speed, and standard swing elevator doors are serviceable and noiseless and are extensively used.

Kalamein Smoke Screens

We manufacture kalamein covered smoke screens of all types and for all conditions. Note one of our standard construction on next page.

Bronze and Copper Kalamein Doors

We also manufacture a high grade line of bronze and copper kalamein doors, etc., for entrances in banks, theaters, public buildings, etc.

Service

Estimates will be furnished from the architect's plans and specifications. Suggestions and shop drawings will be furnished whenever desired. We solicit your inquiries.

Blue Prints of Mouldings and Casings—We have a series of blue prints of our various stock designs of panel mouldings, stop mouldings, and casings which we will be glad to mail upon request.

SYRACUSE FIRE DOOR CORPORATION

INC.

Manufacturers of Metal Covered Doors and Trim and Tin Clad Fire Doors

900 Canal Street
SYRACUSE, N. Y.

Products

UNDERWRITERS' LABELED and NON-LABELED KALAMEIN DOORS, covered with copper, bronze, or kalamein steel, long terne or galvanized; UNDERWRITERS' LABELED TIN CLAD FIRE DOORS and FIRE DOOR HARDWARE.

Also manufacturers of Metal Covered Frames, Trim, Mouldings, etc.; Metal Covered Window Units, Dumbwaiter Units, Elevator Fronts, Smoke Screens, Partitions, Channel and Angle Iron Frames; Hollow Metal Jams, Bucks, etc.

Syracuse Kalamein Doors

These doors are made in a variety of standard designs for use in office buildings, public buildings, schools, theaters, stores, hospitals, etc.

The wood used in the cores is thoroughly seasoned and air dried before going through the factory. Panels are carefully built up and covered with metal, both sides glued, and placed under heavy pressure to insure good contact and eliminate any buckling. Mouldings are drawn true and accurately mitered. All joints are welded and scraped to smooth surface.

Standard thicknesses for metal covered doors are either $1\frac{3}{4}$ or $2\frac{1}{4}$ in.

Unless otherwise advised, our doors, etc., are given one shop coat of special metallic primer.

Whenever practical, the metal covering on our kalamein jams, casings, mouldings, etc., is carefully drawn on the wood cores through steel dies.

Labeled Kalamein Doors

We specialize in labeled kalamein doors.

All doors shown below can be labeled excepting doors marked "B," "W" and "X."

A Typical Smoke Screen Detail

Tin Clad Fire Doors and Shutters

All types of labeled and unlabeled, two-ply and three-ply tin clad fire doors and shutters to fill conditions imposed by insurance and building requirements. First class materials, careful workmanship developed by many years of experience and the most modern and efficient machinery serve to make these fire-proof units of most approved design.

Doors and hardware bearing the label of the National Board of Fire Underwriters' are inspected by their representative at our shop. This is an additional warranty of their worth as fire retardants.

THORP SMOKE SCREENS.
THORP No. 14 GAUGE TUBULAR ELEVATOR DOORS.
THORP BRONZE and COPPER COVERED ENTRANCES.
THORP HOLLOW METAL FRAMES.

Facilities

All products are made in our new plant which is equipped with the most modern machinery made to suit our individual requirements and fully capable of handling any size order.

Details

Full size and scale details are submitted by our Drafting Department for architects' checking and approval. The requisite number of copies is furnished the general contractor.

Construction and Materials

Thorp Kalamein Doors are made on the basis of the Underwriters' requirements of 3-ply built-up pine core, heavily lined with asbestos and thoroughly nailed with cement-coated nails. All mortises in the core are made and reinforced for hardware at this point.

Fig. 1. Section Through Door

A—Wood core. B—Asbestos paper lining. C—Steel sheet. F—Beveled edge band. G—2-in. wood screw

Metal—The steel covering used is No. 1 furniture steel with 24 gauge for stile and rails, and 20 gauge for panels. If desired, 20 gauge may be specified for stiles and rails as well. The panel mouldings are an integral part of the stiles and rails and formed with them, and are not a separate nailed-in mould.

Back of sheet showing the reinforcement at the butt joint of the stiles and rail, and the welded miter joint of the moulding.

Fig. 2. This System of Welding Avoids All Possibility of Breakage and Looseness

Face of the sheet ready for the polishing.

Welding—All stiles, rails, panels, and panel moulds are electrically welded into one sheet. The two sheets thus formed are lapped on all four edges, formed into a groove and held in place by a steel band. No dependence is placed on mortise and tenon joints or (lag) screws to hold the doors together. No solder is used at all, since the door is welded throughout.

Mouldings—We have a large number of dies for both solid panel and glass panel moulding. Since it is more economical to use standard dies, we make our quotations on this basis unless specifically stated otherwise.

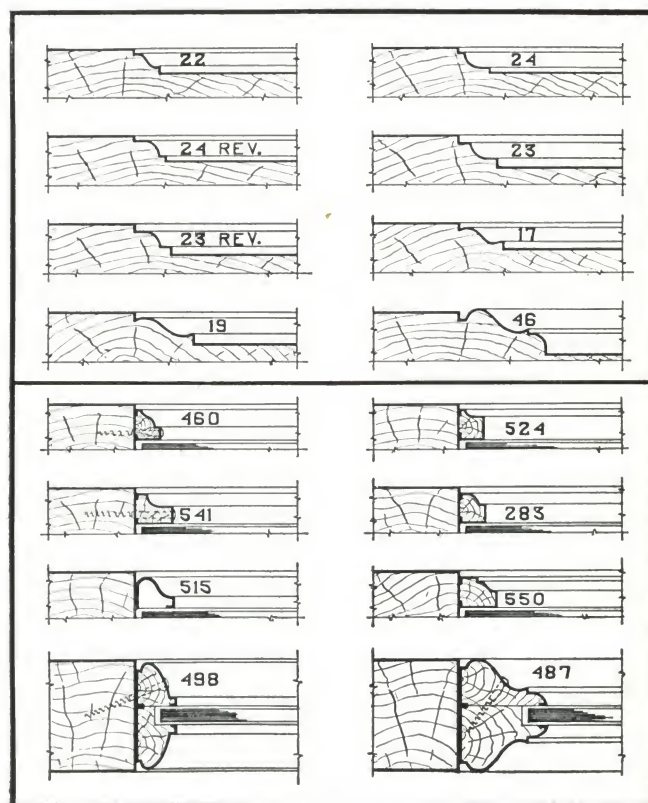

Fig. 3. A Few of Our Many Styles of Casings and Mouldings for Divided Light Panels

Fig. 4. Details of Hardware Reinforcement

A and B—Photographic section of the jamb at the butt seat, showing the sinkage of the washer nut on the back of the jamb.

C—Section of the back edge of a door showing butt sinkage

These methods are typical of the great care exercised by this organization that all details shall be as strong as possible to resist the action of hard usage and fire. Note that the metal is formed in under the butts

Hardware—All hardware, except checks, is fitted at the factory, provided it is delivered to us with all charges prepaid. In making the mortise seat for the hinge, the metal is not cut away, but formed into the mortise to protect the wood core on both the door and frame. The hinge jambs are suitably reinforced at all hinges to carry the door without any sagging. Necessary reinforcements are placed in the door.

Munt Bars—Our Munt Bar construction is the strongest possible, and the smallest. It consists of

$\frac{1}{8}$ -in. steel bar of door thickness to which the mouldings are machine screwed. When hollow mouldings are used, they are made up in framed, welded units for each glass light opening.

Finish—All grained or enameled finishes are baked and are of the very best seven-coat type. We follow the architect's requirements for each individual order. Unless specifically stated otherwise, all work is primed. Copper-plated finish is electro-copper on steel and may be finished in the various shades of statutory copper. This is practical only for interior use.

Fig. 6. The Thorp Method of Munt Bar Reinforcement
Insures complete and lasting rigidity in all divided light panels

Hollow Frames

Our frames are adaptable to any type of building or partition construction. They are either 16 or 14 gauge welded joints fully reinforced and fitted for hardware.

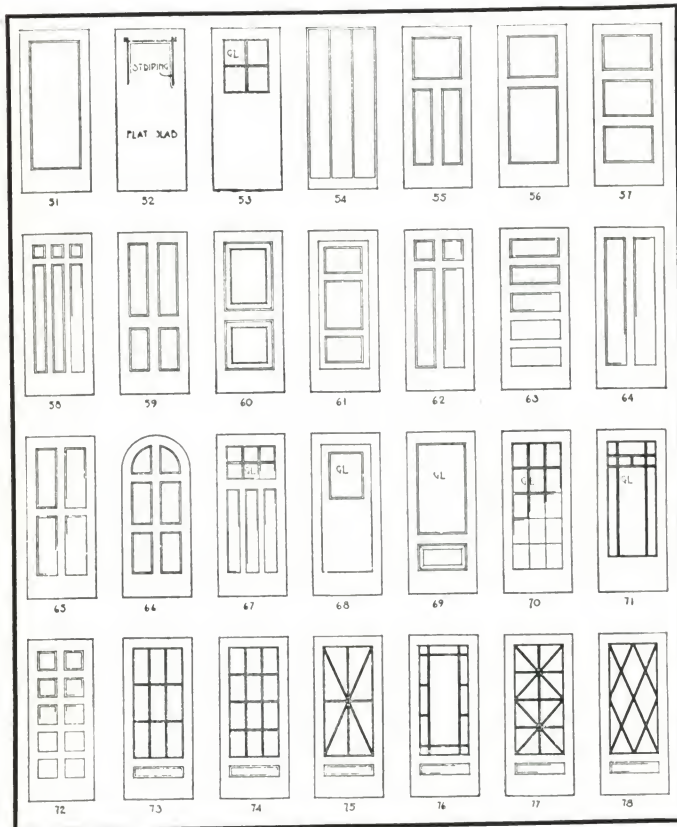

Fig. 5. Some of Thorp Special Panel Layouts

Fig. 7. These Are a Few of the Many Styles of Hollow Trim Architects May Specify

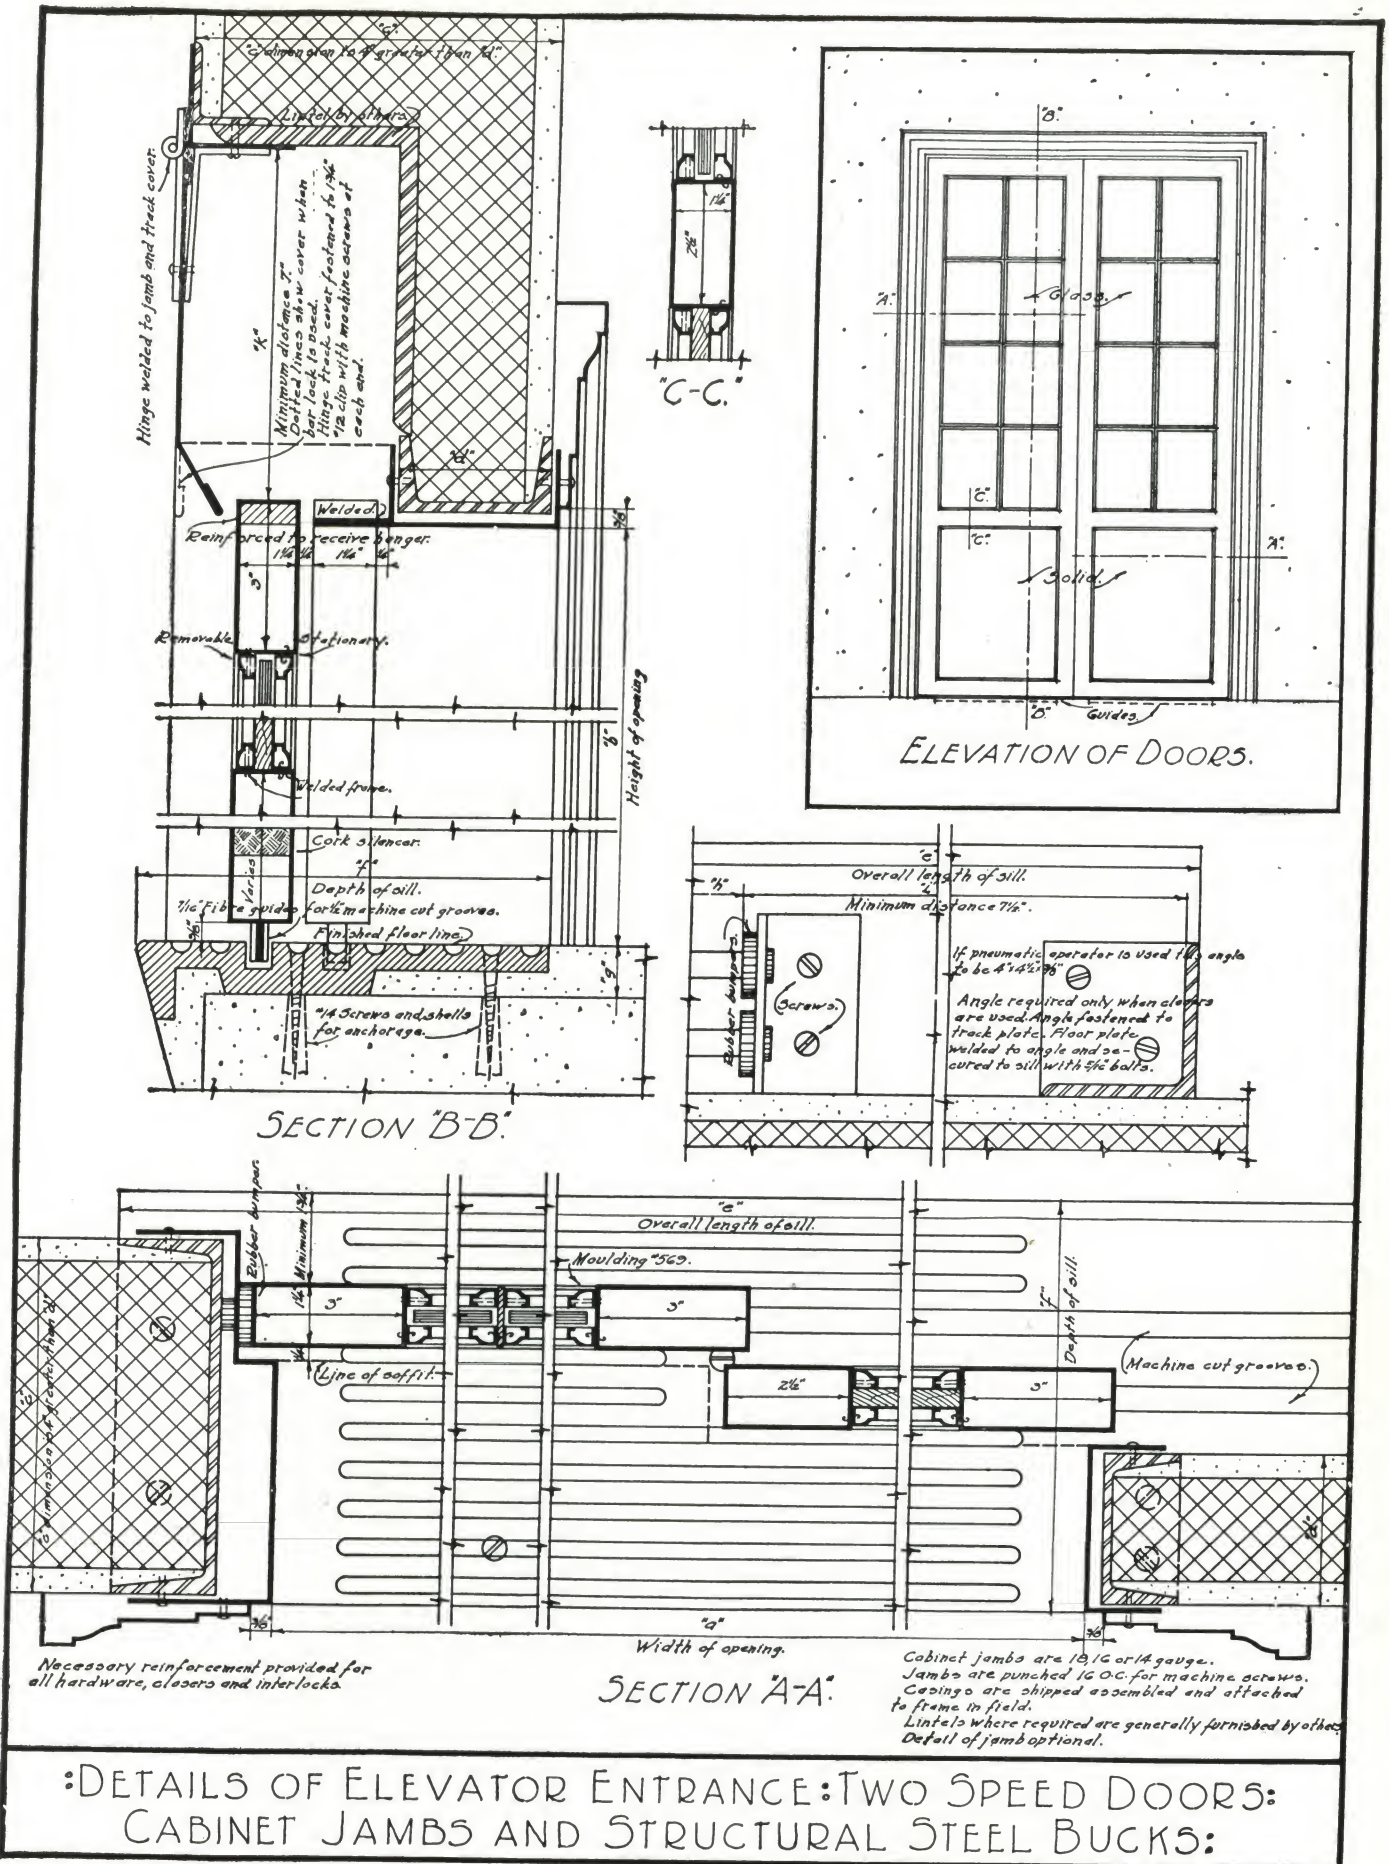

Fig. 8. Typical Detail Sheet of a Thorp Elevator Opening Installation—Note Methods of Construction

Elevator Openings

These may be of metal covered or tubular steel construction. Tubular doors are 14 gauge drawn steel tubes with all mitres and joints welded. Glass mouldings are in welded frame units. This simplifies glass

setting. The Thorp guide is the width of the bottom rail, preventing shaft drafts and light strikes.

The guide is lined both sides with a special grade of hard fibre, obviating metal-to-metal contact, adding to quietness and ease of operation.

We furnish the welded type of hollow metal frame and track cover or cabinet jamb type. Sills and hardware complete are also provided if desired. Sills should be machine grooved or of a similar construction. Elevator openings are finished in baked enamel in any desired wood grain or color. Otherwise it is factory primed.

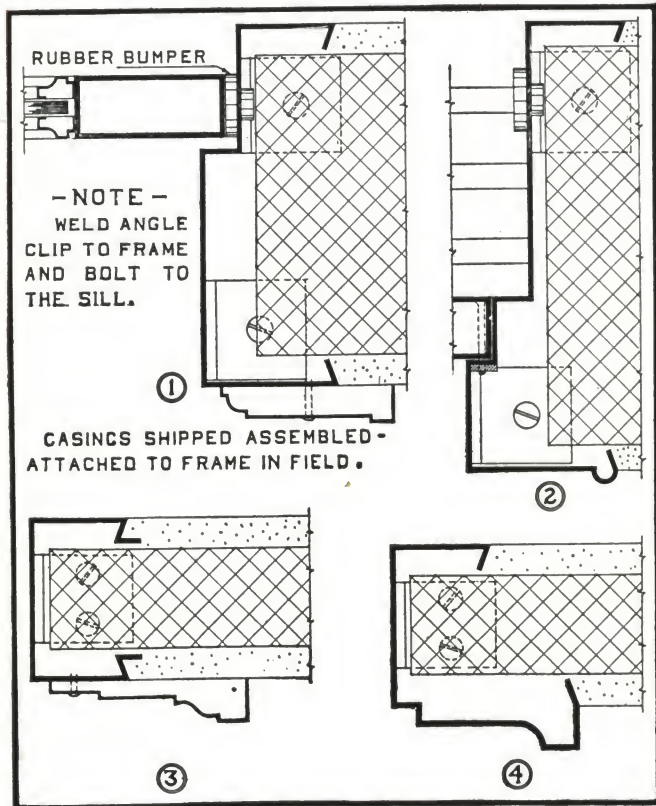

Fig. 9. Four Typical Thorp Elevator Opening Casings

Fig. 10. This Illustrates the Thorp Method of Eliminating Light Strikes Below Elevator Doors and of Reducing Noise

Note hard fibre

Fig. 11. Thorp Elevator Doors As Installed in the New Baker Building, Minneapolis, Minn.

LARSON & McLAREN, Architects

Entrance Doors

Thorp bronze and copper entrances are especially suited to public buildings, such as office buildings, hotels, theaters, etc.

The construction is identical with Thorp steel covered doors except an inside lock seam joint is used instead of welding which is impossible in the case of bronze or copper. No solder is used.

Copper may be 18 oz. to 30 oz. Bronze may be 18 oz. (22 gauge) to 30 oz. (18 gauge). We also use 36 oz. (16 gauge) bronze in hair line joint construction as well as hollow bronze in 16 gauge.

Label Service

If called for, we label doors according to the National Board of Fire Underwriters' requirements for various types of openings. This should be specified when inquiring.

Catalogue

The reference book of Thorp Fire Proof Doors will be sent to any architect who will send for it on his firm stationery. This catalogue of 95 pages will furnish detailed and authoritative information on fire proof doors and allied products.

VULCAN RAIL & CONSTRUCTION COMPANY

Manufacturers of Underwriters' Fire Doors

MAIN OFFICE AND WORKS

Grand Street and Garrison Avenue, MASPETH, N. Y.

BRANCH OFFICE AND SHOPS: 39th Street and A. V. R. R., PITTSBURGH, PA.

Products

VULCAN "ALL-STEEL" FIRE DOORS.

For Pipe, Stair and Bridge Railings, Steel Gratings, Pipe Bends, etc., see page A705.

Underwriters' Approval

The steel fire doors and frames manufactured by this company, and described below, are made in accordance with the specifications of Underwriters' Laboratories, Inc., are inspected by them and carry their Class "C" label.

Vulcan "All-Steel" Fire Doors

Use—These doors are designed for the protection of corridor and partition openings. They are especially suitable for installation in compartment openings in furniture storage warehouses.

Equipment—This type door is furnished with buck and hardware complete, except padlock.

Construction—The entire door, frame and hardware is of steel construction, and all material is painted one shop coat before shipping.

TRADE-MARK

The door sheet is made of blue annealed steel, securely fastened to an angle iron frame, suitable provision being made for expansion in case of fire. This angle frame is braced at intervals of not over 20 in. by cross angles riveted to the door sheet.

Hardware consists of four strap hinges and a three-point latch with spring to hold latches in their keepers. Latch handles extend through the door to permit opening from both sides.

Buck is made of standard rolled steel channel and is furnished 1 in. wider than partition. It runs from the finished floor to the ceiling and is securely fastened to both. Hinge pintles and latch keepers are riveted

to channel jambs in the shop. Doors are usually made 3x8 ft. 4 in. or 3 ft. 4 in. x 8 ft. 4 in. but can be furnished any size up to 4 x 10ft.

Further Information

Complete detailed drawings, together with further information and prices will be gladly sent on request.

LYON-CARR FIRE DOOR COMPANY

Manufacturers of Standard Tin-clad Fire Doors

TELEPHONE
WEST 2703

1737-1743 Walnut Street

CHICAGO, ILL.

Products

LION STANDARD TIN-CLAD FIRE DOORS and SHUTTERS bearing Underwriters' Label.

Also Lion Kalamein Doors and Frames; Lion Standard Meeker Elevator Doors.

Fire Door Types

Designed to conform to various wall conditions, they are of many kinds—swinging (both single and double), and sliding (either gravity, level, horizontal or vertical).

Standard wood core tin-clad fire door construction is extensively used for the protection of large and small openings in fire walls of either old or new buildings.

Official Approval

Lion standard tin-clad fire doors and shutters are approved by the National Board of Fire Underwriters, the New England Mutuals and the Associated Factory Mutuals. The doors are inspected and labeled under the supervision of the Underwriters' Laboratories, Inc., and fully approved by local and state inspection bureaus.

Swinging Fire Doors and Shutters

In design, this type can be either single or double swing and hung either to overlap the wall opening or fit in angle frame, both flush and rabbeted.

Complete fire door hardware can be furnished with or without the fusible link automatic closing device.

Window shutters are constructed so as to close flush with the face of wall or overlap.

No. 307. Lion Standard Tin-clad Swing Fire Door

Sliding Fire Doors

Gravity fire doors are particularly adapted to fire wall openings for their easy operation. They are hung on inclined tracks which are pitched $\frac{3}{4}$ in. to the foot. The doors are held open by a counterbalance weight which is released by the melting of the fusible link when exposed to fire or excessive heat. When counterweight is released the door closes rapidly by force of gravity. It slides flush with the wall and does not take up floor space in its operation.

Split-gravity fire doors are designed to meet conditions such as insufficient wall space on either side of opening, and permit doors to slide clear of jamb, or where overhead carrier track passes through opening. Double sets of fire door hardware are required, and can be made split-slide for level track as well.

Level sliding fire doors are used where headroom is insufficient to place the track on an incline as required for gravity door. To meet varying conditions of headroom special designs of level track and hangers are provided.

Vertical slide-up fire doors are used where it is impossible to install either horizontal sliding or swinging fire doors. They are counterbalanced so as to balance the weight of the door, and are so arranged that in case of fire the fusible link releasing the weight, allows the door to descend slowly from force of gravity.

No. 301. Lion Standard Tin-clad Gravity Fire Door

Facilities and Workmanship

We make a speciality of fire door work including the manufacture of standard (non-labeled) Meeker freight elevator doors and non-labeled kalamein doors.

Special fire door hardware designed and manufactured to meet unusual conditions.

Lion fire doors and fixtures are built of the best in material and workmanship combining sturdy construction, rugged strength and promise of long service.

M & E "ALMETL" Labeled FIRE DOORS and SHUTTERS.

M & E "ALMETL" Unlabeled Doors, for factory and warehouse service.

For "Star" Roof Ventilators, see page A541.

Service

We or our 300 responsible and experienced "contracting and erecting licensees" will quote on "Almetl" Doors and Shutters separately, with or without "approved" hardware and installation—for any contract anywhere.

Our centrally located plant is equipped with up-to-date machinery and skilled workmen. Our sales and engineering department is thoroughly informed and organized for advice on any unusual or complex installation problem.

Single Sliding Door

Single Swinging Door

M & E "Almetl" Labeled Fire Doors

Labeled "Almetl" Fire Doors and Shutters for all building openings under jurisdiction and control of insurance interests.

M & E "Almetl" Fire Doors are made in two thicknesses: 2 3/4 and 1 7/8 in. The 2 3/4-in. door is labeled by Underwriters' Laboratories, Inc. for fire walls (Class A), vertical shafts (Class B), corridor and room partitions (Class C), and exterior openings (Classes D and E) when type and pattern are within the prescribed opening size limits.

The 1 7/8-in. door is labeled by Underwriters' Laboratories, Inc. for Class B, C, D, and E situations when type and pattern are within the prescribed opening size limits.

Approvals—Inspected and labeled by the Underwriters' Laboratories, Inc., Chicago, Ill. and Factory Mutual Laboratories, Boston, Mass.; also approved and used by United States Government. Endorsed and recommended by over 250 National, State and Municipal fire and safety control authorities.

Types—Single sliding, pairs sliding, single swinging, pairs swinging, vertical sliding and horizontal lifting.

We also furnish "Almetl" Doors with convex heads, with panels for wire glass, with wicket gates, or recessed for overhead monorail systems.

Sliding doors made sectional for assembly at destination when occasion requires; and doors to meet special requirements.

Advantages—Aside from the maximum reduction in insurance rates for installation of M & E "Almetl" Doors, the buyer is assured of 100% value, permanence and service due to the lasting and indestructible materials used in their construction. "Almetl" Doors are all steel and asbestos.

Twenty-year guaranteed—no better value in a "labeled" fire stop obtainable.

They are lighter, and the cost of maintenance is negligible.

Description of Door Construction—A panel of transversely laid standard 2 1/2-in. corrugated galvanized steel, with

"ALMETL"
TRADE MARK REG. U. S. PAT. OFF.
**FIRE DOORS
AND
SHUTTERS**

interlining of asbestos—all securely held in a continuous frame of 2 1/2 x 3/8-in. bar steel. All joints are welded and riveted, not bolted. The frame and ends of panel sheet are protected by a cover binder of heavy galvanized sheet steel, securely riveted to the frame, thus forming an armor to protect the edges of the door from abuse.

Construction of "Almetl" Fire Door
Weight, 4 3/4 lb. per sq. ft.

Hardware—Fully approved and labeled hardware furnished with detailed erection prints.

Special hardware to meet unusual conditions when required. Lighter unlabeled hardware for unlabeled doors and panels.

M & E "Almetl" Unlabeled Service Doors

Unlabeled "Almetl" Service Doors for all commercial purposes—to enclose openings to street, yard, loading platforms; for sheds, exterior and interior openings of all kinds not subject to insurance control. These doors are of the same sturdy construction as the labeled product, excepting slight reduction in insulation features.

The special merits and advantages of these doors are light weight, neat appearance, low cost, durability in service. They can be designed for every use and any building mechanic can install them, using standard warehouse door hardware.

Installations

Complete engineering and erecting data with blue prints for all types on request.

Labeled "Almetl" Doors as Lateral Safety and Fire Cut-off

These doors exclusively so used on office floors in new building of National Board of Fire Underwriters, John and Gold Streets, New York, N. Y.

PEELLE TRUCKABLE ELEVATOR DOORS.

PEELLE TEL-Co-DOR (2-section Slide-up Door).

PEELLE HORIZONTAL BI-FOLD CANOPY or JACK KNIFE TYPE DOORS.

For Peelle Standard Steel Plate Counterbalanced Dumbwaiter Doors, see page C3166.

Peelle Truckable Elevator Doors

Recommended for openings in freight elevator shafts and made in two types:

Regular Type (details showing operation on the following page).

Pass Type (details showing operation on the following page).

These types are manufactured by this company under the direct supervision of the Underwriters' Laboratories, Inc., and may be had in kalamein, corrugated steel, or tin clad.

Operation—The door is opened manually; the two sections slide, one up and the other down; each section is equipped with antifriction shoes working in substantial steel guides mounted at jambs on shaft side of opening. Both sections being equal in weight, the door is self-counterbalancing; the amount of effort required for operation need be only enough to overcome the friction of the moving parts.

Construction—The door is mounted on the inside of the elevator shaft giving a clear opening for loading and unloading car. The two sections are connected by strong flexible flat link chains which travel over heavy double race ball bearing sheaves housed in malleable steel brackets. Wearing parts are all of extra heavy design.

Truckable Feature (Patented)—The top of the lower panel of the Peelle elevator door is especially reinforced. A heavy bar which serves as part of this reinforcing extends beyond the sides of the door. When the door is open, this bar rests on solid stops fastened to the guide rails, keeping it in rigid alignment with the floor of the car and building sill, completely filling the gap between and presenting a smooth surface to truck wheels. This bar can be made to carry any specified load.

Electric Interlock—The laws of most states require that all doors to elevator shafts be equipped with a safeguard against leaving the openings unprotected. For ordinary use we recommend our electric interlocking system which prevents the movement of the elevator car until all doors in the shaft are first closed. This is accomplished by means of an individual switch at each opening. An emergency switch in glass covered box can be installed in elevator car, to operate car with doors open, in an emergency.

Elevator cars not having a full magnetic control are equipped with the Peelle mechanical interlock making it possible to interlock any type or make of car.

Peelle Electric Full Automatic Doors—Peelle doors may be equipped with a motor driven device located in the pent house. This device opens and closes the doors by operating a switch in the elevator cab. This switch is so arranged that if the operator removes his hand, closing of the doors stops instantly. All doors are inoperative except at the specific landing where car is located.

In case of emergency a lever is pulled which disconnects the doors from the machine. The doors may then be manually operated.

Underwriters' Label—The aforementioned two types of Peelle elevator doors, when specified, bear the label of the Underwriters' Laboratories, Inc., and the Factory Mutual Insurance Companies on doors up to 8 feet in width and 10 feet in height. Doors exceeding these dimensions can, however, be made according to label specifications and labeled by the Factory Mutual Companies only.

Metal Covered Doors—Panels are made of two thicknesses of white pine, covered with flat sheets, galvanized, and applied to form Manufacturer's R9 panel,

Peelle Flush Truckable Sill

**Peelle Elevator Door, New Process Gear Corp.,
Syracuse, N. Y.**

set and bolted into angle iron frames with reinforced corners. Tin clad panels are used when maximum strength, rigidity, durability and fire protection are required. Labeled by the Underwriters' Laboratories, Inc. up to 8 feet in width and 10 feet high. Doors exceeding these dimensions can be labeled by the Factory Mutual Companies only.

Kalamein Doors—Panels made of two thicknesses of white pine covered with smooth kalamein iron tightly drawn, set and bolted into angle iron frames with reinforced corners. Design can be made to harmonize with interior trim. Maximum amount of glass permitted by most departments is 720 square inches but exterior doors may frequently have more. Underwriters' Laboratories, Inc. label furnished on plain paneled doors not over 8 feet in width and 10 feet in height. No label can be had on glass paneled doors.

Corrugated Steel Doors (Patented)—These doors are built of No. 18 gauge corrugated steel sheets but panels of any desired thickness can be built to order. Underwriters' labeled corrugated steel paneled doors are reinforced with our patented T-bar traveling rail and binder shoe; the rail dovetails into the shoe and is the means of tying both panels of the door securely to the sill and lintel of the opening. The panels are held tightly to the wall when the door is in closed, open or partly open position.

Standard Specifications for Elevator Doors

For all openings in the freight elevator shaft furnish and install in complete working order Peelle Elevator Doors as manufactured by THE PELLE COMPANY, 47 Stewart Avenue, Brooklyn, N. Y.

The panels to be metal clad R9 [kalamein] [corrugated steel] labeled by the Underwriters' Laboratories, Inc. [the Factory Mutual Insurance Companies] (architect to choose).

The doors to be divided horizontally in the center, each half balancing the other. At the upper edge of the lower section, provide a reinforced truckable sill support on each side of the opening by adjustable stops, to carry a trucking load of pounds.

The doors to hang on heavy flat link chain running over 4½-in. double race ball bearing sheaves and operating on the inside of the shaft on malleable steel shoes working in steel guides to eliminate friction.

All doors to be manually operated and equipped with the Peelle Electric Interlocking system for a car switch [double button] [full automatic push button] controlled elevator.

These doors to be guaranteed for a period of two years

after date of completion against defects in workmanship and materials.

Regular Type of Peelle Elevator Door

Regular Type Peelle doors, as shown in the left-hand illustration, are used except where story heights require Pass Type doors as shown in the right-hand illustration.

Peelle elevator doors are horizontally divided at the center and slide vertically, inside the elevator shaft, between the wall and the elevator. The door sections balance each other and move simultaneously up and down.

The full opening is obtained, when the doors are open, for loading and unloading. When the doors are closed, freight and loaded trucks may be placed near the doors without interfering with the operation of the door, thus speeding up the traffic and increasing the efficiency of the elevator.

Every Peelle door is especially designed and reinforced to meet the traffic of the industry in which it is to be used. THE PEELE COMPANY'S unconditional guarantee is back of every installation, which insures the user the highest degree of freight elevator efficiency.

Service to Architects—Special specifications will gladly be furnished, with a quotation, to architects who wish to specify Peelle doors.

Pass Type Peelle Elevator Door

(See detail for clearances.)

This door is used in buildings having high door openings and low story heights, where the regular type can not be used. They can be installed wherever the vertical distance between openings is 12 inches or more, and require no special construction.

The operation is the same as the regular type, except that the panels are staggered and run on separate guides; by this arrangement, the upper panel when open occupies a position directly alongside of the lower panel of the door above. The lower panel likewise lapping the upper panel of the door below (see detail). The gap formed at the lintel is effectually closed by a movable lintel which operates automatically and is so constructed as to allow the lower panel of the door above to pass as required.

NOTE—These doors can be made in Tin Clad, Kalamein or Corrugated Steel

PLAN SECTION AT JAMB

PASS TYPE
PEELLE ELEVATOR DOOR

Peelle Tel-Co-Dor

(See details for clearances.)

This door is made for two distinct uses:

The small Tel-Co-Dor is built for use as an elevator door. The large Tel-Co-Dor is built for large exterior openings and is used in warehouses, loading platforms, etc.

All doors of this type are reinforced with our patented T-bar traveling rail and dovetail binder shoes—one or more to the door according to size.

This door is a counterweighted door divided horizontally in the center; the two panels thus formed, in operation travel upward, both panels arriving at the lintel simultaneously.

Tel-Co-Dor (Elevator)—This door can be made in tin clad, kalamein, or corrugated steel, but for general use corrugated steel is recommended. Labeled by the Underwriters' Laboratories, Inc., and acceptable to all State and labor departments.

Tel-Co-Dor (Warehouse)—This door can be made to any size desired and can be made in tin clad, kalamein, corrugated steel or wood. The door sections move upward simultaneously, and reach the upper limit of travel at the same time.

In this type of door the panels remain in the same vertical plane, removing all strain from the door due to opening and closing. This type of door has been made in three and four sections to meet special conditions.

Co-operative Service—Send us a sketch of your conditions and our engineering department will be glad to make our recommendations without any obligation on your part.

Installation

All Peelle doors are erected by mechanics experienced in the installation of our product.

Painting

All hardware is given a heavy priming coat of metallic paint by this company before leaving the factory.

Additional coats of paint after erection should be specified to be done by painting contractor.

Large Type Tel-Co-Dor

Peelle Folding Canopy Doors

(See detail for clearances.)

Installed on either inside or outside of opening

Electrically Operated Folding Canopy Door

Installed in Packard Automobile Service Station, L. I. City, N. Y.

and can be operated by means of chain hoist and counterweights, electric full automatic machine, or differential geared hoist.

Panels made to any specification of design or construction. These doors can also be installed when conditions do not meet the requirements detailed below.

Co-operative Service—

Send sketch or description of conditions and our engineering department will gladly submit details showing how door can be applied.

Standard Specification—

Furnish, deliver and erect, Peelle Bi-folding doors where noted on the plans, as manufactured by THE PELLE COMPANY, 47 Stewart Avenue, Brooklyn, N. Y.

The door sections shall be constructed of 2½-in. thick selected white pine stiles and rails paneled as shown on plans. (The doors shall be covered with kalamein sheets.)

The hardware shall be of malleable and wrought steel throughout, with roller and ball bearings at all moving points.

The operation shall be by an endless hand chain operating a differential geared hoist. (The operation shall be by means of a push button, controlling a 2 hp. motor, solenoid brake, worm and gear and traction sheaves).

The doors shall close against the wall automatically in closing and break automatically in opening.

The installation shall be guaranteed two years against defects in workmanship and materials.

NOTE:—These doors can also be installed when conditions do not meet the requirements detailed below. Send sketch or description of conditions and our engineering department will gladly submit details showing how door can be applied.

Products

RICHMOND FIREPROOF DOOR CO. has been engaged continuously for thirty-six years in the manufacture, sale and erection of the following products:

FIRE DOORS: Tin clad, corrugated iron, kalamein and steel plate.

COUNTERBALANCED FREIGHT ELEVATOR DOORS: Tin clad, corrugated iron, kalamein, wood and steel plate.

BI-FOLDING, SINGLE SLIDE-UP, TELESCOPING, TURN-OVER, DOUBLE and SINGLE SWINGING and SLIDING DOORS made of all the preceding materials for industrial purposes.

STORAGE ROOM UNITS.

KALAMEIN FRAMES, TRIM, CASINGS, MOULDINGS and SMOKE SCREENS.

Also Electric Interlocks; Steel Bucks.

All of the preceding products are labeled when permissible under the regulations of the Underwriters' Laboratories, Inc., Chicago.

This Company manufactures every type of **FIRE RETARDANT DOOR** except hollow metal and rolling steel curtains.

Kalamein Doors may be finished shop coat or durable baked enamel, plain color or wood grained. We use the term "kalamein" in its modern sense—metal covered. Our metal is patent leveled galvanized stock. Specify *galvanized* sheet—it lasts.

Fire Doors

The three illustrations show the swinging and sliding corrugated iron fire doors and storage room steel plate door, all being labeled by the Underwriters Laboratories, Inc.

The relative appearance of the doors is clearly shown. The corrugated iron doors may have wickets. The swinging type may be single or in pairs, to lap the openings or to close into wall frames, to suit all conditions and openings, and may be labeled for all situations similar to tin clad doors. They may have glass panels for Class C and D openings.

The steel plate doors are labeled for storage room openings only.

Write for catalogue—it contains a full description of the various types with useful information regarding layout and clearances.

Steel Plate Storage Room Door

Corrugated Iron Sliding Fire Door

Corrugated Iron Swinging Fire Door

Elevator and Dumbwaiter Doors

Counterbalanced elevator doors are now universally preferred for freight elevator shafts because they are installed entirely on the inside of the shaft and do not encroach either on floor space or car platform. They provide maximum clear opening.

The door is divided into two equal sections, one half sliding up and the other half sliding down. The guides are bolted to the wall or opening frame.

Vertical telescoping doors are similar in design except that both halves slide upwards, the lower section traveling twice as fast as the upper.

For these types, regular installation requires a distance from floor to floor of one and one-half times the opening height, plus 9 in. for counterbalanced, and 24 in. for vertical telescoping doors, respectively. For limited floor heights the counterbalanced door may be furnished in pass type construction.

Corrugated iron vertical telescoping and counterbalanced doors of the tin clad, kalamein or corrugated iron construction may be labeled by the Underwriters. Both types may also be made of wood for exterior openings or shipping platforms, but are not labeled.

Operation may be manual, semi-automatic closing or electric interlocking.

Vertical telescoping doors are especially adapted to use for shipping platforms or garage and similar openings.

Both types require approximately 8 in. side room each side, but the telescoping door, being counterweighted, needs in addition space at both sides for 8x8-in. weight box.

Richmond counterbalanced doors are furnished with roller or ball bearing sheaves as may be desired, vision panels of labeled construction, if specified, and all modern improvements.

The upper rail of the lower section of the door is so reinforced and constructed that when the door is open a "bridge" is formed between the car and the building sill and, like a bridge, the span is supported at each end by substantial parts of the door assembly. This "bridge" provides a smooth trucking surface over the door.

Richmond counterbalanced dumbwaiter doors, kalamein, tin clad or steel plate, are similar in design and operation, but adapted to dumbwaiter shaft use. They require only 3 in. at each side.

Our catalogue gives all details of construction including shaft space requirements. Let us place a copy in your files.

Corrugated Iron Counterbalanced Doors in Shaft

Corrugated Iron Counterbalanced Door

Tin Clad Counterbalanced Doors

Kalamein Doors

Richmond kalamein doors are covered with No. 26 and No. 24 gauge galvanized patent leveled special door stock—the highest grade material in use in the trade. All work is die drawn in accordance with the usual architectural specifications. Grades heavier than No. 24 gauge are practically always brake formed.

All wood used is thoroughly dried in our own kilns.

We have dies for an unusually large variety of casings and mouldings. Kalamein frames and trim, or combination pressed steel bucks, can be provided with doors. Doors are available with a wide range of panel arrangement and may be labeled within limitations set by the Underwriters.

Our Catalogue contains illustrations of paneling types, moulding shapes, standard specifications, details of construction and other valuable information.

Richmond kalamein frames are formed upon cores rabbetted from one solid piece of wood, and casings, mouldings, etc., are of solid wood lengths up to standard sizes. No piecing or patching is permitted.

For elevator enclosures, our doors are specially reinforced at the head to receive hardware when appropriate.

Durable baked enamel, plain color or wood grained, is applied in our own ovens, when desired.

Particular attention is drawn to the Richmond special labeled kalamein door, which is manufactured with a steel edge underneath metal covering and a fireproof metal lock box. This door is furnished only when definitely specified.

RICHMOND FIREPROOF DOOR CO. is prepared to furnish when desired, special Underwriters' labeled finished hardware completely installed in doors.

Kalamein Faced Counterbalanced Door

Kalamein Door and Partition

Industrial or Warehouse Doors

Richmond horizontal bi-folding doors are widely used for driveways and shipping platforms. Built in two sections, this door folds along horizontal meeting rails at the center, in jack-knife form, and rises upward, leaving a clear opening. The turnover door, made in one piece and adapted to the smaller size openings, operates in somewhat similar fashion, turning up inward overhead. For the two types, a space of 6 in. is required inside of one jamb and 16 in. inside the other jamb, with clear headroom varying according to weight and size of door. While the latter may be as little as 12 to 15 in., the efficient operating minimum is 24 in.

The telescoping or two-piece slide-up door, also in wide use for driveway and shipping platform openings, was described in connection with counterbalanced doors on the second preceding page.

All of the preceding types of doors may be had in wood, kalamein, tin clad, corrugated iron or steel plate, and all may be paneled for glass to permit the access of light, irrespective of material. In addition, we manufacture single and double swinging, sliding, side-folding and single-piece slide-up doors, for industrial purposes, of all the materials mentioned.

Hardware for all these doors, as well as that for fire doors and counterbalanced doors, is manufactured by us in our own factory, being of exceptionally sturdy and attractive design.

Industrial doors are described, together with suggestions as to the appropriate use of the different types, in a special pamphlet which we will be pleased to mail you.

The new Richmond patented *fire-panic* type handles for application to regular triple latches operate with direct, easy, horizontal push and pull, speeding up use of openings in congested factories. Sure locking and easy opening, they are a truly modern type of fire-door hardware operating handles. Specify them exclusively.

"SEC-TEL" CORRUGATED, METAL CLAD and KALAMEIN TWO-SECTION SLIDE-UP FREIGHT ELEVATOR DOOR.

"SECO" CORRUGATED, METAL CLAD and KALAMEIN COUNTERBALANCED FREIGHT ELEVATOR DOOR.

"HORIFOLD" WAREHOUSE, FREIGHT HOUSE SHIPPING PLATFORM and GARAGE DOOR.

"VERTEL" CORRUGATED WAREHOUSE, FREIGHT HOUSE and SHIPPING PLATFORM TWO-SECTION SLIDE-UP DOOR.

"SECO" DOOR ELECTRIC INTERLOCKS.

Also Dumbwaiter Doors for department stores, hotels, hospitals, restaurants and factories.

Underwriters' Approval

All "Sec-Tel" and "Seco" freight elevator doors are inspected and labeled by the Underwriters' Laboratories, Inc., and the Factory Mutuals, when so desired, provided they are within the size limits that permit labeling.

The services of our Engineering Department, as well as those of our representatives in all the leading cities of the United States are at your disposal in solving door problems. Write for Catalogue "C" covering our "Horifold" and "Vertel" doors, or for Catalogue "D" giving complete information about our "Sec-Tel," "Seco" and dumbwaiter doors.

Corrugated "Sec-Tel" Door

"Sec-Tel" Door

The "Sec-Tel" door is a two-section slide-up or vertical telescoping elevator door.

"Sec-Tel" doors permit the use of the permanent building sill for trucking over on to the elevator car.

"Sec-Tel" doors can be furnished with corrugated steel, metal clad or kalamein panels.

"Sec-Tel" doors operate in double guides, the lower half traveling twice as fast as the upper, so that as the lower section is raised, both sections are simultaneously set in motion and reach the lintel of the opening at the same time, giving a perfectly clear opening.

The use of double race ball bearing sheaves and antifriction door guides, assures ease of operation.

**SCHEDULE OF OPENING HEIGHTS
"SEC-TEL" DOORS**
For Various Floor Heights Allowing 4 in. for Bevel "E" of Sill

Opening height "C"		Minimum headroom "D"		Story height "F"

9	6	5	2	15	0
10	0	5	5	15	9

Note: Space "D" for metal clad or kalamein "Sec-Tel" doors should be increased 6 in. if possible.

Section Through Opening Showing "Sec-Tel" Door Space Requirements

Plan of Shaft at Jamb—"Sec-Tel" Door

Plan at Jamb—Corrugated "Sec-Tel" Door

Kalamein and metal clad doors require 9-in. space at sides and 5-in. projecting sills

Large Metal Clad "Seco" Door—Partly Open

"Seco" Counterbalanced Freight Elevator Doors

"Seco" doors are of the truckable counterbalanced type, being made in two sections, which slide in opposite directions on the shaft face of the wall. The sections are of equal weight, evenly counterbalancing each other, eliminating all counterweights.

"Seco" doors can be furnished with metal clad, kalamein or corrugated steel panels.

"Seco" doors are provided with heavy steel angle or tee trucking bars. The trucking bars form the top edge of the lower section and are supported in perfect alignment with the opening or floor sill when the door is in the open position by means of heavy angle trucking bar supports at each end of the trucking bar.

These sill or trucking bar supports rest on the solid opening sill, require no adjustment, and always remain in the same permanent position. The supports are designed to act as gusset plates in the upper corners of the lower section, reinforcing it and securely joining the section frame to the trucking bar.

"Seco" doors are hung with heavy adjustable chain rods and cable chain operating over large double race ball bearing sheaves. No safety gates required when "Seco" doors are used.

Regular Angle Trucking Bar Used with Metal Clad or Kalamein "Seco" Door

Kalamein "Seco" Door Installation

"Seco" Door Construction

Metal Clad Panels—These doors are constructed of two thicknesses of white pine, clinch-nailed together and covered on both sides with fire door terne plate or flat galvanized sheets, and securely bolted into heavy angle frames.

Kalamein Panels—These doors are constructed of white pine cores, paneled on the room side, flush on the shaft side. Room side of panels is covered with smooth kalamein iron, glued to the core, and has drawn steel mouldings around panels fastened in place so that no nail or screw heads show.

The shaft side of doors is covered with flat galvanized steel sheets. All seams between stiles and rails are clipped, filled in with solder and ground smooth. Door panels are securely bolted into heavy angle frames.

Corrugated Steel Panels—These doors are made of corrugated steel sheets riveted into angle frames forming door sections, and are stiffened vertically with flat steel reinforcing bars.

See following page for space requirements and information on interlocks.

Corrugated "Seco" Door with Tee Trucking Bar
Open lower door providing trucking surface between building sill and elevator car

SCHEDULE OF MAXIMUM OPENING HEIGHTS "SECO" DOORS
For Various Floor Heights

Opening height "B" ft.	in.	Minimum "C" for regular type		Minimum "C" for pass type	
		ft.	in.	ft.	in.

6	6	10	6	8	0
6	8	10	9	8	2
6	10	11	0	8	4
7	0	11	3	8	6
7	6	12	0	9	0
8	0	12	9	9	6
8	6	13	6	10	0
9	0	14	3	10	6
9	6	15	0	11	0
10	0	15	9	11	6

Note: Minimum "C" for Regular Type doors can be slightly decreased in special cases. Consult factory.

Plan of Shaft at Jamb—Regular Type "Seco" Door

CLEARANCE REQUIRED FOR "SECO" DOOR

Corrugated "Seco" Door	D, in.	E, in.
Regular type.....	7½	4½
Pass type.....	7½	5½
Metal Clad "Seco" Door	D, in.	E, in.
Regular type.....	7½	4½
Pass type.....	8	6½

Space Requirements—Above schedule should be consulted in order to determine highest opening obtainable in certain story heights for Regular and Pass Type "Seco" doors.

Also note other space requirements to insure a perfect installation.

When story heights are such that Regular Type "Seco" doors can not be used for opening heights desired, Pass Type "Seco" doors should be used.

"Seco" Door Interlocks

Security Electric Interlocks are especially designed for vertically sliding doors and have been approved by the Underwriters and various State and municipal departments, assuring low casualty insurance rates.

Security Electric Interlocks are used with electric elevators, are attached to each door and are connected in series to the elevator control board, so that the elevator can not be operated until all doors in the shaft are closed and contact is made in the door interlocks.

Specify Type "C" or Type "D" Interlocks for car switch controlled elevators, Type "DL" Interlocks for "push button" or "double button" operated elevators.

Send for a copy of Catalogue "D."

"Horifold" Door

The "Horifold" door is a horizontal folding-up door, and can be made of wood, corrugated steel, tin clad or paneled wood metal covered sections.

"Horifold" doors are specially suited for shipping

platforms of warehouses, factory buildings, freight houses and garages.

"Horifold" doors are of rigid construction, operate with ease, and are unexcelled for withstanding severe weather conditions.

"Horifold" Doors to Shipping or Garage Space

"Vertel" Door

"Vertel" doors are made of corrugated steel sheets, riveted into heavy angle frames, and are fireproof.

"Vertel" doors can be arranged for glass in upper half to admit light, and with a wicket door in lower section.

"Vertel" doors are made in two sections, both of which travel upwards; the lower section traveling twice as fast as the upper section, reaching the lintel of the opening at the same time.

"Vertel" doors are ideal for use in freight houses, and for openings where the space above the opening permits their use. "Vertel" doors permit the storage of material to within a few inches of the door without affecting its operation.

Security "Vertel" Door (Interior View)

Used for shipping platform and freight house openings. Above door is used on opening 16x9 ft. showing both door sections solid

QUINCY ELEVATOR GATE CO.

Manufacturers of Power Operators for Elevator Doors and Gates

QUINCY, ILL.

Products

FREIGHT ELEVATOR DOOR OPERATORS for opening and closing landing gates, counterbalanced doors, telescoping fire doors, steel rolling doors and riding car gates.

FREIGHT ELEVATOR GATES.

Also manufacturers of Operators for opening and closing garage doors and steel rolling entrance doors.

Quincy Electric Power Unit

The operating machine shown in Fig. 1 is made for either direct or alternating current. It occupies a floor space of about 4 ft. square and weighs 800 lb. The cable drum is driven by a reversible motor and a worm reducing mechanism and is stopped instantly by a magnet-controlled brake applied to a flanged coupling between the motor and the mechanism.

Fig. 1. Quincy Penthouse Machine

The annunciator informs the elevator operator of the stop to be made. When reaching that floor he releases his elevator control switch handle and the doors open automatically. The operator can at all times instantly stop the doors while opening or closing by pressing "Stop" button.

In addition to automatic opening device, there is a three-button station on the car marked "Open," "Close" and "Stop" and a duplicate station in a locked box at outside of hatch wall at any one designated floor.

Quincy Friction Grip System for Power Operation of Counterbalanced Elevator Doors

The Quincy Friction Grip System has two $\frac{5}{8}$ -in.

Fig. 2. Door Partially Opened (Riding Car Gate Is an Optional Feature)

round rods (one on each end of the door) connected to cables which pass over drums in the penthouse. Doors remain evenly balanced. Any one or more doors can be quickly changed to manual operation, remaining doors can continue to be operated by electric machine.

Door Device and Lock—To each side of the top door section a friction block is attached by means of a $\frac{3}{8} \times 3\frac{1}{2}$ -in. flat bracket.

A friction block can only engage with the vertical rod when the car is at its landing; thus the vertical rods slip through the open friction blocks on the other doors.

The combination lock and interlock is mechanical in operation and positively prevents operation of the elevator when any door is opened or unlocked.

Products and Services

Mechanically operated OGDEN SINGLE SECTION TURNOVER DOORS.

Also Ogden Two-section Turnover Doors, Ogden Canopy Doors, Ogden Airplane Hangar Doors, and Ferry Bridge Operating Mechanism. This company is interested in the design, manufacture, and erection, of all the above named specialties.

Low Cost

You are interested in saving money and maintenance troubles, and at the same time always having doors in working condition, without paying an extra premium, in first cost, to accomplish this. The Ogden Company, therefore, asks you to see its engineers about the new single section turnover door which it has developed to give all of these results.

Use

This new door is for use in warehouses, industrial buildings, railroad freight sheds and public garages. It is comparable in price (and often lower in price) than a rolling steel door.

Advantages

This new door is forever free from rattles, rusting out between slats, trouble with hinges and deflection in high winds. It lends itself to the use of glass in the upper portion and a pass door in the lower portion—two things highly valuable in large warehouses.

This single section door is automatic in locking when closed, thus making it positive in closing, a thing that is seldom accomplished in the so-called jack-knife door. Unlocking is a manual operation.

A Prominent Installation

We have installed 136 of these doors in the large new warehouse of the Seaboard Terminal & Refrigeration Co., at Eleventh and Coles Streets, Jersey City, N. J. Cuts of these doors are shown on this page.

Only Data Necessary

You furnish us with the door opening dimensions. We design, manufacture, and install the doors, guides and mechanisms and erect them completely.

Specifications

Door sections shall be of a skeleton steel construction, covered on outside with No. (black or galvanized, flat or crimped) steel. The door shall be of the slotted link bar type and be easily operated by one man.

Door sections shall be supported by links attached near the center of gravity so that a continuous pull on the chains attached to lower corner of door section will raise the bottom edge of door vertically and will swing the top of the door away from the door header, until, in its final open position, the door assumes a horizontal position extending into the building.

Each corner of the door section shall be securely locked when closed. These locks shall be automatic in closing. The top locks shall be manually operated in opening.

MAJESTIC IRON WORKS, INC.

Standard and Underwriter's Labeled Steel Rolling Shutters and Doors

TELEPHONE
MAIN 0990

559-561 West Fulton Street
CHICAGO, ILL.

Product

MAJESTIC STEEL ROLLING SHUTTERS.

Important Features

The shutter revolves on hardened steel bearings which facilitates operation so that any one can raise or lower shutter with ease.

Spool-shaped flanged gears, each end of barrel, which eliminates friction and make curtain self-aligning when revolving.

One-piece sprocket and pinion gear enclosed in housing. Gear lubricated with cup grease.

Hood angular shaped; acts as water shed, protecting gears and mechanism against dirt and weather conditions. No gears exposed.

Bracket bearings on wall self-adjusting should building settle.

Curtain made of No. 16, 18, 20 or 22 gauge galvanized copper-bearing steel which prevents corrosion. Slats interlocking type, malleable iron ends, operating in heavy iron guides.

Each shutter has a counterbalancing helical oil tempered spring. Size and strength determined by size of

shutter; enclosed in steel tubing which protects it against atmospheric conditions.

Curtain fastened to barrel on adjustable rings with special attachments—no holes drilled in slats. Bottom of curtain strong and rigidly built.

Guides of extra heavy material able to withstand heavy bumps.

Types

Brackets either on face of wall, under lintel or hung on ceiling.

Installation

Simple to install; any mechanic with ordinary tools can set up. Instruction sheet furnished. Special locking attachment for each shutter.

Service

Consult with us regarding your rolling shutter problems.

Our engineers are competent to recommend the type best suited for the conditions existing.

CORNELL IMPROVED DEEP ARCH INTER-LOCKING SLAT STEEL ROLLING SHUTTERS and DOORS, handle, chain, crank, or motor operated, for residences, office buildings, garages, wharves and piers, warehouses, elevator shafts, store fronts, crane-way openings, etc.

UNDERWRITERS' LABELED FIRE DOORS and SHUTTERS.

Send for 32-page, 1927 Catalogue, with complete dimensions and specifications.

Location

Cornell doors are manufactured in Greater New York in a modern one-story factory.

Unexampled shipping facilities by all railroads, as well as water routes to all points on the east, south and west coasts, and the Great Lakes.

Experience

CORNELL IRON WORKS, INC., is the oldest rolling door manufacturer in the United States. Cornell doors have been in use for 50 years and more. Our latest types embody many modern improvements.

Description

Cornell steel rolling doors are designed for the closure of all types of openings. They offer fire and burglar protection, combined with neat appearance and economy of space.

The curtains run in vertical side guides, and coil around a horizontal shaft above the opening.

The weight of the curtain is counterbalanced by springs in the shaft, which permit it to remain stationary in any position.

Steel Brackets Attached for Supporting the Shaft

Widest Rolling Door Ever Made—45 ft., Motor Driven

Operation

There are four typical methods of operation:

Self-coiling Type—Standard for openings up to 8x10 ft. Push up and pull down by handles on the bottom bar. The quickest acting construction possible.

Hand Chain and Gearing Type—Standard for larger openings. Shaft revolved by endless hand chain, acting through single, or compound gearing, on an overhead gear bracket.

Motor Drive Type—Standard for the largest openings, up to 45 ft. in width.

Automatic Closing Type—Controlled by fusible links. Made to Underwriters' standards, labeled by Underwriters' Laboratories, Inc., and approved by Factory Mutual Laboratories. Thirty designs of labeled fire doors, including: Fire wall doors, Class "A"; vertical shaft doors, Class "B"; corridor and room partition doors, Class "C," and exterior doors and shutters, Class "D."

Special Cases—Worm and bevel gear drives, operating from either side of openings, with hand crank, or chain, are provided for special cases.

Cornell Improved Interlocking Steel Slat Curtains

Designed to give unusual rigidity against wind pressure, having a depth at the crown of $\frac{7}{8}$ in. The appearance is attractive from either side, as the curtain is made up of a series of cold rolled steel mouldings with deep relief.

The end locks are made of malleable iron, designed for maximum wear and strength.

Furnished in U. S. gauges from No. 16 to 22, cold rolled and galvanized.

Non-corroding Curtains

Of cold rolled, bronze, aluminum or zinc, interlocking slats.

An original Cornell product. Require no painting. Of great service in resisting coal gas, acid fumes, severe salt water exposure, etc.

Give a very handsome finish at comparatively small extra cost.

Cornell Non-corroding Curtain Bottoms

Experience proves that all exposed doors and shutters of steel corrode fastest at the bottom.

To neutralize this, CORNELL IRON WORKS, INC. has originated the feature of using 12 to 18 in. of bronze bottom slats for exposed doors.

The extra cost is small and the life of the installation may often be more than doubled by this method.

Motor Driven Units

Cornell motor drives are made in a self-contained unit, completely assembled in the shop. The gears can not get out of alignment.

The worm is placed under the worm wheel, is completely enclosed, and runs in an oil bath.

Automatic starters are furnished with all installations.

Electric brakes are furnished where required.

Equipment is G-E material.

Operation—On pushing the proper button, the solenoid acts to open the brake and the door moves up or down, as the case may be, at a rate of approximately 1 ft. per second.

On reaching the top or bottom of the door travel, the limit switch operates, automatically cuts off the current, stops the motor, cuts out the brake magnet and lets the brake go on with full power, locking the entire mechanism against further travel.

The action is foolproof.

Door may be stopped at any point in its travel, by simply throwing the switch. This operation automatically puts on the brake, and the door stops promptly.

Underwriters' Labeled Fire Doors

Cornell rolling doors have been thoroughly tested by Underwriters' Laboratories, Inc., Chicago, and carry their label for the following types of openings:

Fire Wall Doors—Made of No. 16 gauge and labeled up to 80 sq. ft. in size—Class A.

Vertical Shaft Doors—Made of No. 20 gauge and labeled up to 80 sq. ft. in size—Class B.

Corridor and Room Partition Doors—Made of No. 20 gauge and labeled up to 80 sq. ft. in size—Class C.

Exterior Doors and Shutters—Made of No. 22 or No. 20 gauge and labeled up to 100 sq. ft. in size—Class D.

Note: Doors larger than the above limits can be made to Underwriters' specification and a certificate of inspection furnished.

Service

Our engineering department will be pleased to co-operate in working out details and furnishing recommendations for the treatment of special conditions, and is ready at all times to render this assistance which the experience of over twenty years in the treatment of openings in buildings of all types has made possible.

Complete literature descriptive of any of the above types will gladly be furnished on request.

Types

Johnson Steel Rolling Doors and Shutters are made in two types:

(1) Underwriters labeled fire doors and shutters for protection of openings where insurance rates are a consideration. (2) Service doors and shutters for general use where labels are not required.

Labeled doors are classified according to their location in the building, are built in strict accordance to specifications of the Underwriters' Laboratories, Inc., and are inspected and labeled by their representative in our factory.

Design

Spindle or Shaft—Consists of a stationary pipe shaft of sufficient size to prevent deflection, and on which are mounted cast iron spring casing wheels, the number varying according to the size of the door. These wheels are trussed together by 4 flat mild steel bars which form a drum around which the curtain rolls. Highest quality counterbalancing springs of motor type, oil tempered

"Johnson" Roller Bearing Shaft

and of a number and size sufficient to properly counterbalance the curtain, with a factor of safety for reserve power, are attached at one end to the center shaft and at the other to the rim of the spring casing wheels. For mechanically operated doors, the spring wheel at operation end of spindle carries a gear which meshes with a pinion mounted in a bearing on the bracket.

Brackets—D-shaped steel plates reinforced with angles and provided with heavy cast iron bearings to carry the spindle. Mechanical operation and automatic

brackets are reinforced with properly designed castings, and easy and speedy operation insured by proper gear reduction. All gears are mounted on cold drawn steel shafting journaled in gray iron bearings (bronze bushed where necessary), and provided with means for lubrication.

Guides—Built up of steel angles of proper size and weight to meet conditions of openings for which they are intended. The several members are securely riveted together and the wall member provided with holes for bolting in place.

Curtains—Interlocking steel slats formed from rust resisting low carbon steel, furnished in gauges from Nos. 22 to 16 to meet size requirements of the openings for which the doors are intended, heavily galvanized to meet Underwriters' Laboratories', Inc., specifications, and provided at their ends with malleable cast iron edge guards or end locks which prevent lateral movement of the sections and provide a wearing surface in the guides.

Johnson Face of Wall Automatic Fire Door

Typical Installation of Johnson Steel Rolling Doors

Deeply corrugated steel curtain stock rolled from special analysis steel billets and heavily galvanized. Doors with Johnson corrugated curtains are in extensive use, are easily repaired, immediately responsive and speedy in operation, and more economical than the slat type.

The top section of both types of curtain is reinforced with 1-in. band iron with slotted holes (to allow for adjustment) for attachment of the curtain to the drum. The bottom of curtains are fitted with bottom rails 5 in. high reinforced at the bottom edge with two angles. The bottom section of curtain is flattened and bolted between the upper edge of the 5-in. rail and a 1-in. band.

Hoods—Sheet metal hoods with their edges beaded to reinforce and stiffen are provided to cover the coils. Exterior doors are furnished with flashings. Interior Underwriters' labeled doors are furnished with inner smoke dampers or flame baffles.

Locks—Manually operated doors are provided, where required, with push bolts on each end of the bottom-plate; chain operated doors are provided with clevis lock for locking the chain; and crank operated doors are furnished, in the design of the operating gear box, with means for locking with padlock. Special locks are furnished where called for.

Castings—Gray iron castings used in the manufacture of Johnson doors are moulded from metal patterns and machined where required. Malleable iron and steel castings are used where called for by strength and proper design.

Operation

Manually, by means of handles on the bottom plates of doors of nominal sizes.

By endless chain, sprocket and gears on the door side of the wall or on opposite side of the wall where required.

By crank shafting and gears from one or both sides of the wall.

By motor operators.

Note: Johnson doors can be operated at all times without interference with the automatic mechanism. Motor operated doors are provided with emergency hand chain operation.

Installation

Face of Wall—Brackets and drum mounted on face of wall above the lintel; guides on wall at jambs.

Between Jambs—Where required by structural conditions, either by placement within the existing opening, or by preparation of opening by provision of pockets to receive the brackets and rabbeted jambs to receive the guides.

STEEL BIFOLDING DOORS.
VERTICAL SLIDING DOORS.
STEEL ROLLING DOORS and SHUTTERS for service purposes.

Types

Kinnear steel rolling doors and shutters are manufactured and sold under two distinct classifications, viz., Service and Labeled Types. Service doors are designed entirely for such openings as do not require underwriters' label and where insurance rates are not a consideration.

Construction of Steel Rolling Doors

Kinnear steel rolling doors are constructed of the highest class of materials by mechanics especially trained in the exclusive manufacture of doors.

Curtain proper on all Kinnear doors is made of open hearth interlocking steel slats galvanized and equipped with malleable iron endlocks. Curtain is coiled upon barrel journaled in heavy cast iron brackets and travels in steel guides mounted at sides of openings.

Curtain is counterbalanced by means of helical springs which are enclosed in barrel. Galvanized hood of steel of suitable design is supplied with each door.

Method of Installing Rolling Doors

Service doors in general are mounted on face of wall with brackets and coil entirely above the bottom of lintel and with inside face of guides flush with face of brick or concrete jamb.

Where headroom is limited and door can not be mounted on face of wall, it can be mounted in the opening, in which case the brackets and coil would be mounted directly under lintel and guides would be located on the jamb.

Operation of Rolling Doors

Doors may be operated as follows:

Push-up type of doors for openings not exceeding 100 sq. ft. can be operated in the same manner as window shade, being perfectly counterbalanced and same can be opened from either side.

Doors can be operated by means of reduction gearing and endless chain, or by means of crank, shafting and gear.

Where motor operation is desired, it is necessary to have complete description of current and drawing showing clearances and general conditions.

CONCAVE AND CONVEX SIDES OF INTERLOCKING STEEL SLAT No. 2

Illustrations to the left show slat No. 2 fitted with alternate endlocks; those to the right, fitted with continuous endlocks. Slat No. 2 is 1 7/8 in. wide on centers; depth of crown, 1/2 in. Made in gauges Nos. 24, 22, 20, 18 and 16. Especially adaptable to shutters equipped with mechanical operating device.

In cases of extremely wide openings, Kinnear No. 4 slat is used. This type of slat is larger than the No. 2 slat

CONSTRUCTION No. F. H. 61

Door mounted on exterior face of wall. Operated from within building by means of endless chain, sprocket and gear, and by shaft extending through the wall. May be locked on inside by means of a chain lock

CONSTRUCTION No. F. H. 30

Mounted on interior face of wall; not furnished with hood. Open type of bracket facilitates erection. After brackets are in place, curtain barrel can be dropped into bearings. Closed brackets necessitate erection of both brackets and barrel together

CONSTRUCTION No. F. C. 20

Mounted on face of wall. Operated by means of crank, imparting movement to the curtain barrel through shaft and suitable gear. Can be made to operate from either inside or outside of building, or both. Operation from one side only is standard arrangement

CONSTRUCTION No. F. H. 23

Modification of construction No. F. H. 20. A compact design well adapted to large openings, separated by narrow post

INTERMEDIATE MOVABLE POSTS

Wide openings can be frequently more economically closed by a number of small doors, than by a single large one, using, between doors, movable posts hinged to brackets. After doors are open, posts are swung up out of the way by ropes and pulleys

INTERIOR OF PIER 32, SAN FRANCISCO

Steel rolling doors arranged with movable intermediate posts shown above, making entire opening available

OPENINGS FOR KINNEAR ROLLING SHUTTERS

OPENINGS FOR KINNEAR ROLLING SHUTTERS

Information and Measurements Required

Illustrations show essential measurements. In giving information, describe lintel, shapes and sizes of parts composing it, accompanying same with sketch showing cross section. Essential measurements are as follows:

A—Width; if door is mounted in opening, give width at top and bottom.

B and C—Height of opening.

D and E—Projection in close proximity to opening.

F—Clearance between top of opening and floor beams, or ceiling.

G—Height of lintel.

H—Thickness of wall.

I—Projection of some part of wall near opening.

J—Depth of column; give shape and sizes of parts composing column.

K—Width of column.

L—Distance from column to inner face of wall.

M—Lap of guard.

N—Height of guard.

O—Projection of guard.

P—Lap of guard.

Q—Projection of sill.

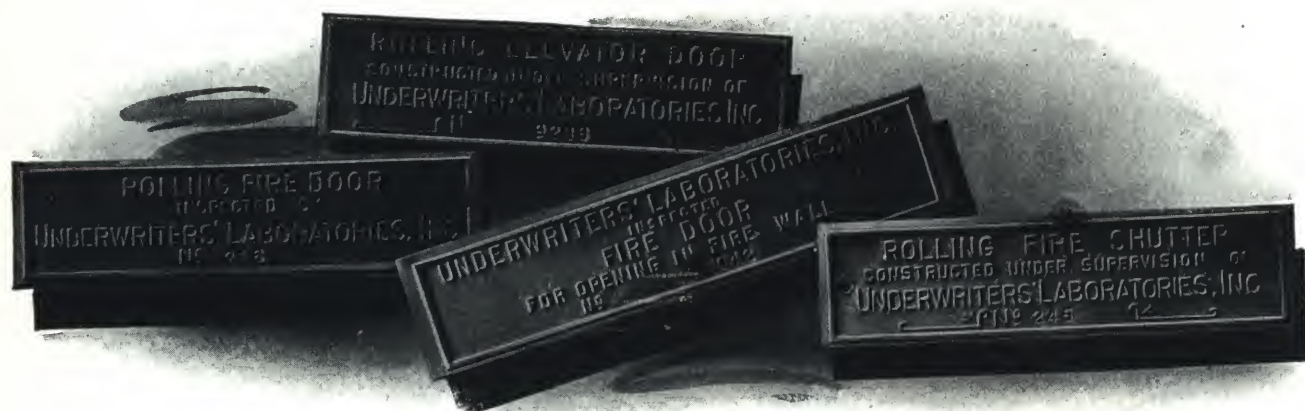

PROJECTIONS (Schedule Below)

Above are indicated the salient dimensions of usual sizes of standard service types of Kinnear steel rolling shutters. View to the left shows shutter placed on face of wall; central view shows shutter placed between jambs, and that to the right shows curtain with concealed coil. The following dimensions are for shutters of height and width indicated:

Height ft.	Width 3 to 7 ft. Groove depth "D", 2 in.					Width 7 to 11 ft. Groove depth "D", 2½ in.					Width 11 to 14 ft. Groove depth "D", 3 in.					Width 14 to 20 ft. Groove depth "D", 3½ in.				
	X in.	Y in.	P in.	A in.	W in.	X in.	Y in.	P in.	A in.	W in.	X in.	Y in.	P in.	A in.	W in.	X in.	Y in.	P in.	A in.	W in.
6	12¾	14	2¾	4	3	13½	15	2¾	4½	3½										
8	14¾	16	2¾	4	3	16½	18	2¾	4½	3½										
10	15¾	17	2¾	4	3	17½	19	2¾	4½	3½										
12	17½	19	2¾	4	3															
6	11	13	2½	4	3	11	13	2½	4½	3½	12¾	14	2½	5	4	15	17	3½	8	4½
8	11	13	2½	4	3	11¾	13	2½	4½	3½	12¾	14	3½	5	4	15	17	3½	8	4½
10	11¾	13½	3½	4	3	11¾	13½	3½	4½	3½	12¾	14	3½	5	4	15½	18	4	8	4½
12	13½	15	3½	4	3	13½	16	3½	4½	3½	13½	16	3½	7	4	17	19	4	8	4½
14	14¾	16	3½	4	3	14¾	16½	3½	4½	3½	15½	17	3½	7	4	17½	19	4	8	4½
16	15¾	17	3½	4	3	15¾	17	3½	7	3½	16½	18	4	7	4	20	22	4	8	4½
18	15¾	17	3½	4	3	15¾	18	3½	7	3½	17	19	4	7	4	22	24	4	8	4½

Sizes above division line apply to shutters operated by handle in bottom of curtain. Those below division line apply to shutters operated by endless chain or crank and bevel gear. Dimension "P" applies only to face of wall constructions. Dimension "W" only to "between jamb" construction. Dimension "D" in the between jamb section applies only to manually operated shutters. Use projection "A" for both sides where chain shutters 10 or 12 in. and more if possible. We do not recommend manually operated construction for curtains of larger area than approximately 100 sq. ft.; chain hoist should be used on larger sizes. Above does not apply to automatic construction; for clearance on automatic or any other special construction. Any unusual sizes, direct correspondence is advisable.

UNDERWRITERS' LABELS

Fire Doors and Shutters

Constructed under the supervision of the Underwriters' Laboratories, Inc., and labeled as above.

Important Features—Kinnear fire doors and shutters are specially designed for fire protection.

Details of construction have been carefully developed. The following are some of the important features:

(1) An auxiliary or inner hood is automatically dropped and closes the space between the barrel and outer hood, thereby preventing the passage of flame over the barrel.

(2) Special endlocks closing the concaved ends of slats and preventing the passage of flame around the edge of the curtain.

(3) Fusible washers employed in the construction of grooves which melt and allow the members composing the grooves to expand without buckling.

(4) Non-corrodible metal used for bearings and contact points of the automatic release.

(5) Single line contact bearings in releasing levers.

(6) Provision made for expansion of parts for all temperatures up to 2000° F.

(7) Disposition of fusible links, insuring prompt closing.

(8) The enclosure of automatic release, protecting it from the weather.

(9) Safety device controlling the speed of curtain in automatic closure.

Catalogues—General Catalogue No. 51 and the special Fire Door Catalogue No. 53 illustrate many additional types and their applications. These doors and shutters are designed to obtain easy operation in normal service, and are easily opened and reset by a single person after automatic closure.

SALIENT FEATURES OF KINNEAR FIRE DOORS AND SHUTTERS

Manual Operation

Chain Operation

Crank and Shaft Operation

A FEW TYPES OF AKBAR CONSTRUCTION

Salient Features of Akbar Construction, a Distinctive Kinnear Product

(1) The automatic closing of this type of door is insured by a powerful starting force which diminishes as door is set in motion.

(2) A special safety device is provided on each door which controls drop of door in automatic closure and which eliminates every element of danger, as well as the violent impact common to other types.

(3) Can be opened and reset without difficulty after automatic closure.

(4) Are available for service purposes at all times and will close automatically from any open position.

Types—Akbar doors are made in the following types:

Akbar No. 1, manual operation

Akbar No. 2, chain operation.

Akbar No. 3, crank operation.

The above three types are labeled for openings in vertical shafts, partition walls, bridge and tunnel entrances where openings do not exceed 80 sq. ft. and where width or height does not exceed 12 ft.

Akbar No. 4, manual operation

Akbar No. 6, chain operation

Akbar No. 7, crank operation

Akbar No. 8, crank operation

The above four types are labeled for openings in fire walls not in excess of 80 sq. ft. and where width or height does not exceed 12 ft.

Akbar No. 9, chain operation

Akbar No. 10, crank operation

The above two types are labeled for openings in exterior walls for openings not in excess of 100 sq. ft., and where width or height is not in excess of 12 ft.

Other types similar to Akbar manual operation are available for exterior openings.

Salient Features of Superior No. 1 and No. 2 Constructions

Labeled for exterior window openings not in excess of 100 sq. ft., neither dimension exceeding 12 ft.

Normally remains in open position, closing automatically by means of fusible link.

Actuated by a powerful starting force which diminishes as shutters are set in motion.

Equipped with *safety device* which controls drop of door in automatic closure, eliminating all danger, as well as impact on sill.

Equipped with testing device by which periodical tests can be made as often as desired.

Can be raised after automatic closure with least possible difficulty.

After lever is reset, can be pushed and locked in any open position without adjustment.

Superior No. 1 to be mounted on face of wall.

Superior No. 2 to be mounted in opening.

SUPERIOR No. 1

SUPERIOR No. 2

Wood Rolling Doors and Partitions

For Roundhouses—Wood rolling doors are particularly desirable in cases where chemical action is liable to deteriorate steel. This is particularly true in roundhouses and chemical plants.

These doors are constructed of wood slats assembled on phosphor bronze ribbons placed at proper intervals. Slats are made of cypress and treated with a coat of wood preservative.

Slat No. 27 is used on exterior doors.

No. 27

No. 27

No. 26

No. 24

SECTIONS OF WOOD SLATS

For Schools, Churches, etc.—Curtains are composed of slats assembled on phosphor bronze ribbons.

Made in long leaf yellow pine, cypress, quarter sawed oak and birch.

Slats Nos. 24 and 26 are for interior work; slat No. 27 for exterior work.

Illustration shows cross section through slats.

The opening through which the ribbon passes is so shaped that, during flexure of the curtain, there is no change in the relative length of the slats or curtain; nor is there any danger of pinching the ribbon.

CONSTRUCTION No. F. H. W. 22

Designed especially for roundhouses. Doors mounted on face of wall above opening; travel in grooves at sides. Counterbalanced by springs; operated by means of endless chain and reduction gear

CONSTRUCTION No. W. B. M. 10

Application of wood rolling door for interior partition. Coil is concealed under lintel; operated by means of handle in bottom of rail. Mechanical operating devices are arranged for large doors. Can be concealed within the casing. Casing and grooves are not supplied, but should be included in general carpenter work

Bifolding Doors, Wood or Steel

In cases where light is desired through doors, the bifolding type lends itself readily to such condition. These doors may be constructed either of wood or steel, and are of two sections hinged at the center and pivoted at top of opening. The upper panel may be fitted with sash, giving a glass area of about two-thirds the total area of the panel.

Bifold No. 5—This is without doubt the most practical bifolding door now on the market, requiring less clearance at both head and sides of opening than do most other types.

BIFOLD No. 5

CLEARANCES REQUIRED FOR BIFOLD NO. 5

Height	6' 0"	7' 0"	8' 0"	9' 0"	10' 0"	11' 0"	12' 0"	13' 0"	14' 0"	15' 0"
B	26 1/2"	26 1/2"	26 1/2"	26 1/2"	28 1/2"	31"	33"	35"	35"	37"
C	3' 10"	4' 4"	4' 10"	5' 4"	5' 11"	6' 6"	7' 1"	7' 8"	8' 2"	8' 9"
E	8"	8"	8"	8"	8"	10"	10"	10"	10"	10"

Dimension A should not exceed 18 ft; dimension B should not exceed 15 ft.

Kinnear Bifold No. 5 is designed with a spring counterbalance, eliminating the heavy counterweights usually used on this type of door. Steel cables connect the door to the counterbalancing device at the top of the opening. Bottom panel is fitted with rollers which travel in guides attached to wall and transmit the thrust.

The simplicity and sturdiness of the mechanism reduces maintenance to a negligible factor and renders quick and easy operation. Less side clearance is required as there are no counterweights. Send us a sketch showing conditions as they actually exist and we will show how this flexible construction adapts itself to other than standard conditions.

Kinnear panels are fabricated in our own factory from extra heavy materials and are built on a purely quality basis. Write for prices and catalogue.

Bifold No. 3—Designed for large openings. Panels are built in two sections. Upper section may carry glass if desired.

In operating, the lower section rises to half the height of opening. The door then breaks, and both sections move simultaneously, the lower edge vertically, the upper edge horizontally, on suspended tracks to a position above the opening.

Panels are entirely counterweighted and operated by means of reduction gearing and endless chain.

This type of door was used in the Boston, Brooklyn, and Charleston army bases by the United States government.

Panels can be constructed either of wood or steel.

BIFOLD No. 3 IN OPEN POSITION

Vertical Sliding Doors

This type of door is particularly suitable for freight houses, piers and warehouses where light is essential through doors.

The door comprises two or more sections consisting of trussed frame covered with corrugated iron, hung independently with chains connected with counterbalance weights. Operated by means of endless chain and suitable reduction gearing.

Where doors are mounted on steel columns, guides and weight boxes should be incorporated as a part of the column, and should be supplied by the steel contractor, according to details supplied by our Engineering Department.

This type can also be supplied to be mounted on the face of the wall, in which case we furnish weight box and guides as part of the equipment.

It is advisable to procure definite information from the factory in connection with the above type of door.

VERTICAL SLIDING DOORS
Installed in Santa Fe freight shed

Kinnear Power Units

THE KINNEAR MANUFACTURING Co., to meet a constantly growing demand for power operation in connection with Kinnear steel rolling doors when applied to openings of extreme sizes, and where frequent operation is required, have developed three distinct types of power units.

While fundamentally the same in operation, the three types afford the opportunity of selecting a type most suitable for the condition in hand.

Kinnear power units are available for small openings on garages or mercantile establishments where frequent operation is desired, and on large railroad openings or crane openings where manual operation would be very difficult or entirely impossible.

Motor operation necessitates a door properly designed and carefully built. Kinnear doors, because of their sturdy character, lend themselves especially to motor operation.

We supply our doors and power units as a complete unit, assuming full responsibility not only for the quality of the material employed, but also for the workmanship, and for the erection and proper working of same where Kinnear erectors put up the work in the field.

Construction of Kinnear Power Units

Each power unit comprises motor, limit switches, reduction gear, manual (or emergency) operating mechanism, automatic starter, reversing and service switches; also a magnetic brake which is an integral part of the unit.

Limit Switches—Of our own design and manufacture and susceptible of precise adjustment.

Control the travel of the curtain, stopping it at the proper time; also actuate the magnetic brake and the automatic starter which breaks the circuit, stopping the motor.

Reduction Gear—Suitable reduction gearing enclosed in heavy cast iron housing. Cast iron and steel cut teeth, running in oil bath, the spray lubricating all bearings.

Bearings—All heavy bearings are bushed with bronze. Light bearings are babitted.

Service Switches—Enclosed type of knife switches externally operated, safety type, are supplied as our standard equipment.

Kinnear Power Unit No. 1

This unit is designed for excessive loads and is so constructed that either power or manual operation is secured through the same gear. Either method may be employed without the shifting of clutches. The emergency chain is always in position to be used in absence of power.

Designed for extremely large openings.

Kinnear Power Unit No. 2

This type is designed for average sized openings and is essentially a power drive; manual operation is intended for emergency only. The emergency chain can

be placed on sprocket in case of emergency, but when motor is employed, the chain should be removed.

Kinnear Power Unit No. 3

This unit is small and very compact and can be supplied in two designs, one mounted on bracket and the other to be mounted on wall or steel members.

It is designed for small openings in garages and buildings of a similar character.

Accessories

Wire, wiring, fuses or conduit are never included in our equipment and must be supplied and installed by others.

Necessary Information

In order to quote intelligently on motor operated doors, we must have the number and sizes of doors. Also a complete description of the current and the number of times the doors will be opened and closed each day.

Kinnear Motor Operated Doors—Practical and Efficient

Motor operation in connection with Kinnear steel rolling doors has grown in popularity for the very good reason that our power units are so designed that they are practically foolproof. They represent the finished product after years of experimental work by capable engineers and are sold with an absolute guarantee that if correctly installed and properly maintained they will render a service 100% efficient.

One power unit will operate one door or a group of doors as a unit. Where hinged posts are used in dividing large openings, power units can also be employed in operating them. Through interlocking switch and automatic locking devices, the entire side of a building may be opened up from any point desired by means of switches.

Push button control is available for individual doors, or for a group of doors operated as a unit. However, where doors and posts are both to be electrically operated we recommend the enclosed type of knife switches externally operated. Push button control is particularly suitable for garages where doors are operated frequently as the stations can be placed in office, or at any other suitable point, and can be operated by any class of help, being as nearly foolproof as it is possible to make it. There is no chance of making a mistake; each operation follows in its logical sequence.

The doors under ordinary conditions will operate at the rate of 1 ft. per second.

In General

Kinnear power units are the result of years of painstaking effort, are compact, sturdy, and are long past the experimental stage.

Kinnear motor operated doors are in general use everywhere and are great time savers on large openings.

If you have door problems it will give us pleasure to help develop them.

Write for detailed information.

KINNEAR POWER UNIT No. 3

Can be supplied as shown or mounted on wall, being flexible enough and compact enough to be used almost anywhere

ENCLOSED TYPE OF SWITCHES
Supplied as part of Kinnear equipment

KINNEAR POWER UNIT No. 2

For large openings. Rugged, compact and complete; out of sight and out of the way. A silent servant ever ready to respond to the touch

THE MOESCHL-EDWARDS CORRUGATING CO., INC.

Manufacturers of Steel Rolling Doors

CINCINNATI, OHIO

Products

- "MECCO" STEEL ROLLING DOORS.
- "MECCO" FIREPROOF KALAMEIN DOORS.
- "MECCO" FIREPROOF HOLLOW METAL

WINDOWS.

Also manufacturers of Tin Clad Doors; Kalamein Smoke Screens; "Mecco" Spanish Metal Tile; Garages; Marquise; Shingles (tin, galvanized or copper), Painted and Galvanized Roofing, Siding and Corrugated Sheets.

"Mecco" Steel Rolling Doors

Advantages—All-steel rolling doors have certain recognized general advantages over doors of other types. "Mecco" doors have other points of superiority that have won general recognition and are of special interest to architects, engineers, owners and contractors, viz.:

- (1) Ease of erecting "Mecco" doors.
- (2) Ease of operating "Mecco" doors.
- (3) Extremely low maintenance cost.

Slat Construction—

"Mecco" slats are rolled from galvanized copper bearing open hearth steel of best grade, with easy curves to prevent crystallization.

The modified Z-form makes this slat unusually strong and able to resist great pressure.

"Mecco" slats are extra wide, thus reducing the joints by 50%—a real advantage

Slats with Malleable End Locks Attached

needing no explanation.

Underwriters' Approved Type No. 100—

Labeled for interior opening not exceeding 80 sq. ft. in area or 12 ft. in width or height. This type for erection on face of wall. Operated by handle on bottom bar, also automatic closing under control of fusible link melting at 150°. Curtains for class "A" openings No. 16 gage galvanized steel; for class "B" No. 20 gage. Two doors required for class "A" openings, one door on class "B" openings to secure full insurance credit.

Type No. 100

Types of Installation—The type of installation most frequently used has the coil mounted on the face of the wall above the opening. Where headroom is limited, the coil and the brackets are mounted under the lintel

and guides placed on the jambs. A large opening may be filled with several doors using removable posts.

Methods of Operation—(1) Handle on bottom bar. This is the push-up type, operated like a window shade. May be operated from either side of the opening. The area for the push-up type should not exceed 100 sq. ft.

(2) Operation by reduction gears and an endless chain.

(3) Operation by gears, shafting and crank.

(4) We also build electric motor operated doors. We must have a complete description of the current to quote on or build motor equipment.

Installations—The following are a few of the users of "Mecco" doors:

- Cleveland Fruit Auction House, Big Four R. R., Cleveland, Ohio
- U. S. Parcel Post Terminal Building, Cincinnati, Ohio
- National Biscuit Co., Cincinnati, Ohio
- Atlantic Coast Line R. R. Co., machine and erection shops, Montgomery, Ala.
- Louisville & Nashville R. R. Co., freight house, Covington, Ky.
- Donaldson Lithographing Co., Newport, Ky.
- B. F. Goodrich Co., Akron, Ohio
- Northern Ohio Traction & Light Co., Akron, Ohio
- Penn Public Service Corporation, Johnstown, Pa.
- Allis-Chalmers Co., Cincinnati, Ohio
- Wm. Powell Co., Cincinnati, Ohio
- Henke Building, Houston, Tex.
- Geo. L. Williams Building, Cleveland, Ohio
- U. S. Industrial Alcohol Co., Peoria, Ill.
- F. W. Albrecht Grocery Co. Warehouse, Akron, Ohio

Services

Our engineers are at your service at all times to give any data you may require.

Quotations will be furnished on any quantity or type.

Get "Mecco" service and quality.

Type No. 6

Erected on face of wall, operation by chain and gear

"Mecco" Kalamein Doors

We manufacture a complete line of kalamein doors, covered with stretcher leveled kalamein iron, copper or bronze. Frames may be wood core, metal covered, or of steel, either hollow or solid.

Doors covered with kalamein iron are ordinarily supplied with a prime coat of paint. We, however, can supply any desired enamel finish, or doors grained in imitation of any kind of wood. Cut shown to right is of doors covered with No. 20 gauge bronze.

Labeled Kalamein Doors

We can supply labeled kalamein doors or frames. Doors with metal panels may be labeled for "Vertical Shaft," "Corridor" openings or "Fire Escape" openings. Doors with glass can not be labeled for vertical shaft.

Installation of Bronze Kalamein Doors

Suggestions for Paneling Kalamein Doors

Ball Gymnasium, Indiana State Normal School, Muncie, Ind.

"Mecco" Hollow Metal Windows

We manufacture a complete line of hollow metal windows of every type, labeled by the National Board of Fire Underwriters.

Double Hung Type—The cut to the left shows an installation of "Mecco" double hung windows.

We have hundreds of such installations in high class office buildings, terminal buildings, stores and other semipublic and private structures.

The sash of windows are made to slide perfectly and yet the design and workmanship are such as to exclude the elements. "Mecco" windows are labeled.

TRADE-MARK

overcome the resistance of Wilson safety knobs
is as follows:18-ft. span 1000 lb. 24-ft. span 500 lb.
30-ft. span 300 lb.

A wind velocity of 120 miles exerts a pressure of 43 lb. per sq. ft.

Curtain has same appearance on either side, thus preserving symmetry when it becomes necessary to hang some doors on inside and others on outside of same elevation.

Made in Nos. 22, 20, 18 and 16 gauge—depending wholly on size on opening.

"Little 4" Interlocking Slat—Similar to "Big 4" slat in appearance and design; the depth of corrugation being slightly less, but possessing the same advantages as the "Big 4." Used in small doors for openings where coil must be made as small as possible and for underwriter labeled exterior wall doors. Fitted with fire stops when necessary.

Made in Nos. 22 and 20 U. S. standard gauges.

No. 2 Interlocking Slat—Especially designed for use on underwriter labeled fire doors and other doors installed on interior of buildings when not subjected to wind pressure or unusual hard service.

Made in Nos. 20, 18 and 16 U. S. standard gauges.

The curtains of the underwriter type are equipped with fire stops on the ends of slats, baffle plates in the hood, and (where permitted) automatic devices which cause them to close in case of fire.

**No. 2 Interlocking Slat with Fire Stops****Where Wilson Rolling Steel Doors Are Used**

Wilson rolling steel doors and shutters are designed to meet all classes of service; first, effective closure of openings against weather and intrusion, second, closure of openings where fire doors are required.

Wilson Interlocking Slat Curtain

The Wilson curtain, that part of the door closing the opening, is formed of a series of interlocking slats of Wilson special Keystone copper-bearing galvanized steel, conceded by all metallurgical authorities to be more effective in retarding corrosion than any other similar product. By actual experience and practical test Wilson doors will greatly outlast all others.

Wilson interlocking slats are made in the three following types:

"Big 4" Interlocking Slat—This slat has distinct advantages possessed by no other slat. Being of corrugated form it has far greater rigidity than the ordinary channel form slat. Its design permits of end-shields which actually do take all wear from that part of the curtain sliding in the grooves. Every part of the Wilson end-shields functions in a definite way, adding considerably to the life of the door.

Deep corrugations also protect the interlocks from damage when hit by moving vehicles. Kinks and dented interlocks will materially affect the operation of other doors.

**"Big 4" Interlocking Slat**

An exclusive Wilson feature is the patented safety grooves and wind locks which are standard equipment on doors over 14 ft. in width. Doors so equipped cannot possibly be blown from grooves and will withstand any conceivable wind pressure without excessive deflection of the curtain, at the same time minimizing possible damage to curtain from whatever cause.

**Safety Groove and Wind Lock**

The wind pressure necessary per square foot of shutter to

Operation of Wilson Rolling Steel Doors

Wilson rolling steel doors may be operated from either one or both sides of opening. Small doors are usually raised and lowered by handles on bottom bar, and large doors are usually operated by chain gear, crank gear, or electrically.

Self-coiling Operation—Wilson types S. C. 11 and 22 are operated by hand by means of handles on bottom bar of door. This type is not recommended on openings over 10 ft. wide or more than 8 ft. in height, or exceeding 80 sq. ft.**Chain or Crank Operation**—Should be used for doors larger than the limitations of self-coiling operation. Wilson types C. G. 11 and 22 are operated by means of chain and gear. Wilson type K. G. 11 is operated by crank gear. The chain operated door has been universally adopted as the standard service door.**Motor Operation**—Coming into general use since the perfection of Wilson super-equipment, constructed entirely of General Electric products, is being used on doors of most any size and type depending largely on the use of the door.

In view of details involved, we solicit the opportunity of working on any such installations to insure provisions being made for the proper equipment at a minimum cost.

Hinged Wicket Doors

Standard size, 2x6 ft., may be placed in any door. Designed so that wicket door with its frame can be swung back out of way with a minimum effort. Substantially built and very practical—used for passage when opening is a means of exit to part of building in which located.

Wilson Rolling Steel Fire Doors (Underwriter Labeled)

Exceptionally durable and equipped with special fire protective devices. Close automatically in case of fire and are approved and labeled by the Underwriters' Laboratories, Inc. for the following services:

Vertical Shafts, Corridors and Room Partitions

—Area of opening not to exceed 80 sq. ft.; neither width

nor height of opening to exceed 12 ft. Curtains may be hung on face of wall or between jambs, self-coiling or crank operation, and where required are automatic closing in case of fire. Specify Wilson type Nos. 21 to 26, inclusive, interlocking slat No. 2, No. 20 gauge.

Fire Walls—Area of wall opening not to exceed 80 sq. ft.; neither width nor height to exceed 12 ft. Two doors are required and may be hung on face of wall or between jambs, self-coiling or crank operation, and close automatically in case of fire. Specify Wilson type Nos. 31 to 35, inclusive, interlocking slat No. 2, No. 16 gauge.

Exterior Walls—Area of wall opening not to exceed 100 sq. ft.; neither width nor height to exceed 12 ft. Curtain may be hung on face of wall or between jambs,

Details of Wilson Rolling Steel Doors

self-coiling, chain or crank operation, and, where permitted, may be automatic closing in case of fire. Specify Wilson type Nos. 41 to 51, inclusive, interlocking slat "Little 4," No. 22 gauge.

Automatic Closing Device—Where required, doors close automatically by the fusing of one of two links located at the head or side of opening, and near the ceiling.

Doors close easily on the sill and can be raised immediately after without difficulty. Automatic device can be reset and new link inserted without removing the hood or dismantling the door.

Grooves and bottom bar of door are provided with

Wilson Rolling Wood Doors and Shutters

Especially made to withstand the corrosive fumes so destructive to iron and steel. Recommended for roundhouses, powerhouses, chemical plants, refrigerating plants, etc.

Heavy Slat Doors—Made of wood slats 2 in. wide and about $1\frac{1}{8}$ in. thick, threaded on bronze bands running from top to bottom about 18 in. apart. Each band is riveted to top slat and attached at bottom to a strong spiral spring anchor of phosphor bronze. This

slotted holes to allow for expansion. Fusible washers are used with bolts securing grooves to wall, allowing freedom of movement during expansion. Bolts for brackets and grooves are bolted through wall or attached to iron inserts furnished and installed by others.

Consultation—Inasmuch as fire doors usually present problems and difficulties, it is suggested that we be consulted for definite details and requirements. A door may be labeled, but will not pass inspection because installation does not meet requirements of the local board, due to construction of opening or conditions surrounding opening.

construction allows for shrinking and swelling of door due to atmospheric changes. It requires less than one minute to raise or lower the door.

The doors are treated with carbolineum, reducing to a minimum any expansion or contraction, and acting as a preservative.

Light Slat Doors—Similar to heavy slat type except slats are $\frac{1}{8}$ in. thick. Used on smaller openings or where not subjected to as heavy wear as the heavy slat door.

DETAILS OF MOTOR OPERATED DOORS & GATES

Electrically Operated Vertical Sliding Partitions or Curtains for Schools, Auditoriums, Churches, etc.

The Allen & Drew Vertical Sliding Partition is built of a properly constructed channel frame covered on both sides with sheet metal, the hollow space being filled with fireproof sound retarding material. The size of the channel framing and gauge of sheet metal varies according to the use to which the "partition or curtain" will be put.

The Allen & Drew partition has fixed guides at each end and several telescoping guides at intermediate points. The bottom of the partition is equipped with dowel pins to lock it to the floor.

The partition is lifted by cables or chains attached to the top. It is raised by means of an overhead equalizing shaft extending the entire width of the opening. A motor drive unit is directly connected to this shaft, making it impossible for the partition to move without releasing the electric brake and rotating the worm.

Estimates and Service—All installations of this nature present problems requiring individual attention. We shall be pleased to receive sketches for any proposed use of curtains or partitions of this type and will gladly furnish detailed drawings, specifications and formal quotations for the complete installation of this equipment in any part of the United States.

Products

REVOLVING DOORS and ENCLOSURES: wood, metal covered and hollow metal; Wings—"Curved" (exclusive patent) and "Straight"; Types—Safety Exit or Panic-proof (NLD and NLE), Full-folding (PB), Semifolding (C), Contiguous Trim, Doors and Accessories in wood and bronze.

Revolving Door Benefits

Conserve Health—Prevent drafts, control ventilation, eliminate dust.

Convenience—Save floor space, reduce entrance effort by elimination of wind pressure, prevent confusion by automatic traffic division.

Increased Capacity—2000 to 3000 persons per hour each way (greater than is usual with swing doors).

Economy—20% annual return on investment due to fuel saving. A door pays for itself in about 5 years.

Always Open—To traffic.

Always Closed—To outside winds and cold.

General Data—Manufacturer's Recommendations

Adaptability—For office buildings, hotels, banks, department stores and all public and semipublic buildings where periodic or continuous traffic congestion exists.

Capacity Provision—The ideal entrance is one provided with revolving doors of sufficient capacity for normal traffic, flanked by single or pairs of swing doors. (See suggested arrangements or send plan of present entrance for individual recommendations.)

Where not originally included, provision should be made for future installations with the least structural change. Preliminary suggestions will be gladly submitted by our service department.

Sizes—For dimensions see cuts No. 164 and No. 166 (second page following). 4-wing doors *should not be less* than 6 ft. inside diameter. The standard is 6 ft. 6 in. except in hotels where 7 ft., 7 ft. 6 in. or even 8 ft. is needed for the convenient handling of luggage.

3-wing doors may be 4 ft. 6 in. to 5 ft. 6 in. in diameter. They are adapted for use where space is too small for 4-wing door or where less capacity is required.

Inside height should be 7 ft. to 8 ft., standard being 7 ft.

Access to Bearing—Space over door *should* (not *must*) be accessible for oiling and adjusting main bearing.

Glass—That the braces may be set sufficiently high to reduce racking strains, 24 in. is recommended as the minimum height from floor to bottom of wing glass.

Avoid other than rectangular glass, to avoid breakage. Beveling is undesirable because of refraction.

Marble Enclosures—Atchison wings are ideal for use with marble enclosures, as no ceiling slot is needed, and slabs can be supported from bearing channel which lies directly over it. Only a 1¾-in. center hole is needed—no other provision prior to placing of wings, except access to space overhead. Always provide anti-flop bevel or relief at ends of walls.

A—One Wall against blank Building Wall—Screen Doors at Outside

B—Common Layout Taking Place of Pair of Swinging Doors

C—To Set Between Thick Masonry Jamb

D—Placed in Existing Vestibule, Sliding Doors at Outside

E—Combining Revolving and Swinging Doors for Large Buildings

F—Another Combination with One Pair Outer Swing Doors Used as Connecting Jamb

G—Having Swing Doors or Side Lights at Either Side of Enclosure

H—With Enclosure Walls Straight Back to Building Wall

I—Special Layout to Get Two Revolving Doors and Small Swing Doors Into Narrow Opening—Note Curved Sliding Doors at Exterior

Suggested Layouts

Types

Safety Exit or Panicproof, Types NLD or NLE
—For doors that are the *sole* exits for massed crowds (not offices, banks or hotels). Their added expense is not warranted for exits where side swinging doors are present or for average exit conditions. Wings assume full line collapsed position and allow passage at either side without revolving. They *also fold aside* like Type PB. See cut No. 165 (following page).

Type NLD is equipped with push-bar-release, Monel cable brace and toggle tightener which will open under panic conditions without knowledge of the mechanism, but which *will not* release under jars, ordinary traffic, or wind pressure.

Type NLE is equipped with simple automatic releasing cast bar braces.

Full-folding, Type PB—Standard wings fold aside in pairs, on pivots, and lie entirely back of the chord line. They lock or unlock from either inside or outside at both top and bottom in diagonal position. They may be fastened (to ceiling only) in crosswise, quartering or lengthwise position.

Semi-folding, Type C—Wings fold into one plane not detached from central pivot and in lengthwise position only (to allow unrestricted passage and passing objects through).

Note: When revolving, they have the same value as other types, and are adapted to use where traffic does not justify investment in the more expensive types.

Special Features

"Curved Wings"—An exclusive basic improvement in design of outstanding importance surpassing all secondary improvements affecting manner of folding, collapsing and locking. The "curved wings" increase the usable space 6 in. in front of the body, permitting a more natural, upright position and easy stride in the line of traffic than is possible with the straight wing.

The "curved wing" is quoted at actual extra cost, under a policy of many years standing.

Experience *shows* that breakage of "curved wing" glass is extremely rare. A replacement plate may be carried or can be obtained promptly from stock at cost.

Folding of Wings—When desired, the wings (with exception of Type C) fold aside in pairs and *lie entirely back* of the enclosure wall opening or chord line *leaving full unrestricted passage space*. Note the particular advantages in this respect of the "curved wing" design. The main wings (to which the secondary wings are hinged) have top and bottom pivots operated by a powerful lever mechanism in the outer stile. By setting these pivots and releasing the wings from each other and from the center pivot and hanger stem, the wings swing smoothly back against the enclosure walls. The whole folding operation may be accomplished with ease in 30 seconds.

No Ceiling Slot—Due to the Atchison method of folding, the conspicuous and unsightly ceiling slot with traveling suspension carriage is eliminated.

Screen Doors—Light double acting screen or flap doors may be hung with removable hanging strips to enclosure wall ends without interference with wings (an exclusive Atchison feature).

Air Lock Strips—Especially designed and selected to maintain the air lock with just the proper amount of friction. Easily adjusted. Consist of wide flexible rubber strips at bottom; heavy felt strips at top; tapered moulded rubber side strips with piano felt edges.

Standard Design Layouts

Materials, Construction and Finish

Wood—Wings and enclosures of all cabinet woods veneered over an improved type of laminated core construction. Material, construction and workmanship commensurate with the highest quality of cabinet work.

The highest class of painters finish applied by skilled workmen in any standard or special finish. (Samples of standard finishes furnished on request.)

Metal Covered—Bronze plate overlay construction in No. 16 gauge (recommended) or No. 20 gauge, applied with special metal holding adhesive, under heavy pressure, to faced, hardwood, laminated cores, with hair-line reinforced joints.

Note: This construction is recommended over hollow metal construction because of (1) greater stiffness to meet twisting strains (usually absent in swing doors), (2) less weight for the required stiffness (essential to avoid undesirable momentum and inertia effects), (3) lower cost, (4) greater fire resistance.

Connected work in ornamental cast iron and bronze. Finishes to match adjacent work. Bronze recommended in fine-line medium oxidized or statuary, not lacquered. (Samples of standard finishes furnished on request.)

Hollow Metal—Enclosures furnished in No. 10 and No. 12 gauge, with drawn and extruded moulds. Wings in No. 14 gauge, specially constructed for stiffness.

Hardware—Heavy, plain design, cast bronze in either polished or brushed natural finish.

Cylinder locks (master-keyed if desired), are standard equipment.

Stock Doors and Enclosures

To be had in one design only, as shown, size 6 ft. 6 in. diameter by 7 ft. high. In oak, gum or birch. All types, with or without glass in enclosure walls. Finished to suit. At considerable saving over cost of door especially designed.

Facilities

Experience—Atchison Revolving Doors have been made continuously since 1906. An outgrowth of 50 years' millwork experience.

Plant—A modern efficiently planned and lighted one-story plant of 75,000 sq. ft. area, equipped throughout with the most modern motor driven machinery. A woodworking factory accustomed to executing and finishing the highest grade cabinet millwork. A complete metal covered and hollow metal door shop. A complete foundry. Every part (except lock cylinders) from the simplest wood to the most elaborate metal doorway executed under our own roof and under closest supervision.

Location—Favorable manufacturing conditions; uninterrupted, prompt, economical execution and advantageous shipping facilities to any part of the United States.

Patents—The "Curved Wing" and other Atchison exclusive features are protected by patent. This company will guarantee against loss or damage from any and all infringement suits.

Service—Adequate and capable Engineering and Service Department maintained at plant and Atchison agents accessible in all principal cities of the United States and Canada.

Quotations and Ordering

Agents can generally quote direct on stock designs. Due to numerous variations in material, design, finish and equipment, special design doors must be quoted upon by the factory. Approximate or comparative estimates from sketch plans and designs promptly furnished.

We urge the placing of orders in the spring and summer to avoid seasonal congestion of fall and winter.

Products and Services

REVOLVING DOORS of every description and of any desired material.

Specialists in all Mechanical Devices as applied to Revolving Doors. Complete installations contracted for anywhere in the United States and Canada.

This company supplies Fixtures for Revolving Doors to manufacturers of cabinet work, kalamein work, hollow steel and architectural bronze work, together with construction details and, if desired, assembling and erecting labor.

Automatic Panicproof Revolving Door

Wings are suspended from a universal ball bearing located in a dustproof oil chamber mounted on a carriage running on tracks. The wings can be folded centrally and moved to one side in the usual manner.

Each wing is hung to the center post with spring hinges, which hold it under spring control when the braces are detached, preventing slamming of the wings against each other and breaking the glass, which happens in other panicproof revolving doors.

The Slip-bar—The braces which hold the wings in rotating position are the vital feature of a panicproof door. This company uses neither cables nor chains, but manufactures the only slip-bar brace that pushes or pulls out under undue pressure. Brace is positive in action, durable, and conforms to building and fire department regulations.

**Standard Design No. 106,
Panicproof Slip-bar
Construction**

Adaptable to slight architectural changes. Any material; any wood or hardware finish; kick plates and key locking bolts when desired

Positions of Wings**

Some Recent Installations

The following is a list of some recent installations with the names of the architects and contractors who were connected with the work:

New York, N. Y.

Graybar Building (6 doors), 420 Lexington Avenue, Sloan & Robertson, Architects; Todd, Robertson & Todd Engineering Corp., Contractors
Chelsea Exchange Bank, 36th Street and Eighth Avenue, Eugene Schoen, Architect; Charles H. Tyler Co., Contractors
Manufacturers Trust Company, 407 Broadway, A. F. Gilbert, Architect; installed for Norman-Seton Co.
Ritz Tower Apartment Hotel, 57th Street and Park Avenue, Emery Roth, Architect; Thomas Hastings, Associated Architect; Todd, Robertson & Todd Engineering Corp., Contractors
Apartment Hotel, 95th Street and West End Avenue, Emery Roth, Architect; Bing & Bing, Inc., Contractors
Franklin Society for Home Building & Savings, Broadway and Vesey Street, John J. Sheridan, Architect; Wm. L. Crow Construction Co., Contractors
Hearst Publications, Inc., South Street & Catherine Slip, Charles E. Birge, Architect; Turner Construction Co., Contractors
Union Dime Savings Bank Addition, 40th Street and Sixth Avenue, A. H. Taylor, Architect
New Fifth Avenue Hotel, Fifth Avenue and 9th Street, Emery Roth, Architect; Bing & Bing, Inc., Contractors
Silver's Cafeterias, Astor Building, Fifth Avenue and 33rd Street and Astor Theatre Building, 45th Street and Broadway, B. H. Whinston, Architect
Toddle Inn Restaurant, 2549 Broadway, B. H. Whinston, Architect
East River Power Station (3 doors), 14th Street and East River; installed by Dahlstrom Metallic Door Co.
Office Building, 20-22 East 57th Street, Emery Roth, Architect; installed by Norman-Seton Co.
Apartment Hotel, 115 West 46th Street, George Fred Pelham, Architect; Samuel Roseff & Sons, Owners
Standard Oil Building (7 doors), 26 Broadway, Carrere & Hastings, Shreve, Lamb & Blake, Architects; Charles T. Wills, Inc., Contractors
New York County Courthouse (5 doors), Center, Worth, Baxter and Pearl Streets; Guy Lowell, Architect; installed for John Polacheck Bronze & Iron Co.

Brooklyn, N. Y.

Copley Plaza Apartments, Eastern Parkway and Underhill Avenue, Shampian & Shampian, Architects
Manufacturers Trust Co., Broadway & Sumner Avenue, E. A. Klein, Architect; installed by Norman-Seton Co.

Other Localities

Denver, Colo.—Bosworth Chanute Building, Fisher & Fisher, Architects; Alexander Simpson Jr. Co., Contractors; installed by Colorado Builders Supply Co.
Columbus, Ohio—American Education Press Building, Richards, McCarthy & Bulford, Architects; E. Elford, Contractor
Williamsport, Pa.—Williamsport Sun Building, Jacob Gehron Company, Contractors
Norfolk, Va.—Parkes Restaurant; installed by Hall-Hodges Co.
Wilkes-Barre, Pa.—Liberty State Bank, Ralph M. Herr, Architect
Salisbury, Md.—Wicomico Hotel, Wm. E. Booth & Son, Contractors
Lincoln, Neb.—Lincoln State Capitol; installed by Art Metal Construction Co.
Newark, N. J.—Kresge Department Store, second section (5 doors), Starrett & Van Vleck, Architects; Starrett Bros., Contractors
Harrisburg, Pa.—Dauphin Deposit Trust Co., Halsey, McCormack & Helmer, Inc., Architects; Joseph W. Pomraning, Contractor

Products

Three distinct types of REVOLVING DOORS, known under the following terms: AUTOMATIC COLLAPSIBLE, PANICPROOF TYPE; STANDARD "C" RIGID BRACE ARM TYPE; STANDARD "N" RIGID BRACE ARM TYPE.

VAN KANNEL REVOLVING DOORS are manufactured in various styles, using the above types. The styles of doors are as follows: 3-Wing Revolving Door and 4-Wing Revolving Door.

Also manufacturers of Van Kannel Revolving Pantry Windows (Patented).

Original Patentee

This company is the pioneer manufacturer and original patentee of revolving doors; its patents cover every practical improvement and substantial feature.

Architects may spare their clients expense and embarrassment from patent litigation by specifying Van Kannel doors.

Van Kannel Revolving Doors

Automatic Collapsible, Panicproof Type—This type of door has 3 or 4 wings hung independently of each other on a central shaft of metal and wings are held together by flexible cables. This type of door gives a feature of absolute safety at all times and under all conditions. The safety feature lies in the fact that the revolving wings are so arranged that by application of pressure to any part of the revolving door, slightly more than necessary to revolve door, the revolving wings will instantly and automatically collapse and fold outwardly in line of egress, leaving a free, unobstructed passageway.

Rigid Brace Arm Type, Styles "C" and "N"—These two types consist of either 3 or 4 wings, held together in their radial position by rigid braces; wings are collapsed only by means of pressing a spring when it is desired to have doors open in the middle, or pushed to one side for a wide open passageway. These types, although collapsible as to folding of wings, are not automatically so, as in case of automatic collapsible, panicproof type of door previously described.

3-Wing Revolving Door—The 3-wing revolving door is especially adapted for entrances that are too small to accommodate a 4-wing door at least 6 ft. in diameter. It is being used to a great extent in entrances to toilet rooms in schools, institutions and public buildings and the company has installed 34 of these doors for the Prudential building, Newark, N. J. Approximately, 5 ft. diameter.

3-Wing Revolving Door

DESCRIPTIVE DATA

Standard Type Wings — Thickness, 1 1/4 to 1 1/2 in., wood; 1 to 1 1/2 in., metal.

Panicproof Type Wings — Thickness, 1 1/4 in., wood; 1 to 1 1/2 in., metal.

Door Vestibules—4 ft. 8 in. to 6 ft. diam., 3 wings; 6 ft. to 8 ft. diam., 4 wings; 7 ft. diam., normal.

Standard Size—7 ft. to 7 ft. 6 in. vestibules. Large enough for maximum capacity.

Materials—Materials used for entire construction are any kind of hardwood, bronze or steel on a metal frame or wood core covered with various gages of metals in either copper, steel or bronze, using the following gages—Nos. 24, 20, 16. Revolving door vestibules may be made of other materials such as marble, tile or cement, as may be needed in order to carry out architectural treatments.

Stock Designs—Several stock designs are carried on hand in plain oak and birch, on which practically immediate delivery can be quoted. See stock series and stock special doors as illustrated.

Dimension Diagram

ELEVATION OF CORNICE

Dotted line shows space required for all types. Provision can be made, either in the roof or a trap in the ceiling to take care of our overhead mechanism.

This is our high stock cornice, 1192-3 and 1192-4 designs. Our 1192-1 and 1192-2 designs have low cornice, 2 1/4" to 3" high, necessitating a channel box covering to protect overhead trolley mechanism.

Doors moved aside for wide open position. This method can be used with our Standard "N," Standard "C," & "JC" Panic-proof types.

Special method of folding doors to one side which can be used in all three types, "N," "C," and "JC."

Special method of folding doors to one side, applicable only to "JC" Panic-proof type.

This is the marble wall construction we recommend where marble ceiling is used in connection with marble, tile, plaster or brick side walls. Ceiling slot extends across entire ceiling.

NOTE: Standard size vestibule giving maximum capacity is 7'-0" diameter, 7'-0" high. Revolving doors are made in 3-wing and 4-wing types. The 3-wing type vestibule ranges from 4'-8" to 6'-0" diameter, and the 4-wing type ranges from 6'-0" to 8'-0" diameter. Normal diameter 7'-0". We also make 6-wing type doors, but do not advocate their use.

Stock "Series" Illustration No. 6—Furnish and install where shown on plans, revolving doors of the VAN KANNEL DOOR Co. make, Design Stock "Series" [No. 1S] [No. 2S] Collapsible. Woodwork to be white pine. Finish to match surrounding trim.

Type "N" Fixtures

This type of fixture may be applied to any 4-wing design of Van Kannel Revolving Door, made of any material. The four wings are held in their revolving position by means of metal brace arms in the form of hooks. When it is desired to fold the wings for any reason it is only necessary to unhook the brace arms and hook them back against the fixed wings, since all the four brace arms are attached to these wings by means of sockets. After the brace hooks are caught back, as above mentioned, the two hinged wings can be folded and the revolving door may assume positions illustrated on following page.

HOLLOW STEEL DOORS.
ROLLED STEEL WINDOWS.
BRONZE COVERED DOORS.
BRONZE STORE FRONTS.
"BILTRITE" HOLLOW STEEL UNDERWRITERS' DOORS.
Also Copper Covered Doors and Windows.

Facilities and Service

Our plant is one of the largest in this line and our output runs from 1500 to 2000 steel bucks per week. Output of steel covered doors from 500 to 1000 per week. Everything turned out is a quality job and delivered on date specified.

Steel Bucks

The details shown on the following page are the latest type. The 16 gage rolled steel combination bucks illustrated in Fig. 1 are made for 6, 4 and 3-in. partition walls, to receive 1 $\frac{3}{4}$ -in. thick doors. The buck for a 3-in. wall can be made for 1 $\frac{3}{8}$ -in. doors.

The bucks numbered A, A3, C, and C1 are 16 gage rolled steel type.

Steel Bucks Type B—Pressed steel bucks illustrated are made in 16, 14, 12 and 8 gage to fit any width partition or wall and to any thickness rabbet or width of flange. These bucks can be arranged with applied, clipped or spot-welded trim.

Sanitary Design Buck Type D—Pressed steel buck shown is made in 14, 12 and 10 gage. This type of buck is used in Bell Telephone Co. buildings and various hospitals because of the sanitary design.

Furniture Steel Covered Doors

Leonard Furniture Steel Covered Doors are made of 22 gage furniture steel with various types of paneling and glazing and with 20 gage hollow steel moulding. The moulding is welded into the frames and housed in stiles and rails when doors are put together. The stiles and rails are mortised, tenoned and doweled.

Underwriters' labeled doors can be had in furniture steel at very little extra cost.

Hollow Steel Doors

Made of 18 gage rolled steel. The principal feature of these doors is the rolled edge strip which takes all of the cut-out and reinforcement for hardware. This means that as long as we have the size of the door and type of paneling we can proceed with the manufacturing of the door without waiting for the hardware.

Hollow steel doors come only in a prime finish.

Can also get Underwriters' label service on these doors at small extra cost.

Rolled Steel Windows

Our standard on these windows is 22 gage galvanized steel for frames, 14 gage galvanized steel for sash, 16 gage galvanized steel for sills and 14 gage furniture steel for stools. Frames, sills and stools can be heavier if desired. Windows are labeled by the National Board of Fire Underwriters.

Bronze Covered Doors

Our standard doors can be covered with 20, 18 or 16 gage bronze for rails, stiles and panels. Extruded bronze shapes are used for mouldings and edge pieces. Cast bronze ornaments can be applied to rails, stiles, and panels.

Bronze Store Fronts

Made over white pine cores, in either 20 or 16 gage bronze, to architects' designs.

Reference list of installations furnished upon request.

Leonard Bronze Store Front Work

"Biltrite" Hollow Steel Underwriters' Doors

This is a 20 gage steel built-up door which is manufactured under supervision of the National Board of Fire Underwriters. Can be either slide or swing. Used for vertical shafts, party walls, boiler and transformer rooms. Made in two thicknesses, equivalent to 2 and 3-ply tin covered doors.

They pass any classification of the Underwriters.

Products

ROLLED STEEL FRAMES for Doors and Sidelights.

Also Hollow Metal Doors, Frames and Trim; Elevator Enclosures; Dumbwaiter Enclosures; Steel Mouldings.

Rolled Steel Frames

Frames illustrated on following page may be used in connection with either wood, kalamein or hollow metal doors or sash 1 3/8 or 1 3/4 in. in thickness.

Frames are manufactured by a *rolled process* (not formed), insuring clean cut profiles true to detail.

These units are made to jamb opening sizes in accordance with architects' plans and in any combination suitable for 2-in. plaster, 3, 4 or 6-in. tile partitions, brick walls, wood stud or Simplex partitions.

Frames are mortised, reinforced, drilled and tapped for hardware at the factory and are delivered to the building completely assembled ready to install.

The side jambs are coped to the heads with mortise and tenon attachments, insuring proper alignment and accurate dimensions. The casing sections are accurately mitred and welded on the reverse side, insuring neat and permanent joints.

Time, the essential factor in the completion of a building, is materially reduced by the use of steel frames, the enforced waiting period necessary between the erection of wood bucks, thorough drying out of plaster and application of jambs and casings being entirely eliminated.

Steel frames, owing to their initial low cost, durability and economical installation on any sizable operation, such as office, apartment or hotel buildings, are a desirable factor in present day building.

Catalogue

For Specifications and Details of Hollow Metal Doors, Frames and Trim, Elevator and Dumbwaiter Enclosures, Steel Mouldings, also for further details on Rolled Steel Frames for doors and sidelights see our Metal Door and Trim Catalogue. Sent on request.

Specifications for Rolled Steel Frames

Frames to be manufactured of No. 16 gauge cold rolled steel by a *rolled process* (not formed), to insure moulded members being clean cut, straight and true, equal in quality to that manufactured by METAL DOOR & TRIM Co., La Porte, Ind.

Jamb portion of frame to be coped at intersections to insure proper alignment and accurate jamb dimensions with tenons in side members entering up through slots in head member and bent over, while casing portion of frame is to be mitred and oxy-acetylene welded from the inside and then cleaned off to make a neat, permanent joint.

Frames shall be mortised, reinforced, drilled and tapped for lock strikes and butts in an approved manner at the factory. (Drilling and tapping for any other hardware, as well as the application of hardware shall be done at the building by the contractor erecting the doors.)

Frames to have No. 14 gauge clip angles spot-welded to bottom of each side member for fastening to floor.

Wire anchors to be provided for securing frames to masonry partitions.

Where transom bars or mullions are required, they are to be rolled of not less than No. 18 gauge cold rolled steel and fastened in frames in an approved manner.

Removable cold drawn mouldings of standard design, made up into frames, neatly mitred and welded at the corners, and fastened to frames with oval head machine screws to be furnished for retaining sash or glass panels.

After removing all oil, dirt, rust or impurities frames are to receive one dip coat of red oxide primer. Final finish to be applied at building by painter contractor.

Frames shall be set accurately and braced in position until partitions are set up. After partitions have been built and before the mortar has set, this contractor shall check up each frame to see that it is in proper location, plumb and true.

Note: On these pages we present specifications and detail drawings of rolled steel frames only. See "Catalogue" paragraph for other products.

ROLLED STEEL FRAMES FOR DOORS AND SIDELIGHTS

DRAWING NO. 1
JUNE 23, 1927
SCALE 3 IN.=1 FT.

PETERSON AND NEVILLE, INC.

Manufacturers of Pressed Steel Products: "Steelweld" Steel Door Frames, Medicine Cabinets and "Kleen Kitchen" Metal Furniture
365 Dorchester Avenue, BOSTON, MASS.

Product

"STEELWELD" DOOR FRAMES.

Also Radiator Furniture, Economy Lockers, Steel Tanks, Conveyor Buckets, Steel Platform Skids, Circuit Breaker Tanks, Steel Tote Boxes and Steel Concrete Forms.

For "Kleen Kitchen" Metal Furniture, see pages B2216-2217; for Medicine Cabinets, see page C2581.

Steel Combination Door Frames

Five types of our steel combination door frames are shown in cuts A, B, C, D and E. These frames are suitable for all interior openings and are complete frames in every detail, embodying the buck, jamb and trim, with provisions made to receive all hardware, such as hinges, striking plates, locks and pads for door checks or any other special hardware.

"Steelweld" door frames are made of steel, are fireproof and free from defects. They will not sag, warp or open up at the joints as do wood frames. All joints are gas welded and ground to a smooth finish.

The economy of "Steelweld" frames becomes apparent when you consider that the erection of a "Steelweld" frame comprises the total cost of erecting a finished door opening. The buck, jamb and trim are all in one piece so there is no further cost of erecting the finished jamb and trim. Our frames can be made to accommodate walls of varying thicknesses, from a 2-inch wall up.

There are several designs of steel anchors that are used with these frames as shown in Types A, B, C, D and

E. The selection of the type of anchor is left to the architect, who can select a fixed or a loose anchor as he chooses.

Type A Frame—Made of No. 14 gauge cold rolled steel of simple design and few mouldings, and is very suitable for school work.

Type B Frame—Made of No. 18 gauge auto body steel and is one that we have used extensively for apartment hotels. In lots of 1000 frames or over we can modify these mouldings somewhat to meet the architect's designs.

Type C Frame—Made of No. 16 gauge cold rolled steel with $\frac{3}{8}$ -in. plaster lock holes placed 2 in. on center as shown in sketch. We have used this type extensively in hotel work. This is a very rugged frame and one that will stand considerable abuse.

Type D Frame—Made of No. 12 gauge cold rolled steel with very simple mouldings suitable for hospital work.

Type E Frame—Made of No. 12 gauge blue annealed steel and shows another treatment to prevent the plaster from cracking where it joins the metal buck. This method is somewhat more expensive than the other types.

Other Uses

These same sections can be used in making up the steel door frames for elevator enclosures, also for cased openings, and all interior sash, either fixed or movable.

Service and Samples

We will be pleased to study your specific problem in detail if you will send us a set of floor plans and a copy of the specifications.

These frames can be shipped economically to any part of the country, especially if there are 400 frames or over. 400 frames fill an average car and can be loaded without the extra expense of individual crating for each frame.

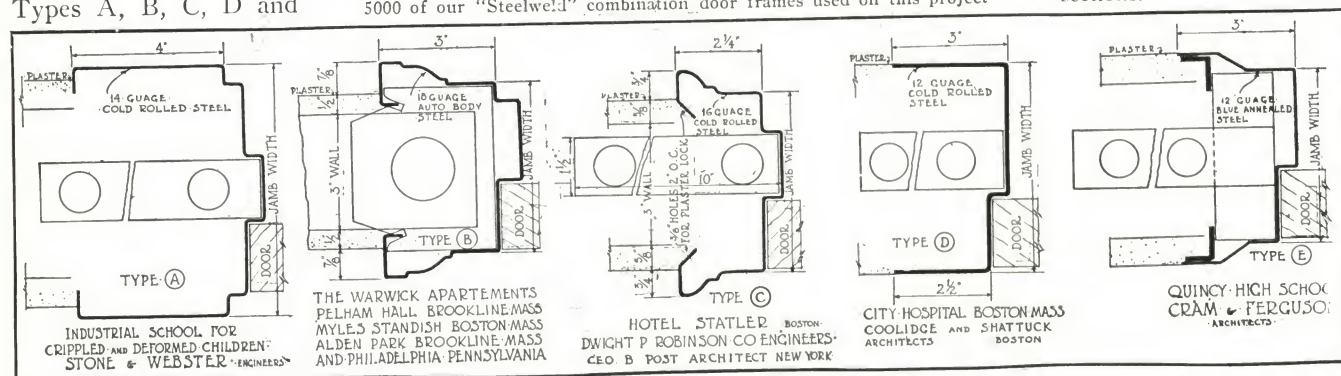

Hardware templates must be furnished us with the order and with the general plans and specifications for the building.

We manufacture many types of special steel door frames and invite you to send us your problems in this line. Send for sample sections.

CASEMENT and WINDOW SECTIONS.

For Stair Nosings and Edgings, see page A680; for Steel Mouldings, see pages A748-749; for Perforated Sheets, see page C2807.

Catalogue

Our Catalogue No. 25 on steel mouldings contains many other sections useful for window construction.

A copy will be sent the architect, builder or owner upon request.

Features

These sections are of the two-point contact type and suitable for all windows; casement type, double hung, austral type, in- or out-opening. The large chamber makes windows constructed with them rigid, airtight and watertight.

Wide members make for ease of application and tight fit of hardware.

A special feature is the grooves in sections Nos. 1206 and 1207. Adherence of glazing and setting compound makes windows doubly weathertight.

ESTABLISHED 1884

THE PHILADELPHIA SUPPLIES CO., INC.

SUCCESSORS TO P. DEISSLER & BRO.

All-metal Window Frames and Pivoted Window Ventilators1741 North Sixth Street
PHILADELPHIA, PA.**Products**

Sole manufacturers of the P. Deissler & Bro. patented PIVOTED VENTILATORS.

METAL FRAMES for church windows and the leaded glass trade.

BASEMENT WINDOW VENTILATORS for masonry or wood construction.

Also Skylights, Domes, and all other kinds of wrought iron work used in the leaded glass trade.

Improved Type All-metal Built-in Window Frames

Frames are made of steel or wrought iron as desired. They are built in as the building is in course of construction and make a rigid and everlasting weather-proof job. They are made in all styles—square, round or gothic top, and in any size or weight material desired. Used for leaded, plate, wire, ribbed or prism glass. Finish is either painted or galvanized.

Frames are made for storm glass outside and leaded glass inside or for single glazing.

Ventilators can be put in the top, center or bottom of frames, and the inside swinging frames can be removed for glazing.

"Deissler" Improved Pivoted Ventilators

These ventilators have been specified for over 40 years as the standard church window ventilator. They

are made of steel or wrought iron angles for single or double glazing and can be used for leaded, plate, wire, ribbed or prism glass. The inside frame of ventilators can be taken out and bars put in to suit the design. Finish is either painted or galvanized.

Where ventilators are in reach they are provided with spring lock at the top and lug at the bottom with strap for adjusting extent of opening. Ventilators out of reach should be specified with bottom heavy, self-closing; these are for the intermediate and bottom sections of windows. They are equipped with lock, pulley, bracket and chain fastener attached to the ventilator and are operated from the side with a chain. This eliminates the objection of cords or chains obstructing the design or view of the window.

**Two Stock Designs of Frames That Are Reasonable in Price**

We also make special designed metal frames—any style, size or weight material desired

Fig. 1—Sectional View
(Full size)

Fig. 1. Sectional View (Full Size)

Illustrates a section of a metal frame for outside storm sash and inside leaded glass glazing. The double, double bottom ventilator shown is pivoted in the center to swing in at the top. Specify Catalogue No. 10 for double bottom ventilators where operation of sash is by spring lock at top and adjusting lug at the bottom; for the bottom heavy self-closing type adjusted by chain at the side specify Catalogue No. 38.

Fig. 2. Sectional View (Full Size)

Illustrates a section of a Te-iron metal frame for single glazing. Type illustrated is for building into masonry openings but it can be made with angle iron all around and screwed into rough wood openings. Can also be used where wooden frames have a rabbet in which case the angle iron on the outside is not required as the frames have turned ends on the mullion bars which can be screwed direct to the wood.

The ventilator is also for single glazing and pivoted in the center to swing in at the top.

Specify Catalogue No. 1 ventilator for the bottom; No. 2 for the middle, and No. 3 for the top. Hardware can be furnished the same as described for the Nos. 10 and 38 Double, Double Bottom Ventilators described above.

Information Required for Estimates

All-metal Window Frames—Send blue prints and specifications with list of bidders. Any charge for these will be gladly remitted.

Pivoted Window Ventilators—The quality of ventilators and style wanted; and if for leaded glass, give bar sizes.

The sizes should be taken from the outside of angle iron, giving the width first, then the height. For rabbeted work, sizes should be taken full size.

In grooved mullions or jambs, the sizes should be taken daylight size.

State if ventilators are to be placed in top, middle or bottom of window, and if they fit in wood all around; and, also, if they are to be painted or galvanized.

For domes, skylights or iron work, send sketches.

Sizes, shapes and quantities vary so considerably, that it is impossible for us to issue a reliable price list. We will be glad to prepare a special estimate on receipt of specifications and quantities.

Patented 1926

No. 38 Bottom Heavy Self-closing Ventilator

Details of P. Deissler & Bro. Pivoted Ventilators and Metal Frames

Fig. 2—Sectional View
(Full size)

Fully Weatherproof, All-metal Basement Window Ventilators for Masonry and Wood Construction

These ventilators have many advantages over the old style as they make a permanent, weatherproof job and have no hinges to get out of order. They have a spring snap catch at the top and pivot at the bottom (see sectional views).

These ventilators are made for single or double glazing and pane glazing.

When specifying steel basement windows notify us, sending us the necessary blue prints, specifications, and

Ventilators for Masonry and Wood Construction

list of bidders and we will remit any set charge for same.

No. 36 Basement Window Ventilator—Substantially made with horizontal stiffening bars. Extension arms which hold ventilators open ride through slotted frame, and when ventilator is closed they fit snugly into the frame.

Equipped with brass lock and made for leaded glass.

No. 37 Basement Window Ventilator—This frame is constructed on the same principle as the No. 36 for opening and closing and is made for pane glazing.

Made for single or double glazing as shown in the sectional views below. Frames painted or galvanized.

Full Size Sectional View Style No. 55

For Nos. 36 or 37 ventilators. For double glazing set in groove. Made for masonry construction only

No. 37 Ventilator for Pane Glazing

No. 36 has horizontal stiffening bars only and is made for leaded glass

Full Size Sectional View Style No. 54

For Nos. 36 or 37 ventilators. For leaded glass. Single glazing made to set in wood or stone.

For basement window for pane glazing, specify No. 53

THE WILLIS MANUFACTURING COMPANY

INCORPORATED 1891

Manufacturers of Hollow Metal Windows and Tin Clad Fire Doors

HOME OFFICE and FACTORY
GALESBURG, ILL.

Products

HOLLOW METAL WINDOWS of all types; TIN CLAD FIRE DOORS and Hardware.

Approvals

All types of Willis hollow metal windows and tin clad fire doors have been tested and approved by the National Board of Fire Underwriters.

Hollow Metal Windows

The Willis hollow metal window is made in all types including, double hung, single pivoted, double pivoted, top hinged, casement and stationary. Double hung with pivoted, hinged or stationary transoms.

Our approved mullion may be employed when it is necessary to use more than one single unit in an opening.

Tin Clad Fire Doors

Two-ply and three-ply, wood core, tin clad doors of the sliding or swinging type for any kind of opening.

Specifications for Hollow Metal Windows

All hollow metal windows shall be those manufactured by THE WILLIS MANUFACTURING COMPANY of Galesburg, Ill., or such other make that will comply in every respect with their design and construction.

Metal used throughout shall be No. 24 gauge tight coated galvanized, as required by the Underwriters' Laboratories, Inc., and shall be copper bearing. Heads, jambs and all sash rails shall be constructed of one piece of metal each, excepting back covers. All covers to be carefully and securely locked to their respective members. Heads and jambs shall have a moulded brick or staff bead and shall be properly constructed for building into brick, stone or terra cotta walls. All members must be carefully formed and miters neatly cut, lapped and riveted. Where two sash members lap on an exposed surface, the under member shall be offset the thickness of the metal to permit of a smooth and even surface to insure perfect operation of sash.

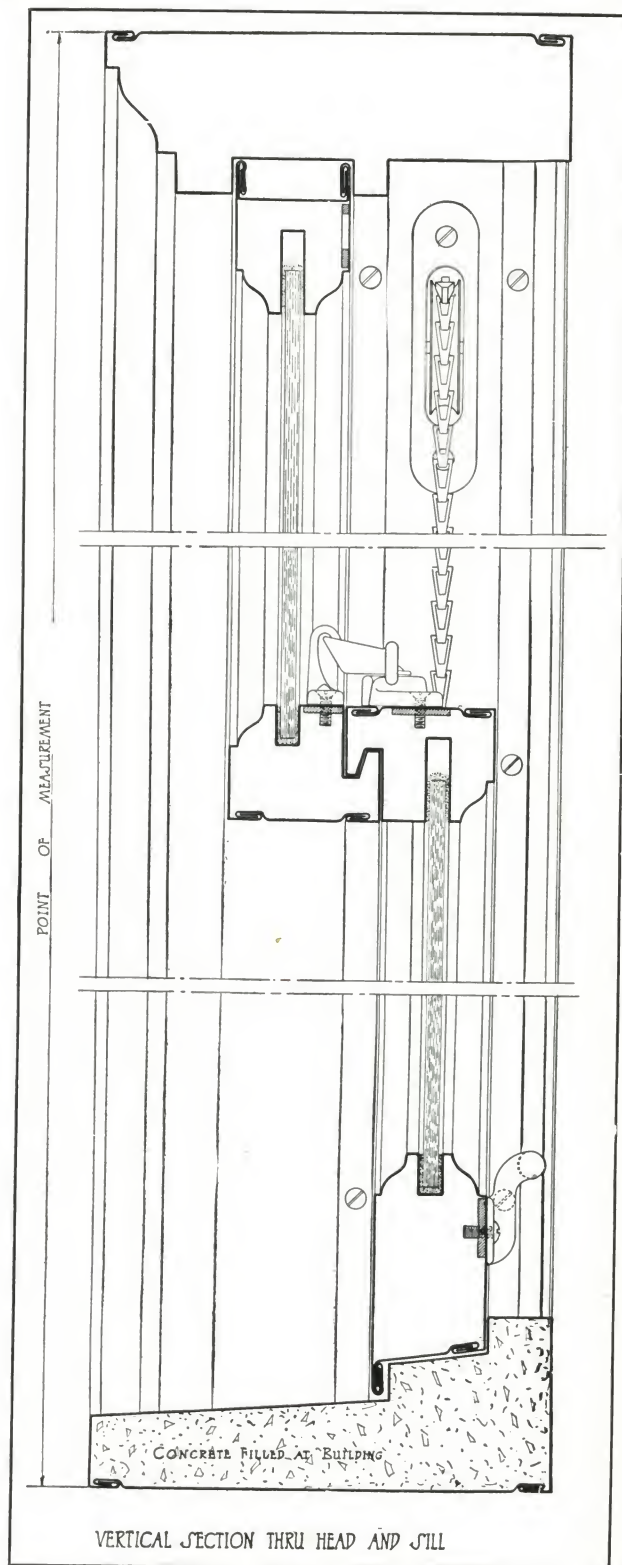

Pulley stiles shall each be formed accurately to provide for a perfect operation of the sash. Each jamb to have a weight pocket of ample size to permit of easy application of the sash weights. Weight pockets to have a removable cover which will fit tight and which will not offer obstruction to the sash in their operation.

Sash rails to be neatly mitered and riveted. All sash to be carefully fitted into the frames at the factory to insure perfect operation and a weathertight job. Meeting rails to lock tightly together when both sash are closed to insure strength and weathertightness. Glass rabbets on all side and bottom rails to be $\frac{3}{4}$ in. deep and on top rails $1\frac{1}{2}$ in. deep. Sash to be divided with muntin bars into lights as required by the Underwriters' Laboratories, Inc., or as shown on the plans. Muntins to have removable caps to permit of glazing without removing sash from the frames. The outside section of the muntin to be securely fastened to the sash rails by rivets and reinforced every 12 in. with a steel, tapped plate. The inside muntin section to be secured to the outside section by means of screws passing through the reinforcing plates. Both sections of the muntin to be moulded to conform with the sash rails.

Hardware to consist of substantial ball bearing pulleys fastened in place in the jambs by means of screws passing through plates riveted on the inside of jambs. Sash shall be hung on heavy sherardized sash chain, approved by the Underwriters' Laboratories, Inc., and counterbalanced with sectional weights. All pulleys shall be placed in jambs in such a manner that they may be removed and replaced without disturbing other parts of the window. Sash shall be equipped with pole socket, bar lifts and underwriters' approved malleable iron lock, dead black, bronze or brass plated finish. Plates to be attached inside sash rails with rivets for attaching hardware. Sash shall be glazed with $\frac{1}{4}$ -in. wire glass (specify kind) thoroughly embedded in putty. All metal shall have one shop coat of an approved metallic paint before leaving the factory.

All windows shall be constructed in accordance with the specifications of the National Board of Fire Underwriters and shall meet their requirements in every respect. All win-

dows shall bear both Underwriters' and manufacturers' labels.
Note: In sending in specifications be sure to furnish all necessary information such as type of window wanted, brick opening size, style of head, whether square or segment, division of glass in sash and kind of glass wanted.

Details Willis Hollow Metal Window

CAMPBELL METAL WINDOW CORPORATION

Pershing Square Building, NEW YORK, N. Y.

BALTIMORE, MD., Bush and Hamburg Streets

Campbell Solid Metal Windows

Model No. 26-W Double Hung—All parts of the sash and frame, as indicated on detail drawings, are formed of No. 12 gage blue annealed steel, the balance of No. 16 gage. Sash weights are single-unit castings. Chains are of steel, hot galvanized, with galvanized connectors to sash and weights. Rubbing strips on each jamb at ends of meeting rails are of bronze. Screws are of steel with standard 10-24 machine thread and heads as detailed. Cast iron sills and stools furnished for this model, if desired.

Model No. 25-W Double Hung—Materials entering into the construction of Model No. 25-W are essentially the same as described for Model No. 26-W with the exception that the sash members are made of No. 14 gage steel and parts of the frame (as indicated on detail drawing) are formed of No. 20 gage blue annealed steel; staff bead of No. 12 gage steel. Sills are of No. 12 gage drawn steel.

Assembly—Sash frames have mitered and welded corners. Glazing stops are mounted with screws on interior. Members forming jambs and head boxes are welded together. The frames are shipped with sash, pulleys and chains installed.

Weathering—Sill, meeting rails and head are fitted with metallic flexible weather stops. Vertical guides and sash members are fitted with metallic flexible interlocking weather stops within the boxes.

Guarantee—The amount of infiltration of air through standard double hung windows is guaranteed not to be more than 1/2 cu. ft. of air per foot of sash perimeter per minute when subjected to a static air pressure equivalent to the pressure exerted by a wind of 25 miles per hour.

Adjustment—Sash have concealed adjusters to prevent sash members from rubbing on exposed face of jambs and scraping paint.

Finish and Hardware—All steel in windows, except inside glass stops and inside cover plates, is galvanized after fabrication.

All finish hardware is solid bronze, polished and unlacquered.

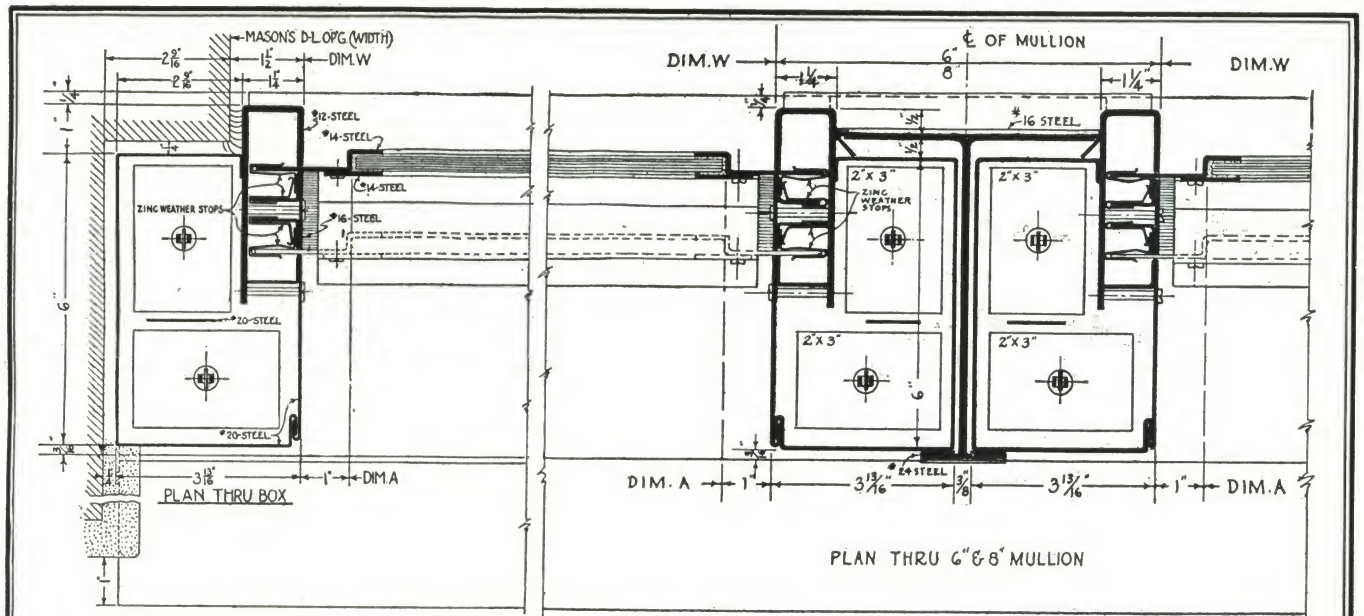

Labels—Where required, windows are made in accordance with the regulations of the National Board of Fire Underwriters and bear their label.

Bronze Windows

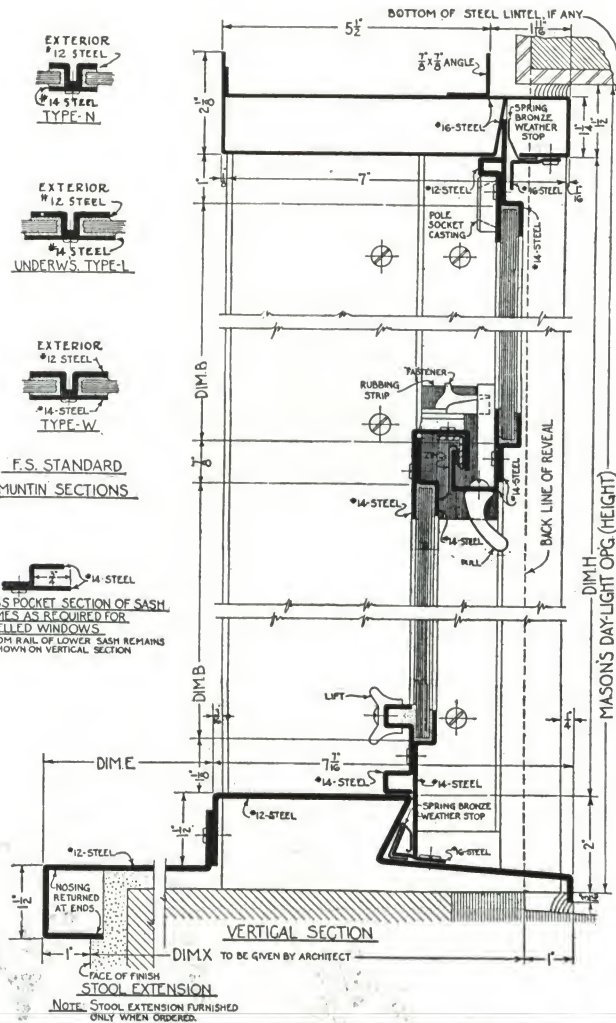

All types are made in bronze if desired.

WEIGHT HUNG, STANDARD CASEMENT, SPECIAL TRANSOM CASEMENT and PIVOTED TYPE WINDOWS made of Solid Nickel-Silver.

VENTILATOR BRACKETS for controlling drafts from weight hung windows.

For Store Fronts made of solid copper, see pages B1763-1765; for Reversible Window Fixtures, see page B2057.

Architectural Service

Information concerning Kawneer windows will gladly be furnished on request. A serviceable catalogue featuring our solid nickel-silver window has been published for the convenience of architects. The manufacturers will be glad to mail a copy of this catalogue or full size details.

Our Engineering Department will gladly co-operate with architects in solving problems concerning special window construction.

Rustless Metal Windows

Kawneer windows are made in solid nickel-silver to meet the requirements of permanency for the better class of buildings. They are made from heavy cold rolled mouldings, all joints being mitered or coped and securely welded. With our method of forming mouldings we are able to build these windows weathertight. This reduces fuel costs and eliminates the use of weather strips. Upkeep costs are restricted to a minimum. Kawneer nickel-silver windows do not require painting on the outside but may be finished to correspond with decorative schemes.

Types

Kawneer Solid Nickel-Silver Windows are offered in standard weight hung, out swinging casements, special transom casement and pivoted types. Practically any style of the various types may be had. If desired they can be made with muntins, and in groups with mullions of corresponding metal.

A Pioneer Manufacturer of Metal Windows

The S. H. POMEROY CO. INC., was a pioneer manufacturer of metal windows. It has been engaged in perfecting window design and adaptability for over 30 years, during which time many prominent installations have been made. It now offers its—

"Superior Type" Heavy Metal Double Hung Window

Superior Metal—This window is made throughout of hot dipped galvanized copper-bearing steel. It is painted with a special galvanized iron primer made to our order.

Note: Committee A-5 American Society for Testing Materials:

"We have now reached a point where we may definitely conclude that copper-bearing metal shows marked superiority in rust-resisting properties as compared to non-copper-bearing metal of substantially the same general composition . . . under atmospheric exposure."

Superior Distribution of Metal—Structural and wearing portions of frame and sash of No. 16 and No.

18 gauge metal, viz.: sill, No. 16 gauge; pulley stiles, head and vertical rails of sash, No. 18 gauge; jamb boxes and cross rails of sash, No. 20 gauge.

Superior Weathering—Two-point contact inside and out entire perimeter of both sash, making double weathering.

Superior Light—Due to small sash and frame members, maximum sight glass area is obtained.

Width of standard muntin 1 in., Underwriters' muntin 1 3/4 in.

Superior Appearance—Compare the slender lines, the simplicity and dignity of design with other metal windows. Note the absence of rivet and screw heads, bolts, etc. All exposed screw heads on interior are countersunk.

Superior Economy—In the "Superior" window we offer to the building public, wherever located, a double hung metal window of unequaled merit and at a price so surprisingly close to wood windows that their use must now become universal.

Air Infiltration

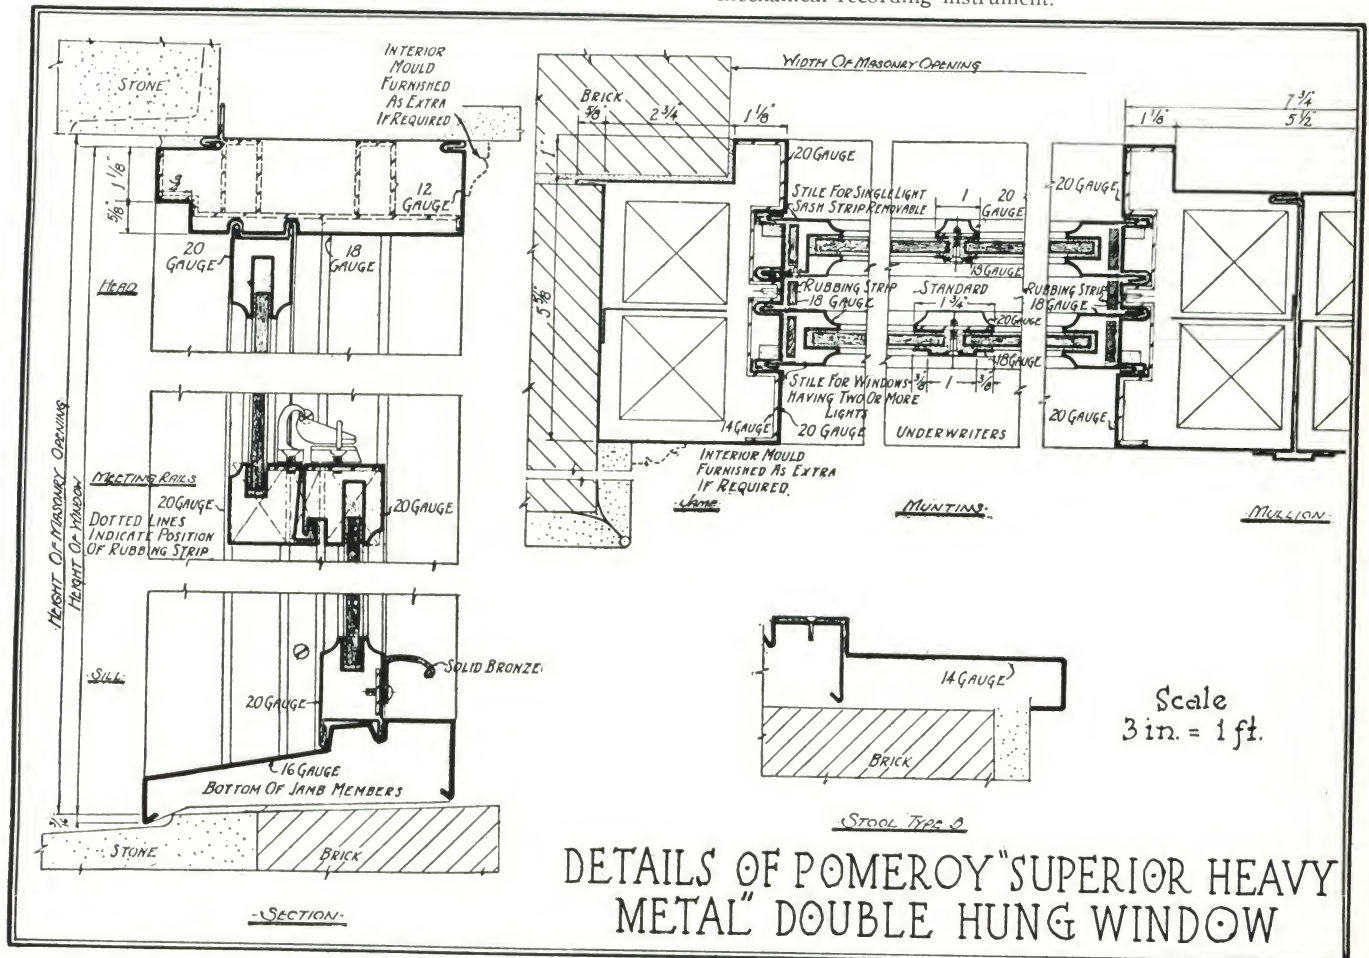

This window has been designed and constructed with the idea of insuring against excessive infiltration of air.

Subjected to test made at the University of Wisconsin by Professors Edward Anderson and G. C. Wilson, under the supervision of Professor G. L. Larson, in a manner similar to that described in the Journal of the American Society of Heating and Ventilating Engineers, June, 1924, the amount of infiltration of air through a standard double hung window proved

to be less than two-thirds of a cubic foot of air per foot of sash perimeter per minute when subjected to static air pressure equivalent to air pressure exerted by a wind of twenty-five miles per hour.

This minimum amount of infiltration of air is accomplished without any added weatherstripping, device or appliance, with their additional cost.

This amount of air leakage is not discernable to a person standing on the room side of a window without the aid of a mechanical recording instrument.

DETAILS OF POMEROY "SUPERIOR" HEAVY METAL DOUBLE HUNG WINDOW

Specification for "Superior" Type Heavy Metal Double Hung Window

Scope—Furnish and install, where shown on drawings, double hung windows of heavy metal "Superior" Type, as manufactured by S. H. POMEROY CO., INC., of New York City.

Material—All windows to be constructed throughout of copper-bearing hot dipped galvanized steel. Sills shall be of No. 16 gauge, jambs of No. 20 gauge, pulley stiles No. 18 gauge, heads No. 18 gauge, side rails of sash and inside muntin caps No. 18 gauge, cross rails of sash No. 20 gauge.

Frame Construction—Head, sill and jambs shall be constructed of one piece of metal, exclusive of pulley stiles and closure strips. All members shall be formed straight and true, neatly mitered, lapped and properly interlocked to their respective intersecting parts. Exterior hanging stile shall be flat and 1 1/8 in. in width. The interior of jamb shall be flat and 3 3/8 in. wide. The depth of frame from inside to outside of hanging stile shall be 6 5/8 in. Pulley stiles shall be formed with deep weathering grooves and shall be removable to permit of access to weight boxes and pulleys, and held in position by flat head countersunk screws. These screws shall pass through heavy reinforcing plates spanning the inside of jamb box. With the exception of these screws no other screw heads, nuts, bolts or rivets shall appear on the inner face of the jamb or soffit of the head.

Sash Construction—Sash shall be moulded and of tubular design 1 1/4 in. thick. Side rails shall project not more than 1 1/4 in. beyond the inner face of the jamb, making the total distance from masonry jamb to sight line of glass 2 1/2 in. Stiles and rails shall be constructed of one piece of metal moulded and neatly mitered, lapped and properly welded and interlocked. Side rails shall be of open construction with each flange being formed with a returned edge projecting into and operating in

the weathering grooves of pulley stiles. Top and bottom sash rails shall be formed with flanges which shall engage in weathering grooves in the soffit of the head and those formed in the sill. Meeting rails shall not be more than 1 3/4 in. in depth and constructed with flanges forming interlocking contact. Glass rabbets in side and bottom rails shall be 3/4 in. deep. Those occurring in top rails of upper and lower sash shall be 1 3/8 in. deep. Where sash are to be glazed with one light of glass the side rails shall be constructed with removable inside glazing beads which shall be held in place with flat head countersunk machine screws.

Muntins—Exterior muntin bar shall be moulded and reinforced with No. 14 gauge steel lugs. Interior caps shall be flat and held in place by flat head countersunk machine screws passing through the reinforcing lug of the exterior member.

Hardware Equipment—Frames shall be equipped with solid steel bronze bushed pulleys, contained in Nos. 12 and 14 gauge steel housings. Sash shall be hung on substantial sherardized steel sash chain and properly counterbalanced by cast iron weights. Sash shall be equipped with one pair of solid moulded bronze lifts, one malleable iron plated sash lock and pole socket.

Painting—Frames and sash throughout shall be given one shop coat of manufacturer's special prepared metallic primer before delivery.

Note: If Underwriters' label is desired the following paragraph should be incorporated:

"Windows shall be constructed in accordance with the requirements of the National Board of Fire Underwriters and shall bear their label of approval, as well as the label of the manufacturer."

Note: If it is desired to construct this window of bronze or copper, please write for specification.

Reed and Fulford Streets
KALAMAZOO, MICHIGAN

Products

VOIGTMANN ROLLED STEEL WINDOWS, Double Hung.

VOIGTMANN HOLLOW METAL WINDOWS, Double Hung.

Tested and approved by the Underwriters' Laboratories, Inc.

Improved Features

All Voigtman Windows are now made with patented, removable jamb feature which greatly simplifies the hanging of sash and permits of easy access to weight boxes. This feature also eliminates all exposed screws and difficult sash adjustment. All Voigtman Windows are also equipped with improved weathering features which combine ease of sash operation and weathertightness.

Voigtman Model No. 12 Rolled Steel Window

This window is the result of thirty-three years of Voigtman experience in metal window building. It is made of heavy gauge materials and combines correct architectural design with great durability. This, in conjunction with its weatherstripping features, makes it especially suitable for all high class, modern buildings. Sash, sill, head and removable weight pocket are made of heavy hot rolled steel running in thickness from 10 to 12 gauge. Balance of frame is made of 14 gauge steel galvanized after fabrication. Glazing stops are neatly mitered and welded at the factory, to be held in place with counter sunk screws effecting a glazing stop finish in neatness and design not heretofore accomplished. Rolled steel sash operating in rolled steel weathering grooves assure perfect fit, excellent weathering, along with noiseless and easy operation.

Voigtman Model No. 24 Hollow Metal Window

This window possesses the same Voigtman quality and the many other desirable features of the Model No. 12 window. It was developed to meet the demand for a lower cost window without a sacrifice to strength and durability. Although possessing neat members, its strength is provided for by the number of correct reinforcing bends made in the metal during the forming operations. This model is a pleasing type, architecturally correct, and permits a maximum of glass area. All

Barker Bros. Building, Los Angeles, Cal.

Details of the Voigtman Model No. 12 Double Hung Window

frame and sash members are made of No. 24 gauge, tight coated, galvanized steel. The sash weights are hung with extra heavy steel chain. This window can be made of 20-oz. cold rolled copper, or bronze if desired. Sash operate easily and are weathertight.

Hardware

These specifications apply to both Model Nos. 12 and 24: Voigtmann special removable pulleys, sash lock, lifts and pole socket. Furnished either in solid bronze or malleable iron, brass plated. Special hardware furnished if desired.

The Company

VOIGTMANN METAL WINDOW CORP. was the first to make metal windows and now offer the experience of thirty-three years of continuous, successful manufacture. The plant facilities and grade of skilled workmen employed are such as to guarantee the highest grade of product and deliveries according to schedule. An opportunity to estimate your work will be given prompt and careful attention.

Jackson Windows

Jackson Windows are designed to meet the most exacting demands of architects and engineers. They are made airtight and watertight without the use of weatherstrips and are easy to install.

Bronze for Permanence

Permanence is the outstanding characteristic of Jackson Windows. The enduring bronze of which these windows are made and their perfection of manufacture give them an unlimited term of service.

Type H
Bronze Double
Hung Window

Fidelity-Philadelphia Trust Company Building, Philadelphia, Pa.

SIMON & SIMON, Architects

2650 Jackson Bronze Windows for the entire building, also ornamental bronze work, will be installed in this new Philadelphia landmark

Economical

This quality of permanence, together with the fact that they require no maintenance, make Jackson Windows of solid bronze ultimately less expensive than other types.

For example, the maintenance of an ordinary iron window will, in a short number of years, amount to more than the added price of a bronze window at the time of installation. In addition, the weathertightness of Jackson Windows decreases the cost of fuel. The iron window after a period of a few years begins to deteriorate and becomes more and more expensive to maintain, while the bronze window is in as perfect condition as when first installed and calls for no expense or care.

Catalogues and Service

Catalogue No. 21, "Jackson Windows of Bronze," will be sent on request.

Adams Steel Windows

Industrial Type—This style of window made with ventilator vertically pivoted, horizontally pivoted, top pivoted, bottom pivoted and projector type.

Dwelling Type—The illustration below is one of the attractive designs which we suggest for homes.

Window fitted with bronze adjusters and cremone bolts.

Installation Detail of Case-moment Type Windows

Adams Steel Window for Dwelling

Glazing—Windows are glazed with wire clips or steel glazing beads using special steel putty.

Construction—The sash and frame are made from heavy rolled, special formed solid steel. All joints are electrically welded to insure perfect rigidity. Extra strong steel hinges with brass bushings are riveted to frame and sash. Hinges have heavy steel hinge pins which are easily removed. This feature makes the glazing of the sash very simple.

Screen or wire guard may be easily attached.

Anchor angles are furnished bolted to each frame if wanted.

No. 1-24 Reversible Windows (20 pages)

CRITTALL SOLID STEEL AND BRONZE CASEMENTS

Uses—For banks, public buildings, residences, churches, universities, office buildings, clubs, hospital operating rooms, etc.

Material—The weight of sections, heavy or medium, shall be determined by manufacturer's best standards as set forth on page 46 of Catalog 6-26. All steel used in the manufacture of these sash shall be Crittallloy—the copper bearing steel—containing not less than 0.15% nor more than 0.30% copper in order to resist rust. All bars shall be hydraulically straightened and free from hammer marks or other imperfections.

Painting—All steel shall receive two coats of rust resisting paint, each coat baked on separately.

Weathering—The sections shall be so designed as to give double contact on all sides without the use of pressed or screwed on fillets or strips of any kind.

Welding—All corners shall be mitered and electrically welded. Plates to receive hardware must be securely welded to the casement sections.

Hardware—All hardware shall be solid bronze, government mixture, toned a dark coinage color, this color secured without the use of plating or chemicals.

(Transoms in [describe location] shall be fitted with mechanical operators to operate from floor.)

Note: Specially designed hardware in bronze or hand wrought iron may be specified when desired.

Glazing—All sash shall be fitted with *solid* rolled steel glazing stops for glazing from the inside. Glazing stops shall be mitered at the corners and shall be held in place by countersunk brass screws. (Alternate: All sash shall be fitted with copper covered spring clips for putty glazing from the outside.)

Design—Sash shall be made to the design and sizes shown on the elevations and details. Ventilating units are marked on elevations with dotted diagonal lines; all other units to be fixed or stationary.

Erection—These windows shall be set by the manufacturer and all joints between the steel sash and the collateral construction are to be made tight with the use of Crittall Mastic Cement neatly pointed on the exterior.

(Describe here whether the windows set in $\frac{3}{8}$ -in. rabbeted stone, wood or cast iron frames, or are fitted with angle fin for setting directly into masonry, or are to set into rabbeted No. 12 gauge pressed metal frames to be furnished by the casement manufacturer but to be built in as the walls go up.)

STOUDER THOMPSON RESIDENCE, CLEVELAND HEIGHTS, OHIO
PHILLIP LINDSAY SMALL, Architect

Details—The details shown above can be varied to suit any given conditions. Wood frames, mullions and transom bars may be used in a detail very similar to the cut stone shown.

In place of the No. 12 gauge hollow metal frames shown in the second detail, ornamental cast iron frames may be used where expense is not a primary consideration.

The third detail is economical and suitable wherever a narrow sight line is sought.

Special Hardware—While standard hardware is of solid bronze, of Government mixture, toned a dark statuary color, in pleasing and substantial designs, specially designed hardware may always be obtained when desired.

Such special hardware may be of bronze, of hand wrought iron, or of bronze nickel, silver or gold plated, to our own or to the architects' designs.

Operating Devices—Mechanical operating devices are available to meet all requirements.

These can range from a simple but effective cam stay for the pole operation of a hinged-at-top-to-open-out casement to a power driven operator for groups of sash.

Shades, Screens and Draperies—In laying out the windows it is always advisable to make provision for shades (if used), drapes and screens and it is recommended that the casement manufacturer be consulted in reference to these three items while the job is still in a preliminary stage.

Co-operative Service—The CRITTALL CASEMENT WINDOW COMPANY has six branch offices in principal cities and has over fifty representatives. There is usually a branch office or representative near an architect, eager to be of service in the way of details, drawings and suggestions.

CRITTALL STANDARDIZED CASEMENTS

Sizes and Types

The sizes shown at the left are standard and the operation of types is as follows:

Types 21, 51, 81, 111 are stationary.

Types 22, 52, 82, 112 are hinged at side to open out.

Types 23, 53, 83, 113 are hinged at side to open in.

Type 24 is hinged at top to open out at bottom.

Type 25 is hinged at bottom to open in at top.

It is possible to join two or more types by means of a small T mullion or transom bar, to secure various opening sizes.

All types, whether opening in or out, are *guaranteed* weathertight.

Type 82

Uses

These casements are designed for projects where the architect desires to use the best. Economy is affected by standardization but quality is maintained. Residences, churches, clubs, libraries and similar buildings may use these windows to advantage.

Hardware

All handles are of solid bronze of Government Standard. They are well designed and finished and are toned a dark statuary bronze color. Stays are bronze finished, adjustable friction type, and are fitted at the head of each casement.

Quality

Standardized casements are of the same quality as Crittall custom built casements with minor adaptations for standardization. They are made of the medium section illustrated in full size on the preceding page. They may be glazed with either large lights of plate glass or with leaded glass in small panes.

CRITTALL REVERSIBLE WINDOWS

Uses—For office buildings, public buildings, schools, hospitals, etc.

Material—All steel used in the manufacture of these sash shall be copper bearing steel and shall be free from hammer marks.

Weathering—The solid sections must give double contact on all sides without screwed on strips.

Welding—All corners shall be electrically welded.

Hardware—Shall be solid bronze of Government mixture, finished a dark coinage color. It shall include a lever handle at the main sill, a pole catch at the meeting rail, and shade brackets and shade cord stop pulleys on each leaf.

Glazing—All sash shall be fitted with steel angle glazing stops for glazing from the inside.

Design and Construction—The sash shall be so designed and constructed that the ventilators will reverse for cleaning from the inside. Each leaf shall operate independently.

Painting—All steel shall receive two coats of rust resisting paint, each coat baked on separately.

Labeled Windows—All sash on (give location) shall bear the label of the National Board of Fire Underwriters. Sash shall be divided by muntins so that no pane of glass exceeds 720 sq. in. in area and no one dimension (either width or height) shall exceed 54 in.

GENFIRE STEEL COMPANY

(THE GENERAL FIREPROOFING BUILDING PRODUCTS)

Manufacturers of Steel Windows and Doors

YOUNGSTOWN, OHIO

For Branch Offices, see page B1294

Products

STEEL CASEMENT WINDOWS; STEEL BASEMENT WINDOWS; STEEL CASEMENT DOORS; STEEL PIVOTED WINDOWS; COMMERCIAL and ARCHITECTURAL TYPES PROJECTED WINDOWS; CONTINUOUS WINDOWS; INDUSTRIAL DOORS and FRAMES.

Also Mechanical Window Operators.

For Waterproofings, Dampproofings and Technical Paints, see pages A62-63; for Metal Lath, Channels, Corner Bead, Self-Sentering, Trussit, Expanded Metal,

Steel Joists, Steel Tile and Metal Building Specialties, see pages B1294-1297.

Genfire Windows

All types of Genfire Windows are made from hot-rolled sections of highest grade steel and are given one dip coat of English oxide of iron and oil paint in factory. Double weathering contact in all types assures weather-tightness. Malleable iron hardware is standard equipment but bronze is furnished at slight additional cost.

Genfire New Type Standard Steel Casement Windows and Doors

Genfire Standard Steel Casements—A quality product in every sense of the word with double weathering contacts, welded and smooth-ground joints, continuous muntins, bronze bushings in hinges and many other refinements. Having the fewest parts to assemble, Genfire casements are economical in first cost, installation and maintenance.

Genfire Casement Doors—These doors harmonize perfectly with the casement windows for the various fittings may be used in combinations. A cremone bolt on one leaf and top and bottom bolt on the other assures weather-tightness when closed and allows the use of one door for general passage. Each leaf has three heavy hinges welded to frame.

Construction Details

- (1) *Adjustable friction stay* holds the casement open in any desired position, is entirely concealed inside the weathering at the top of casement when closed. Shipped unattached.
- (2) *Vertical mullion*. This simple mullion provides a neat paneled appearance inside.
- (3) *Steel push bar* can be furnished with BT-114 unit (without friction stay and cam handles).
- (4) *Continuous head drip* showing shape and proper position when attached. Its practical sturdy construction insures proper weathering and joins the units solidly together when assembled in combinations.
- (5) *Transom bar* used when two or more units are combined one above the other, forming a drip over lower sash and providing rigidity in combination of units.
- (6) *Cam handles* are shipped separately. Furnished in malleable iron for both right and left hand. Solid bronze handles of same design if desired at slight extra cost.
- (7) *Flexo-stay adjuster*, for use under screen, operates with the casement from the inside without opening screen. Will hold sash open in any desired position. Standard friction stay at top is omitted when flexo-stays are used. Furnished in bronze or black finish.
- (8) *Continuous sub-sill section* provides extra weather protection at the sill and unites combinations in solid mass.
- (9) *Corners of frame* are mitted and electrically welded with welds inside concealed from view.
- (10) *Corners of sash* welded same as frame.
- (11) *Spring wire glazing clips* hold glass any thickness firmly in place. Provision made for bed and face putty. Outside glazing gives neat interior finish.
- (12) *Jamb angle* provides secure anchorage into masonry wall construction and makes wooden frame unnecessary.
- (13) *Cleaning hinges* are supplied if desired. Bronze bushed heavy steel pins.
- (14) *Standard heavy hinges* are spot-welded to frame and sash. Bronze bushed heavy steel pins.
- (15) *Anchored* in any type of wall construction.

WIDTHS OF WINDOW OPENINGS FOR GENFIRE CASEMENTS

Number of units	Lights wide in each unit	Total number of lights wide	Width of window opening
1	1	1	*1'- 1 1/8"
1	2	2	1'- 7 3/8"
2	2	4	3'- 2 3/4"
3	2	6	4'-10 1/4"
4	2	8	6'- 5 1/4"
5	2	10	8'- 0 7/8"
6	2	12	9'- 8 3/4"
7	2	14	11'- 3 3/8"
8	2	16	12'-11"

*One light wide units only furnished in 3 and 4 light heights without Friction Stay.

HEIGHTS OF WINDOW OPENINGS FOR GENFIRE CASEMENTS

Number of units	Single unit or combination of two units	Total number of lights each	Height of window opening
1	Single Unit	1	0'-11 3/8"
1	Single Unit	2	2'- 1 3/8"
1	Single Unit	3	3'- 0 5/8"
1	Single Unit	4	3'-11 1/4"
2	3 lights and 1 light	4	3'-11 1/4"
1	Single Unit	5	4'-11 1/4"
2	4 lights and 1 light	5	4'-11 1/4"
2	3 lights and 2 lights	5	5'- 2 1/8"
2	5 lights and 1 light	6	5'-10 1/8"
2	4 lights and 2 lights	6	6'- 1 3/8"
2	5 lights and 2 lights	7	7'- 0 1/8"

Genfire Steel Basement Windows

These windows are made in four standard sizes as shown below. They are furnished complete for installation and there are no hinges or locks to buy, no fitting of sash to frame or priming coat of paint necessary.

May be installed in concrete, masonry, wood or any other type of construction.

**BASEMENT WINDOW SIZES**

Glass size, in.	Lights wide	Window opening ft.-in.
10x12	3	2-9 $\frac{5}{8}$ x1-3 $\frac{1}{8}$
10x20	3	2-9 $\frac{5}{8}$ x1-11 $\frac{1}{8}$
14x20	2	2-7 $\frac{3}{8}$ x1-11 $\frac{1}{8}$
12x18	3	3-3 $\frac{3}{8}$ x1-9 $\frac{1}{8}$

Genfire Pivoted Windows

The various sizes of pivoted windows fill practically all building needs.

Glass size in stationary portion 12x18 or 14x20 in.; all lights at top and bottom of ventilator are 1 in. shorter and lights at side of ventilator are 1 in. narrower than in stationary portion.

The twenty-five types of sash shown below are available from all our warehouses and can be combined with standard mullions to fit all sizes of window openings.

**Types of Pivoted Windows**

Ventilators indicated by cross-dashed lines are horizontally pivoted 2 in. above center.

How to Read Unit Type Number

First figure denotes number of glass panels wide
Second figure denotes number of glass panels high
Third figure denotes number of ventilator
Fourth figure denotes number of glass panels in ventilators
Fifth figure denotes distance (in lights) of ventilator from bottom of sash

Genfire Projected Windows

Commercial Type—Wherever the practical advantages of projected windows are sought, the commercial type is specified.

These windows harmonize perfectly with the pivoted windows so that they may be used for the office section of an industrial plant with complete conformity with the external design.

Genfire Utility Doors and Frames

These doors are available with sash or solid panels, in four standard stock sizes which can be used singly or in combination for door openings of different dimensions. The hardware equipment supplied with each unit converts the standardized door panels into either the swing or sliding type, as required.

Genfire Utility Doors are made from carefully formed steel sections, reinforced at the corners and electrically welded at the joints.

**Genfire Projected Window, Architectural Type**

Architectural Type—This type of window emphasizes proportion as well as the practical.

In keeping with the greater suggestion of massiveness, its outside frame is a heavy channel. All corners of the frame and ventilator are welded and ground.

Complete details contained in handbook, "Architectural Details."

Products

INTERNATIONAL CASEMENTS and WINDOWS in solid rolled steel and drawn bronze; COTSWOLD CASEMENTS and DOORS; AUSTRAL SOLID STEEL WINDOWS.

Also Casement Hardware and Leaded Glass.

Specifications for International Steel Casement Windows Set to Rabbeted Wood Frames or Cut Stone

Solid rolled steel casement windows as manufactured by INTERNATIONAL CASEMENT CO., INC., or equal in the opinion of the architect. Steel sections of suitable design and weight, metal to metal contact, no loose strips. Bars hydraulically straightened, corners accurately machined, electrically welded and cleaned free from flux.

Casement manufacturer shall furnish and apply at the factory all hardware and operating devices, which shall be of solid bronze. Side hinged casements swinging out 5-ft. high and over shall have double grip bolt in addition to fastener, and side hinged casements swinging in 4 ft. 6 in. high and over shall be similarly equipped. Transoms out of reach from floor shall have operators that can be worked from the floor.

Sash shall be fitted with moulded steel glazing beads (glass stops) set with brass screws. Corners mitered and neatly fitted. All steel work cleaned free from rust and scale, painted two coats rust resisting paint, each coat separately baked on.

The casement window contractor shall set the casement sash. Frames to be bedded and pointed (inside and out) with approved mastic cement, finished in a workmanlike manner and guaranteed absolutely weathertight. If set to stone rabbets, lead expansion shields to be used.

Not included: glass, glazing, painting after erection, screens or preparation for same.

Specifications for International Composite Windows Set to Masonry Reveals

Sub-frames of pressed steel No. 12 gauge [No. 11 gauge, ingot iron] of size and contour as shown by scale details. If both dimensions exceed 7 ft. they shall be assembled at the factory, taken down and shipped knocked down. If under this size, corners shall be electrically welded and cleaned free from flux.

Steel work painted two heavy priming coats of rust resisting paint, each coat separately baked on.

The sub-frames are to be delivered to the building site by the casement manufacturer but must be set and built in by the mason. The masonry contractor will be required to set frames plumb and level, in close contact with masonry reveal at sides and head, and resting solidly on sill. After setting, wood spreaders or braces shall be placed in the frames to keep them true and square.

Calking—The calking between masonry and sub-frame to be covered under separate heading.

Casement Sash—Shall be of suitable design and weight, etc. (Copy specification.)

Literature and Drawings

The following catalogues contain scale and full size details, photographs and measured drawings:

- No. 6. International Austral Windows.
- No. 7. International Casements (224 pages).
- No. 10. International Cotswold Casements.

Ellison Window Operator

The Ellison window operator for out-swinging casement windows, either wood or steel, is designed to operate through the stool of the window without opening the screen.

It is pleasing in appearance, simple and rugged in construction and foolproof in operation.

Built with ample strength to open and close the largest casement, self-locks in any position, and absolutely prevents rattling.

INTERNATIONAL COTSWOLD CASEMENTS AND DOORS

In Standard Types and Sizes

Cotswold Casement Specification

(1) Casements of Cotswold type, made from heavy two-point steel section (not Cottage Sections) hinged at side opening outwards painted two coats of rust resisting paint, each coat separately baked on, hung on drop forged steel pivots bronze bushed and fitted with solid bronze hardware of standard design.

(2) Furnish leaded glass of standard sizes and design, first quality D.S.A. glass $\frac{1}{2}$ -in. lead comes, all horizontal comes steel reinforced.

(3) If steel muntins are required omit paragraph 2 and specify steel muntins to be furnished.

(4) The whole to be set by sash contractor and guaranteed weathertight.

Cotswold Door Specification

(1) Doors of Cotswold type (either "L" or "M") made of heavy two-point steel sections, hinged at side opening outwards, painted two coats of rust resisting paint, each coat baked on separately, hung on drop forged steel pivots bronze bushed, having bronze intermediate hinges and fitted on the first opening leaf with bronze cremone bolt which can be operated from inside or out and secured on inside by a safety catch. The other leaf being fitted with two bronze bolts, friction adjusters being supplied on each leaf. Galvanized kick panels to be provided.

(2) (For "L" type only). Furnish leaded glass of standard sizes and design, first quality D.S.A. glass $\frac{1}{2}$ -in. lead comes, all horizontal comes steel reinforced.

(3) (For "M" type only). Doors to be divided into panes with rolled steel tee muntins.

(4) The whole to be set by sash contractor and guaranteed weathertight.

ALL THE TYPES SHOWN ABOVE (EXCEPT 21-25-45-31-55 AND 135 WHICH ARE FIXED SASH) ARE HINGED TO OPEN TO THE RIGHT OR LEFT OR THEY CAN BE SUPPLIED AS FIXED SASH. COMBINATIONS OF VARIOUS TYPES CAN BE MADE BY THE USE OF STEEL MULLION AND TRANSOM BARS.

Types and Sizes of Cotswold Casements

Types and Sizes of Cotswold Doors

The above full size detail applies to Cotswold doors and casements. The corresponding fixed light section consists of a channel section of similar outline and gives the same sight line. Glazing angles are provided on doors type "L" only and are optional on the casements of leaded light type. All other types have putty glazing.

International Austral Windows

Specifications—

Windows where marked on plans to be copper-bearing steel with Austral balance arms as manufactured by the INTERNATIONAL CASEMENT CO., INC., Jamestown, N. Y. Sub-frames of No. 12 gauge steel, with welded corners, painted two priming coats, each coat separately baked on, to be delivered to building site, but same to be set up, built in and calked by mason contractor.

Sash to be of special shapes, made of copper bearing steel. All bars hydraulically straightened, corners electrically welded and cleaned from flux.

Frames and sash carefully fitted to insure absolute weathertightness. Fit with steel glazing beads (glass stops) set with brass screws. Clean all steel work free from rust and scale and paint two heavy priming coats, each coat separately baked on.

This contractor shall furnish all necessary hardware and fittings as follows: galvanized drop-forged steel window cleaner's bolts, shade brackets for both upper and lower sash with roller guides to hold cords. Polished cast bronze automatic cam catch and pull.

The sash shall be erected by this contractor after the plastering is completed. Same to be bedded and pointed in mastic cement and secured to subframe by machine screws. All to be finished in a workmanlike manner and guaranteed weathertight.

DETROIT STEEL PRODUCTS COMPANY

Manufacturers of Fenestra Steel Windows

2250 East Grand Boulevard, DETROIT, MICH.

Fenestra

(1) Experience and Facilities

Fenestra, the Latin word for "window," is also the registered trademark of the first steel window made in America. Since 1907, the DETROIT STEEL PRODUCTS COMPANY has manufactured these windows under exclusive patents covering the Fenestra joint, a process of interlocking steel bars in such a manner that strength increases at the point of intersection. The company has always enjoyed an exceptional reputation for financial soundness and is recognized as one of Michigan's strongest industrial concerns. Its product has been used on many of the largest structures in the United States. Besides the main plant covering 14½ acres in Detroit, branch plants are maintained at Oakland, California, and Toronto, Canada. The product is sold through 14 branch offices, direct agents in all the principal cities, dealers in towns of every size, and a world-wide export organization. Canadian sales are handled through the Canadian Metal Window and Steel Products Company, Ltd., of Toronto.

(3) Designing Service

To assist in the proper designing of steel windows for architectural structures, we maintain an Architectural Service Department composed of architects with special training in the correct use of Fenestra in all types of monumental buildings. A word to your local Fenestra representative will place this department at your disposal without charge or obligation, with either direct personal service in your own drafting room or through intelligent co-operation from headquarters in Detroit.

(4) Research Service

The daylighting and ventilating results, which may reasonably be expected from any given arrangement of windows, can now be predetermined with considerable accuracy through methods developed over a period of years by our Department of Engineering Research in conjunction with the Engineering Research Department of the University of Michigan. On major operations where the type and character of fenestration play an important part in the design of the building, we shall be glad to consider the special problems involved and give you the benefit of our research along these lines. No cost or obligation is involved as this service is rendered in the interest of better use of natural forces in the daylighting and ventilating of industrial structures.

(2) Scope of This Catalogue

While the DETROIT STEEL PRODUCTS COMPANY is fully equipped to manufacture solid steel windows, doors, partitions and operators of every type and character, it is manifestly impossible to show in any catalogue the hundreds of special designs which this company can supply.

This catalogue, therefore, covers only such designs as have been accepted throughout the steel window industry and approved by the Department of the Interior as the stock and standard products normally used in building.

On individual operations where windows of special design are absolutely required, layouts and detail drawings are supplied without added cost.

To secure the most practical and economical window designs, we strongly recommend consultation with our branch offices and agents *at the time the building is designed.*

(5) Erection Service

The FENESTRA CONSTRUCTION COMPANY, a subsidiary of the DETROIT STEEL PRODUCTS COMPANY, offers builders the service of an organization especially equipped and trained for the erection and field painting of Fenestra windows. *Under separate contract*, this company will assume complete responsibility for the delivery, handling, erection and painting of Fenestra products and will guarantee satisfaction from the time the material leaves the factory until it is installed in the building. Twelve erection supervisors and twenty-seven experienced field superintendents are constantly employed in this work all over the United States.

General Information—Read Carefully

(6) Nomenclature

Numbers designating various types of Fenestra Windows are translated as follows: first digit—number of lights in width; second digit—number of lights in height; third digit—number of ventilators or swing leaves; fourth digit—number of lights in each ventilator or leaf; fifth digit—number of lights between ventilator or swing leaf and the sill of the window. Thus a casement type 4528 indicates a unit 4 lights wide, five lights high with two 8-light swing leaves at the sill. A Horizontally Pivoted type 35161 indicates a unit 3 lights wide, 5 lights high with one 6-light ventilator 1 light above the sill.

(7) Dimensions

In all Fenestra except casements and basements, the window dimension is always equal to the clear opening. In other words, that part of the window frame which is embedded in the wall is not considered in the window dimensions. On casement windows the window

opening dimension is ¼ in. larger than the window dimensions, for clearance. On basement windows dimensions are overall. See details.

(8) Stock Types

Stock types of Fenestra Windows—those types which are made up and carried in warehouses—are indicated in this book by solid outline drawings, *shaded*. Standard types—those types which are not made up but for which bars are already cut and in stock at Detroit—are shown in solid outline, *not shaded*. Listed Special Windows are shown in *broken* outline. Stock types are always preferable from the standpoint of economy and quick shipment. Standard types are next best.

(9) Installation

All window openings should be so designed that steel windows may be installed after the walls are up. This is the most economical, as well as the most practical method of erection and obviates many difficulties frequently

encountered when an attempt is made to set the windows as the building progresses. Rebates, clearances and angles as shown have been accepted as the best building practice and such details should be followed closely.

Steel windows are not structural members and under no circumstances should any portion of the building structure be allowed to rest on the windows.

(10) Glazing

Standard glass dimensions for horizontally pivoted units are: 12x18 in. and 14x20 in.; but glass in ventilators which abut on the top, sides or bottom of the ventilator must be trimmed 1 in. along the abutting edge. See accompanying diagram. It is desirable to cut glass full to the specified dimension.

Casement and Architectural Projected glass sizes are indicated on the plates showing types and sizes of standard units.

Ordinarily, the DETROIT STEEL PRODUCTS COMPANY does not do glazing but any Fenestra representative can refer you to reputable concerns who make a specialty of glazing steel windows. A sufficient quantity of spring glazing clips accompanies every order of Fenestra windows, without added cost. After the windows have been bed puttied and glass inserted, the clips are used together with face putty to hold glass in place. On casement windows use two clips for each light. On horizontally pivoted windows use four clips for each fixed light, and six clips for each ventilator light.

Plate glass is desirable for casements though double strength clear glass may be used. The standard method of glazing architectural projected windows is with $\frac{1}{4}$ in. glass or double strength glass, held by glazing angles or

glazing bead. On horizontally pivoted windows $\frac{1}{4}$ in. factory ribbed or wire glass or $\frac{1}{8}$ in. ribbed, or double strength glass may be used.

(11) Putty

Wood sash putty never should be used with steel windows. Steel casement putty or any other high grade of steel window putty should be used, and is obtainable locally. Putty may be ordered from Fenestra dealers or from company warehouses in 25, 50 and 100 pound drums. Use $\frac{1}{2}$ pound per square foot of glass area.

(12) Basement Windows

Fenestra Basement windows are sold exclusively through dealers. Thousands of dealers in all parts of the country carry them in stock for immediate delivery. Any responsible dealer can secure them by writing to the home office at Detroit.

(13) Lists and Schedules

We recommend that all steel windows, doors, partitions or operators be accurately listed and located either in schedules on plans or in specifications. If more than one type of the same product be desired, each type should be listed and located separately. In the case of mechanical operators, it should be clearly indicated whether the ventilators are to be operated from one or more stations and whether in single or in multiple runs. These details assure greater accuracy in estimates.

(14) Fillets to Increase Strength

Most of the bars used in the manufacture of Fenestra steel windows, doors and partitions, are of solid, open hearth steel, hot rolled to special Fenestra designs. All such bars are rolled with heavy fillets in all re-entrant angles. These fillets increase the strength and rigidity of the bars, making them much stronger than similar sections of pressed metal.

(15) Protection of Hardware

We strongly recommend that hardware be stored carefully in the original packages and that it be attached *only* after the windows, doors or partitions have been erected, glazed and painted.

(16) Galvanizing

Where specified at the time the order is taken, Fenestra Architectural and Industrial Windows can be supplied, hot galvanized. (Certain parts, such as glazing angles and side arms, electro-galvanized.) Mechanical operators may also be secured, galvanized, under the same conditions with the exception of powers which are painted with aluminum paint.

Bed Puttying

Inserting Glazing Clips

(A) STEEL CASEMENT WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(A-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(A-2) General

Steel Casement Windows shall be Fenestra as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(A-3) Material

(A-3a) Casement Sections—All sections shall be specially designed, hot rolled, solid steel casement bars with heavy fillets in all re-entrant angles.

All frame members and the stiles and rails of each swing leaf shall be rolled with a $\frac{1}{8}$ " baffle.

Muntins shall be T bars.

(A-3b) Mullions—All mullions shall be hot rolled, solid steel T bars.

Note: Use when two or more Casements are placed side by side or one above another in the same opening.

Note: Pressed metal or built up sections should not be used for either vertical or horizontal mullions.

(A-4) Construction

(A-4a) Frames and Swing Leaves—Frames and the stiles and rails of swing leaves shall be baffled Z bars mitered at all corners and electrically butt welded. All exposed faces at welds shall be ground to a smooth finish. Provide continuous, two-point, flat contact weathering between swing leaves and frame.

(A-4b) Muntins—Muntin bars shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase the rigidity and strength at intersections. Joints at frames, stiles and rails shall be mortise and tenon, air hammer riveted.

Note: Intersections of casement window muntins are made substantially as described on Fenestra Page 44.

Note: Muntins may be omitted to permit glazing in single lights or leaded glass. If desired so specify. We do not supply leaded glass.

(A-4c) Vertical Mullions—Vertical mullions shall be $1\frac{3}{8}$ " deep. Provide bolts for frame attachment.

(A-4d) **Horizontal Mullions**—Horizontal mullions shall not be less than 2¼" deep with tip of protruding web bent downward to form a drip. They shall be continuous from jamb to jamb. Provide bolts for frame attachment.

(A-4e) **Copper Head-Drip**—Wherever swing leaves extend to head of frame, provide a continuous 20-gauge, cold rolled, copper drip.

Note: Copper drip is shipped unattached. See details Fenestra Page 11.

(A-4f) **Jamb and Head Fins**—

Note: We recommend that for all masonry construction jamb and head fins be specified to provide added anchorage and form wind stop. Where used, Casements must be built into the masonry work (not installed in prepared openings). See note (A-8). (See detail Fenestra Page 11.) Their added cost is warranted. If desired so specify. If not included specify that jamb and head anchor clips shall be furnished.

(A-4g) **Sill and Jamb Anchor Clips**—Furnish steel (sill) (jamb) anchor clips with bolts to attach to frame as required.

(A-5) Attached Hardware

Note: Attached at factory.

(A-5a) **Side Hinges**—All side hung swing leaves shall be hung on two (2) heavy, extension (cleaning) hinges of special, solid rolled, steel with heavy re-entrant angle fillets. Hinge pins (non-removable) shall be of solid bronze accurately fitted into flanged, bronze bushings.

Note: Bronze pins and bushings provide 100% bronze bearing at all moving points.

(A-5b) **Top Hinges**—Top hung swing leaves in transoms shall be hung on heavy steel hinges with bronze pins.

(A-5c) **Locking Handle Brackets**—Ornamental locking handle brackets shall be cut from special, solid rolled, steel sections and both riveted and welded to the swing leaf styles.

(A-5d) **Operator Provisions**—Bottom rails of all side hung swing leaves shall be provided with tapped holes, standardized as to size and location to take any of the six types of casement operators.

Note: See (A-6c).

(A-5e) **Strikes (for Side Hung Swing Leaves)**—Provide bronze strike plates attached to frames.

(A-6) Detached Hardware

Note: See Fenestra Page 6.

(A-6a) All detached hardware shall be shipped carefully packed to prevent damage until applied for use.

(A-6b) **Locking Handles (for Side Hung Swing Leaves)**—Ornamental locking handles, so designed as to produce a cam action, shall be:

- (1) Handle 198 (malleable iron with dull black, rust-resisting finish) (dark oxidized bronze).
- (2) Handle 699 (dark oxidized bronze).

Note: Select as to design and material. No. 699 at slight added cost over No. 198. Bronze at added cost over iron.

Handles shall be attached to handle brackets with bronze hexagonal headed bolts tap-screwed into steel, spring, friction clevises.

Note: Clevis assures constant and even tension which prevents handle from becoming loose.

All handles at latch shall be provided with notched heads to permit restricted ventilation.

(A-6c) **Operators (for Side Hung Swing Leaves)**—

Note: Select as required.

Note: All casements are furnished with the "Standard" operator. Where desired, any of the types listed "Optional" may be substituted at a reasonable added cost.

(1) **Standard: Sliding Stay** (malleable iron with dull black rust-resisting finish).

(2) **Standard: Peg and Stay** (bronze peg, malleable iron stay with dull black rust-resisting finish, stay plate and stay bracket).

Note: In oxidized bronze for both 1 and 2 Standards at slightly added cost.

(3) **Optional: Thumb Screw Stay** (malleable iron with dull black rust-resisting finish, oxidized bronze friction plate, guide and thumb screw).

(4) **Optional: Gear Type Underscreen** (malleable iron with black rust-resisting finish or oxidized bronze).

(5) **Optional: Surface Type Underscreen** (malleable iron with dull black rust-resisting finish).

Note: In oxidized bronze at slightly added cost.

(6) **Optional: Flush Type Underscreen** (oxidized bronze).

(A-6d) **Operator (for Top Hung Transom Sash)**—

(1) **Standard: Peg and Stay** (malleable iron with dull black rust-resisting finish).

(A-7) Mastic

The Casement Manufacturer shall furnish a sufficient quantity (one pound to ten lineal feet) of mastic to form a weather-tight frame bed, at head, jambs and sill (and mullions).

(A-8) Erection

Note: In brick masonry construction wherever casements are built into the brickwork (not in prepared openings) without wood bucks, include in the masonry specification a clause that the mason shall use every precaution against springing or racking the casements out of shape.

Note: Where desired, the FENESTRA CONSTRUCTION Co., under a separate contract will erect Casements windows in prepared openings. (See Paragraph 5, Fenestra Page 1.) If required so specify.

(A-8a) All casement windows shall be set plumb and true, properly aligned and securely anchored before glazing.

(A-8b) All mullions shall be rigidly bolted to frames.

(A-8c) Set all frames in mastic neatly applied in a narrow beading where they come in contact with the building construction (or steel mullions). Use one pound of mastic to 10 lineal feet.

(A-8d) Apply all hardware in accordance with the manufacturer's directions.

Note: Give second coat of paint and glaze before applying finish hardware.

(A-9) Painting

All casement windows shall be given one dip-coat of grey lead and oil paint by the manufacturer before shipment.

Note: The following should be provided for in the painting specifications:

Note: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

(A-10) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(A-10a) **Glass**—Glass shall be (¼" thick plate) (double strength).

Note: Single strength glass is not recommended.

(A-10b) **Putty**—Putty shall be Fenestra Steel Casement Putty.

Note: This is a special, high-grade, steel window putty which assures quick setting. Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

(A-10c) **Glazing**—All casement windows shall be glazed from the outside. All glass shall be set in a bed of putty and secured by copper plated, steel, spring glazing clips furnished by the Casement Manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. See Paragraph (A-9).

(A-11) Provisions for Screens

Note: Fenestra Pages 12 and 13 give suggestions for screening provisions. Include in the Carpentry Specifications, the necessary clauses covering stops and wood trim. Space between screen and casement frame must not be less than 2½".

(A-12) Screens

Note: Metal or wood screens, sliding, hinged or rolling may be used as desired. Screens are not included by the Casement Manufacturer and should, therefore, be provided for under another division of the specification.

(A-13) Shade and Drapery Brackets

Note: Shade and drapery brackets are not attached to the steel casement frame and are, therefore, not provided by the Casement Manufacturer. Suggestive provisions are made in Fenestra Pages 12 and 13.

(D) STEEL BASEMENT WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

Note: These windows are sold exclusively through dealers. See Paragraph 12 Fenestra Page 2.

(D-1) Work Included

Note: List and locate. (See Paragraph 13 Fenestra Page 2.)

(D-2) General

Basement Windows shall be Fenestra as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(D-3) Materials

All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles. All frame and sash members shall be rolled with $\frac{1}{8}$ " baffles. Sash bottom rails shall be rolled with special projecting drip. Provide steel fins for jamb anchorage and weathering. Muntins shall be T bars. Provide two holes in each frame jamb for screen attachment.

Note: Sections (except sash bottom rails) are similar to Casement Window Sections (see Fenestra Page 4) arranged for inside glazing.

(D-4) Construction

Sills and jambs of frame shall be continuous of one piece mitered and turned at corners. Joints at head of frame and all joints of sash shall be mortise and tenon, air hammer riveted. Fins shall be spot welded to frame jambs. Provide continuous, two-point, flat contact weathering between sash and frame.

(D-5) Hardware

All hardware shall be of steel and shall be attached at the factory. Hinges shall be of "pinless" hook design riveted to the frame, so constructed, in conjunction with formed slots in the sash top rail, that the sash may be removed for glazing. Locks shall be self-centering and shall consist of a bevel lipped,

slotted angle, riveted to sill and a wedge pin attached by ring and heavy chain to the bottom rail of sash to act as the support for the sash when open.

(D-6) Erection

Basement windows shall be set plumb and true securely anchored to the building construction. Adjust all sash to properly operate.

(D-7) Painting

All Basement Windows shall be given one dip-coat of grey, lead and oil paint by the Manufacturer before shipment.

Note: The following should be provided for in the painting specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

(D-8) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10 Fenestra Page 2.

(D-8a) Glass—Glass shall be double strength.

Note: Single strength glass is not recommended.

(D-8b) Putty—Putty shall be a high grade Steel Window Putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11 Fenestra Page 2.

(D-8c) Glazing—All windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured by copper plated, steel, spring glazing clips furnished by the Window Manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. See Paragraph (D-7).

ELEVATION OF WINDOWS INSTALLED IN CONCRETE BLOCK AND FRAME CONSTRUCTION.

NOTE

THE FENESTRA UTILITY WINDOW IS DESIGNED FOR SMALL BUILDINGS SUCH AS GARAGES FILLING STATIONS, SHOPS, STORES AND BASEMENTS HIGH ABOVE THE GRADE LINE.

IT IS ALSO DESIRABLE IN AREA-WAYS WHERE MORE LIGHT IS NEEDED THAN IS SUPPLIED THRU FENESTRA BASEMENT WINDOWS, AS IN LAUNDRY ROOMS.

IT IS MADE IN ONE SIZE, ONLY, 3'-4 1/2" x 3'-7 1/2".

VENTILATOR IS ONE LIGHT HIGH, PIVOTED 2" ABOVE CENTER TO PREVENT UNDUE PROJECTION EITHER INSIDE OR OUTSIDE.

SECTIONS AND FITTINGS ARE THE SAME AS FOR HORIZONTALLY PIVOTED WINDOWS.

OPERATING HARDWARE CONSISTS OF IRON CAM HANDLE AND NOTCHED STAY-BAR AS IN HORIZONTALLY PIVOTED WINDOWS.

INSTALLATION DETAILS

(G) ARCHITECTURAL PROJECTED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(G-1) Work Included

Note: List and locate. (See Paragraph 13 Fenestra Page 2).

(G-2) General

Architectural Projected Windows shall be *Fenestra* as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(G-3) Materials

(G-3a) Window Sections—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in re-entrant angles.

(G-3b) Frame Members—All frame members shall be unequal leg channel sections, outside leg 1½", inside leg ¾".

(G-3c) Muntins—Muntins shall be 1½" deep.

(G-3d) Vertical Mullions—Vertical Mullions shall be standard *Fenestra*, hot rolled, solid steel T bars.

Note: Use where two or more windows are placed side by side in the same opening.

(G-3e) Horizontal Mullions—Horizontal mullions shall be standard *Fenestra* (hot rolled, solid steel Z bars and angles) (structural angles and channels).

Note: Specify type. Use where two or more windows are placed one above another in the same opening.

(G-3f) Mullion Covers—(Vertical) (Horizontal) Mullion covers shall be of pressed steel designed to neatly cover mullion recesses.

(G-4) Construction

(G-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted and electrically welded at all corners. All exposed faces at welds shall be ground to a smooth finish. Provide continuous two point, flat-contact weathering between ventilators and frames.

(G-4b) Muntins—Muntin bars shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase the rigidity and strength at the intersections. Joints at frames shall be mortise and tenon, air hammer riveted.

Note: Intersections of muntins are made as illustrated on Fenestra Page 44. An exclusive Fenestra feature.

(G-4c) Glazing (Angles) (Beads)—All glass shall be secured with glazing (angles) (beads) neatly mitered at corners. (Angles) (Beads) shall be secured to head, jamb and sill frame and ventilator members with brass tap screws and to muntins with brass barrel screws.

Note: Specify choice of angles or beads. Glazing Beads as detailed on Fenestra Page 21 are furnished at slightly added cost over the cost of angles.

(G-4d) Vertical Mullions—Where two or more windows are placed side by side in the same opening, provide vertical mullions with bolts for frame attachment.

(G-4e) Horizontal Mullions—Where two or more windows are placed one above another in the same opening, provide horizontal mullions with bolts for frame attachment.

(G-4f) Mullion Covers—Provide (vertical) (horizontal) steel mullion covers with the necessary clips and bolts for attachment.

(G-4g) Sill and Jamb Anchor Clips—Furnish steel (sill) (jamb) anchor clips with bolts to attach to frame as required.

(G-5) Attached Hardware

Note: Attached at Factory.

(G-5a) Ventilator Operating Hardware—Ventilators shall (swing-out from the bottom while sliding down from the top) (or) (swing-in from the top while sliding up from the bottom) as indicated. The *open-out* ventilators shall be so constructed that by tilting them slightly beyond the horizontal they may be conveniently washed from inside the building. (The *open-in* ventilators shall tilt to 90°.)

Note: Specify swing-out, swing-in or both as required.

Each ventilator shall be accurately balanced on two supporting arms of solid spring steel attached to the ventilator with bronze shoulder pivots, equipped with bronze washers. Connections between supporting arms and window frame shall be made by malleable iron brackets rigidly supported on the horizontal frame members or muntins and double riveted to the vertical frame members or muntins with arms attached by bronze shoulder pivots.

Each ventilator shall be equipped with two bronze friction shoes sliding vertically in the ventilator jambs to guide the ventilator and prevent rattling. Friction shoes shall be channel shaped

(to insure ease of operation) and mounted on bronze shouldered studs, so constructed that through galvanized compression springs (covered by weather protecting bronze tubes) uniform tension is secured. Shoes shall be accurately gauged and located and solidly riveted in place to assure proper, constant pressure at the jambs.

(G-5b) Alignment Springs—Each *open-out* ventilator shall be equipped with two shouldered, alignment-control bronze springs riveted to the channel jambs.

Note: The shoulders of these springs are so designed and located as to limit the downward travel of the friction shoes and stop all open ventilators in uniform alignment of approximately 60 degrees. When it is desired to open the ventilator at a greater angle or reverse for washing, light pressure on the springs depresses the shoulders and allows the friction shoes to slide past. As the ventilator is returned to a closed position, the action of the spring is automatic. See Fenestra Page 19.

Note: Include if open-out ventilators are used.

(G-5c) Alignment Stops—Each *open-in* ventilator shall be equipped with a solid steel stop which prevents its opening farther than 90°.

Note: Include if open-in ventilators are used.

(G-5d) Cam Handle Brackets—Where required, provide special design malleable iron brackets, triple riveted to ventilators, for attachment of cam handles.

(G-6) Detached Hardware

Note: See Fenestra Page 19.

(G-6a) All detached hardware shall be shipped carefully packed to prevent damage until applied for use.

(G-6b) All hardware for Architectural Projected Windows shall be of bronze, light coinage finish.

(G-6c) Locking and Operating Devices

Note: Select as required.

Note: Where ventilators are screened, special flat-type bronze handles may be secured which will permit the screen to be set 1" from the face of the window instead of 2" necessary with standard cam handles. Specify if desired.

(1) *For open-out ventilators within reach from floor*—Bronze cam handle, Part 114, attached to malleable iron bracket by bronze screw-head bolt through steel spring friction clevis. Bronze strike plate carrying a 6" bronze hook stay, Part 122, riveted to window at ventilator sill.

(2) *For open-out ventilators beyond reach from floor*—Riveted bronze pole ring, Part 151, at head of ventilator. Bronze cam handle, Part 150, with hole for pole hook, attached to malleable iron brackets by bronze, screw-head, steel, spring, friction clevis. Riveted bronze strike plate.

(3) *For open-in ventilators within reach from floor*—Riveted bronze spring latch with ornamental handle, Part 212, at head of ventilator. Riveted bronze lipped strike.

(4) *For open-in ventilators beyond reach from floor*—(Riveted bronze spring latch with pole hook ring handle, Part 147, at head of ventilator; riveted steel strike). (Riveted bronze spring latch with endless chain, Part 146, at head of ventilator. Riveted steel strike. Riveted bronze chain guide, Part 149, at sill).

Note: Select type desired.

(G-7) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows may be erected after masonry is completed. (See Paragraph 9, Fenestra Page 1.)

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.

(G-7a) All Architectural Projected Windows shall be erected in prepared openings by the FENESTRA CONSTRUCTION COMPANY, under a separate contract.

Note: See paragraph 5 Fenestra Page 1.

(G-7b) All windows shall be set plumb and true, properly aligned and securely anchored before glazing. Standard *Fenestra* sill anchors shall be used under the following conditions:

- (1) In all cases where a ventilator comes at the sill of the window, regardless of the window width.
 - (2) In all cases where the window is over 5' 0" wide, regardless of the location of the ventilators.
 - (3) In all multiple unit openings where mullions are not anchored into the sills.
- All ventilators shall be properly adjusted before glazing.

(G-7c) Apply all hardware in accordance with the manufacturer's directions. Detached hardware shall not be installed until after glazing and painting has been completed.

(G-8) Painting

All Windows shall be given one dip-coat of red mineral paint by the Manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required so specify here, including specification for paint and its application.

(G-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10 Fenestra Page 2.

(G-9a) **Glass**—Glass shall be (1/4" thick plate) (1/4" wire of type desired) (double strength).

Note: 1/4" thick glass is recommended. Single strength glass is not recommended.

(G-9b) **Putty**—Putty shall be a high grade steel window putty.

Note: Ordinary wood sash putty must not be used. See paragraph 11, Fenestra Page 2.

(G-9c) **Glazing**—All Architectural Projected Windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured with glazing (angles) (beads) set against face putty neatly and smoothly applied.

Note: Do not paint until putty has thoroughly hardened. See note paragraph (G-8).

(G-10) Provision for Screens

Note: Fenestra Page 26 gives suggestions for screening provisions. Include in the Carpentry Specifications the necessary clauses covering wood trim required in conjunction with screens. Space between inside screen and window must be not less than 2" to clear standard hardware. If special "Flat Type" handles are specified. (See note, paragraph [G-6c] 1" clearance only is required.) On account of the roller, rolling screens require a 2 1/2" clearance.

(G-11) Screens

Note: On open-out ventilators, metal side hinged or vertical sliding screens may be used as desired. Rolling screens up to 6' 0" wide may be used where entire window is covered. On open-in ventilators, metal, removable, fixed, outside screens may be used. Screens are not included by the Window Manufacturer and should, therefore, be provided for under another division of the specification.

(G-12) Shading

Note: All shades must be located at least 2" from the inside face of the window for hardware clearance. Clearance for screens depends upon the type selected.

Note: Shade bracket clips designed to attach by drilling and tapping two small holes at the top of each jamb section are supplied at slight added cost (see Fenestra Page 25). These clips are of sufficient depth to bring the shade bracket in the proper position and are slotted to accommodate any standard shade bracket. Shade clips cannot be used satisfactorily with rolling screens but shade brackets may be attached to the underside of screen box. Brackets of various projections may be used to clear any type of screening except where whole opening is screened. If shade bracket clips are required, so specify.

(GC) COMMERCIAL PROJECTED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

Note: Commercial Projected Windows are in general design and operation similar to Architectural Projected Windows. They are made to meet the demand for a less expensive window of this type. The chief differences between the two are (1) the section of the frame member; (2) the addition of muntins dividing the window into small panes; (3) inside putty instead of glazing angles or beads; (4) use of malleable iron instead of bronze hardware.

Note: Commercial Projected Windows with "open-in" ventilators are particularly adapted to Food Products Plants since these windows may be screened economically. See Paragraphs (GC-10) and (GC-11).

Note: To avoid repetition where the specification is the same as that for the Architectural Projected Windows, this is so noted. Where not identical, use the clauses here given. For Specification for Architectural Projected Window referred to, see Fenestra Page 18.

accordance with the standard Fenestra installation details so that windows may be erected after masonry is completed. See Paragraph 9, Fenestra Page 1.

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.

(GC-1) Work Included

Same as (G-1).

(GC-2) General

Commercial Projected Windows shall be Fenestra as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(GC-3) Materials

(GC-3a) Window Sections—Same as (G-3a).

(GC-3b)—Frame Members—All frame members shall be (special angle sections with protruding leg 1" deep) (special unequal leg channel sections).

Note: Select as required unequal leg channel at added cost over angle section.

(GC-3c) Muntins—Same as (G-3c).

(GC-3d) Vertical Mullions—Same as (G-3d).

(GC-3e) Horizontal Mullions—Horizontal mullions shall be standard Fenestra (hot rolled solid steel T bars) (Structural angles and channels).

Note: Specify type. Use where two or more windows are placed one above another in the same opening.

(GC-3f) Mullion Covers—Same as (G-3f).

(GC-4) Construction

(GC-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted at all corners. Ventilators shall, in addition to riveting, be electrically welded at corners, with exposed faces ground to a smooth finish.

(GC-4b) Muntins—Same as (G-4b).

(GC-4c) Vertical Mullions—Same as (G-4d).

(GC-4d) Horizontal Mullions—Same as (G-4e).

(GC-4e) Mullion Covers—Same as (G-4f).

(GC-4f) Sill and Jamb Anchor Clips—Same as (G-4g).

(GC-5) Attached Hardware

Note: Attached at factory.

(GC-5a) Ventilator Operating Hardware—Same as (G-5b) (G-5c).

(GC-5d) Cam Handle Brackets—Where required, provide solid rolled steel Z bar brackets, triple riveted to the ventilators, for the attachment of cam handles.

(GC-6) Detached Hardware

(GC-6a) Same as G-6a).

(GC-6b) All hardware for Commercial Projected Windows shall be (malleable iron with one coat of red mineral paint) (bronze, light coinage finish).

Note: Select as required. Bronze at added cost over iron.

(GC-6d) Locking and Operating Devices—

Note: Select as required.

Note: Where ventilators are screened, special flat type handles may be secured at added cost which will permit the screen to be set 1" from the face of the window instead of 2" necessary with standard cam handles. Specify if desired.

(1) For open-out ventilators within reach from floor—Malleable iron cam handle attached to Z bar bracket by bolt and nut, Part 150.

(2) For open-out ventilators beyond reach from floor—Riveted malleable iron pole hook ring at head of ventilator, Part 151, malleable iron cam handle, Part 150, with hole for pole hook, attached to Z bar bracket by bolt and nut.

(3) For open-in ventilators within reach from floor—Riveted malleable iron spring latch with finger ring handle at head of ventilator, Part 147.

(4) For open-in ventilators beyond reach from floor—(Riveted malleable iron spring latch with endless chain, Part 146, at head of ventilator. Riveted iron chain guide, Part 149, at sill) (or) (Riveted malleable iron spring latch with pole hook ring handle, Part 147, at head).

(GC-7) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in

(GC-7a) All Commercial Projected Windows shall be erected in prepared openings by the FENESTRA CONSTRUCTION COMPANY, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(GC-7b) Same as (G-7b).

(GC-7c) Same as (G-7c).

(GC-8) Painting

Same as (G-8).

(GC-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(GC-9a) Glass—Same as (G-9a).

(GC-9b) Putty—Same as (G-9b).

(GC-9c) Glazing—All Commercial Projected Windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured by copper plated, steel, spring, glazing clips furnished by the window manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Glazing angles are obtainable at slight added cost.

Note: Do not paint until putty has thoroughly hardened. See note Paragraph (G-8).

(GC-10) Provision for Screens

(GC-10a) For Open-out Ventilators—Same as (G-10).

(GC-10b) For Open-in Ventilators—For open-in ventilators provide permanent brackets for removable screen support.

Note: See Fenestra Page 31.

(GC-11) Screens

Same as (G-11).

Note: Where desired for open-in ventilators, the Window Manufacturer will furnish, at reasonable added cost, removable, tubular, steel frame, removable screens (baked enameled finish) with No. 16 mesh bronze screen cloth. These screens are well constructed and furnished completely adapted to and fitting the ventilator opening. (See Fenestra Page 31.) If required so specify.

(GC-12) Shading

Note: Where ventilators are "open out" shade bracket clips, slotted to accommodate standard shade brackets, may be attached by drilling and tapping two small holes at the top of each jamb section of the frame. Clips are supplied at slight added cost. If required so specify.

(H) COUNTERBALANCED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(H-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(H-2) General

Counterbalanced Steel Windows shall be *Fenestra* as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(H-3) Material

(H-3a) General—All sections, unless otherwise specially mentioned, shall be specially designed, hot rolled, solid steel sections with heavy fillets in all re-entrant angles.

(H-3b) Frames—Jambs or mullions shall be 4" I-beam sections with flaring channel parting beads. Heads and Sills shall be heavy pressed steel sections.

Note: Jamb members serve also as mullions. No extra mullions needed.

Note: Flaring channel parting beads provide continuous "line" contacts for efficient weathering, eliminating friction produced by flat surfaces.

Note: Brass flaring channel jamb weathering may be provided at added cost to increase weathering and reduce friction. If required, so specify.

(H-3c) Sash—Stiles of sash shall be equal leg channels. Head and sill rails shall be unequal leg channels. Meeting rails shall be special channels with one leg rolled to provide a beveled, interlocking, flat contact weathering. Muntins shall be 1 3/8" deep.

Note: Muntins may be omitted for single light sash. If required, so specify.

(H-3d) Fittings—Provide malleable iron, adjustable, sill clips and meeting rail parting bead closures.

Note: Pulley housings form adjustable head clips.

(H-4) Construction

(H-4a) Frames—Parting beads shall be riveted to jambs.

Note: Brass weathering, if specified, is riveted to jambs in sash runs. If required, so specify.

Frame members shall be shipped "knocked down."

(H-4b) Sash—Stiles and rails shall be mortise and tenon, air hammer riveted and electrically welded at all corners. All exposed faces of welds shall be ground to a smooth finish. Muntins shall be mortise and tenon, air hammer riveted, at joints with sash rails.

(H-5) Hardware

Note: Hardware is shipped carefully packed to prevent damage until applied for use.

(H-5a) Pulleys and Chains—Each window shall be equipped with two roller bearings, steel pulleys mounted in a malleable iron housings.

Note: Pulley housing forms a clip for securing jambs to head and is accessible for oiling and easy removal.

Provide tension, malleable iron chain cleats cored to snugly receive three links of chain. The lower sash meeting rail cleat shall be tension adjusting. Chains shall be flat link, galvanized steel, tested to 400 pound load.

(H-5b) Locks—Meeting rail locks shall be cam action malleable iron.

(H-5c) Lifts—Lifts shall be of malleable iron attached to lower sash bottom rail with bolts and lock nuts.

Note: Bronze lifts, furnished at added cost. If required, so specify.

Note: A hole is provided in upper sash top rail for pole hook.

(H-6) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows may be erected after masonry is completed.

Note: Include in the Masonry Specifications that all mortar grouting, painting, etc., shall be done by the Mason Contractor after windows have been erected.

(H-6a) All Counterbalanced Windows shall be erected in prepared openings by the FENESTRA CONSTRUCTION COMPANY, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(H-6b) Frames shall be accurately assembled in accordance with the manufacturer's directions. All windows shall be set plumb and true, properly aligned and securely anchored before glazing. All sash shall be properly adjusted before glazing.

(H-7) Painting

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required so specify here, including specification for paint and its application.

(H-8) Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

Glass—Glass shall be (1/4" thick plate) (1 1/4" wire of type desired) (double strength).

Note: 1/4" thick glass is recommended. Single strength glass is not recommended.

Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

Glazing—All Counterbalanced Windows shall be glazed from the inside. All glass shall be set in a bed of putty secured by copper-plated, steel, spring glazing clips furnished by the window manufacturer and face puttied in a neat and smooth manner.

Note: Do not paint until putty has thoroughly hardened. See note Paragraph (H-7).

Note: Where single light sash are used, glass shall be secured with glazing angles. If required, so specify.

(I) INTERIOR CORRIDOR WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Corridor Windows are designed primarily for office buildings as a means of daylighting and ventilating corridors and inside offices.

Note: See "Open In" Architectural Projected Windows, Paragraph (G-5a), Fenestra Page 18.

(I-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(I-2) General

Corridor Windows shall be Fenestra as manufactured by the DETROIT STEEL PRODUCTS COMPANY.

(I-3) Materials

(I-3a) Frame Sections—All frame sections shall be specially designed, hot rolled, solid steel, equal leg channel with heavy fillets in all re-entrant angles.

(I-3b) Muntins—Muntins shall be 1½" deep.

(I-4) Construction

(I-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted and electrically welded at all corners. All exposed faces at welds shall be ground to a smooth finish.

(I-4b) Muntins—Muntins shall be mortise and tenon, air hammer riveted.

(I-4c) Jamb Anchor Clips—Furnish steel jamb anchor clips with bolts to attach to frame as required.

(I-5) Attached Hardware

(I-5a) Ventilator Operating Hardware—All ventilators shall swing in from the top while sliding up from the bottom and shall be equipped with standard Fenestra supporting arms and friction shoes as used in Fenestra Projected Windows.

(I-6) Detached Hardware

Each ventilator shall have one riveted, malleable iron spring latch with pole hook ring handle, part 147, and riveted steel strike. See Fenestra Page 27.

Note: Bronze hardware may be had at slight added cost.

(I-7) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be constructed in accordance with standard Fenestra installation details and that the Mason Contractor shall do all pointing, mortar grouting, etc., after windows have been erected.

(I-7a) All corridor windows shall be erected in prepared openings by the FENESTRA CONSTRUCTION COMPANY under separate contract.

(I-7b) All corridor windows shall be set plumb and true, properly aligned and securely anchored before glazing.

(I-8) Painting

All corridor windows shall be given one dip coat of red mineral paint by the manufacturer before shipment.

Note: See Paragraph (G-8), Fenestra Page 19.

(I-9) Glass and Glazing

Note: See Paragraph (G-9a) and (G-9b), Fenestra Page 19.

(I-9a) Glazing—All glass shall be set in a bed of high grade steel window putty, held by copper plated spring glazing clips furnished by the window manufacturer and face puttied in a neat and smooth manner.

(L) HORIZONTALLY PIVOTED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

(L-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(L-2) General

Horizontally Pivoted Windows shall be *Fenestra* as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(L-3) Materials

(L-3a) Window Sections—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

(L-3b) Frame Members—All frame members shall be special angle sections.

(L-3c) Muntins—Muntins shall be 1½" deep.

(L-3d) Vertical Mullions—Vertical mullions shall be standard *Fenestra* hot rolled, solid steel T bars.

Note: Use where two or more windows are placed side by side in the same opening.

(L-3e) Horizontal Mullions

Note: Horizontal structural mullions are not furnished by the window manufacturer. Include structural steel horizontal mullions in Structural Steel Specifications.

(L-4) Construction

(L-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted, at all corners. Provide continuous two point, flat-contact weathering between ventilators and frames.

(L-4b) Muntins—Muntin bars shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase their strength at the point of intersection. Joints at frames shall be mortise and tenon, air hammer riveted.

Note: Intersections of muntins are made as illustrated on Fenestra Page 44. An exclusive Fenestra feature.

(L-4c) Vertical Mullions—Where two or more windows are placed side by side in the same opening, provide vertical mullions with bolts for frame attachment.

(L-4d) Structural Steel Clips—Furnish in types adapted to conditions, all necessary clips and bolts for attaching windows to structural steel.

Note: All structural steel is furnished by others. Include in steel specifications all punching to accommodate clips. Where masonry work will interfere with installation of clips at time windows are erected, provide that clip bolts be included and attached by the steel contractor.

(L-4e) Sill and Jamb Anchor Clips—Furnish steel (sill) (jamb) anchor clips with bolts to be attached in the field.

(L-5) Attached Hardware

Note: Attached at factory.

(L-5a) Ventilator Pivots—All ventilators shall be horizontally pivoted and supported by external, adjustable, special, solid rolled, steel butts double machine riveted through window bars and weathering.

Note: Butts are set 2" above center unless otherwise specified. Butts may be set 4" below ventilator top where windows are required to be relatively rain protecting when open or where center pivoting would throw the upper half of the sash in conflict with piping, sway bracing or other interior obstructions. If required, so specify.

All butts shall have ⅝" solid steel bolts equipped with washers and nuts; each pin shouldered to insure constant, free and easy ventilator operation.

(L-5b) Operator Provisions—All ventilators shall be provided with solid rolled steel Z bar brackets, triple machine riveted to ventilator sill for attachment of operating hardware.

(L-6) Detached Hardware

Note: See Fenestra Page 44.

(L-6a) All detached hardware shall be shipped carefully packed to prevent damage until applied for use.

Note: Select type desired.

(L-6b) Provide malleable iron cam latches and rolled steel stay bars.

(L-6c) Provide malleable iron cam latches, chain, chain catches and pulley brackets.

(L-7) Mechanical Operators

Note: Specifications for mechanical operators are given on Fenestra Pages 55 to 59.

(L-8) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows can be erected in prepared opening. (See Fenestra Page 37.)

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.

(L-8a) All Horizontally Pivoted Windows shall be erected in preparing openings by the FENESTRA CONSTRUCTION COMPANY, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(L-8b) All windows shall be set plumb and true, properly aligned and securely anchored before glazing. Standard *Fenestra* sill anchors shall be used under the following conditions: (Use 2 clips for windows up to 6'-6" wide and 4 clips for windows over 6'-6").

(1) In all cases where a ventilator comes at the sill of the window, regardless of the window width.

(2) In all cases where the window is over 5'-0" wide, regardless of the location of the ventilators.

(3) In all multiple unit openings where mullions are not anchored into the sills.

All ventilators shall be properly adjusted before glazing.

(L-8c) Apply all hardware in accordance with the manufacturer's directions.

(L-9) Painting

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at a reasonable added cost, will do field painting after erection. If required, so specify here, including specification for paint and its application.

(L-10) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(L-10a) Glass—Glass shall be (¼" rough wire) (¼" factory ribbed) (⅛" factory ribbed) (double strength).

Note: ¼" thick glass is recommended. Single strength glass is not recommended.

(L-10b) Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

(L-10c) Glazing—All Horizontally Pivoted Windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured by copper plated, steel spring, glazing clips furnished by the window manufacturer. (4 clips for each fixed light and 6 for each ventilator light.) Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. See note paragraph (L-9).

(L-11) Screens

Note: Special metal pivoted ventilator screens may be used. These lie close to the ventilator, the upper half outside, the lower half inside, with insect-proof closures at ventilator pivot line. For suggested screening details, see Fenestra Page 45. Screens are not ordinarily included by the window manufacturer and should, therefore, be provided for under another division of the specification.

INSTALLATION IN CONCRETE

INSTALLATION IN BRICK

INSTALLATION IN TILE

INSTALLATION IN STEEL

NOTE:-

WE STRONGLY RECOMMEND THE INSTALLATION OF FENESTRA SIDEWALL WINDOWS AFTER THE WALLS OF BUILDING ARE PRACTICALLY COMPLETED.

IN EVERY CASE, REGARDLESS OF WHETHER SINGLE UNITS OR COMBINATIONS OF UNITS ARE TO BE USED, THE OPENING SHOULD BE PREPARED IN ACCORDANCE WITH THE DIMENSIONS SHOWN IN THE INSTALLATION DETAILS ON PLATES L-104 & L-105. REBATES AND ANGLES SHOWN HAVE BEEN ACCEPTED BY BUILDERS AND CONTRACTORS AS THE BEST PRACTICE AND THESE SHOULD BE CLOSELY FOLLOWED.

MISCELLANEOUS

THE MULLIONS SHOWN WITH THESE DETAILS HAVE THE STEM TURNED OUT. IT IS ADVISABLE TO DO THIS AS GREATER STIFFNESS IS SECURED.

WITH STEEL WORK THIS IS ESSENTIAL IN ORDER TO AVOID NOTCHING OF THE STEEL OR A SPECIAL CUT-OFF OF MULLIONS.

ANCHORING MULLIONS AT SILL AS SHOWN IS RECOMMENDED.

STANDARD SCREENS ARE MADE FOR 4, 6 OR 8 PANE VENTILATORS IN BOTH 12" X 18" AND 14" X 20" GLASS.

SCREEN FRAMES ARE OF ELECTRICALLY WELDED CONSTRUCTION FROM OPEN HEARTH STEEL GALVANIZED AND FINISHED IN BLACK BAKED ENAMEL. TURN BUTTONS, HINGE LUGS AND WING NUTS ARE BRASS. BOLTS ARE STEEL GALVANIZED AND CLAMPS ARE OF STEEL GALVANIZED WITH TIPS OF MONEL METAL (A NON-RUSTING AND NON-CORRODING MATERIAL).

CLOTH IS OF 16 MESH OXIDIZED BRONZE WIRE AND IS WOVEN FROM #32 GAUGE BRONZE WIRE.

SCREENS ARE MADE TO ALLOW 45° OPENING AND LIMIT RING MUST BE PLACED IN CHAIN TO REGULATE THIS.

WHEN VENTILATOR COMES TO THE HEAD OF AN OPENING OR DIRECTLY BELOW ANOTHER VENTILATOR, A LOWER OUTSIDE SCREEN AND FILLER PIECE IS USED. SEE DETAILS E-E AND G-G.

WHEN SCREENING IS SPECIFIED THE WINDOWS ARE PUNCHED IN SHOP TO RECEIVE NECESSARY CLIPS FOR HOLDING SCREENS, WHILE SCREENS AND CLIPS ARE SHIPPED DIRECT FROM MANUFACTURER.

IF SCREENING IS NOT SPECIFIED BUT LATER IS DESIRED IT WILL BE NECESSARY TO DRILL HOLES FOR ATTACHING CLIPS IN FIELD.

GLASIRON PRODUCTS COMPANY

Manufacturers of Glasiron Roofing Tile

TELEPHONE
LAFAYETTE 6278

Scotten Avenue at Michigan
DETROIT, MICH.

Advantages of Glasiron Tile

- (1) Unusual durability.
- (2) No yearly maintenance.
- (3) Non-fading colors.
- (4) Unlimited color choice.
- (5) Easy and quick application.
- (6) Adaptable any construction.
- (7) One-sixth weight of clay tile.
- (8) Low understructure cost.
- (9) Cool summer—warm winter.
- (10) Waterproof and noiseless.
- (11) Architectural beauty.
- (12) Adaptable over old roofing.
- (13) Fireproof—lower insurance.

Architect's Specifications

Special Service Upon Request—Manufacturer shall make all cuts according to blue prints for hips, dormers and all other irregular sections of roof including closed valley pieces, tile to be enameled after cutting. Roof must be constructed strictly according to all dimensions on blue prints in order for cuts made at factory to be correct.

Roof Boarding—Roof boarding or sheathing shall be $\frac{7}{8}$ in. thick and not more than 8 in. wide, tongued and grooved, surfaced one side, and free from wanes, shakes, loose or large knots.

Roofing Felt—All roof boarding shall be covered with "asphalt felt" weighing not less than 30 lb. per 100 sq. ft., and laid in horizontal layers with joints lapped towards the eaves, interlapped with the tile courses having two layers under each tile.

Cutting—If tile are cut on job with shears or torch, all openings and cut edges shall be thoroughly cemented.

Flashings—Galvanized ingot iron or copper drip shall be used over the edge at the eaves and overlapped with the roofing felt. A base and cap flashing course of galvanized ingot iron or copper shall be laid against all chimneys, parapet and party walls, roof posts and porch roofs where they connect with the walls. Roofing felt shall be laid 5 in. or more up the side underneath the metal flashing.

Glasiron
ROOFING TILE

Glasiron Home on Balfour Road,
Detroit, Mich.

Glasiron Tile

A new roofing tile which is the result of years of scientific development in two great industries. The roofing qualities of a combination of glass and iron fused together at 1600° F. are apparent. It cannot burn, fade, rust or decay. It is exceptionally durable and will remain in perfect condition during the life of the building. Each tile is 1 $\frac{1}{8}$ in. high in the center of its crown, casts 1-in. shadow lines and has a covering space of 10 in. square to the weather. It weighs only 245 lb. to the square. Glasiron is a most distinctive roof—a gold bond investment which will not depreciate in value.

Colors—Endless color tones can be matched in addition to having 50 tones as standard. Glasiron colors can be made according to your own ideas. Two tones blended in each tile or solid colors are available in three finishes—glazed, dull, sand.

Tiling—The main and porch roofs, the roofs and sides of dormer windows and all other surfaces, so indicated on the drawings, shall be covered with Glasiron Tile of ... color, ... finish as manufactured by the GLASIRON PRODUCTS COMPANY, Detroit, Michigan.

Side Spacing—Beginning at the center of the roof at the eaves, space the bottom first row complete.

End Spacing—Finish ridge piece shall be placed over the ridge and the cornice tile spaced from eaves to ridge.

Nails—Use only Deniston "Led-Hed" copper nails 1 $\frac{1}{2}$ in. or longer; distributed by GLASIRON PRODUCTS COMPANY.

Ridge—Main ridge shall be lapped over the laying groove on the top row of tile. Leave $\frac{1}{4}$ in. between each ridge piece for nailing on ridge brackets. Bottom of ridge brackets shall be hooked under edge of main ridge at joint; the two brackets fitted together at top and nailed to wooden strip underneath with long copper nail.

Hips—Apply a $\frac{3}{8}$ in. by approximately 3 in. white pine board cleated upright. Notch upper end of hips to fit tile. Nail hips with 2 copper nails 3 in. long.

Note: Entire application to be in accordance with manufacturer's specifications in effect at the time of applying.

Product

"IMPERIAL" SHALE ROOFING TILES.

Description

We manufacture vitreous shale roofing tiles in all standard shapes.

Four regular stock patterns are shown on the page following, in addition to which the "IMPERIAL Roman," the "IMPERIAL Greek," the "IMPERIAL" slab shingle, the "IMPERIAL" English and other special shapes are manufactured. These are produced in a natural red color or in glazes of almost any color.

Specifications

All pitched roofs shall be covered with (insert name of pattern) tiles made by the LUDOWICI-CELADON COMPANY with stock fitting suitable for each pattern. The tiles as specified above must be hard burned of color, and in accordance with samples deposited in the office of the architects.

Before the roofer is sent for, the owner or general contractor should construct roofs in strict accordance with plans, sheath the roofs tight, have all chimneys and walls above roof line completed, have all vent lines put through roofs, furnish all strips of required width used under hip rolls, furnish any strips that may be used under tile at eaves, and have all scaffolding ready for roofer's use. The metal contractor should have all gutters in place on the roof (gutters, whether box, hanging or

secret), to extend over the roof sheathing and run under the felt and tile at least 8 inches and should also have in place all valley metal, the width of which must be not less than 24 inches with both edges turned up $\frac{1}{4}$ inch, the entire length of the valley. The valley metal to be fastened with clips and never nailed or punctured in any manner. The valley metal must be laid over one layer of felt running lengthwise the entire distance of the valley. The metal contractor must have in readiness all flashing metal used alongside and in front of dormers, gables, skylights, towers, perpendicular walls, also around vent pipes and chimneys, and place same after arrival of the tile roofer and in accordance with the requirements of the tile.

After the roofs have thus been prepared to receive the felt and tile, the tile roofer shall cover the sheathing of the roofs with one thickness of asphalt roofing felt weighing not less than 30 pounds to the square, laying same with a $2\frac{1}{2}$ -inch lap and securing in place with capped nails. The felt should be laid parallel with the eaves and lapped over all valley metal about 4 inches and laid under all valley metal about 6 inches.

The roof having thus been prepared, the tile layer is to fasten tile with copper nails. The roofer shall see that the tiles are well locked together and lay smoothly, and no attempt shall be made to stretch the courses.

The tiles must be laid so that the vertical lines are parallel with each other and at right angles to the eaves. The tiles that verge along the hips should be cut close against the hip board, and a watertight joint made by cementing cut hip joint to hip board with elastic cement. Each piece of hip roll shall then be nailed to the hip board, and the hip rolls cemented where they lap each other. The interior spaces of hip and ridge rolls must not be filled with the pointing material.

Above: A Close-up of the Same Roof. Showing Its Pleasing Irregularity

An English-Type House, Roofed with Imperial Brittany Shingle Tiles in Dull Reds and Sage Browns

The Brittany Shingle tile illustrated above is one of several types of special shingles made in various colors and textures. With our genuine Hand-Made and Old English shingles, and stock machine-made patterns, we have shingle tiles varying in size from 6x12x $\frac{3}{8}$ in. to as large as 8x16 x1 in.; furnished in textures and colors to suit requirements

Specifications for Brittany Shingle Tile

Cover all pitched roofs with "Imperial" Brittany Shingle Tile 6x12x $\frac{3}{8}$ in., as manufactured by the LUDOWICI-CELADON COMPANY, in colors as selected by the architect, including appropriate fittings such as ridge, hip, terminals, etc. Hip and valley tile to be cut to the correct pitch in the green before burning and provided with nailholes for proper fastening.

Tile to be laid with some irregularity in exposure to eliminate straight horizontal lines, but not more than 5-in. exposure nor less than 4 $\frac{1}{2}$ -in., in order to insure proper head lap.

Before tile are laid, cover sheathing with best quality asphaltum felt weighing not less than 30 lb. per square (40 lb. on low pitches), laid parallel to eave and ridge and lapped 2 $\frac{1}{2}$ in.

Apply on hips and ridges 1-in. wood stringers of proper height to carry hip and ridge and use $\frac{3}{4}$ x1-in. cant strips at eaves.

Fasten tile with 1 $\frac{3}{4}$ -in. copper nails, 2 to each tile. Where tile joins hip stringer, cement cut hip tile to hip board with a good quality elastic cement. Nail hip roll with 2-in. copper nails and ridge with 2 $\frac{1}{2}$ -in. nails.

MOUND CITY ROOFING TILE COMPANY

3301 Morganford Road
ST. LOUIS, MO.

Mound City Roofing Tile Is Made of Finest Grade of Shale

Our shale is of the finest grade, making a roofing tile of superior quality and color, burned a solid red throughout at a temperature of 2000 degrees Fahrenheit. Our machinery is the most modern and our plant the most up-to-date in the country.

Colors

Our tile is made regularly in the various shades of red, also in dull and full green, and brown glazes. Our red tile is called Vitreous Face tile. This class of tile is preferred by a great many architects for several reasons; namely, being vitrified on the exposed surface it will not absorb any moisture from the outside and prevents the possibility of dripping caused through condensation at certain seasons of the year; it will not gather soot and dirt, but remains clean.

We also produce sage, oak, burgundy and sumac shades, which can be assembled with the red, producing the beautiful autumn foliage roofs so much in vogue at the present time. We are equipped to make any shape and color of tile or trimming the architect desires.

Awards

Highest Award, Gold Medal, World's Fair, St. Louis, Mo., 1904.

Gold Medal, Panama-Pacific Exposition, San Francisco, Cal., 1915.

"A" INTERLOCKING TILE

With No. H-5 hip and H-5 hip-starter, No. R-5 ridge and No. T-3, 2-way terminal.
Size of tile, 9x15½ in.
Shipping weight, including trimmings, 1000 lb. per square

CLOSED PANAMA TILE

With No. H-8 hip and H-8 plain hip-starter, No. R-6 ridge and No. T-2, 2-way terminal.
Size of tile, 8½x13¾ in.
Shipping weight, including trimmings, 1250 lb. per square

General Specifications

Cover all pitch roofs with one layer of asphalt felt weighing not less than thirty pounds per square. Same to be laid parallel with the eaves, each layer lapped at least three inches and nailed with capped or large-headed nails. The felt shall lap the valley metal at least six inches and on upright walls it shall lap under the tile at least four inches.

The metal contractor shall then place all valley metal, same to be held in place with clips fastened to the metal. The metal shall be bent over 1 by 2 strips running parallel on each side of the valley and must not be punctured in any manner. All eave strips and strips for hips and ridge shall be on hand ready for the roofer.

Cover all roofs so prepared with Mound City hard burned red (or green) pattern tile with trimmings as designated by the manufacturer. All tile to be fastened with copper nails.

No attempt shall be made to stretch the courses. The tile shall be so laid that the vertical lines are parallel with each other and at right angles to the eaves. The tile that verge along the hip shall be cut close to the hip board and a water tight job made by cementing the cut tile to the hip board with elastic cement. The joints of the hips and ridge should be cemented, but the interior space of the hips and ridge must not be filled with the pointing material. After roofer has completed his work he shall remove all broken and damaged tile.

"C" SPANISH TILE

With No. H-3 hip and H-3 ornamental hip-starter, No. R-1 ridge and No. T-3, 2-way terminal.
Size of tile, 12½x9½ in.
Shipping weight, including trimmings, 1100 lb. per square

MISSION TILE

Size of tile, 15½x7¾ in.
Gauge, 9½x12 in.
Shipping weight, including trimmings, 1400 lb. per square

WILLIAM L. BARRELL CO. OF N. Y., INC.

Cotton Duck—Converted Fabrics

93 Worth Street

NEW YORK, N. Y.

Product

CON-SER-TEX, a covering for roofs and floors.

Con-Ser-Tex—An Ideal Roof and Floor Covering

Con-Ser-Tex is a specially woven, chemically treated, tough cotton duck which meets the exacting requirements of an ideal covering for roofs and floors of porches, sleeping balconies, piazzas, etc.

Con-Ser-Tex is also an ideal floor covering for kitchens, laundries, garages, etc.

Con-Ser-Tex is so woven that there is absolutely no tendency to curl, as is the case with ordinary cotton fabrics. Con-Ser-Tex lies flat permanently, as is essentially necessary.

Con-Ser-Tex will never split, not even under severe vibration or strain. It is comfortable under foot and may be turned up to form a sanitary, verminproof and waterproof base, integral with the floor.

Immune to Dry Rot and Mildew

Con-Ser-Tex is subjected to a chemical treatment in which every fiber is impregnated with a special composition which protects it against the elements. This renders it permanently waterproof and immune to the ravages of dry rot and mildew. The effectiveness of the process is proved by the great endurance of the similarly bitumen soaked mummy cloths of the ancient Egyptians.

This chemical treatment also exercises a distinct rot preventive and antiseptic effect upon the wood over which Con-Ser-Tex is laid.

The chemical treatment also overcomes the detrimental oxidizing action of the oil in the paint.

Durability Proved Through Service

Con-Ser-Tex is more durable than ordinary wood shingles or tin and nearly as durable as copper. The durability of Con-Ser-Tex has been proved by the many years of service which it has rendered to the largest transportation companies, which have used it exclusively for passenger car roofing.

Con-Ser-Tex is soundproof and non-heat-radiating and is a non-conductor of heat and cold.

Con-Ser-Tex has found wide use in every climate and for every class of service with complete satisfaction.

Easily and Quickly Laid—Conserves Labor

Con-Ser-Tex is easily and quickly laid, consequently it effects great savings in time and labor. It can be applied at one-half the cost of laying other materials on the same surface and area.

A Lower Grade of Lumber May Be Used

In the construction of porch floors, sleeping balconies, etc., it has been customary to use clear pine owing to its durable nature. With the aid of Con-Ser-Tex, however, a lower grade of lumber can be used with equally satisfactory results, because Con-Ser-Tex protects the lumber from the action of the elements and a surface so covered will have greater life than would an unprotected clear pine surface.

How to Lay Con-Ser-Tex

Dress the surface to be covered with Con-Ser-Tex by eliminating rough places and sharp edges, after which apply a heavy coating of white lead thinned in linseed oil as a bedding (see note below). Over this bedding (while still wet) lay the Con-Ser-Tex, slightly stretching it so as to insure a close adhesion to the wood surface, taking care to arrange laps so as to permit free drainage.

If Con-Ser-Tex is to be laid in parallel courses with the building, the strips start from the outer or lower edge of the surface to be covered. Con-Ser-Tex should be turned up or flashed 4 to 6 in. at walls to insure a watertight result.

While Con-Ser-Tex is stretched, fasten with copper or galvanized tacks $\frac{3}{4}$ in. apart, and then apply the next strip, allowing a lap of not less than $1\frac{1}{2}$ in.

After Con-Ser-Tex is laid and set, apply a light coat of good quality lead-and-oil paint, and a second or heavier coat after the first is thoroughly dry.

Note: If desired, we can furnish a special bedding paint which has greater adhesive qualities than ordinary white lead and oil.

Grades of Con-Ser-Tex

Grade E—A light weight grade, suitable for roofing small porches and for floors where traffic is light.

Grade G—A medium weight grade, suitable for larger porch floors and roofs on residences and public buildings.

Grade I—The heaviest grade, used principally for public buildings and all places where severe conditions exist.

Reasonable in Cost

The first cost of Con-Ser-Tex is reasonable and its upkeep practically nil, requiring painting only as often as the rest of the house.

LIST PRICE OF CON-SER-TEX PER LINEAL YARD

Width, in.	Grade E	Grade G	Grade I
30	\$1.17	\$1.38	\$1.47
36	1.39	1.60	1.78

Discounts furnished on request.

Consult Us Regarding Economical Laying

On receipt of dimensions of the surface to be covered, we will submit an estimate of cost, also a diagram showing the most economical method of laying Con-Ser-Tex, eliminating to the greatest possible extent all waste in cutting.

There is no charge for this service.

Club House of the Empire City Race Track, Mt. Vernon, N. Y.

Con-Ser-Tex is giving service on the porch floor and roof

THE BARRETT COMPANY

Flashings for Brick and Concrete Walls

40 Rector Street
NEW YORK, N. Y.

For Branch Offices, see page A393

Products

FLASHING BLOCK for Brick Walls (Patented), FLASHING FORM for Concrete Walls (Patented), PLASTIC ELASTIGUM for Flashings.

For Roofing, see pages A393-395; for Roof Leader and Roof Vent Connections, see page C2333. For detailed description and specifications, see Volume III, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

Essential Features of Barrett Flashings

Barrett Flashings, which are the result of nearly three-quarters of a century of successful roofing experience, embody all of the following essential features:

(1) They provide amply for expansion and contraction. (2) Their elasticity takes care of settlement or shrinkage. (3) All joints are watertight under every weather condition. (4) They will not pull away from either roof or wall. (5) They are practical and easy to install. (6) They are adaptable to every complex wall construction. (7) They are durable and require no maintenance or repair. (8) They eliminate division of responsibility between contractors. (9) Their cost is moderate.

Barrett Flashing Blocks and Flashing for Brick Walls

These blocks provide a permanent, upwardly inclined flashing groove in the wall, which performs the function of a cap and weather protection for the flashing. This cap, being an integral part of wall, is as permanent as the wall itself, and can not become detached.

The flashing material is installed over one unbroken plane, eliminating the buckling, tearing, pocketing, and special wear which so frequently occur where flashings are set in at right or acute angles. The cant construction provides support from below throughout the extent of the flashing, hence there is no strain from wind and gravity.

For detailed specifications see Volume III, Architects' and Engineers' Built-up Roofing Reference Series.

Barrett Flashing Form and Flashing for Concrete Walls

This flashing form is identical in principle with the flashing blocks described above. The metal flashing form, shown at right, provides a permanent, upwardly inclined flashing groove in the wall, which performs the function of a cap and weather protection for the flashing. This cap, being an integral part of wall, is as permanent as the wall itself, and can not become detached.

The metal flashing form is not intended to be permanent, its only function being to shape or create the flashing groove. It is left in the wall merely as a matter of convenience.

The flashing material is installed over one unbroken plane, eliminating the buckling, tearing, pocketing, and special wear, which so frequently occur where flashings are set in at right or acute angles. The cant construction provides support from below throughout the extent of the flashing, hence there is no strain from wind and gravity.

For detailed specifications see Volume III, Architects' and Engineers' Built-Up Roofing Reference Series.

THE FIGGE COMPANY

Manufacturers of the Patented Figge Roof Flashing

1110 West Adams Street

CHICAGO, ILL.

Product

FIGGE PATENTED ROOF FLASHING for all types of built-up roofings.

Figge Roof Flashing

Figge roof flashing is manufactured for the one purpose of permanently protecting the vital point in built-up roof construction.

Architects recognize that 95% of roof leaks develop in and around the flashing.

Figge flashing is furnished complete in two weights—two-ply and three-ply—the material is woven fabric thoroughly saturated with bituminous compound. The life of the Figge flashing is equal to the best built-up roof constructions. There are no nails to rust, no wood to rot, no crevices for water seepage. It forms a solid, permanent waterseal between the wall and the roof. Figge flashing presents perfect flexibility working perfectly into corners and uneven mortar courses.

How to Specify

Figge flashing requires a raggle which is formed by raking out the mortar joint between brick. This raggle should be $1\frac{1}{2}$ in. deep and at whatever height

desired. It can be taken care of in mason specification where it is raked out before it sets or can be taken care of by the roofer. Wherever concrete is used a raggle can be provided by a wood strip nailed on to the form. Under roofing specifications have subheading:

Roof Flashing—The roof flashing shall be Figge Flashing applied according to manufacturers' directions.

Specify either Two-ply, Three-ply, Standard or Extra Heavy and the width. Specify either 6, 8, 10 or 12 in.

The flashing should extend out on the roof from 1 to 2 in., to reinforce angle between roof and wall so that if necessary to flash up on the wall 6 in., specify 8 in. wide flashing. If necessary to flash up on the wall 8 in. specify 10-in. wide, etc.

How Packed

Figge flashing is packed in specially designed cartons of tough and durable fiber board which assures flashing arriving on the job in perfect condition. Each carton is labeled properly with type and size clearly shown, bound with heavy steel strapping. Direction sheet in each package.

Package contains 100 lin. ft.

Fig. 1—Provide raggle $1\frac{1}{2}$ in. deep at required height. Place flashing so that corrugation in device is in center of raggle. Place screwdriver or flat piece of metal at corrugation in securing device and push into raggle

Fig. 2—When securing device in place press down so that it takes on position shown in Fig. 2

Fig. 3—Cement flashing to wall and turned-up portion of roof covering. Care should be taken here to prevent wrinkles

Fig. 4—Point up raggle with a rich mixture of portland cement mortar, or asphalt roof cement. In using asphalt roof cement stiffen with portland cement to form a mastic consistency. Then apply a coating of bituminous cement over entire exterior of flashing

COUNTER-FLASHING RECEIVER CO.

712 Park Street, MILWAUKEE, WIS.

AGENTS IN ALL PRINCIPAL CITIES

Product

SCHNEIDER COUNTER-FLASHING RECEIVER, a permanently built-in, leakproof metal raglet for masonry parapets and walls. Receives and securely holds, without calking, the standing flat-roof counter-flashing. Fully protected by patent.

Materials

16 ounce, cold rolled copper. 26 gauge galvanized Armco iron. Furnished in 8-ft. lengths.

Adaptability

Adapted to all classes of buildings with flat or slight pitch composition roofs such as those of industrial and commercial buildings, hotels, apartments, schools, etc.

Advantages

Furnished and installed by mason. Flashing receiver is furnished and built in by the masonry or general contractor with little labor cost as the masonry work of parapets and walls progresses.

Permanence—Made up of non-corrosive metals, it lasts as long as the masonry walls. Permits the removal and replacing of counter-flashing without injury to the receiver.

Leak-proof—Most roof leaks occur at or about the flashing against parapets and walls. The counter-flashing when set with its top flange inserted in a cut out mortar joint secured with flashing hooks and calking cement is far from permanent and is the vital point where leakage occurs.

The turn-up at the back of the Counter-flashing receiver body, not only securely anchors the receiver in the masonry mortar joint, but it permanently prevents wind driven rain or the water from melting banked snow from passing over the receiver body, and penetrating through the mortar joint to the interior of the wall to appear on the walls and ceilings beneath with resultant costly damage.

This positive and permanent assurance against leaks at this most vital point is a prime reason for the inclusion of the receiver on all buildings where counter-flashing is required.

Easily and Quickly Installed—Furnished in convenient lengths of 8 ft., the Counter-flashing Receiver is easily handled and quickly installed by the mason without special tools or skill in metal working.

Reduces Labor Costs—Eliminates the usual labor costs of roofing and

sheet metal contractor in cutting out the mortar joint to receive the counter-flashing flange and the initial cost of flashing hooks and calking cement, and the labor of installation.

Application

The Schneider Counter-flashing Receiver is furnished and set by the mason in the masonry mortar joint. The body of the receiver (A) is set level in the wall with the guide flange (E) pressed close against the vertical masonry face. Splice plates with turn-up at back edge, are furnished to fit snugly into the splicing plate groove (F) to firmly join abutting ends in perfect alignment. Corners and re-entrant angles are easily made without intricate fitting or special tools. On roofs with considerable pitch the receiver is installed in steps maintaining a minimum of from 6 to 8 in. and a maximum of 12 to 16 in. above the roof surface. After the roofing or sheet metal contractor has set the counter-flashing with its top flange inserted in the counter-flashing groove (D), he bends down the projecting flange (C) securely locking the counter-flashing in place, yet allowing for its normal and natural expansion and contraction. The locking flange (C) is easily lifted and re-bent to its customary position without injury when removal and replacement of counter-flashing is necessary in reroofing.

Detail of Application

Specification

Include in Masonry Specifications—The Mason Contractor shall furnish and build into all parapet and similar walls where counter-flashing is required [copper] [galvanized Armco iron] Schneider Counter-flashing Receiver as manufactured by the COUNTER-FLASHING RECEIVER Co., Milwaukee, Wis.

The Counter-flashing Receiver shall be set in the masonry mortar joint in accordance with the manufacturer's details. Butting end joints shall be secured in perfect alignment with splice plates, furnished by the receiver manufacturer, and all corners and re-entrant angles shall be lapped and joined as shown.

The receiver shall be set in a mortar joint approximately 9 in. at its lowest point, from the roof level. Where steps are required by changing roof level, these shall occur at points where the maximum height above the roof surface is approximately from 12 to 16 in.

Include in Roofing and Sheet Metals Specification—[Copper] [galvanized Armco iron] Schneider Counter-flashing Receiver is furnished and built in by the Mason Contractor (see page ... of specifications and details). This contractor shall insert the top flange of his [copper] [galvanized Armco iron] counter-flashing in the receiver counter-flashing groove, and bend the projecting receiver flange over the counter-flashing top.

Note: No counter-flashing hooks or calking cement are required.

Note: To prevent electrolysis, the receiver and counter-flashing must always be of the same metal, i.e. copper receiver—copper counter-flashing; galvanized Armco iron receiver—galvanized Armco iron counter-flashing.

ESTATE OF J. G. HETZEL

Manufacturers of Roofing Cements and Paints

CABLE ADDRESS
"HETZEL, NEWARK"

67 Maine Street
NEWARK, N. J.

Products

HETZEL'S ELASTIC ROOF CEMENT for all kinds of roofs, glass skylights, coping stones, etc.

HETZEL'S PLASTIC ROOF COMPOUND and FIBROUS KOTING.

HETZEL'S ELASTIC CALKING COMPOUND.

HETZEL'S PIPE JOINT COMPOUND.

HETZEL'S DAMP RESISTING PAINT for brick walls.

Also Hetzel's Asphalt Paints; Hetzel's "Rub-on" Roofing Paint; Hetzel's Enamel Paint for boiler fronts and steam pipes; Hetzel's Acidproof Paint for metal work, ammonia tanks and gas tanks; Hetzel's Structural Paint for exposed surfaces.

Hetzel's Elastic Roof Cement

Hetzel's elastic roof cement, which has been in general use throughout the United States and Europe for many years, is especially valuable for covering and repairing all holes, cracked joints, breaks, or leaks in roofs of all kinds. It is also used for pointing around chimneys, skylights, and dormer windows; for repairing coping stones, gutters, wood and stone work which requires to be made watertight; and for laying and bedding slate and tile roofs.

Asphalt shingles laid in Hetzel's cement will not curl, nor can snow or rain blow under them.

Colors: brown, gray, black, white, green and red. It is also made to order to suit every purpose, and is the only slaters', tinnners' and tile roofers' cement.

Hetzel's elastic roof cement is equally well adapted for use on slate, tin, asbestos, glass, wood and metal roofs; is permanent; does not run or loosen from joints or cracks, and is not affected by any extreme of temperature or climatic changes. It does not harden, but preserves its complete elasticity even when exposed to extreme heat, cold, dryness or humidity.

Hetzel's Plastic Roof Compound and Fibrous Koting (Liquid)

Specially prepared compounds for repairing and painting old wood, tin, iron or felt roofing; for repairing

TRADE-MARK

leaky chimneys; for waterproofing walls below and above grade, etc.

Hetzel's Elastic Calking Compound

For pointing window frames, hothouses, steel sashes, crevices, cracks in masonry, etc. Remains elastic indefinitely. Will not crack or dry up. Far superior to lead or oakum. Does not contain asphalt or coal tar. Can be painted over with any color. Also made in special consistency for use in guns.

Colors: white, gray, green, black and red.

Pipe Joint Compound (Red and Gray)

This compound is used for joints of gas, steam, water, and air pipes. It will not harden, and prevents joints from rusting. It will make absolutely tight joints, which can be disconnected at any time, without injury to fittings.

Hetzel's Damp Resisting Paint

A compound black paint for dampproofing foundations and walls above and below grade. When applied to inner side of exterior walls, forms a good dampproof surface for direct application of plaster, rendering plaster stainproof, and saving cost of furring and lathing.

Specifications for the Use of Hetzel's Elastic Roof Cement

All nailholes and joints between the slates shall be sealed with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J., in such quantities as to hold the slates in position should they break, or the nails rust away. (Fig. 1.)

The joints of all tiles shall be sealed with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J. To prevent leaking, the hip and ridge rolls shall be sealed in a like manner. (Fig. 2.)

All cap flashings shall be carefully pointed up with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J. (Fig. 3.)

The joints of all copings shall be set and sealed with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J. (Fig. 4.)

COP-COR MFG. & SALES CORP.

Manufacturers of the Pfistner Copper Corner Guard

345 Central Avenue, JERSEY CITY, N. J.

The Pfistner Copper Corner Guard

The matter of finishing house corners in a manner which, while preserving the appearance of the building, at the same time provides for efficiency, economy and endurance, has engaged the serious attention of architects and builders for years. Bulky two or three-piece wood corners and methods of mitering, lapping or weaving are relatively expensive and tend to leave openings for the elements to work in, to the damage of the house and the detriment of its appearance.

The Pfistner Copper Corner Guard is a one-piece, complete, ready-to-attach product which is designed to provide an efficient ground for all types of sidings. It represents a distinctive stride forward in practical construction. The Johns-Manville Corporation unreservedly endorse and recommend the use of the Pfistner Copper Corner Guard with their rigid asbestos siding shingles, specifying size No. 1, Special.

Construction

Is of 16-oz. pure copper sheeting. The quarter-round section is reinforced with a wood filler moulding. The flanges are $1\frac{3}{4}$ in. in width corrugated with 3 deep grooves. Sections are 5 ft. in length for ease in applying and the end of each is tongued or offset to provide an overlap fit of the next section.

Sizes

Made in 3 sizes: No. 1 is for use with asbestos shingles and stucco and is provided with a turn back lip that prevents any water, which a driving rain might force beyond the corrugations, passing the edge of the flange.

No. 2 is for use with novelty board, clapboard and asbestos shingles of greater thickness.

No. 3 is for use with wood shingles and colonial board.

Features

The outstanding features of Pfistner Copper Corner Guard are:

Weatherproof—The corrugated flanges absolutely prevent seepage of water past the grooves.

Lasting—Made of pure copper. The use of copper in construction is widespread and its value is acknowledged.

Simple to Apply—One nail at each corner of each section.

Neat—Stays in place. There is no wood to rot, no cement to chip away, and no butt end fit. It forms a uniform line.

Economical—Through saving labor in the original application and eliminating replacements.

Saves Labor—The corners are ready to apply and there is no expensive lapping or mitering.

Adaptable—For use with any style of board, shingle or stucco.

Finish—May be painted as desired for the copper will hold the paint as long or longer than wood, or if left to color naturally a pleasing tone develops.

Size No. 1 Copper Corner Guard with Asbestos Shingles

A combination which defies time. D—offset which provides overlap for next section.

F—Johns-Manville 14-lb. asbestos felt.

G—Johns-Manville No. 80 rigid asbestos siding shingles

Pfistner Copper Corner Guard

A—full length wood filler insures rigidity.

B—corrugations which arrest the passage of water.

C—turn back lip which is a special feature of Size No. 1 for use with asbestos shingles.

D—offset which provides for overlap fit of next section

Size No. 3 Copper Corner Guard

For use with wood shingles and Colonial boards

Size No. 2 Copper Corner Guard

For use with clapboard and novelty boards

E. M. LONG & SONS

"Improved" O. G. Fir Gutters

CADIZ, OHIO

Product

"IMPROVED" O. G. FIR GUTTERS, for use on all types of building where exposed or hanging gutters are contemplated.

Material

"Improved" O. G. Fir Gutters are manufactured from clear, soft, old growth Douglas fir and are very strong and durable.

Stock Sizes and Weights

They can be furnished in the following stock sizes: 3x5 in., 4x6 in., 5x7 in., and in lengths from 10 to 40 ft. The 3x5 in. size weighs 1½ lb., the 4x6 in. size, 2 lb., and the 5x7 in. size 3 lb., per lineal foot.

Note: Lengths 22 ft. and under can be shipped locally in any quantity; for lengths longer than 22 ft., order should call for not less than 1500 lb.

Description

"Improved" O. G. Fir Gutters are rapidly replacing metallic gutters on all types of buildings, because they look better, last longer and are less expensive; they do not corrode or disintegrate when exposed to the elements, smoke, or acid fumes. There is no expansion or contraction.

In New England, wooden gutters have been and are in general use, and have proved very satisfactory and durable over a long period of years.

There are numerous instances where old growth, Douglas fir gutters have lasted 25 years and more without any attention or repairs.

They add to the attractiveness of a house and have architectural merit on account of their form and design. "Improved" O. G. Fir Gutters can be included as a part of the cornice profile—eliminating the unsightly appearance of the ordinary hanging metal gutter.

The ultimate cost is less than gutters of copper, galvanized iron or best tin, and they are adapted for both new construction and replacement work.

A large stock of "Improved" O. G. Fir Gutters is always available for quick shipments—half a million feet is carried in stock. "Improved" O. G. Fir Gutters

are sold through retail lumber dealers.

Specifications

General—The Contractor shall provide and install....in.

"Improved" O. G. Fir Gutters as furnished by E. M. LONG & SONS, Cadiz, Ohio.

Material—The gutters shall be manufactured from clear, soft, old growth Douglas fir.

Priming—When specifying, state whether gutters are to be furnished unprimed or treated with creosote wood preservative. Before installing the inside or trough should be well coated with a good grade of asphalt and the outside well primed with lead and oil.

How to Install

It is recommended setting all gutters level for architectural and practical reasons. Architecturally—so that straight horizontal lines will be retained. Practically—because water, always seeking its own level will find its outlet at the leader spouts. One leader is sufficient for short gutters, but long lengths require two or more, depending upon roof area to be drained.

Gutters can be set with a slight pitch towards the leader end; or in long lengths, each end near a leader can be sprung downwards slightly and fastened in that position.

In joining two lengths, the ends should be cut bevel to fit closely, the joint cemented and fastened securely with two 3-in. brass screws through the bottom and two ¾-in. brass screws at the top. Screw heads should be countersunk and puttied. The ends of gutters may be rebated for a distance of 1½ in., on each side of the joint deep enough to hold sheet-lead or copper flashing which should be embedded in the rebate with elastic cement, and tacked around the edges with ¾-in. copper tacks.

Ask for booklet showing photographs, details, drawings for down-spout connections, etc.

BERGER BROTHERS COMPANY

Gutter Hangers and Conductor Pipe Fasteners

229-237 Arch Street, PHILADELPHIA, PA.

Products

GUTTER HANGERS and CONDUCTOR PIPE FASTENERS, of malleable iron, wrought iron, solid cast bronze and copper channel.

Also a general line of Sheet Metal Workers' Requirements; "Shurlock" Conductor Pipe and "E-Z" Fit Eaves Trough; "Quaker City" line of Mitres, Ends, Caps and Outlets.

Exclusive manufacturers of Octagon and Polygon Conductor Pipe.

The Mark of Quality Which Protects the Purchaser

We are the originators, designers and manufacturers of the best grade of gutter hangers and conductor pipe fasteners on the market.

Our registered trade-mark appears on all products manufactured by us. This mark represents dependability, durability and strength and protects the purchaser against inferior imitations.

When specifying, full protection is assured by insisting that our trade-mark appear on every piece.

How Furnished—Made of malleable and wrought iron, plain or tinned (plain furnished unless otherwise specified), solid cast bronze and copper channel. All shanks and circles interchangeable. One bolt included with each hinged shank. Hinged shanks are adjustable to any pitch of roof. Shanks may be lengthened with our extension shanks.

Free samples on request.

No. 1. Clamped direct to metal roof, requiring only one bolt through the iron. Especially suitable for awnings and corrugated roofs

No. 5. Will span over various shaped mouldings and is easily bent larger or smaller before nailing to eave

No. 6. For nailing against O. G. mouldings. The two stays are made to fit in the cove and can be bent to suit variation

No. 7. For driving from 3 to 4 in. square in cornice. Lower prong forms a brace for the upper and makes it strong and firm

No. 8. For driving from 3 to 6 in. square in cornice. Intended for eaves where shingles project over the cornice

Penn Gutter Circle
For double bead gutters. Sizes, 3½, 4, 4½, 5, 6, 7 and 8 in.

Gem Gutter Circle
For single bead gutters. Sizes, 3½, 3¾, 4, 4½, 5, 6, 7 and 8 in.

Circles are applicable to any B. B. hanger

No. 9. For driving with the pitch of the roof. Suitable for narrow moulded cornice

B. B. Gutter Hangers

TYPICAL DETAILS SHOWING APPLICATION OF BERGER BRO'S. GUTTER HANGERS

No. 10. For nailing against square box cornice

No. 11. For nailing to the side of exposed rafters

No. 17. For fastening under shingles. Hinge and circle both adjust to every $\frac{1}{8}$ in.

No. 16. For fastening under shingles

No. 12 $\frac{1}{3}$ PITCH

No. 15 SQUARE

Nos. 12, 15 and 25. For fastening under shingles or slate. Can be bent to any pitch of roof without weakening or breaking

No. 20. For nailing or screwing to various shaped mouldings at any angle desired. Hinged for any pitch of roof

B. B. Gutter Hangers

Made of malleable and wrought iron, plain or tinned (plain furnished unless otherwise specified), solid cast bronze and copper channel. All shanks and circles interchangeable. One bolt included with each hinged shank. Hinged shanks are adjustable to any pitch of roof. Shanks may be lengthened with our extension shanks. Free samples on request

Pipe Fasteners

For fastening all kinds of conductor pipes at any distance from the wall. Used in any position and allow enough variation to let pipe slip together until tight in the joints. Needs no close measuring on wall to find a joint for the drive

No. 0. For brick, 3 in. No. 1. For brick or stone, $4\frac{1}{2}$ in. No. 2. For stone, 6 in. No. 3. For stone, 9 in. No. 4. For wood, 3 in.
No. 5. For wood, 5 in. No. 6. To nail on wood. No. 7. To screw in wood.

Clasp Pipe Hooks

For fastening conductor pipe to wood, brick or stone at any distance from the wall. Length drives: 3 and 5 in. for wood; 4, 6 and 9 in. for brick and stone

Round Corrugated Hinged Pipe Hook
With wood and brick drive.
Sizes, 2, 3, 4, 5 and 6 in.

Plain Round Hinged Pipe Hook
With brick drive in 2, 3, and 4 in., and wood drive in 2, 3 and 4-in. sizes.

Plain Sickle Pipe Hooks
With wood and brick drive. Sizes, 2, 3, 4, 5 and 6 in.

Corrugated Sickle Pipe Hooks
With wood and brick drive. Sizes, 2, 3 and 4 in.

Square Wired Pipe Hook
With wood and brick drive. Sizes, 3, 4, 5 and 6 in.

Round Wired Pipe Hook
With wood drive. Sizes, 3 and 4 in.

B. B. Conductor Pipe Fasteners and Hooks

Made of tinned malleable iron and of solid cast bronze

Hungerford Star Brand Copper Leaders

Only 16 oz. pure copper will give the satisfactory long life and permanently trim, neat appearance that rightfully should be and is expected of copper leaders and gutters.

Every length of our Star Brand leader and gutter is clearly embossed with our name and the net weight of hard rolled, roofing temper pure sheet copper from which it is made. Our name and brand mark on a length of copper leader or gutter is positive assurance of full net weight, standard quality material. All Hungerford Star Brand copper products are unconditionally guaranteed.

In order to meet requirements of the building trades for prompt service we carry on hand in our warehouses, ready for *immediate* shipment an extensive stock of our Star Brand copper leaders comprising the following sizes and kinds:

Copper leader	Weight of copper, oz.	Lengths, ft.	Diameter, in.
Plain round	16	10	2, 3, 4, and 5
Corrugated round	16	10	2, 3, 4, 5 and 6
*Corrugated square	16	10	2, 3, 4, and 5

*From long custom this type of leader is termed "square," whereas it is in reality rectangular in shape. Sizes carried in our stock as noted above are standard. Actual measurement of 2-in. "square" corrugated leader is $1\frac{3}{4} \times 2\frac{1}{4}$ in.; 3 in. = $2\frac{3}{8} \times 3\frac{1}{4}$ in.; 4 in. = $2\frac{3}{4} \times 4\frac{1}{4}$ in.; 5 in. = $3\frac{3}{4} \times 5$ in.

Hungerford Star Brand Copper Leader and Gutter Fittings and Accessories

No. 1 45° No. 2 60° No. 3 75° No. 4 90° Shoe

Types of Leader Elbows

Elbows, shoes, miters, end pieces, caps and outlets are also carried in our warehouse stock in sizes and patterns to correspond with foregoing stock items of leader and gutter.

Leader elbows are ordinarily designated by "number" and diameter. "Number" indicates degree of angle (see accompanying sketch).

Cut Copper Nail

Copper Spanish Tile

Hungerford Star Brand Copper Gutter

Single bead, lap joint half round. Stock sizes: 16-oz. copper, 10-ft. lengths, 4, 5, and 6-in. diam.

Double bead, half round gutter, also double or single bead, *slip* joint types can be furnished promptly to special order.

While it is possible for a skilled metal worker to make satisfactory quality copper gutter, this practice leaves the architect without positive means of knowing that full weight, 16-oz. copper has been installed on a residence, in accordance with specifications.

Like our "Star Brand" copper leader we advocate the use of *factory made* material and for purposes of quick identification and as our positive guarantee of full weight standard quality, every length of genuine Hungerford "Star Brand" copper gutter is indelibly die stamped with our name, "Star" trade-mark and the full net weight of copper from which it is made.

To meet special requirements a variety of "OG" and other types of copper gutters can be made to order promptly. The following suggested patterns give some idea of our facilities in this direction.

Styles of Special Copper Gutters

End or contour views showing some types of "OG" and special patterns of copper gutters that can be made promptly to special order (not drawn to scale). These designs may be varied in any particular to conform with architects' plans and can be made in any size desired

Copper Gutter Hangers

Copper hangers should of course always be used with copper gutters and it is also important that copper nails be used; iron nails of any type should never be driven through or allowed to come in contact with copper; galvanic action which is sure to result from such practice will quickly disintegrate and destroy the nails.

Rex Strap Copper Gutter Hangers—In the Rex hanger, simplicity of construction and ease with which it can be installed are outstanding features.

Rex Copper Gutter Hanger

Note the following five points of superiority in the Rex hangers:

(A) Reinforced truss type of crossbar $\frac{5}{8}$ in. thick by $\frac{5}{8}$ in. wide supports sides of gutter and prevents bending out of shape or alignment by painters' ladders.

(B) Hook is slit at this point to facilitate bending

and will automatically adjust itself to any variation in size of bead. This feature insures tight fit.

(C) Spur on understrap slips up under bead and forms a lock when strap is bent around gutter.

(D) Hole is punched for nailing through gutter and hanger into fascia board. Prevents gutter from tipping over.

(E) Adjustable locking feature permits pulling strap to a snug, tight fit all around gutter.

Monarch Shank, Plate and Circle Gutter Hanger

Built on an entirely new principle that overcomes the limitations and disadvantages of old-fashioned numbered shank and circle gutter hangers:

Monarch Shank and Circle Gutter Hanger

Monarch shanks are adjustable; only one type of shank required for any pitch of roof.

Monarch plates, for use on fascia boards and overhanging rafters, are reversible, which permits either right or left fastening; plates are adjustable up or down, same as the shanks.

A secure fastening can also be made by using the

Monarch circle alone, nailing direct to the rafter or fascia board; no other circle can be used alone in this manner.

In stock, ready for immediate delivery, in pure copper and galvanized iron for 4, 5 and 6-in. gutters.

Hungerford Star Brand Sheet Copper

Has a fifty-year old reputation with the roofing and sheet metal working trades as a dependable, uniformly satisfactory product.

Every step in the production of Star Brand sheet copper from mine to ingot and from ingot to the rolled sheet is carried out in full accordance with present day standards and improved methods. Star Brand sheet copper is as near 100% pure as any sheet copper can be made.

By writing "Hungerford Star Brand Sheet Copper" into specifications you will have the satisfaction of knowing that you are providing for material with a thoroughly tried and proved reputation for quality.

Hungerford "Old English" Lead Coated Sheet Copper

For roofs, valleys, flashings, leaders, gutters and other outside metal trim on country houses or public buildings where "English" style of architecture is a feature. Can be furnished in any required size. Coated on one or both sides, as desired. The cost is only a fraction of that of hard sheet lead or cast lead fittings. It is much lighter than pure lead and therefore easier to handle and support. It will not dent and damage as easily as pure lead. It can be worked into innumerable designs and patterns that would be impossible of attainment with cast lead.

"WHEELING" HAND DIPPED ZINC COATED CONDUCTOR PIPE, made of Ohio Metal (Copper-Alloy), a new galvanized conductor pipe of superior rust resisting quality.

"WHEELING" EXTRA HEAVY COATED EAVES TROUGH, made of Ohio Metal (Copper-Alloy).

"WHEELING" HAND DIPPED ELBOWS.

"WHEELING" HAND DIPPED TIN ROOFING (Roofing Ternes).

"WHEELING" STEEL CEILINGS.

For Metal Lath, Corner Beads, etc., see page B1308.

"Wheeling" Hand Dipped Zinc Coated Conductor Pipe

This product is formed from heavy gauge Ohio Metal (copper-alloy) and is hand dipped *after forming* in pure molten zinc. The hand dipping process embeds surfaces, edges and seams within a thick, impenetrable weatherproof, rustproof coating to an extent never before possible of attainment in a conductor having the rigid strength of steel.

Hand dipping *after forming* assures an unbroken coating, thereby obtaining the maximum protection of pure zinc, in fact, making virtually a pure zinc conductor with the added advantage of steel reinforcement.

Made in all sizes and styles and may be specified without materially increasing conductor costs.

"Wheeling" Hand Dipped Elbows

For use with "Wheeling" Hand Dipped Zinc Coated Conductor Pipe. They are made by the same process and of the same materials. Specify "Wheeling" Hand Dipped Elbows.

"Wheeling" Extra Heavy Coated Eaves Trough

Made by the same method and of the same material as "Wheeling" Hand Dipped Zinc Coated Conductor Pipe in both slip joint and lap joint styles. Sizes 4, 4½, 5 and 6 in.

Specify for gutters: "Wheeling" Extra Heavy Coated Eaves Trough.

"Wheeling" Hand Dipped Tin Roofing (Roofing Ternes)

For a third of a century "Wheeling" Hand Dipped Roofing Terne Plates have made permanent roofs for every type of building.

The base of these plates is Ohio Metal (copper-alloy) highly rust resistant in itself, and the coating consists of pure tin and lead applied by the "Wheeling" hand dipped process, assuring a heavier and longer wearing coating on both sides of the plates.

For protection of the user each plate is stamped with the "Wheeling" trade-mark and weight of coating.

To insure long lasting, fireproof roofing, specify "Wheeling" Terne Plates, which are obtainable in standard sizes with coating weights up to 47 lb. per box of 112 plates.

"Wheeling" Steel Ceilings

"Wheeling" Steel Ceilings continue to be the standard fireproof ceilings of the country and are manufac-

tured in an extensive range of designs appropriate for every type of room.

They are made with re-pressed beads and die-cut nailholes, which facilitate erection and insure perfect alignment and dustproof joints.

"Wheeling" Steel Ceilings are fireproof, sanitary and dustproof, and are carried in stock for prompt shipment at each Wheeling warehouse.

For your convenience a large catalogue of designs will be supplied upon request.

O. S. STEWART CO.

Manufacturers of Iron Protectors for Sewers and Downspouts
923 Maud Street, CLEVELAND, OHIO

Construction of Stewart Protectors

Stewart Protectors for sewers and downspouts are made of extra heavy gray iron and dipped in olive green enamel to protect them from corrosion and rust. A curve at the bottom allows the fitting to strike the center of the sewer. They are fitted with ears and a guide and equipped with bolts ready for installation. When anchored to the building they set plumb with the wall, are neat in appearance and add much to the finish of the building. They are made to fit all standard sizes of conductor pipes.

Uses

The hub of the protector is installed above the grade line. It protects both the sewer and downspout and thus eliminates the 80% of sewer stoppages caused by broken sewer pipes and rusted conductor pipes at the grade line, and the washing of sand and dirt into the traps.

The short protector may be used around residences where there is danger of breaking from lawn mowers,

etc. The long protector should be used at driveways and around commercial buildings where there is danger of vehicles coming in contact with the downspouts.

Ordering

When ordering refer to the plate and table of dimensions, and order by number to insure getting the fitting for which the downspouts have been designed.

Fittings of special size or offsets made to order.

Specification

The contractor shall furnish and install at the foot of each rain water conductor one Stewart Iron Downspout Protector of proper size to fit the downspout and to connect with the sewer 6-in. below the grade line. Each protector shall be set plumb with the building and securely anchored to the same. All joints shall be properly cemented or calked.

BLASKI MANUFACTURING CO.

Exclusive Skylight Manufacturers

4132-4138 Belmont Avenue
CHICAGO, ILL.

BRANCHES IN PRINCIPAL CITIES

Product

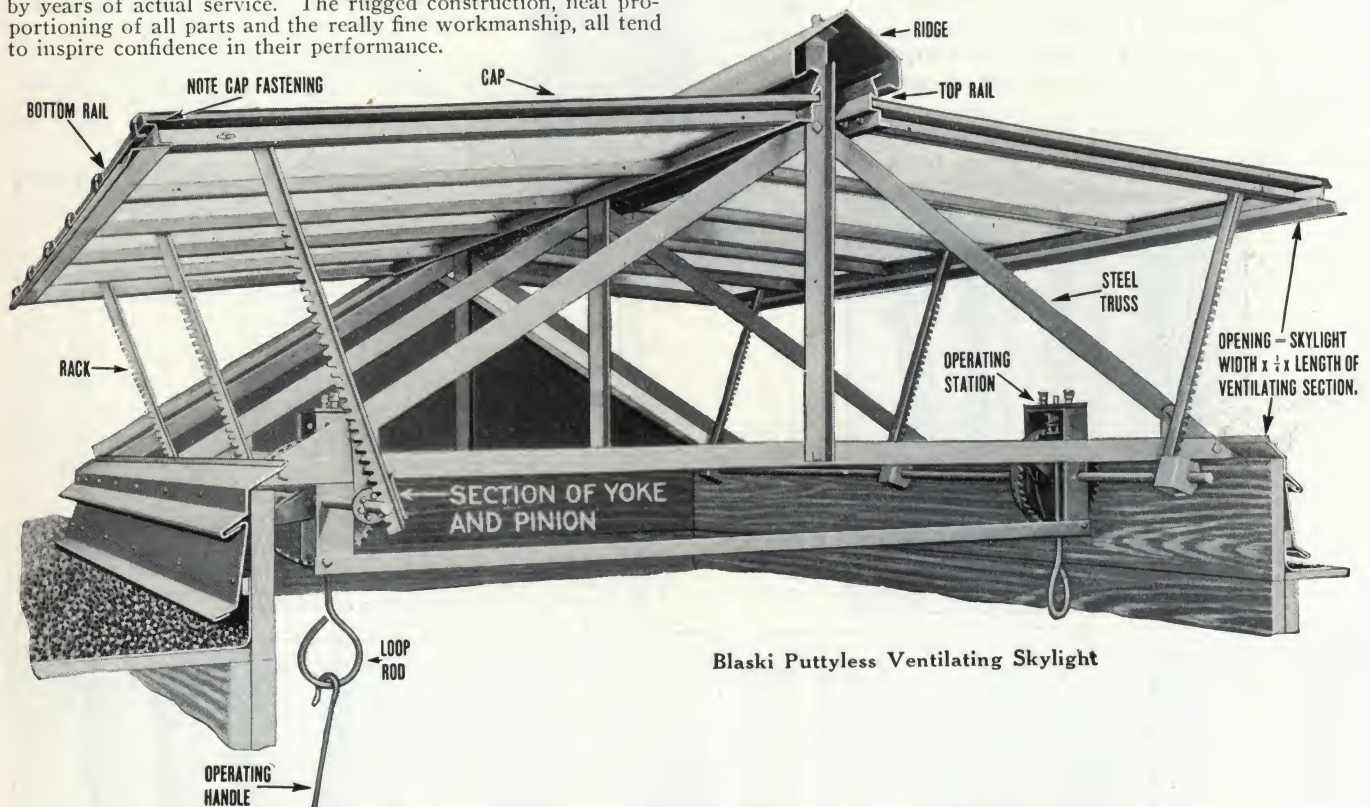

BLASKI LEAKPROOF PUTTYLESS VENTILATING SKYLIGHTS stocked in standard size widths 4 to 20 ft. wide, ready for erection in any length. Also stocked in the sawtooth type 4 to 7 ft. high and any length. All features patented or covered by patents pending.

Really Good Skylights

Types "B," "C" and "D" skylights, we believe are the outstanding examples of really good skylight construction. Every detail incorporated in these skylights is the result of long study and experimentation by experts and then proven under all conditions by years of actual service. The rugged construction, neat proportioning of all parts and the really fine workmanship, all tend to inspire confidence in their performance.

Blaski Skylights for All Uses

Types "B" and "C" skylights, in their variety of sizes and possible lengths of ventilating sections, can be placed at strategic points so as to light and ventilate the entire building chiefly through the roof. The increased efficiency and saving of electric light soon pays for the installation. The general trend when Blaski skylights have been tried is increased use, and many architects literally flood the building with Blaski skylights and ventilation. We also receive a large number of orders direct from owners who add to the quantity of Blaski skylights originally installed to cover additional requirements.

Blaski Puttyless Ventilating Skylight

Special Features

Blaski skylights are entirely self-supported by steel trusses, so do not require any special preparatory construction, except the curb. They are built entirely of 18 gauge copper bearing galvanized iron, properly fabricated and will last a lifetime.

A perfect puttyless glazing system provides for quick and easy removal of all glass for cleaning and painting of skylights.

This feature saves considerable time and money and insures a better job of painting.

The all-pressed steel operating system of Blaski skylights does away with hanging chains, and requires only one-third of the effort needed to manipulate other devices.

Quality and Quick Delivery

The quality of the die and machine made parts is of a uniform high standard, every piece being an exact duplicate of the original which was designed and made by experts. An average of over 100,000 sq. ft. of skylights are stocked for immediate delivery. The actual installation requires only a few assembling operations that are of such a nature that they cannot be performed otherwise than correctly. This is particularly desirable when skylights are ordered to be erected by mechanics already on the job.

Installation Gangs and Factory Branches

Our erection gangs are thoroughly experienced and available for service in any part of the country.

Factory branches located in most principal cities. These branches carry complete stocks and replicas of our factory service equipment so can give prices and service equal to that of the parent organization. Your inquiry will be referred to the nearest branch.

Prices, Inquiries, etc.

Inquiries as to prices should be accompanied with a list of skylight sizes, etc. Any other inquiries related to skylights are invited and will receive prompt and unqualified attention.

DETAILS OF TYPE "C"

Ventilating or stationary skylight construction. Upper and lower sections of skylight can be arranged to ventilate. Operating mechanism same as used on type "B" skylights. Stocked for curb widths 12-0, 14-0, 16-0, 18-0 and 20-0 wide and any length.

Construction Details

Fabrication—Complete fabrication of all parts direct from raw materials is done in plants owned by the BLASKI MANUFACTURING CO., under the strictest supervision and inspection. This we believe is the strongest guarantee of quality in any specification.

Supporting Structure—All steel angle iron trusses built from angles from $2\frac{1}{2} \times \frac{1}{8}$ in. to $2\frac{1}{2} \times 2\frac{1}{4}$ in. depending on size of skylight, but never spaced more than 67 in. apart.

Glass Bearing Members and Closures—These parts are all die and machine fabricated from 18 gauge galvanized copper-bearing iron. The galvanized coating is not injured, as is very likely with handwork. Assembly of the various parts is by bolting, lug and slot interlocking or riveting, but never soldering. Thus each joint is of a predetermined strength.

Glass and Puttyless Glazing—The $\frac{1}{4}$ -in. thick ribbed wire glass set in Blaski moulded glazing cushions is perfectly protected against expansion, contraction and flexure of skylight or glass. The cushions take up all twist and shock—as we frequently demonstrate by lifting one corner of an open sash without breakage of glass.

Operating Mechanism—All-steel rack and pinion type with all setscrews of permanent self-seating type. Shafting journaled in brass bushings which prevent rusting in. Operation by light detachable handle with friction clutch that positively prevents accidental or willful injury to operating mechanism. This operating mechanism requires only one-third the manual power as compared to the cast iron worm gear

type, and does away with the common and troublesome chain nuisance.

Hardware and Miscellaneous—Like the operating mechanism, all hardware is pressed steel and designed especially for the purpose required. A flexible 24 gauge galvanized iron weatherstrip is used between the curb and lower rails. This is the only place where metal lighter than 18 gauge is used.

Painting—Trusses receive a shop coat of red mineral paint before assembly. Operators and mechanism receive one shop coat of black paint. Galvanized iron parts are not painted unless painting is specified.

Flashings—Our composition flashing 9 in. wide is regularly furnished with all skylights. Other kinds of flashing can be installed on special order or can be included in the specifications of other contractors.

Special Metals—For general use the metals specified above will prove satisfactory, as the careful fabrication and high quality of metals give the skylight an expected life of from 50 to 75 years. For abnormal conditions skylights of a variety of metals can be made to stand up under any kind of requirements.

Recommended Architects' Specifications

Skylights to be of the ventilating type as manufactured by the BLASKI MANUFACTURING CO., 4132-4138 Belmont Avenue, Chicago, Ill. The size of skylights and lengths of ventilating sections to be in accordance with sizes shown on plans.

General Information

Curbs and Flashings—Curbs for Type "B" skylights should be 4, 6, 8 or 10 ft. wide, and any length. For Type "C" the curbs should be 12, 14, 16, 18 or 20 ft. wide, and any length. Measurements in both cases are outside measure. Measures for opening in sawtooth framing are from head to sill and inside between ends. Variation of $\frac{1}{4}$ in. over or under is the maximum allowance for all skylight curbs or openings. A typical wood and concrete curb is shown in section on detail of Type "B" skylight, and typical sawtooth framing on detail of Type "D" skylight. Any other style of curb can be built, however, as the only requisites for Blaski skylights are continuous fastening grounds or wood plate on the top of the curb, and continuous nailing strip about 6 in. above the roof line for fastening of roofing and flashing. Type "D" skylight framing can also be of any style with provisions for fastening of skylight and flashings. The details on the two preceding pages are drawn to a 3-in. scale. Necessary dimensions can be scaled directly from them.

The height of curbs or sills above the roof line depends on circumstances. A high curb must be metal flashed. Low curbs, such as possible on rounded truss roof construction, can be finished with our composition flashing as shown by typical curb sections on detail of Type "B." This type of flashing has been used by us very successfully for over six years and effects

considerable economies both in first cost and later re-roofing. The joint being roofing to a similar material is very tight and is much better than joints made to brick walls. The joint is also protected by the large overhang of the galvanized weather-strip.

Skylight Sizes and Lighting Efficiency—A general statement can be made, that about 15% to 25% of the floor area should be the area of skylights, and this percentage can vary with the nature of the work performed in the building. Large skylights in preference to smaller sizes are recommended. As an example; a room 40x80 ft. 20% lighted requires a 10x64 ft. skylight. The same amount of money spent for, say four smaller skylights, would probably buy only 10% to 15% of the floor area in skylights on account of the greater cost of small skylights, extra curb framing, etc.

Length of Ventilating Sections—The maximum length of ventilating sections for 4, 6, 8 and 10-ft. wide skylights are 40, 35, 30 and 25 ft. respectively; for 12, 14, 16, 18 and 20-ft. wide are 40, 35, 30, 25 and 20 ft. respectively; and for sawtooths 4, 5, 6 and 7-ft. are 40, 35, 30 and 25 ft. respectively.

Any combination of ventilating and stationary sections are possible, but all skylights are recommended full ventilating, especially when the length of skylight is less than the possible length of ventilating section.

DROU-VE-LITE (NON-CORROSIVE) GLASS STRUCTURE, patent pending.

"STRAIGHT-PUSH" SASH OPERATOR, tension type.

"DROUVÉ LOVELL" SASH OPERATOR, tension type.

WORM and GEAR SASH OPERATOR, torsion type.

Also manufacturers of the "Drouvé" Double Gutter Ventilators.

Facilities and Service

A modern one-story factory building containing 40,000 sq. ft. of floor space, equipped complete with the most modern sheet metal and skylight working machinery known to the trade.

This entire plant, one of the largest of its kind in the country, is devoted exclusively to the manufacture of our "Anti-Pluvius" puttyless skylights, ventilators and various types of sash operating devices.

A competent Engineering Department, invested with our twenty years of experience in the manufacture of puttyless skylights, is maintained for the purpose of furnishing you with practical information pertaining to all types of skylight construction.

Detailed drawings of different types of skylights embodying various conditions of installation will be forwarded on request, if you will advise us approximately regarding requirements.

We maintain an erecting force thoroughly skilled in the erection of our skylights.

Catalogues and estimates will be furnished on request.

"Straight-Push" Sash Operator

Designed to operate all types and makes of sash in monitors, skylights and sidewalls of buildings. Designed to withstand all manhandling and unexpected conditions.

Guide rolls mounted on brass pins to prevent rusting. All working parts have brass-to-iron connections. The sweep of levers is level.

Leverage force applied is uniform throughout length of line, insuring equal opening and closing of all sash.

"Improved Lovell Dreadnought" Sash Operator

This design, with its sweeping movement, gives large openings to heavy top hung sash. All parts made extra heavy, with phosphor bronze working joints.

Worm and Gear Operators

Practically all types of standard worm and gear devices supplied as desired for operating lines of ventilating sash in sidewalls, pitched roofs, sawtooth roofs and monitors, and for pivoted or hinged sash.

Details of standard worm and gear operating devices forwarded on application and, when sufficient information is given, recommendations will be made as to efficient and economical procedure.

Forty Thousand Square Feet of Floor Space Devoted Exclusively to the Manufacture of:
 The "Anti-Pluvius" Puttyless Skylight
 The Drou-Ve-Lite Glass Structure
 The Drouvé "Improved Lovell" Sash Operators
 The Drouvé "Straight Push" Sash Operators
 The Drouvé Worm and Gear Sash Operators

"Anti-Pluvius" Puttyless Skylights

"Anti-Pluvius" is one of the original puttyless type skylights to be introduced into this country. Thirty years of practical experience obtained under the most exacting conditions, from installations in all parts of the United States has enabled us to produce a perfect puttyless construction, one which will serve its owners satisfactorily under any and all climatic and atmospheric conditions. This type of construction was designed to eliminate sweating of the main supporting bars, or channels as we call them, so prevalent, naturally, in skylights and this we have very successfully accomplished by the simple method of isolating the glass and its rest from the main supporting bars (channels) and permitting of free circulation of air between this main supporting bar and the glass. Secondly, this construction combines into one its main supporting bars and condensation gutters by reason of the fact that the main supporting bars are U-shaped channels and in consequence, are utilized as condensation gutters as well as ample support for the skylight structure. This gives you an exceptionally large condensation gutter due to the depth of these channels without cutting down excessively on your glass area which, in skylights, is always desired in the maximum. The over-all width of the channels at their widest point is only $2\frac{1}{4}$ inches.

Other exceptional features, all necessary and proper to good skylight construction, to be found in the "Anti-Pluvius" construction are phosphor-bronze tension springs to allow for expansion, contraction and vibration and hence reducing glass crackage, so prevalent in skylights, to an absolute minimum; three-point contact caps; safety walk-bridges; overhang construction at curbs permitting the successful discharge of condensation to outside of building, and unusually high grade materials (see material specifications) well balanced and perfectly fitted in their respective places in the structure.

"Anti-Pluvius" (Non-corrosive) Puttyless Skylights

This skylight in design and construction is identical with our "Anti-Pluvius," the difference being only in the metals used. These are of non-corrosive materials (not a protective process). This construction is guaranteed absolutely against any form of deterioration for an indefinite length of time. The cost of this construction is surprisingly low considering the fact that it is a skylight entirely free from any maintenance expense. This construction is ideal for use on powerhouses, chemical plants, railroad shops, foundries, etc., as it is the only construction that will stand up under the conditions existing in these types of buildings.

Advantages of "Anti-Pluvius" Puttyless Skylights

The "Anti-Pluvius" puttyless skylight (either type) will satisfy the most exacting requirements for strength.

It is positively watertight. The strength of materials of the structure is ideal (see specifications following page). The glass may be readily cleaned by laying planks across the bridge sections, on which men can stand without injury to any part of the skylight structure.

The frames are flexible and ample allowances are made for expansion and contraction, vibration and wind pressures; the skylight is adaptable to all types of roof construction. It can be erected by anybody, anywhere.

Each light of glass as placed in the skylight is independent of every other light. The lights do not come in contact with each other nor do they come in contact with any metal.

The glass rests on pure non-rotting cattle hair felt.

Drou-Ve-Lite Glass Structure

In late years there has been a tendency to eliminate, as much as possible, structural steel work for the support of the skylight itself. In the successful development of a self-supporting skylight, regardless of length of span, a considerable saving is effected where exceptionally wide skylights are desired, by reason of the fact that the self-supporting skylight does not require any steel work for its support other than that which is a part of the skylight itself, and last, but not least, the elimination of unsightly steel trusses, etc., in a skylight well opening eliminates the casting of shadows and obstruction of light.

The Drou-Ve-Lite glass structure represents the last word in *self-supporting* skylight construction. Study our construction details of this skylight on the third page following. Take particular note of the methods of assembling this structure into one unit. Every part of the structure from ridge bar to curb functions in harmony. Its interlocking sections prevent, beyond any question of a doubt, sagging at the ridge and in consequence, spreading at the curbs. The rafter bars are $\frac{5}{8}$ inch thick by a depth suitable for span without any intermediate supports whatsoever. Intermediate rafter bar spacers are employed at certain points between ridge and eave, usually directly under glass laps, thereby holding the rafter bars absolutely parallel and in perfect alignment between the ridge and eave. The rigidity of this structure when assembled, is amazing. In the development of the Drou-Ve-Lite glass structure, we have, as in the now famous "Anti-Pluvius" construction, eliminated sweating of the main supporting bars and also we employ springs, although in a little different manner, to allow for expansion, contraction and vibration. While this structure does not give the exceptionally large condensation gutter to be found in "Anti-Pluvius," it does, however, give a condensation gutter decidedly in keeping with any number of competitive skylight constructions with the one advantage that this skylight obstructs less light than any other. The over-all width from out to out of condensation gutter (this being the widest point of light obstruction) is $1\frac{5}{8}$ inches.

Drou-Ve-Lite (Non-corrosive) Glass Structures

This skylight in design and construction is identical with our Drou-Ve-Lite, the difference being only in the metals used. These are of non-corrosive materials (not a protective process). This construction is guaranteed absolutely against any form of deterioration for an indefinite length of time. The cost of this construction is surprisingly low considering the fact that it is a skylight entirely free from any maintenance expense. This construction is ideal for use on powerhouses, chemical plants, railroad shops, foundries, etc., as it is the only construction that will stand up indefinitely under the conditions existing in these types of buildings.

Advantages of Drou-Ve-Lite Glass Structures

Construction is entirely suitable for use over very small openings as well as exceptionally long spans, because its rafter bars are furnished proportionately to the size of the skylight; easily adaptable to all types of roof construction; each light of glass, as placed in the skylight, is independent of every other light and lights do not come in contact with each other.

Drou-Ve-Lite glass structures admit more daylight and in consequence, cast less shadow; they are positively watertight and, furthermore, the construction is such as to eliminate sweating of the rafter bars, thereby preventing condensation dripping into the room.

They can be erected by anybody.

Specifications Covering the "Anti-Pluvius" Puttyless Skylight

Skylight shall be of the "Anti-Pluvius" puttyless construction as manufactured by The G. Drouvé Company, Bridgeport, Conn., having all metal parts which are exposed to the weather of { copper. } galvanized iron. Skylight ribs or main supporting channels to be U-shaped and of high carbon steel painted one good shop coat of metallic paint. Glass to be and to be laid on pure non-rotting cattle hair

felt cushions. The cushions shall be confined and supported by continuous metal guides so constructed, that the underside of the glass, when installed, will not come in contact with any materials other than the felt. The glass rest shall be raised above channels sufficiently so that there will be a free circulation of air between the glass and the channels. Skylight studs and caps to be so constructed, as to allow for expansion, contraction and vibration, by the use of phosphor bronze springs.

(OPTIONAL)

SAFETY WALK-BRIDGES. Safety walk-bridges shall be supplied above each channel and supported from the channel for use in cleaning and maintaining skylights.

MATERIAL SPECIFICATIONS The "Anti-Pluvius" Puttyless Skylight

Continuous Clip 1/16 in. steel painted

GENERAL SHEET METAL WORKS

Manufacturers of Skylights and Pressed Steel Sash Operators
BRIDGEPORT, CONN.

Cibulas Puttyless Skylights

Cibulas puttyless skylights are not carried in stock, but are built to take care of the proper span and conditions.

They are furnished with or without ventilators, in the following types: hip, turret, sawtooth, double pitch, single pitch and marquise.

Glazed with either ribbed or rough plain or wire glass, or plain actinic glass.

Outstanding Features

(1) Cibulas skylights are made entirely of heavy gauge, non-corrosive metals, No. 18 or No. 16 gauge copper, aluminum or galvanized rust-resisting metal. They are lasting; there is nothing to rot or deteriorate.

(2) They are built to prevent sagging or breakage under heavy wind or snow pressures and are perfectly weathertight and watertight.

(3) Their construction includes complete provision for contraction and expansion.

(4) They are suitable for all classes of buildings.

(5) They safely support a weight of 35 to 40 lb. per sq. ft., the bars being made in direct proportion to the length of the span.

(6) They dispose of all condensation. Gutters are made large enough to carry off water and prevent accumulation of dust and dirt.

Our Service to Architects

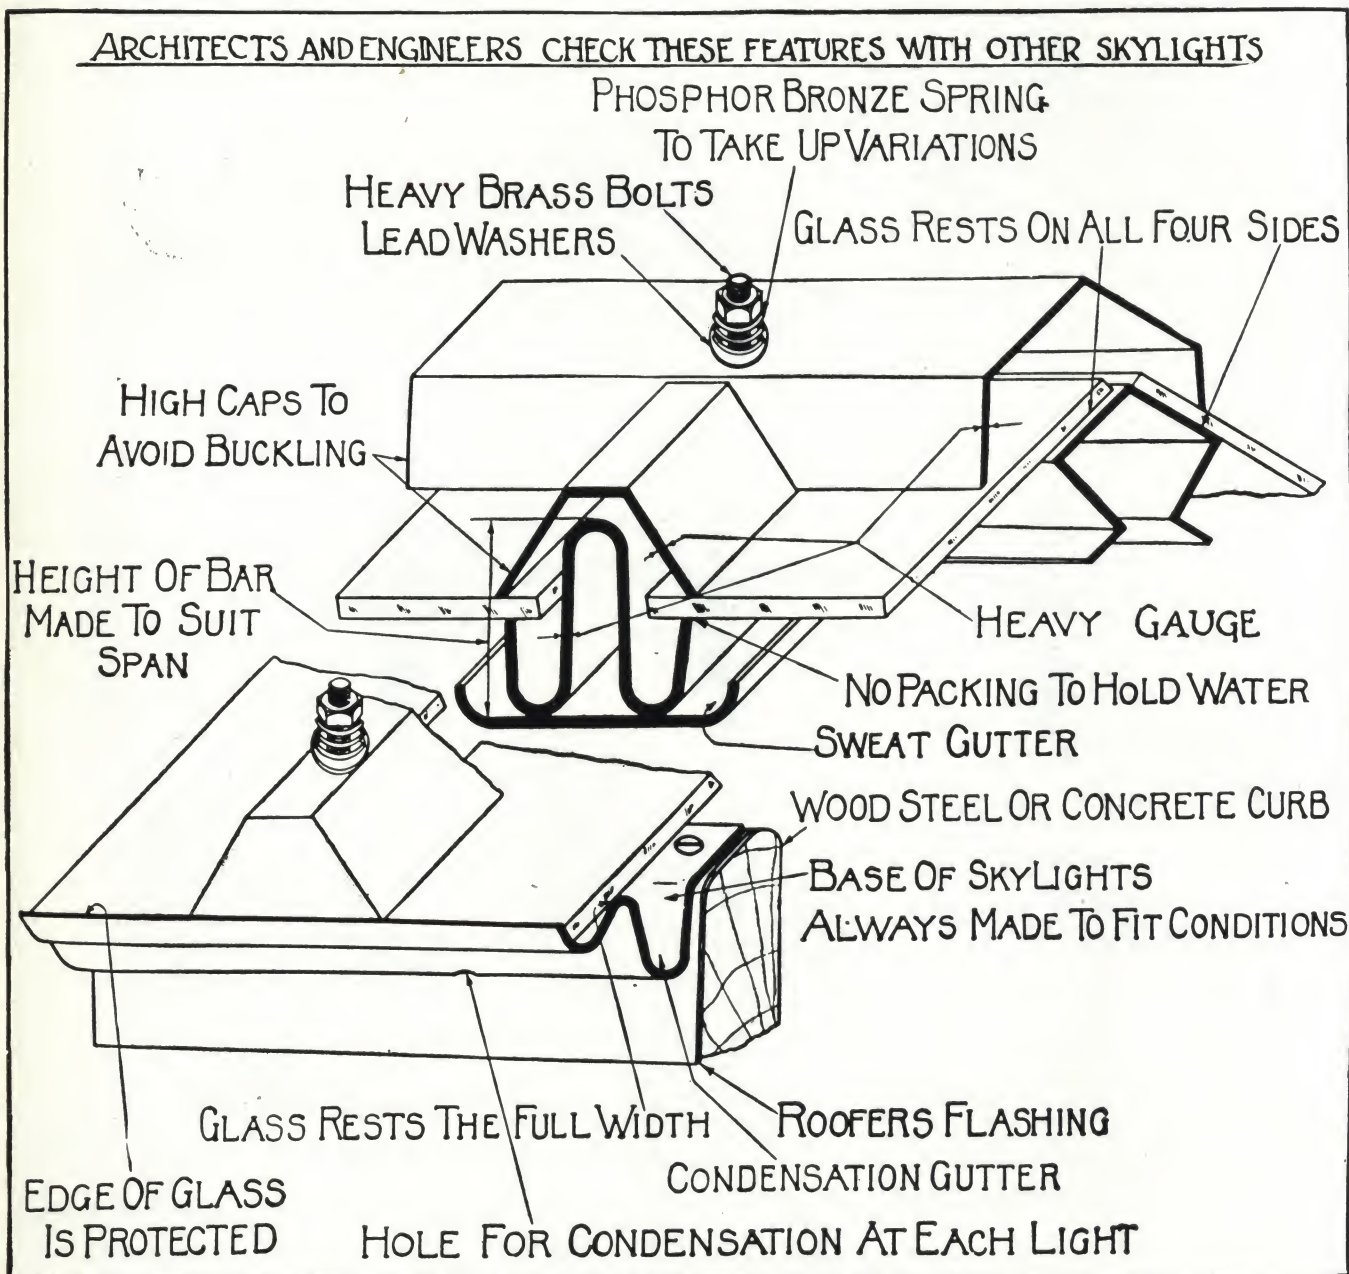

When desired, our engineers furnish complete detail drawings and estimates without obligating the architect.

Send for our latest catalogues, and chart for making curbs for all conditions to receive Cibulas skylights.

Specifications for Cibulas Skylights

Furnish and erect, where shown on plans, Cibulas Puttyless Skylights, manufactured by GENERAL SHEET METAL WORKS, Bridgeport, Conn., made of No. 16 [No. 18] gauge galvanized rust-resisting metals [of copper, using 48 oz. for the supporting bars and 18 oz. for the caps and gutter] [all-aluminum, $\frac{1}{8}$ -in. thick].

Note: The glass commonly used in skylights is ribbed or rough plain glass, or ribbed or rough wired glass.

Detail of the Cibulas Puttyless Skylight

THE HOWIE COMPANY, INC.

Manufacturers of Skylights

9011 Central Avenue
DETROIT, MICH.

Products

PEERLESS SKYLIGHTS.

Also manufacturers of Fireproof Windows, Tin Clad and Metal Covered Doors, approved by Underwriters' Laboratories, Inc.; Copper and Bronze Doors, Architectural Sheet Metal Work.

Peerless Skylight, Sawtooth and Marquise Constructions

These are designed to provide a weatherproof and dustproof skylight construction and one guaranteed against any and all possible glass breakage due to vibration, or through expansion and contraction due to temperature changes.

Specifications for Peerless Skylight and Marquise

Intent—This specification together with the accompanying drawings and details is intended to provide for all labor and material required for the completion and erection of all skylights as shown or mentioned.

Work by Others—All steel framing, wood curbs, nailing strips, gutters and roof flashings, shall be provided for under another contract, unless otherwise specified.

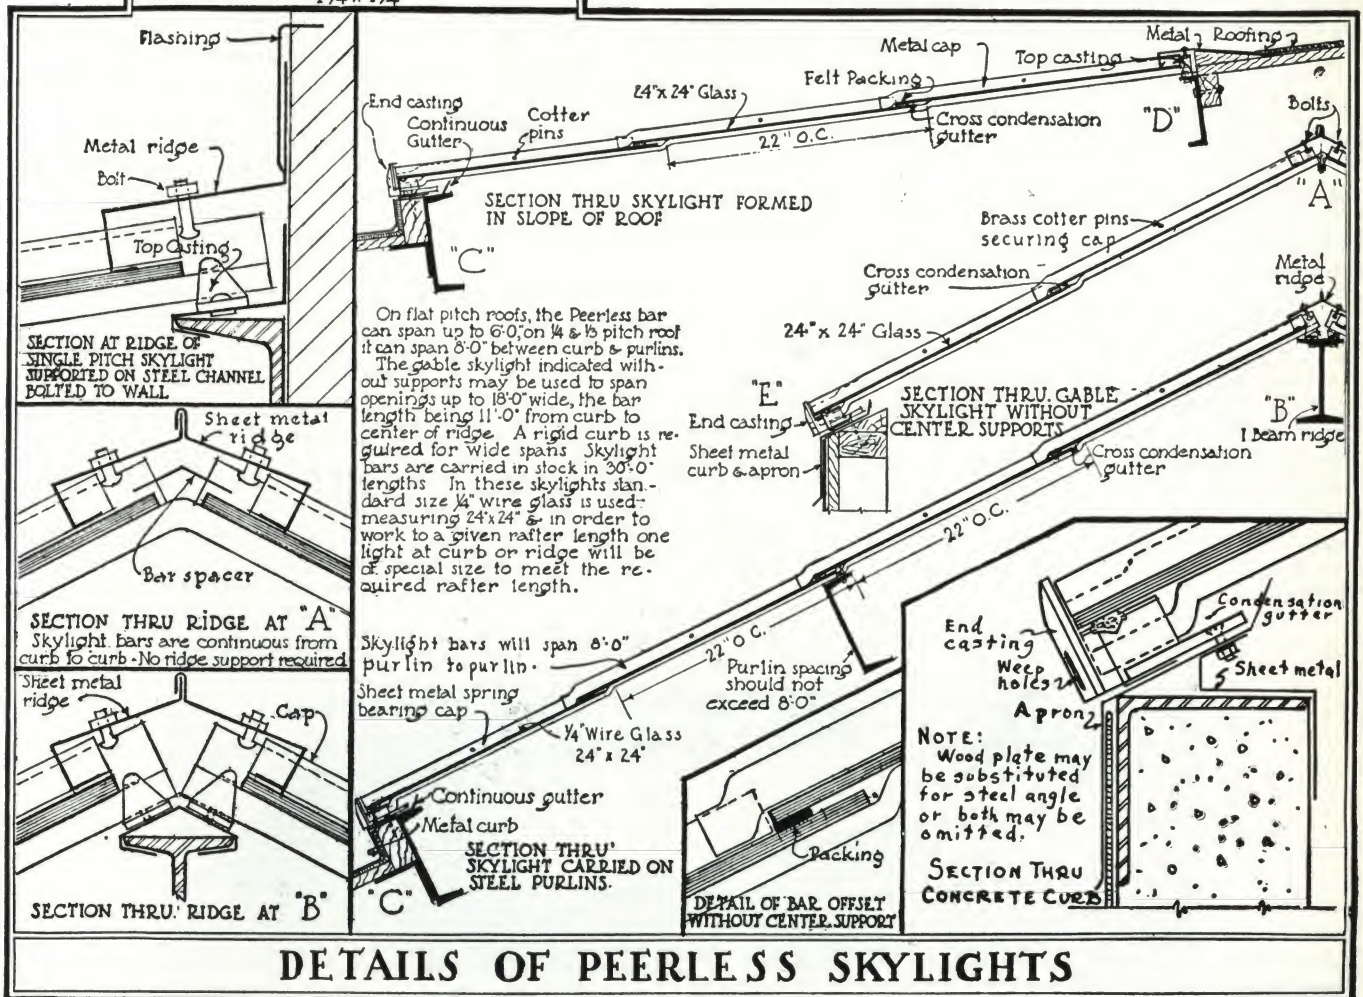

Work Required—Provide and install all skylights as shown or indicated on drawings. All skylights shall be "Peerless" skylight construction as manufactured by THE HOWIE COMPANY, INC., DETROIT, MICH., complete as shown by their standard details, and adapted to the construction of the building.

All sheet metal trimming shall be of No. 24 gauge galvanized iron [or 16 oz. cold rolled copper] [or No. 11 zinc].

Glazing—All skylights to be glazed with best quality 1/4-in. rough wire glass not to exceed 24 in. in width. All glass to be left whole and clean at completion of the work.

Painting—All metal work in connection with skylight, except copper or zinc, shall be painted; also paint all skylight bars with 1 good coat of approved paint.

Guarantee—This contractor is to furnish a written guarantee for 5 years.

A. H. JETER & COMPANY, INC.

Manufacturers of Puttyless Steel Skylights

TELEPHONE

GENERAL OFFICE AND WORKS
496-498 Hancock Street
LONG ISLAND CITY, N. Y.

Products

PUTTYLESS STEEL SKYLIGHTS.

Also Sheet Metal Skylights, Turrets and Louvers; Architectural Sheet Metal Work of every description; Metal, Tile and Slate Roofing.

Services and Estimates

This company's estimating and drafting department is at the disposal of architects, engineers and owners. Estimates, suggestions, specifications and plans for its products will be gladly given on request. A large force of experienced men is employed, who have been carefully trained to erect the company's products.

When material only is supplied, complete instructions and drawings are furnished.

Facilities

This company's factory is situated in Long Island City, near the Long Island Railroad and Brooklyn Eastern District Terminal. This gives direct shipping facilities to any point in the world, either by railroad or water.

Jeter's Puttyless Skylights

Special Features—The sash bar of Jeter's patented puttyless steel skylight is composed of a lower channel, over which is placed a special moulded glass rest, secured to the bottom channel by means of wrought iron stirrups and tap bolts.

The glass rest is held in position by a brass bolt, which is of sufficient length to engage and secure the metal cap that covers the edges of the glass.

On the rolled steel glass rest, a cushion of heavy saturated asbestos is provided, running entirely across the glass rest. After the glass is laid in place, a saturated asbestos sealing strip is provided, which is securely held in place by the metal cap. This feature insures against any dust or moisture getting under the glass and into the sash bars or gutters.

A special moulded section is used as a continuous bottom support for the glass. This section also contains a pocket, on which is placed a strip of saturated asbestos upon which the glass rests. Connections at intervals of about 20½ in. are provided in the continuous bottom members, which receive and secure the bars. This method of asbestos cushioning device makes the skylight waterproof and dustproof and, being of a soft indestructible material, reduces the cracking of the glass to a minimum.

Adaptability—Jeter's patented system of puttyless steel glazing is adaptable for use in railroad terminals, museums, schools, hospitals, factories, machine-shops, etc.

The very simplicity of construction enables any mechanic to readily erect this system.

Specification for Jeter's Puttyless Skylights—Suggested for Architects' Use

All skylights shall be of rolled steel, of a type to allow for free expansion and contraction and made tight without use of paint, cement or putty.

Sash bar shall be composed of a special U-channel 2 in. wide and 1½ in. deep, made of high carbon steel ⅜ in. in thickness.

A rolled steel glass rest made of 1½x½x⅛-in. channel shall be provided. This glass rest shall be in the shape of a trough and shall be supported on wrought iron stirrups which will be tap-bolted through the walls of the special U-bar.

A heavy non-absorbent asbestos cushion shall be placed over the glass rest. Cushion and glass rest shall be securely fastened to the wrought iron stirrup by means of brass or copper machine screw.

A special continuous moulded member shall be provided at eaves of skylights. Between this member and the glass shall be placed a non-absorbent asbestos cushion and same drawn up tight under glass by means of bolts at bar centers.

After glass is set in place, provide a metal spring cap 1¼ in. out to out of flanges. This cap shall be underlined with a sealing strip of non-absorbent asbestos material, held in position by being punched and strung over the cap bolts. Edges of sealing strip shall not protrude beyond edges of cap. Securely fasten cap by means of a brass nut.

All skylights to be glazed with ¼-in. ribbed wire glass.

All caps, combing and trim shall be of (specify copper, zinc or galvanized iron).

After fabrication and before assembling the sash bars, all parts, shall be thoroughly coated with an application of bitumastic solution (or specify hot galvanizing).

Jeter's Top Ventilating Puttyless Skylights

A puttyless steel skylight made from the same steel section as our regular skylights, previously described. The steel channel bars form the top chord of a truss and are securely bolted top and bottom to a steel curb and ridge plate, of the same gage metal as the bar. When the curbs are tied by either angles or rods a perfect truss is thus formed which obviates the necessity of building up an independent steel truss as is usually the case. This method is successful in skylights not exceeding 12 ft. in width, but any length.

The ventilating sections at the ridge are made from sheet metal, either galvanized iron or copper, and are top hung by means of heavy iron butts, securely bolted

Installation of Jeter Top Ventilating Puttyless Skylights

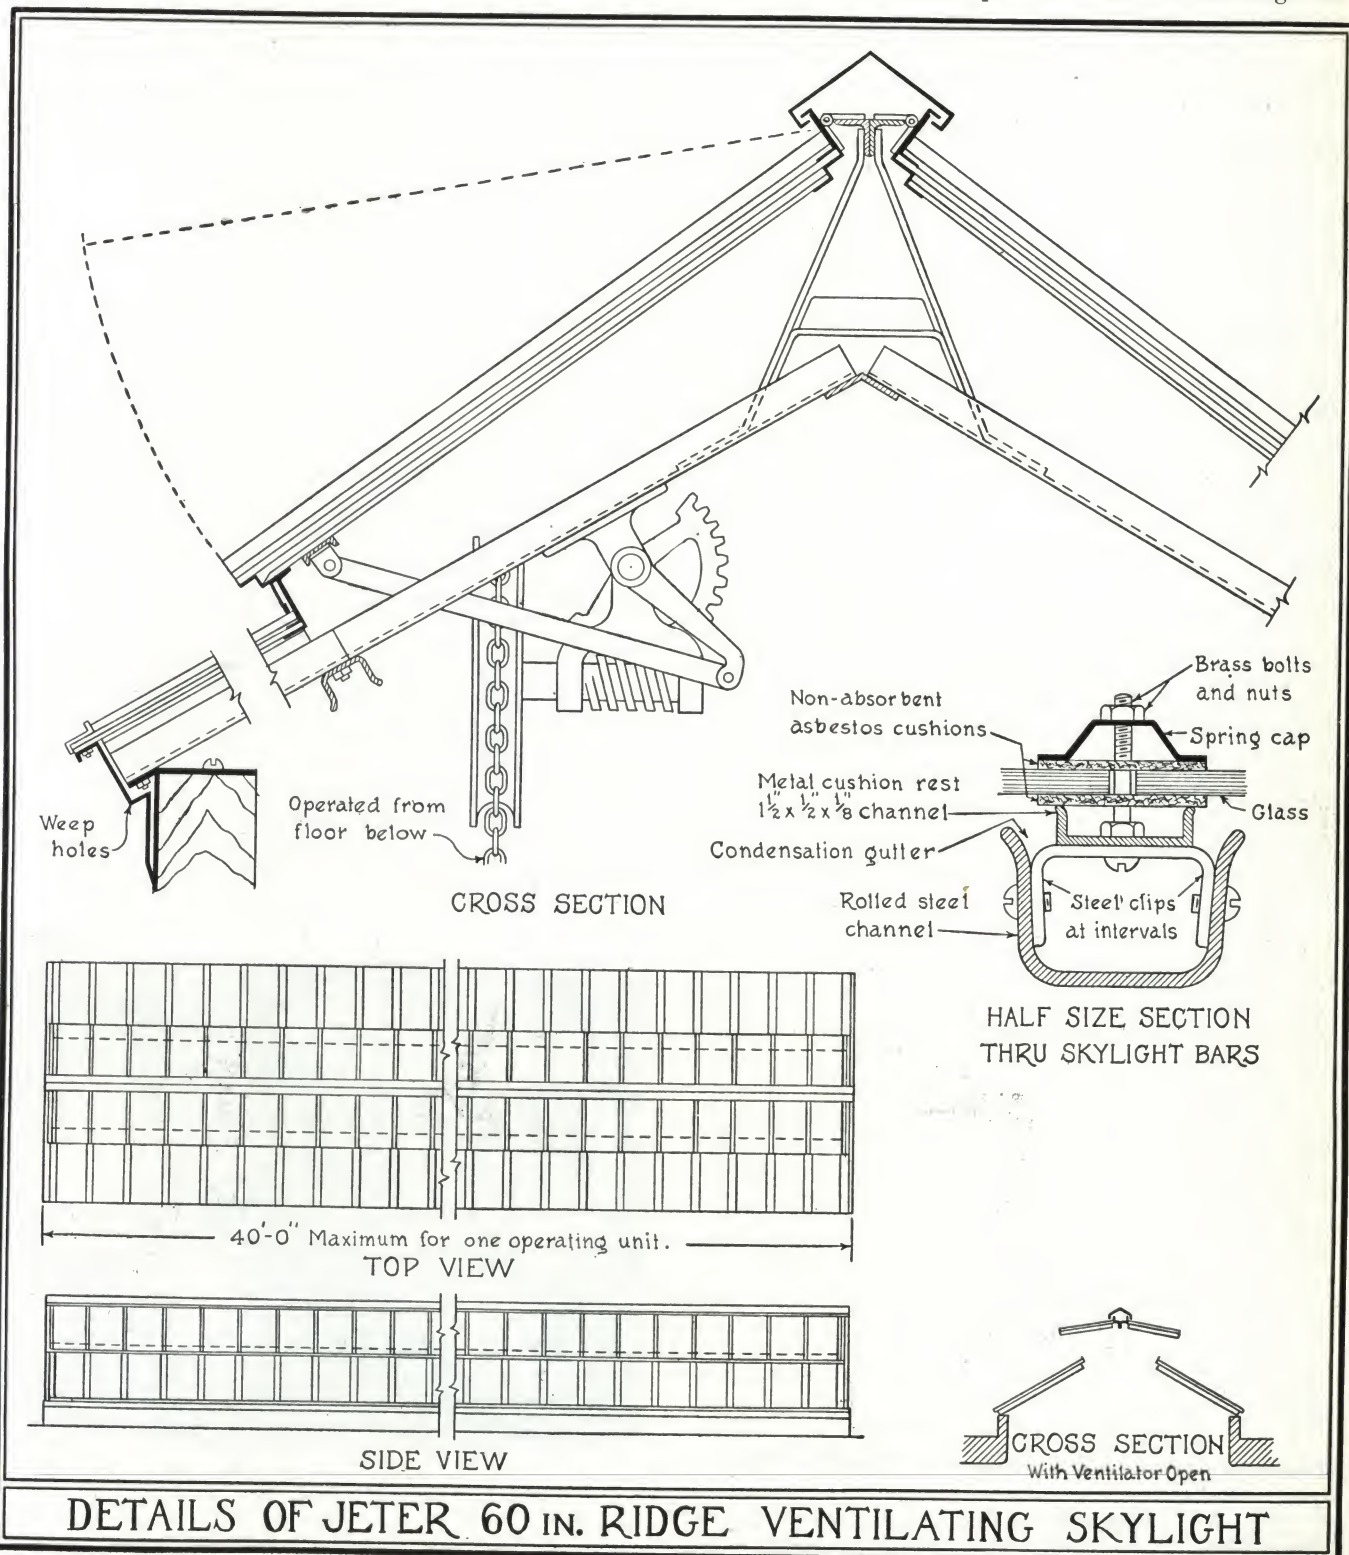

to continuous angles which run the entire length of the skylight. The sheet metal sash bars of this ventilator, besides being securely fastened to a stiffening member top and bottom, are again reinforced and tied with a $2\frac{1}{2} \times \frac{1}{2} \times \frac{1}{8}$ -in. channel which is fastened to the bars the entire length of the skylight with two $\frac{1}{4}$ -in. bolts at each sash bar. This channel also receives the hinges of the operating device into which the push arms of the operators work.

The ventilating section is operated by heavy chain operators of the worm and gear type. Either side can be operated separately or independently of the other.

Thus when one side is opened and the other is closed a suction is caused which "pulls" the dead air from the building; both sides can be opened if desired, which causes a natural forced ventilation from the building.

Standard Details

We have prepared drawings, showing plans, elevations, sections and details of this and many different styles of skylights, which will be forwarded on application, and when sufficient information accompanies request, recommendations will be cheerfully given as to the most economical and efficient practice. Send for drawing S-13.

NATIONAL VENTILATING COMPANY

Manufacturers of Puttyless Skylights

GENERAL OFFICE AND FACTORY

TELEPHONE

STILLWELL 5733, 5734

75 Tenth Street

LONG ISLAND CITY, N. Y.

Products

MULTI-UNIT PUTTYLESS SKYLIGHTS.

Also manufacturers of Side Lights, Operating Sash, and National Ventilating Devices; all kinds of Sheet Metal Products; Drawing and Stamping.

Adaptability

Skylights for railway terminals, power stations, machineshops, factories, foundries, libraries, museums, art galleries, and all other buildings whereon permanent watertight skylights of large area are required.

Advantages and Distinctive Features

Referring to Fig. 4 on following page, the bar and upper lights are supported in a fixed manner by the purlin thereunder; while the lower bar, supporting the lower lights, is secured by the same purlin in a loose manner, permitting it to expand freely.

This construction, being repeated at each purlin, permits movement, all in same direction, due to expansion, contraction, or vibration (along the slope of the skylight) of the cap, glass and bar of each unit or tier of glass, independently of every other unit or tier.

Along the longitudinal line of the skylight the steel frame of the building and the entire length of the glass are each taken as separate units, and the difference, nearly 100%, in the expansion and contraction of these materials (glass and steel) is likewise thoroughly taken care of by the copper spreader clips shown in transverse section at supporting bar (Fig. 2). These spreader clips are placed over each cap bolt, spaced about 10 in. along each skylight bar, and incidentally they serve also to better secure in place the brass bolts for holding the caps.

The cap is strong and yet resilient. Its upper half is of an inverted "U" shape, which provides strength and rigidity; while the lower half, especially at the lower extremities, is resilient, so as to conform thoroughly, when secured in position, to the surface of the the glass.

All gutters and parts that are non-accessible, without removing the glass, are of non-corrosive material. The entire top of the bar is covered with 8-oz. copper, the same being applied while the last coat of bar-paint is still wet; and a flexible bearing for the glass is formed, which adjusts itself to any warps or irregularity of the glass along its bearing line.

The company is equipped to cover the bottom of the bar also. Both the top and bottom bar covers are made by special dies and both fit the bar snugly.

No packing or filling substance of any kind is required, and no material is used other than glass and metal.

Standard Specification, Multi-unit System Puttyless Skylights

All curb and roof flashings shall be included under heading "Sheet Metal Work." They must be well connected, ready

to receive the skylight work, and must include all necessary counter flashing, well secured to roof flashings and made watertight.

The skylights shall be of the puttyless type, of a design to allow for free expansion and contraction, or movement due to vibration, of the glass and supporting bars in line with the pitch of roof, *all in the same direction.*

Each light of glass shall be entirely independent of every other light, so that one light does not support another; and the glass shall be held laterally in a manner to prevent its coming in contact with any rigid part.

The bearing for the glass shall be flexible, so as to adjust itself to any warps or irregularities of the glass along its bearing line.

The caps shall be spring bearing, in order to thoroughly conform along the lines of contact, when secured in position, to the surface of the glass.

All bar gutters shall be of copper and all exposed parts other than sheet metal shall be of brass.

The supporting bars shall be of rolled steel, and shall be held in a loose manner at the upper end and in a fixed manner at the lower end.

Packing, filling substance of whatever kind, or material other than glass and metal shall not be used.

All skylight sheet metal work shall be [copper, zinc, or galvanized iron].

The glass shall be $\frac{3}{8}$ in. thick [wire, plain or ribbed].

Adopted by Leading Railroads

The Pennsylvania Railroad Company, after carefully examining all other types of puttyless skylights in actual service, adopted the construction herein shown and described for its new New York & Long Island Railroad Passenger Station, 31st to 33d Streets and 7th and 8th Avenues, New York City, on which building this company completed, about 15 years ago, the erection of 83,000 sq. ft. of skylight, embracing nearly every known variety, such as hipped, ridge, flat, barrel-roof, sawtooth with bowed ridges, circular, elliptical, etc., all constructed with flat glass.

Fig. 1. Group of Multi-unit Skylights Over Concourse of Pennsylvania Terminal, New York, N. Y.

Area of this group, about 50,000 sq. ft. Total area on the terminal, 83,000 sq. ft.

Fig. 4. Half Sized Perspective

Showing exterior view over each purlin between the eave and the ridge

The Central Railroad of New Jersey adopted this system of skylights for its new terminal at Jersey City, N. J., where 116,000 sq. ft. of this construction has been installed.

The New York Central Railroad Co. also has this construction on its new Grand Central Terminal at 42nd Street, New York City; on its New York City Power House at 50th Street and Lexington Avenue; Power Stations at Yonkers and Port Morris, N. Y.; Boiler Shops at West Albany, N. Y., Reed & Stem, Architects, and for their new Passenger Station at Utica, N. Y., Stem & Fellheimer, Architects.

Result of Thorough Investigation

The system of skylight construction described here is the result of experience and investigations made by the NATIONAL VENTILATING COMPANY in this line over a period of nearly 20 years.

All efforts during this time have been directed to producing, not the cheapest, but the best construction.

As to skylights, true economy does not consist in buying the cheapest.

Public Buildings and Other Notable Installations

The following are a few, among many, installations made by this company during the past 24 years; in some cases replacing other work with the new and improved system above described. They include building, location and architect.

Manufacturers of Puttyless Skylights and Revolving Ventilators

Winter Avenue and Blumerich Street, Northwest
GRAND RAPIDS, MICH.

Products

The SIMPLICITY PUTTYLESS SKYLIGHT; the SIMPLICITY SKYLIGHT VENTILATOR; the VENTWELL REVOLVING VENTILATOR.

Simplicity Puttyless Skylight

Our aim in designing this skylight was to provide a product which would combine the maximum amount of daylight per square foot of area, with the lowest maintenance cost possible, and at the same time be of such construction as to lend itself to erection in the field with a minimum amount of time and labor.

The simplicity Puttyless Skylight consists of a steel supporting frame of tee iron rafters with angle curb and ridge members. The rafters are provided with sheet metal condensation gutters over which the glass (set in came lead glazing strips or channels) is laid. The mounting caps are set in place over the glass and secured, compressing the glazing channel firmly against both sides of the glass. The ridge cap and end flashing is then applied completing the assembly.

Steel Frame—The sizes of the steel members comprising the frame vary to suit conditions. Ridge and hip members are made in two sections (details on following page); this form of construction allows the frame for each slope, consisting of rafters, ridge and hip members, to be assembled complete at the factory. The erection work in the field is reduced to bolting the ridges and hips together and anchoring frame at curb.

Glazing Strips—These strips are small channels of came lead placed on the edges of the glass resting on the rafter members. When the mounting caps are set and secured they compress the lead firmly against both sides of the glass, making an absolutely windtight and weathertight joint. The soft lead takes up any unevenness in the surface of the glass and gives a continuous bearing surface; it also permits enough come and go in the glass to provide for contraction and expansion, thereby eliminating glass breakage from either of these sources.

SECTION OF SIMPLICITY PUTTYLESS SKYLIGHT BAR

Materials—The sheet metal work consisting of the mounting cap, ridge cover, condensation gutter and flashing may be of lead coated metal, galvanized iron or copper.

Advantages—Absolutely weathertight construction; maximum amount of daylight; condensation conducted to the exterior; glass breakage reduced to a minimum by use of lead glazing strip; ease of erection; ease of glass replacement.

Specification—Furnish and erect where shown on plan, skylights of the puttyless type, of a design to allow for free expansion and contraction of the glass, or movements due to vibration.

Each light of glass shall be entirely independent of every other light and the glass shall be held laterally in a manner to prevent its coming in contact with any rigid part.

The bearing of the glass shall be flexible, so as to adjust itself to any warps or irregularities in the glass.

Simplicity Skylight Ventilator

These ventilators may be placed in any of our skylights by removing the glass and substituting the ventilating frame.

These ventilators are also made with flat flanges for use on shingle or composition roofs.

We manufacture an efficient and reliable operating device for these ventilators. Prices and description will be sent on request.

"Ventwell" Revolving Ventilator

This ventilator revolves with the wind and is so constructed that the action of the outside air creates a vacuum in the ventilator itself thereby drawing up the air to be expelled. It is efficient, and guaranteed to give satisfaction under all weather conditions.

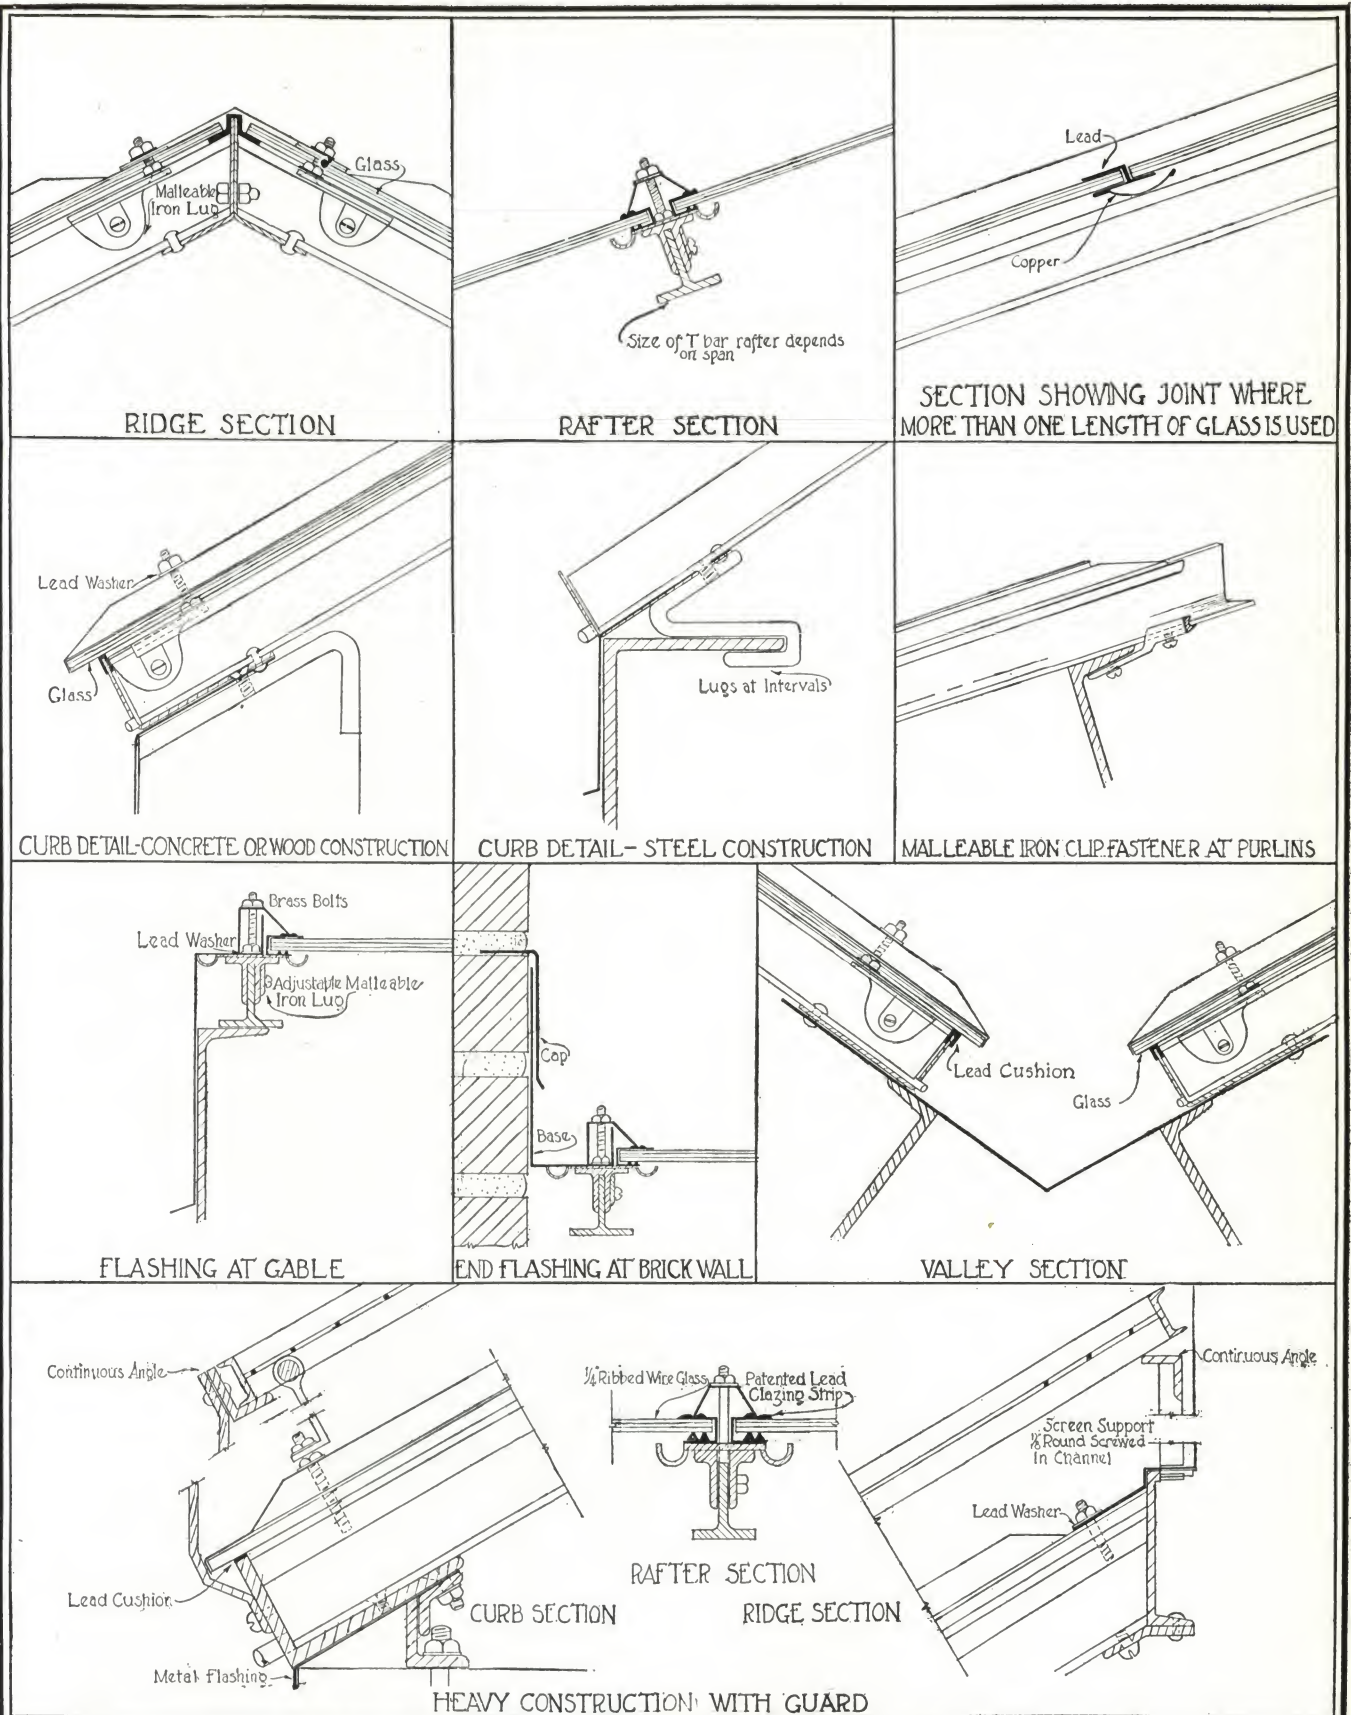

It may be had in either galvanized iron or copper.

Bases and dampers extra.

Prices quoted on application.

TRADE-MARK

Robertson Glazing Construction

Robertson Glazing Construction offers the following valuable advantages:

(1) It does away with all avoidable skylight glass breakage; (2) it is designed to eliminate leakage; (3) it can be made proof against corrosion and the consequent deflection and weakening of load carrying members; (4) it provides the lowest possible combination of first cost, maintenance and depreciation.

Available in All Forms—Robertson Glazing Construction comes in all skylight forms, from a single hip skylight, to complete glass roofs; and in all types of sash: namely, monitor, sawtooth, sidewall, fixed, operating, etc.

Also in Standardized Unit Skylights—This is a new development in which the H. H. ROBERTSON COMPANY has put into the skylights all the benefits of standardization. These standardized units come in double pitch and hip skylights, in any desired lengths, and in standard widths from 3 to 20 ft. Any unit can be promptly furnished from pre-fabricated parts, carried in stock, and the parts can be easily assembled and erected on any properly designed curbs. These units mean simplification of the work of designing and specifying skylights, they lessen cutting and fabricating on the job, and they give the assurance of a thoroughly satisfactory skylight installation.

Two Basic Types—Robertson Glazing Construction is manufactured in two basic types.

Type A combines all of the essential characteristics of an ideal skylight, in a design of remarkable simplicity, and at a very moderate cost (see illustration and details on following page).

Type B is especially adapted to the requirements of buildings exposed to severely corrosive influences.

Glass Breakage Minimized—The chief causes of broken glass in skylights are deflection of supporting members or improper cushioning and separating methods.

Robertson Glazing Construction provides a double safeguard against glass breakage. A rolled steel bar

provides a firm, rigid, durable supporting member. The maximum deflection of the Robertson bars (1/30 in. per lin. ft.) is never such that glass breakage will result from lack of initial bar stiffness.

Furthermore, Robertson Skylight Construction provides a non-absorbent, resilient, insulating bed for the glass.

Robertson Glazing Construction is backed by a complete engineering service which assures perfect installation and complete satisfaction. The Robertson Daylighting Catalogue containing simple, practical and complete information on how to introduce natural light into industrial and commercial buildings, will be sent to you upon request. It also gives complete and detailed information regarding all types of Robertson Glazing Construction and Robertson Skylight Engineering Service. Specifications for Robertson Glazing Construction are shown on following page.

Robertson Protected Metal (RPM)

A permanent building material made by enveloping a steel sheet with three protective coatings: (1) asphalt, (2) asphalt-impregnated asbestos felt applied under heat and heavy pressure, (3) waterproofing.

The finished sheets weigh from 138 to 224 lb. per 100 sq. ft., depending on gauge of the core sheet. Their strength and light weight allow the same savings in the cost of foundations, structural steel, transportation and erection that characterize the use of ordinary corrugated steel. To these are added the advantages of having a factory built-up roofing applied to both sides

Robertson Protected Metal (RPM)

of the sheets. The covering area of RPM is greater per ton than that of any other durable corrugated material. RPM is moderate in first cost; easily erected, never needs painting, requires practically no maintenance and its insulating advantages make buildings cooler in summer and easier to heat in winter. RPM is the result of 20 years of experience and of study in our own and other research laboratories. A sample showing the processes by which the material is made will be sent on request.

Cross Section Robertson Glazing Construction, Type A

Robertson Glazing Construction (Type A)

This type of Robertson Glazing Construction represents a tremendous advance in skylight design. There is no type of skylight on the market today that offers such an ideal combination of durability, simplicity of construction, economy and attractive appearance.

Robertson Glazing Construction (Type A) can be furnished with caps and gutters made of any of the standard sheet metals that may be desired, but it possesses far greater durability than the ordinary skylight of copper, galvanized iron or aluminum construction because of the more efficient way in which the metal is utilized and because of the superior method used in supporting the skylight glass.

In the first place, it will be noted that all construction details are above the supporting bar (A) and that the condensation gutter (B) is not a part of the supporting member. This is a vast improvement over the usual type of glazing construction in which the bar and the gutter are formed as a single unit with the result that the bar is subjected to the corrosive action of the water of condensation which the gutter is designed to carry away. In Robertson Glazing Construction (Type A) there is absolutely no contact between the supporting member and the gutter. The two are completely separated by insulation (C).

In Robertson Glazing Construction (Type A) the glass (J) rests on a durable, watertight asphaltic cushion (D). This material is ideally adapted to the purpose it fulfills. Because of its flexibility and adhesive character, the Robertson asphaltic cushion adapts itself to all irregularities in the surface of the glass, forming a continuous, leakproof union. Thus it does away with one of the most common causes of glass breakage, for glass which lies on an irregular surface, touching in some places and not in others, is constantly subjected to destructive stresses and strains.

The Robertson skylight cap (E), scientifically designed and efficiently secured by the stud (H) and nut (G), contribute further strength, rigidity and durability to this type of Robertson Glazing Construction. The cap is extremely simple in construction, but it is perfectly suited to the job it has to do, for it is so designed that it is absolutely rigid between the studs. The pressure it exerts is continuous and equal at all points. Pressure is easily regulated by simply screwing the cap nut up or down. The lock nut and washer (K) do away with the possibility of leakage below the gutter.

You will see from the cross section view that the glass in this type of glazing construction does not touch metal at any point. The glass "spacer" (I) prevents the contacting of the glass with the lock nut (K).

The Robertson Unit Skylights—How to Specify and Order

All the information the H. H. ROBERTSON COMPANY needs for filling an order for Robertson Unit Skylights is:

The outside dimensions of curbs; width and length (see diagram below).

Thickness of the curb.

Type of skylights (double pitch or hip).

Type of end construction—hip or double pitch gables (if gable type, are gables to be glass or sheet metal?).

Kind of skylight trim—copper or galvanized.

Kind of glass.

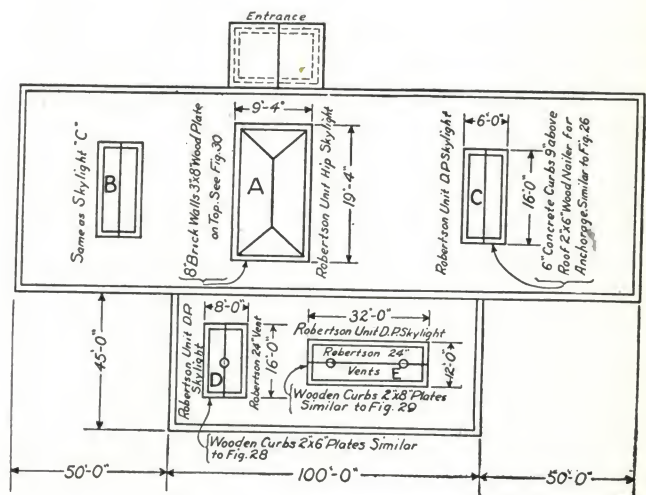

Kind of curb construction. (We will be glad to send a bulletin showing a wide variety of curb types, and methods of attaching unit skylights to each type).

The fifty-two standard sizes in which Robertson Unit Skylights are furnished (and the 4 in. variation possible in each size) are given in the table below. Length can be anything desired.

NONPAREIL SKYLIGHT CO.

Manufacturers of Nonpareil Puttyless Skylights

MAIN OFFICE

2609-2611 Pennsylvania Avenue, N. W., WASHINGTON, D. C.

Product

The NONPAREIL PUTTYLESS SKYLIGHT (patented November 1, 1910; October 3, 1911; October 14, 1913).

Some of Our Claims, for Our Construction

- (1) It can not, and does not leak.
- (2) Glass breakage with this construction is reduced to a minimum.
- (3) A highly practical construction.
- (4) Our lead glazing cushions are practical and lasting. Detail 5, Fig. 1.
- (5) These cushions are *not* attached until after all field work is done, therefore, they are always in perfect condition when the glass is put in place.
- (6) They are reversible, so that in case of accident to the glass and they are injured, they can be reversed for installing new lights of glass—very advantageous feature.
- (7) Our condensation gutters are so made, and of such size, as to really and properly perform the functions they are supposed to perform. Details 6 and 7, Fig. 1.
- (8) Our bars are made from lead coated Armco Iron, where the skylights are copper trimmed; and from galvanized steel, where they are galvanized trimmed. They are also of the proper size and section, to make the best and most practical job. Details 6 and 7, Fig. 1.
- (9) Our bolts and nuts, are made from cold drawn brass (*not cast brass*) and all our castings are brass.

Specifications for Nonpareil Skylights

The skylights must be of a type that can be made watertight without the use of putty, and shall *not* contain any material other than metal and glass, in their construction.

ESTABLISHED 1873

E. VAN NOORDEN COMPANY**Puttyless Skylights**

TELEPHONE 100 Magazine Street, near Massachusetts Avenue
HIGHLANDS 3040, 3041, 3042 BOSTON, MASS.

Products

Manufacturers of "ANCHOR-BAR"
ROLLED STEEL, PUTTYLESS SKYLIGHTS.

Also manufacturers of Sheet Steel and Copper Skylights of every type, Sheet Steel or Copper Windows and Trim, Kalamein Doors and Windows; Bois Steel Stairs.

For Roof Ventilators and Steel Door Bucks, see page A556.

**Rolled Steel, Puttyless Skylights—"Anchor-bar" Type (Patent No. 931638)**

The Van Noorden rolled steel "Anchor-bar" puttyless skylight is designed particularly for large skylight areas, and is a most economical construction for skylights where the bar length exceeds 8 ft. Fewer purlins and steel supports are required than for any other skylight.

This company solicits from architects an opportunity of suggesting framework for any type of glazed roof structure, and a saving in the steel framework required is assured.

The structural parts of rolled steel, and the trim of sheet metal (generally copper), form a combination which can not be surpassed; namely—steel for strength and copper for weather protection.

Bar—The bar consists of a tee and angle combination as shown. The angle member serves as a gutter for condensation. Glass rests loosely on cushion of pure wool felt.

Curb—The "Anchor-bar" skylight is the only skylight of prominence which has continuous steel reinforcement at the base. The thrust of skylight bars is directly against this member, which can not give way while the curb holds.

General Features—The distinctive feature of "Anchor-bar" skylight is the unit steel frame, consisting of bars, base and ridge—an independent self-supporting steel structure, upon which the glass is loosely bedded; after which, the exposed portions, such as bar caps, ridge caps, base and side apron of sheet metal (generally copper), are applied. Caps are secured with brass bolts.

Expansion and Contraction—Owing to the fact that the sheet metal parts of "Anchor-bar" skylights are independent of the rolled steel parts, expansion and contraction are amply provided for. Glass sets loosely on the cushion of wool felt, thus there is no possibility of breakage due to expansion and contraction.

Accessibility for Re-painting—A feature to be recommended in "Anchor-bar" skylights is their accessibility for the easy re-painting of the rolled steel portions. The sheet metal portions, being preferably of copper, are impervious to weather conditions.

Adaptability—"Anchor-bar" skylights are recommended wherever overhead light is desired. Inquiries should state over-all length of outside of curb, bar length, pitch of skylight (5 in. to the foot, or more) and distance between intermediate purlins.

"Anchor Truss Bar" (Patent No. 1140909)—"Anchor Truss Bars" are used where bar length is more than 10 ft., unless intermediate purlins are provided. Truss bars are self-supporting for a bar length up to 15 ft. The saving effected in the steel frame support is far greater than the excess cost of truss bar construction. Details on application.

Products

SKYLIGHTS and GLAZED ROOFING; MARQUESSES; GLAZED CANOPIES; SIDEWALLS, etc.

SOLID WIRE GLASS—Rough, Ribbed, Polished, Corrugated (CWG), Figured, and ACTINIC GLASS.

Also Glass without wire netting, in various patterns and thicknesses, to suit every requirement.

TRADE-MARK

The color of Actinic is technically described as an "unsaturated yellow," although it is some times spoken of as "light amber."

Surfaces and Thicknesses—Actinic Glass is made in rough and ribbed surfaces, in $\frac{1}{8}$ -in. plain, and in $\frac{1}{8}$ and $\frac{1}{4}$ -in. wire; also in the corrugated wire pattern, $\frac{5}{16}$ in. in thickness.

Wire Glass

Process—Solid wire glass, made by the Pennsylvania continuous process, is completely formed by one pouring and one rolling; the only process that makes possible the manufacture of wire glass as thin as $\frac{1}{8}$ in.

Fire Protection—Wire glass is a valuable fire retardant—it prevents flames from attacking adjacent buildings.

Approval (Distinguishing Mark)—All of our wire glass, $\frac{1}{4}$ in. and over in thickness, has the full approval of the National Board of Fire Underwriters as a fire retardant, which requires a distinguishing mark to identify the glass. Our distinguishing mark is our *cabled strand*, appearing every 10 in. across the sheet and the full length of each sheet.

Service—We offer gratuitous engineering advice on all glass problems.

Samples—Samples, catalogues and circulars on request.

Specifications—Architects should always specify "Solid Wire Glass manufactured by the PENNSYLVANIA WIRE GLASS COMPANY," (mention the kind desired).

Actinic Glass

This improved form of tinted glass possesses the following extraordinary combination of advantages.

- (1) In various ways it greatly reduces glare.
- (2) It materially reduces the radiant heat in direct sunlight.
- (3) It greatly retards quite a number of undesirable chemical changes, such as the fading of colors.
- (4) On dark days illuminating effects are produced, more like pleasantly diffused sunlight than the somber light from the sky.

The above claims are verified by extensive practical experience. Users report increased general satisfaction.

Corrugated Wire Glass

CWG is a corrugated sheet of glass with wire netting incorporated.

Corrugated Wire Glass Skylight—Corrugated wire glass is made to meet the demand for a substantial skylight, admitting properly diffused light. CWG can be placed on a roof of any material, including corrugated iron and corrugated asbestos.

Uses—CWG can also be used on roofs, sidewalls, marquees, canopies and wherever *daylight* is desired.

Weight—CWG weighs about $4\frac{1}{2}$ lbs. to the sq. ft.

Strength—CWG has strength many times greater than any other glass of equal thickness, owing to the corrugations.

Kind—CWG is made in deep angle, $2\frac{1}{2}$ in. center to center of corrugations.

Standard Size— $27\frac{3}{4}$ in. wide by 42 or 64 in. long, or any length up to 126 in., conditions governing.

Corrugated Wire Glass Canopy at American Tobacco Co., Durham, N. C.

Specifications for Installation of CWG

The skylights, roof or sidewall construction, where marked "Corrugated Wire Glass" on the plans and elevations, shall be formed of Corrugated Wire Glass (if Actinic Corrugated Wire Glass is wanted,

say "Actinic Corrugated Wire Glass"), with standard fittings of 18-oz. copper and brass (can be furnished, if desired, in Armco iron, zinc, aluminum or lead), in accordance with details and instructions submitted.

AMERICAN 3 WAY-LUXFER PRISM CO.

Skylight Engineers

1313-1315 South 55th Court
CICERO, ILL.
(Suburb of Chicago)

37-28 30th Street
LONG ISLAND CITY, N. Y.

For 3-Way Armored Glass Sidewalk Lights, see page A387; for Transoms, see page B1751

3-Way Armored Wired Glass Skylights (Glass Guaranteed for 5 Years)

This construction combines the everlasting advantages of the reinforced concrete skylight with the great daylighting value of the metallic wired glass constructions. It has great light area; is absolutely fire resisting, weatherproof, burglarproof, everlasting, requires no upkeep, no protecting screen, can be walked on, and broken glass is instantly replaceable. So perfected is this construction that we supply all glass for replacement for a period of 5 years.

The glass is cut from standard $\frac{1}{2}$ -in. thick wired glass into panels $8\frac{1}{4}$ in. square. These are firmly and tightly caulked into galvanized cast iron shields. These in turn are embedded in the concrete. The shields protect the glass from the expansion pressure, and at the same time permit the instant and easy replacement of any one broken.

Factory-built in ready-to-set slabs for installation by contractor or installed by our own skilled workmen. These 3-Way Reinforced Concrete Skylights can be laid flush with the roof, but we recommend that they be raised on curbs and provided with a definite pitch. Weight is 33 lb. per sq. ft.

Specifications—All skylights shown on plans shall be of the reinforced concrete type known as 3-Way Armored Wired

Construction of 3-Way Armored Glass Skylight

Glass Construction as manufactured by the AMERICAN 3 WAY-LUXFER PRISM CO., Cicero, Ill.

Glass shall be standard $\frac{1}{2}$ -in. wired glass cut into squares of $8\frac{1}{4}$ in., set and caulked with tar and sulphur compound, into tight-galvanized cast iron shields which are embedded in the concrete.

Glass for replacement to be supplied free for a period of five years.

Carrying capacity to be 150 lb. per sq. ft. on a 10-ft. clear span, with a factor of safety of 4.

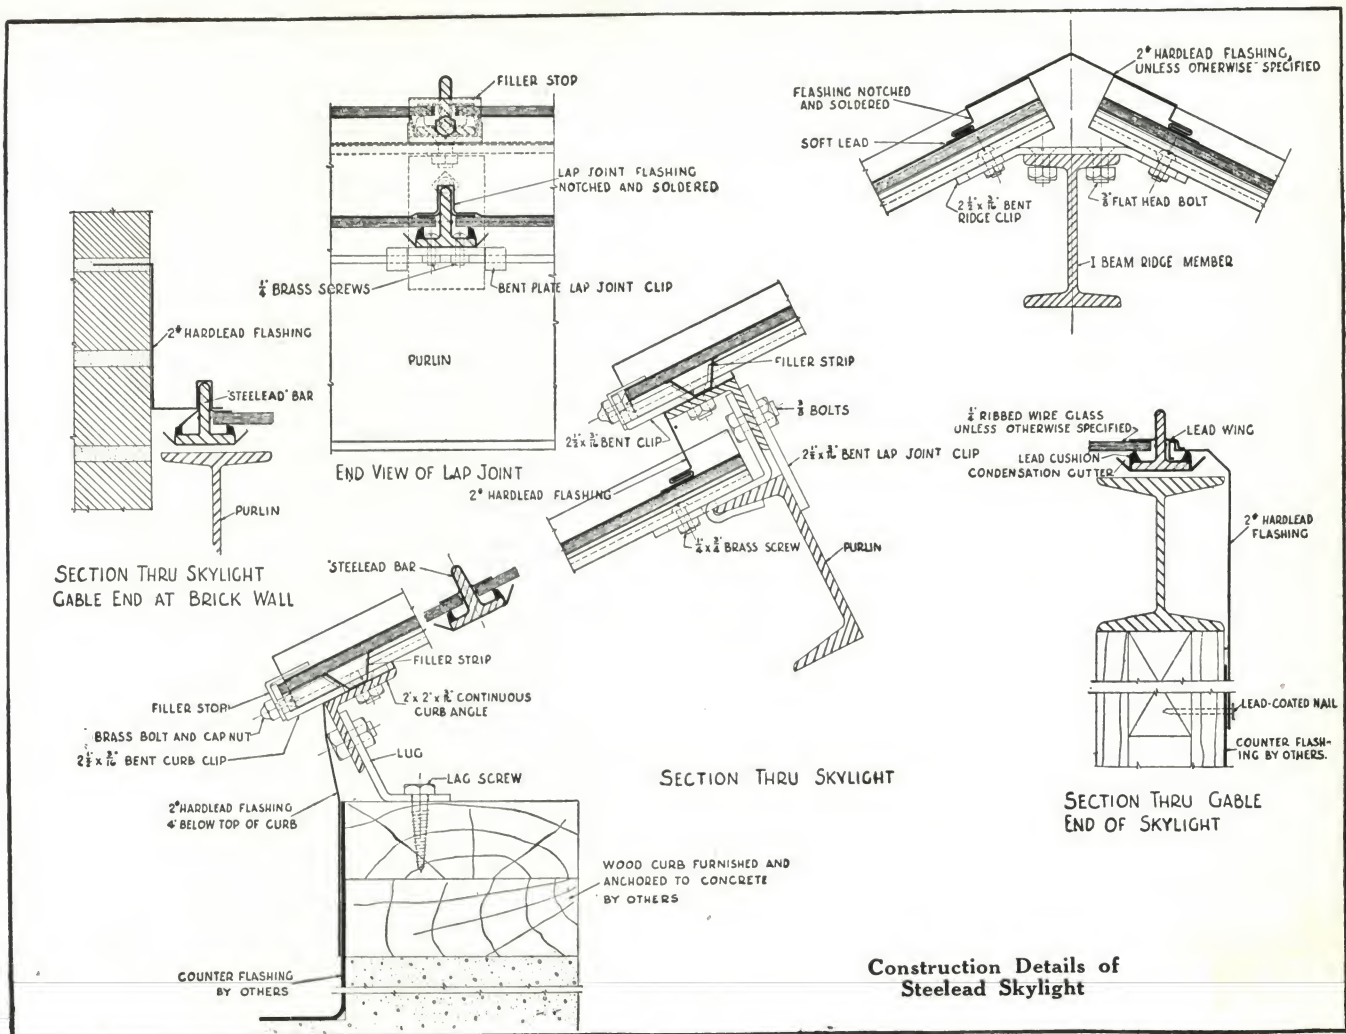

All joints between and around slabs to be caulked with 3-Way Caulking Compound.

Details 3-Way Armored Wired Glass Skylight, Flush with Roof

Details of 3-Way Armored Wired Glass Skylight Installed on Curb, with Pitch

Specifications for Steel Lead Skylight

Skylight shall be of Steel Lead construction as manufactured by the AMERICAN 3 WAY-LUXFER PRISM CO., Cicero, Ill. The steel tee bar shall be hermetically sealed in a seamless lead sheath, fully capable of resisting attacks by fumes, gases, etc. Glass shall have a bearing on a lead cushion and be free to

expand without coming into contact with bolts or other rigid substances. The glass shall be held securely in place by the lead wings on the bar, making a weathertight joint without the use of putty or packing. Ample provision shall be made for carrying away all condensation which may be delivered from the under side of the glass. All flashings pertaining to the skylight shall be hard lead weighing not less than 2 lb. per square foot.

Specifications for 3 Way Ventilating Skylights

Both Types "J" and "F" carried in stock, sizes from 4 to 20 in. in width, length as desired. Special sizes furnished when necessary.

Type "J"—Skylights shall be 3 Way Ventilating Type "J" construction as manufactured by the AMERICAN 3 WAY-LUXFER PRISM CO., Cicero, Ill. All glass bearing members to be formed of 18 gauge steel, designed to provide ample condensation gutter. Glazing to be 1/4-in. ribbed wire glass set in putty bed with 18 gauge galvanized steel caps over the glazing bar. All metal parts to be given one shop coat of paint.

Note: The Type "J" skylight is full ventilating, hinged at

the ridge with complete movable sash lifting from the curb and equipped with 3 Way Operating Device.

Type "F"—Skylights shall be 3 Way Ventilating Type "F" construction as manufactured by the AMERICAN 3 WAY-LUXFER PRISM CO., Cicero, Ill. All glass bearing members to be formed of 18 gauge steel, designed to provide ample condensation gutter. Glazing to be 1/4-in. ribbed wire glass set in putty bed with 18 gauge galvanized steel caps over the glazing bar. All metal parts to be given one shop coat of paint.

Note: The Type "F" skylight is composed of a fixed section and movable section at the ridge for ventilation equipped with 3 Way Operating Device.

AMERICAN BAR LOCK CO., INC.

Manufacturers of Skylight and Roof Light Construction

LONG ISLAND CITY, N. Y.

BRANCH OFFICES OR REPRESENTATIVES IN ALL LARGE CITIES

Product

"BAR LOCK" TRANSPARENT ROOFING SKYLIGHT and ROOF CONSTRUCTION.

For Sidewalk Light Construction, see page A386.

"Bar Lock" Transparent Roofing (Skylight and Roof Light) and Floor Light Construction

Built strongly of reinforced concrete ribs $3\frac{1}{2}$ in. deep, supporting the frames around the replaceable glass units, on four sides of each unit. Designed for permanency, protection of glass from breakage, leakage and maintenance expense. It is mechanically correct and is as strong and durable as the walls of the building. Can be walked on; is wear, burglar, fire and water proof. Requires no protecting screens. Will support the loads required, and withstand the action of the elements. Not affected by smoke or acid fumes.

Advantages of "Bar Lock" Transparent Roofing

Their durability makes "Bar Lock" Skylights with wired glass more economical than other types.

The surface will harbor neither water nor dirt. Quick repairs are possible by unskilled labor.

Glass units are cushioned with a specially prepared waterproof composition. Metal frames entirely surround each unit of glass for its full depth, providing perfect protection against concrete expansion.

The $\frac{1}{2}$ -in. wired glass is of the replaceable type,

and can be replaced by unskilled labor without any cutting of concrete, leaving of patch work or liability of leakage.

Expansion joints relieve pressure, and are caulked and made watertight with oakum and "Bar Lock" caulking compound. Spans, up to 8 ft. in the clear without intermediate supports, for any type of building.

Construction of "Bar Lock" Transparent Roofing

Made in completed factory finished slabs ready to drop over the openings, or we will send our own mechanics, if preferred, to install in the field anywhere in the United States.

Specification

"Bar Lock" Transparent Roofing Double Reinforced Concrete Construction using $8\frac{1}{4}$ in. square, $\frac{1}{2}$ in. thick, wired glass, protected by metal shields, with a signed guarantee to furnish glass for replacement free of charge (f.o.b. factory) for a period of 5 years.

Guarantees

We guarantee to maintain all work against defective workmanship and materials, and any leakage caused thereby, for a period of one year.

The AMERICAN BAR LOCK CO., INC., further guarantees to furnish glass for replacement in the "Bar Lock" wired glass skylight construction free of charge (f.o.b. factory) for a period of 5 years.

95 Webster Avenue, LONG ISLAND CITY, N. Y.

SUPERIOR AUTOMATIC GRAVITY VENTILATOR.

For Superior Roof Leader Connections and Expansion Roof Fittings for Vent Stacks, see pages C2336-2337.

A combined ventilator and skylight. Universally approved for use over theater stages, elevator shafts, stair wells and fire-proof roofs, etc. Efficient, reliable and automatic in action in case of fire.

The operation and automatic action depend on a series of hempen cords, each of which is attached to a sash or ventilator and which are immediately released, either independently or all at once, by the melting of fusible links, such as are in common use on fire doors, sprinkler systems, etc. They will melt and release the ventilators at a temperature of 160° F.—long before the flames reach them.

The ropes connecting with the sash are brought down to the stage and attached to a triangle plate which is connected with one main rope to the stage floor. Chains are also attached to the ropes permitting the manual opening and closing of the sash from the stage floor.

The automatic ventilator is to be mounted on an ordinary curb of concrete or angle iron frame made level with the wood plate set flush with the outside of the curb. The curb should be not less than 2 ft. 6 in. high from the finished roof in order that snow drifts and other encumbrances will not prevent outward gravitation. The roof of the ventilator skylight is to be of first class hip ridge construction with heavy bars and condensation gutters, glazed with a thin glass in accordance with the New York Building Code and made perfectly watertight. A No. 12 Galvanized 1-in. Underwriters wire mesh is placed underneath this roof to gather in the glass which invariably breaks from excessive heat in case of fire.

We manufacture these ventilators to any specified dimensions using standard gauges of galvanized iron or copper, and will deliver them, ready to assemble, to any part of the United States, Canada and Europe. We will supervise their installation and guarantee that they will meet with the approval of local fire marshals, inspection bureaus, fire insurance underwriters, etc.

The only gravity stage ventilator recognized by all municipal authorities throughout the United States.

Superior standard automatic ventilators are constructed in a manner approved by the National Board of Fire Underwriters, and in accordance with "An Ordinance Regulating the Construction and Equipment of Theater Buildings, and Auditoriums as approved by the National Fire Protection Association and the Board of Standards of the City of New York."

AUGUST KUHNLA, INC.

Manufacturers of Skylights

10 to 20 Lorimer Street

BROOKLYN, N. Y.

Products

"KUPE" AUTOMATIC STAGE VENTILATORS; "KUPE" AUTOMATIC VENTILATING SKYLIGHTS.

Also "KuPe" Better Standard Non-automatic Skylights.

MARK

"KuPe" Automatic Skylights and Ventilators are protected under various U.S. Letters Patents and the trade-mark "KuPe" is registered. Any infringement of patent or trademark rights, either in whole or in part will be prosecuted.

Catalogue

Supplementary descriptive sheet for complete list of Automatic and Non-automatic skylights mailed on request.

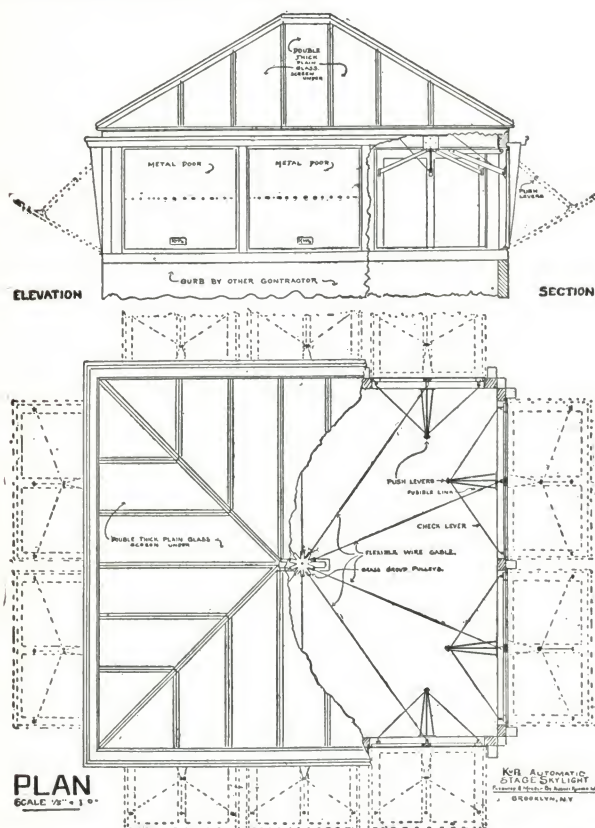

"KuPe" Automatic Stage Ventilator No. 67

A combined ventilator and weatherproof skylight. It consists of a metal frame with hipped glass roof, and sides provided with bottom hinged metal shutters. Flexible cable equipped with fusible links passes over pulleys and connects the top of each shutter to a main rope which extends down to the stage floor. This main rope is also provided with fusible links. Under ordinary conditions the shutters are hand operated, but in times of emergency the shutters may be quickly opened by cutting the rope; in case of fire the operation of the shutters is effected either individually or simultaneously by the melting of said fusible links.

Connecting the top rail of the shutters with the head jamb is a jackknife bracket which acts as a gravity lever in thrusting the shutters outward, overcoming any possible obstruction of ice, snow, or other encumbrances. This bracket also prevents the shutters from opening beyond a certain point, and holds same rigid against wind when open.

Gutters under the roof supports conduct condensation to the exterior.

This is a scientifically constructed, efficient, self-opening ventilator, proof against obstruction by ice or snow, and positive in action under all conditions.

Details "KuPe" Automatic Stage Ventilator No. 67
(Patented)

"KuPe" Standard Automatic Stage Ventilator No. 67
(Patented)

Construction and Installation—We manufacture and install these ventilators to any dimension, complete, glazed with sheet glass and equipped with woven wire screen under the glass. We use standard gauges of galvanized iron (or copper) and the shutter hinge plates and pins are of brass.

Indorsement—Approved by the Board of Fire Underwriters, city officials, architects and owners.

Other Types—In addition to the above noted "Standard" design ventilators, we also control patent rights for the sole manufacture of various other stage skylights, including those equipped with exterior or interior bracket and weight control door as well as those embracing the falling hood arrangement.

Installations—Prominent theaters, high schools, parochial schools, public auditoriums, masonic temples, etc., throughout the country, are now equipped with the "KuPe" Stage Ventilator; list of these installations will be gladly furnished on application. Limited space here prevents itemized mention.

Note: Stages having no gridiron will require a beam across center of roof opening to act as an anchorage for tackle-blocks. (This anchorage not in "KuPe" contract.)

"KuPe" Simplex Automatic Stage Ventilator No. 87

This is another type of ventilator meeting with popular favor among architects, owners and the trade in general, owing to the extreme simplicity of operation.

This ventilator, like all others of the "KuPe" manufacture, is of pleasing design and exceptionally strong construction. The sides and ends being of heavy gauge galvanized metal, while the hipped top is formed of special galvanized bars, hips and ridge glazed with $\frac{1}{2}$ -in. sheet glass and equipped with wire screen under same, according to standard requirements of New York and various other cities.

Inside gutters are, of course, provided for condensation drainage, which is allowed to pass from the interior to the exterior by way of weep holes at eaves.

The outside gutter is of liberal size, substantially made, well braced, and is provided with suitable leaders to carry water downward to roof level.

Parts, as already noted, are of galvanized metal. When copper is desired, or metal top is to be substituted

Details of "KuPe" Simplex Stage Ventilator No. 87
(Patented)

for glass (not generally recommended), special mention should be made to avoid misquotation.

As shown in illustration, the operation of "KuPe" Simplex No. 87 is entirely on the gravity principle. The manual release of main rope or the melting of fuse links causes the cover hoods to fall downward away from the various openings leaving the entire unobstructed area clear for immediate escape of smoke and fumes, a feature only possible in "KuPe" construction.

All equipment is of the best quality. The flexible cables, connecting hoods with main rope, are supplied with special locking non-corroding turnbuckles for fine individual adjustment; pulleys are of galvanized iron and hinges are furnished with brass pins.

Separate standard fuses are inserted in each cable while special fuse release makes connection at main rope. The main rope, in turn, is equipped with suitable pulley blocks for easy manipulation and extends down to tie cleat at stage floor.

"KuPe" Automatic Quick Acting Ventilating Skylight No. 66

A combined ventilator and skylight that operates instantaneously. It consists of a rectangular metal frame having a hipped roof of glass. Designed especially for immediate vent action in time of emergency.

The sides of the structure consist of vertical sash openings, fitted with side pivoted sash.

Struts from the bottom rail of these sash connect with a runner which is on a fixed vertical rod.

A chain from this runner extends to a point suitable for manual operation, where it passes through a key slot arrangement permitting the sash to be opened simultaneously and locked in any desired position.

Sash may also be opened thermally if so desired, by means of a fusible link.

The weight of the operating device effects a positive opening action on sash when the chain is released. When closed, head of the sash swings under the rain shed, flanges on the side stiles fit into grooves on the panels, the apron on the bottom rail overlaps the sill, making the sash stormproof.

Gutters under the roof support conduct condensation to exterior.

Details "KuPe" Automatic Ventilating Skylight No. 66 (Patented)

Construction and Installation—We manufacture these skylights of standard gauge galvanized iron or copper and are prepared to install them complete with glass, gutters, leaders and operating device in the following sizes:

(Outside curb measurement, ft.)

2x3	5x5	6x10	8x12	10x12
3x4	5x7	7x9	8x16	10x14
4x4	6x6	8x8	8x20	10x16
4x6	6x8	8x10	10x10	10x20

Other sizes if required.

Indorsement—"KuPe" Automatic Ventilating Skylight No. 66 is approved by architects, engineers, contractors and owners after rigid tests and inspection.

Recent Installations—Include dairies, baking plants, cabinet mills, ice cream and candy factories, markets, storage houses, automobile works, garages, schools, chemical plants, furniture warehouses, office buildings, acetylene works, laundry buildings, hospitals, doctors' and dentists' offices, residences, emporiums, hotels, clubhouses, department stores, police stations, etc.

Itemized lists of these would be impossible in the space allotted here.

DICKINSON CAST IRON FLOOR VENTS, MUSHROOM TYPE; "ÆOLUS" ROOF VENTILATORS.

For Dickinson Cast Iron Exhaust Heads and Dickinson Cast Iron Scuppers, see page A597.

Dickinson Cast Iron Floor Vents (Mushroom)

Oval Type—

Standard size—8x12 in.

Cap size—11¾x15¾ in.

Squared floor size—6, 8 and 10 in.

Maximum height—at full capacity 3½ in. from floor.

Dickinson Mushroom Floor Vent

Round Type—

Standard sizes—6, 8, 9 and 10 in.

The floor section may be had with or without means for bolting to the floor.

The caps are easily and fully adjustable, and the only tool needed is a screwdriver, the nuts being held firmly in slots.

E-Z Damper Griptite Mushrooms

Standard sizes—6, 8, 9 and 10 in. round and also 8x12 in. square floor.

The advantages of this method of controlling air are evident, as the space between the damper and cap acts as an expansion chamber, reducing the velocity of air before leaving the mushroom instead of at the time of leaving.

AKRAT VENTILATORS, INC.

Ventilating Engineers

1180 Builders Building

CHICAGO, ILL.

"Aktrat" (Accurate) Siphonage Roof Ventilator

All that a roof ventilator should be. Simple in design—accurate in detail—efficient in exhaust capacity. Their neat appearance insures a graceful skyline wherever they are installed.

Design

Designed after years of observation and study by our engineers, Aktrat Ventilators embrace all of the above qualities. The design is scientifically correct, as the slightest air currents coming in contact with any portion of the ventilator creates a siphonage action which greatly increases the volume of the exhaust. A glance at the interior of the ventilator reveals a large chamber, the area of which is much greater than that of the eduction pipe (see phantom view). This is of extreme importance, inasmuch as the large openings permit exhausted air to escape freely, while friction has been reduced to a minimum. Each of these large openings is an exhaust outlet which is constantly in operation.

Uses

Akrat Ventilators should be installed to exhaust foul air, smoke, dust, fumes, gases, steam, etc., from all types of buildings: also to create a constant circulation of air by gravity ventilation. When the installation has been completed, they require no further attention and their powerful exhaust capacity can be utilized twenty-four hours of each day.

Features

The table of comparative dimensions indicates that the over-all height is very low in comparison to the diameter of the various sizes. This feature was developed by our engineers at no sacrifice in exhaust capacity. Another feature is that the ventilators do not detract from the appearance of the buildings on which they are used. To facilitate the erection of the larger sizes, Aktrat Siphonage Ventilators are assembled in two sections. These two sections are fastened together with brass bolts, nuts and washers. The upper section, which consists of the top and weather-band, is securely riveted together with heavy bars of material. The lower section consists of the eduction pipe with siphons riveted solidly thereon. The top section can be removed easily by taking out the brass bolts. This is of importance when it becomes necessary to paint the ventilators after they have been installed. All joints of these ventilators are securely riveted—absolutely no solder being used in their assembly.

Patent applied for
Phantom View of Aktrat Ventilator

Material

Fabricated from prime galvanized sheets; also of Keystone copper-steel, Armco ingot iron, Toncan metal, cold rolled copper, zinc, aluminum, monel metal, or any other sheet metal. Only the best materials, assembled by skilled mechanics, are used in their construction. Our standard gauges are adequate for the various sizes. Braces and reinforcements are of galvanized material. When ventilators are made of special metal, the braces will be made of the same material from which the ventilator is fabricated.

Engineering Service

To obtain the greatest exhaust possible, many important elements, such as prevailing conditions to be remedied, temperature differences both inside and outside, humidity, location of ventilators, type of bases used, height above roof parapets or surrounding obstructions, etc., must be considered before specifying any particular size or quantity of ventilators.

Canneries, dye works, paper mills, etc., require special aprons, hoods or fixtures in conjunction with gravity ventilators.

We are prepared to furnish such equipment and our Engineering Department will gladly co-operate with architects and engineers who desire to obtain data and information regarding such installations.

Capacities

The following table shows the proportionate dimensions and exhaust capacities. The figures quoted are conservative and not a maximum that will be exhausted. They are compiled from tests that were conducted at the Armour Institute of Technology, Chicago, Ill.

DIMENSIONS AND EXHAUST CAPACITIES

Dimensions, in.			Area, sq. in.	Exhaust, cu. ft. per hr.

Note: These figures show capacities based only on the aspiration effect of the wind, no corrections having been made for increased flow induced by temperature differences.

ALLEN AIR-TURBINE VENTILATOR CO.

Manufacturers of Allen Multi-vane Turbine Ventilators

GENERAL OFFICES AND FACTORY

Fourteenth and Lafayette Streets, DETROIT, MICH.

SALES ENGINEERS IN PRINCIPAL CITIES

The New Allen Multi-vane Turbine Ventilator— Patented and Patents Pending

A new sturdy, durable and automatic exhaustor embodying the turbine principle in its construction, and designed so that it operates not only continuously, efficiently and silently, but to fit into the architectural lines

of any building. It has the merits of the power driven systems without the heavy initial cost and continuous operating expense. The perfectly balanced multi-vane turbine, actuated by the air not only pulls up and ejects smoke, fumes, foul air, gas, dust and moisture, but creates an air circulation.

Alemite Lubricating System—There is also embodied in its construction a complete Alemite pressure lubricating and relubricating system.

The New Allen Multi-vane Turbine Ventilator

of any building. It has the merits of the power driven systems without the heavy initial cost and continuous operating expense. The perfectly balanced multi-vane turbine, actuated by the air not only pulls up and ejects smoke, fumes, foul air, gas, dust and moisture, but creates an air circulation.

Whenever a definite number of air changes are required in any type of building the Allen Ventilator can be used. Their constant and uniform displacement enables engineers to predetermine the air condition of any building by applying the guaranteed table of displacements as published below.

This ventilator is absolutely leakproof; its operation is not hampered by ice, sleet or rain. Constant operation under all conditions insures positive and uniform ventilation. The powerful upward suction force of the rotary multi-vane turbine makes down-drafts a mechanical impossibility. They are constantly efficient and not affected by cross air currents as in the case of types equipped with placement wings.

Lower First Cost with No Upkeep

The first cost of the Allen Multi-vane Turbine Ventilators is not only less than the cost of power-operated exhaust equipment, but all maintenance and operating expense is eliminated. Once installed it requires no attention, care or adjusting.

Construction

This ventilator is constructed of standard gauge, rust resisting galvanized metal, protected with a special

Two Typical Installations

Sizes—Made in eleven different sizes, 8, 10, 12, 15, 18, 20, 24, 30, 36, 42 and 48 in. These dimensions refer to the diameter of bases of ventilators. This range of sizes makes them adaptable to care for any ventilating problem.

Great Displacement Capacities

The displacement capacities of the respective sizes in which Allen Ventilators are shown below are con-

servative, and fully guaranteed. These capacities have been substantiated by numerous actual installation tests.

Industrial Ventilation

All industries present unusually difficult problems of ventilation. Allen Ventilators, wherever installed in every line of industry, have proven to be not only the most economical in first cost and maintenance, but efficient in operation. "Ask the user—he knows."

Uses

The Allen Multi-vane Turbine Ventilator is particularly adapted and proven to be most satisfactory in actual installation in displacing vapor (steam), smoke, fumes, poisonous gases, dust, etc., from factories, mills, laundries and garages, and for displacing foul air, mois-

Typical Installation

Bases should be constructed of a heavy gauge of galvanized iron, which should be square to round and long tapered as indicated above. This type of base construction not only lends itself well to adaptation on any type of roof but has decided advantages; it increases the area or broadens the scope of exhaust and lessens friction, thereby increasing the displacement. Bases of this type further make for rigidity and long life.

Guarantee

The displacement capacities of Allen Multi-vane Turbine Ventilators, as published and tabulated here, are guaranteed if installed in accordance with the instruction tag attached to each ventilator.

This Plant Completely Equipped with Allen Ventilators

Engineering Service

The ALLEN AIR-TURBINE VENTILATOR Co. maintains an Engineering Department, the service of which is extended to council without cost or obligation.

Our engineering staff have had a most diversified experience in handling all kinds of ventilating problems in connection with various types of buildings and the broadest experience in eliminating not only smoke, excessive heat units, vapor, etc., but heavier-than-air bodies, such as gases, fumes, dust and foul air.

Our sales engineers in the principal cities supplement this service and make practical and definite recommendations for the adaptability of Allen Exhausters.

ture, odors and dust from barns, stables, etc. It is preeminently designed and adapted for removing excessive heat units and vitiated air from factories, theatres, schools, etc.

AMERICAN-LARSON VENTILATING COMPANY

MAIN OFFICE

Keystone Bank Building

PITTSBURGH, PA.

Product

AMERICAN-LARSON SUCTION VENTILATORS (Patented 1927).

The Principles of Static Ventilation

Two distinct sets of forces produce natural air currents in ventilators. These forces are stack action, and wind action.

Stack action occurs when air in a stack is heated above the temperature of the surrounding atmosphere. This action is independent of wind velocity, and ceases when the temperatures inside and outside of the stack are equalized.

Wind action is not so simple, and its effects follow different laws at different wind velocities.

In the flow of fluids in pipes, ducts, etc., it is found that there are two critical velocities. Below the lower critical velocity, the fluid moves in parallel lines, and pressure drop is due to viscosity only. Above the upper critical velocity, the fluid moves in a turbulent manner, and pressure drop grows as the square of the velocity. Between the upper and the lower critical velocities, the motion of the fluid is unstable, and vacillates between one or the other states of motion, depending upon small irregularities and accidental happenings.

Requirements for Ventilating Action

Unless a ventilator can produce good results at extremely low wind velocities it is actually worse than useless, as reverse currents are likely to occur, carrying accumulations of foul air into the spaces for which adequate ventilation was intended.

It is extremely easy to build a ventilator which will exert a suction or ventilating effect at high wind velocities, but it is quite difficult to produce a ventilator which will exert a suction of reasonable strength with very low wind velocities.

The American-Larson Ventilator possesses features which make it possible to produce good ventilating effects even at wind velocities which are much too low to have any effect whatsoever in the majority of ventilators now on the market. These facts may readily be confirmed by reference to extremely careful tests conducted by Professor Trink of the Carnegie Institute of Technology, Pittsburgh, Pa. It was by these tests, in fact, that true effects of wind action in this class of ventilator were first studied and properly analysed.

In many cases, it is essential that the ventilator should produce a positive pressure difference by a very slight wind action, entirely independently of the temperature difference. Such cases are those in which the ventilator is connected to basements or lower floors. Ventilation can not start of itself, because the air in the duct to the ventilator is either at the same temperature or is cooler than the air in the upper parts of the

building, and no force due to temperature difference is available for discharging the air through the ventilator; reverse flow might even occur. If, however, an ever so slight but yet positive draft is available from wind action, sufficient to start air moving through the ventilator and duct, the latter becomes filled with warm air, which by its own buoyancy produces a much greater difference than was at first available.

The Practical Design of Ventilators

The practical designer of ventilators endeavors to combine the greatest possible draft, with the least possible resistance to air flow. He must accomplish this at extremely low wind velocities. The action at low wind velocities must be quite independent of temperature differences. Under no conditions must the design be subject to interference by back drafts.

Unless proper provisions are incorporated in the design these features are very hard to combine. In the American-Larson Ventilator however, the patented ejector tube effects air movement in direct ratio to wind velocities and temperature differences. When there is no temperature difference many ventilators do not function at all unless wind velocity is greater than 3½ miles per hour; furthermore under temperature differences as great as 20° F., the efficiency of such ventilators actually decreases in gentle breeze up to 4 or 5 miles per hour velocity.

Wind Rating Curves of American-Larson Ventilator

Graphic Record of Comparative Tests by Professor Trink

X = 18-in. stationary siphon ventilator
Y = 18-in. rotary siphon ventilator
Z = 18-in. American-Larson suction ventilator

Cut View of Typical American-Larson Ventilator

In the American-Larson the kinetic energy of the wind is used to the maximum possible extent, by creating suction, due to the viscous drag both inside and outside the cowl.

On account of the easy or gradual turn of the air current and the unobstructed discharge area, the discharge for a given pressure drop in the American-Larson is unusually high—about 75% of that through a rounded opening of the same area.

In the stationary type of ventilator the great number of turns of direction of the air causes excessive resistance or pressure drop. To avoid this the proportions of the passage have in some designs been made excessively large in order to reduce air velocities, but these large passages mean that the ventilator is not properly shielded and that down-draft is an ever present source of trouble in high winds, so one or the other feature (freedom from downdraft or low pressure drop) which ever is considered of least importance must be sacrificed. This condition is particularly unsatisfactory when snow is falling with relative humidities around 96 to 98%.

Static Draft Produced by the American-Larson Ventilator

Static draft can be computed from the equation given below, where C = wind velocity in miles per hour.

$C^2 \div 4800$ = Static draft, in inches of water.

This draft produces an upward velocity in the throat of the ventilator, when the flow of air to and through it is unrestricted, of a little less than 70% of the wind velocity.

With ejector tube closed, the static draft is just one-half as great as with the tube open.

The draft given above is the pressure difference produced by the ventilator alone, independent of the building to which it is attached. In addition, a slight pressure is usually produced in the building by the action of the wind on the openings on the windward side. The total air moving force is then the sum of this pressure difference plus the draft produced by the ventilator. The amount of the pressure obviously varies with the proportion and location of the openings, so that no definite values can be given. It is usually of the same order of magnitude as the ventilator draft given by the formula.

It should be noted that the American-Larson Ventilator is absolutely free from back or down-draft at any wind velocity.

Solution of a Typical Ventilation Problem

A given building is 44x110x28 ft. average height and will be used to house equipment and appliances which will throw off approximately 416 lb. of steam per hour.

The ventilator capacity to be figured on the following conditions: 10 changes of air per hour; temperature difference, 20° F.; wind velocity, 5 miles per hour; ventilators 36 ft. above the floor level. The heating system will be adequate.

In summer the proper ventilating requirements will be a question of providing sufficiently rapid flow of air into the building to (a) absorb a large part of the water vapor, and (b) produce sufficient upward velocity of air flow to carry upward the minute globules of water which compose visible steam. The temperature difference between air inside and outside the building in summer is usually small, but the building is wide open. Under these conditions the problem is simply that of providing sufficient ventilator capacity.

In winter, while the same requirements are to be met as in (a) and (b) above, the temperature difference is great and the wind velocity usually high; since the building must be kept at a reasonable temperature, the air inflow will naturally be restricted by closing doors and windows. It is evident that the ventilation conditions in winter do not depend entirely upon the number or size of ventilators installed, but on the capacity of the heating system and the amount of heat given off by the equipment and appliances in the building.

Another item which must be considered is that of condensation and dripping of water from the roof. This is rather a question of roof construction than one of ventilation. If the roof is unprotected sheet iron, and if the building is kept at a rather high temperature in winter, with very restricted air inflow, condensation on the under surface of the roof will inevitably occur. On the other hand, with a roof laid on wood or protected with insulation, if a reasonably large air inflow is permitted, condensation will not occur.

Considering all of these features it would appear proper to install the ventilator capacity required under summer conditions.

Calculation of Capacity—The volume of air moved per hour by a ventilator or set of ventilators can be derived from the following American-Larson ventilator capacity formula,

$$Q = A \left[\frac{36\sqrt{H}(t_1 - t_0)}{6 + v} + 20 \times v \right]$$

where Q = cu. ft. of air exhausted per hour; A = throat area of ventilators in sq. in.; H = center of ventilator outlet to floor; v = (wind velocity) miles per hour; t_1 = inside, and to outside average temperatures.

In solving; $Q = 10 (44 \times 110 \times 28) = 1,357,000$ cu. ft. per hour ventilating capacity, whence, from the formula, $A = 7200$ sq. in.

Seven 36-in. American-Larson Ventilators have an area of 7150 sq. in. Six 40-in. American-Larson Ventilators have an area of 7540 sq. in. Four 48-in. American-Larson Ventilators have an area of 7220 sq. in.

Actually, the results given by the formula are very conservative and the last term of the equation should be multiplied by the factor of 140% which would, with any of the three combinations figured on, give a capacity of 12 changes per hour instead of 10. The lower figure has been used, however, to allow a greater "factor of safety." And since the average wind velocity for the vicinity in which the building is located is shown by the U. S. Weather Bureau reports to be about 12 miles per hour, the ventilating capacity at most times would be considerably greater. It is best, however, to provide for the least favorable conditions.

Moisture Absorption—(A) Moisture content of air 70° F., 75% relative humidity = .00086 lb. cu. ft.

If raised to 90° F. and saturated, moisture content = .00213.

Moisture absorbed per cu. ft. = .00213 - .00086 = .00127.

Moisture absorbed by 10 changes of air per hour = .00127 \times 1,357,000 = 1720 lb. per hour.

Steam given off by the equipment and appliances = 416 lb. per hour, or only 24% of what could be absorbed.

(B) If air is not heated at all, but absorbs all of the steam given off by the equipment and appliances, $416 \div .00030$ lb. per cu. ft. = increase in moisture.

1,357,000

This corresponds to a relative humidity of 100%—that is to say, the air at 70° F. could absorb all of the steam without becoming over saturated.

Recommendations—The combined throat area of all ventilators should be approximately 7000 sq. in. This is equivalent to seven 36-in. ventilators, or six 40-in., or four 48-in. of the American-Larson type.

The location of the ventilators or the best number to use, will depend largely upon the number of bays of the building, since it is generally preferable, although not essential, to locate each ventilator at the center of a bay (i.e., midway between the roof trusses).

Suggested Form of Specification

(1) All ventilators shall be American-Larson Suction Ventilators, as manufactured by the AMERICAN-LARSON VENTILATING COMPANY, of Pittsburgh, Pa., and shall [shall not] be equipped with dampers.

(2) The ventilators shall be made of (see Note 1) and shall be of the following gauges:

Below 18-in. diam., No. 24 gauge; 20 to 24-in. diam., No. 22 gauge; 30 to 48-in. diam., No. 20 gauge; 54-in. diam., No. 18 gauge.

(3) Where so indicated, the ventilators shall be mounted on extension piping of sufficient height to raise ventilators above surrounding obstruction.

(4) The ventilators shall be erected plumb and in a substantial manner. Where extension pipes are used they shall be anchored to four points with heavy gauge guy wires.

(5) Ventilators for _____ shall be equipped with fusible links to close dampers automatically in case of fire.

Note 1:

Material of ventilator	Uses of ventilator
Galvanized iron.....	1. All purposes for which no acid or corrosive fumes pass; standard practice.
Copper.....	2. All purposes for which long life is desired, provided that no strong acid or alkaline fumes pass.
Choice of metal.....	3. For ventilating buildings or rooms from which acid or other corrosive fumes rise.
Monel metal.....	4. Same as No. 3; has longer life, but is more expensive.
Zinc.....	5. Similar to copper, but a little cheaper.

"ARIN" ANTI-DRAFT WINDOW VENTILATORS. (Installed in Sash.)

view on following page) a powerful vacuum is created, drawing out air at a tremendous speed.

Foul air, warm air, fumes, gases, vapors, steam and smoke are quickly and completely removed. Passing wind plays upon the siphons so as to accelerate the outflow of foul air from interior of building, but it permits none of the outside wind to enter the ventilator. Every opening is an outlet.

Arex-Austor

Scientific Design—This ventilator, designed on the original siphonage principle, assures by natural means constant, positive and uniform ventilation.

The siphon or vacuo chambers are so placed as to concentrate all wind currents into a steady pulling force; by means of deflections opposite each siphon (see sectional

120 Arex-Austors on This Forge Shop

Under ordinary conditions Arex-Austor will remove 300 cu. ft. of foul air per square inch per hour on a 9-mile wind velocity.

Upper part consists of a conical deflector top surrounded by a scientifically adjusted broad storm-guard, making the Arex-Austor absolutely storm-proof.

Arex-Austor Construction

Arex-Austors are made of Galv. Iron, Ingot or Toncan Metal, Cold-rolled Copper or any other special metal, in any size or gauge. The installations shown on this page are standard; special bases and pipe connections made to order—submit sketch.

Arex-Austors, 24-in. and upwards are provided with brass bolts connecting the frustum to the siphons. This permits installation in two halves and facilitates painting inside and outside at any time after they have been installed.

Details and Data, Arex-Austor Ventilators and Bases

First Class Construction—Fabricated in one solid unit, no solder used, every joint rigidly riveted. Has no movable parts, no shutters or louvers to break off, no ball bearings to clog, no meaningless fancy trimmings to impede ventilating action, nothing to get out of order.

In short, a ventilator, simple in principle, durable in construction and sure to give year-in and year-out service without attention or repair.

Made of galvanized iron, Ingot or Toncan metal, cold rolled copper; or in any special metal in size or gage.

Prompt shipments from large factory stock.

Wide Adaptability

—Thousands of installations have proven the Arex-Austor to be the ideal ventilator for mills, factories, foundries, warehouses, power plants, train sheds, railway cars, ships, theaters, hospitals, schools, etc.

Can be installed on flat roofs, sawtooth roofs, slant roofs or on skylights and monitors.

Caution: The phenomenal success of Arex ventilators has provoked petty imitations by name, design or principle. Beware of such infringements.

Arex is the only trade-name under which our ventilator is sold.

Bottom View

Actual photograph. Note the extraordinary outlet for escape of air—greater than in any other ventilator. Observe the immense ventilating area—the deep, penetrating siphons—the triangular channels between the siphons.

Well-balanced and mechanically perfect throughout

Standard Specifications for Arex Ventilators

All roof ventilators to be Arex original siphonage ventilators as patented and manufactured by the AREX COMPANY, 1598 Conway Building, Chicago, Ill.

Engineering Service

The first and foremost requirement is air exhaust capacity. Every factor that makes for or against results is of vital importance. The mere purchase of ventilating units does not in itself always solve a problem. That is why we, with 20 years' experience and the record of 200,000 successful installations, recognizing our position and responsibility as the world's largest exclusive manufacturers in this field, surround our product with an engineering service aimed to assure maximum Arex efficiency. This service consists of analyzing a problem, preparing sketch or blue print, making correct recommendation and giving valuable information and expert advice on this all-important subject of ventilation.

Manufacturing Facilities

Our own modern plant and warehouse at South Gary, Ind., afford us unequalled advantages for manufacturing and shipping standardized ventilators in large quantities on short notice.

Special bases and pipe connections made to order from submitted sketches.

Arex-Austor (Original Siphonage)

Economy Roof Ventilator

This ventilator is designed to meet the demand for a ventilator at lowest possible cost, yet capable of solving any ordinary ventilating problem.

Manufactured in attractive proportional design of solid sturdy construction. Absolutely guaranteed storm-proof.

Economy Roof Ventilator

Made in same sizes and gages as Arex-Austors. Workmanship and materials are of the same high quality. Furnished with or without damper or base. Prompt shipment from large stock always on hand.

Utility Ventilators

This ventilator is designed especially for use on school buildings. They are made with a storm band larger in circumference and width than those on the Economy Ventilators, but are lower in proportion to width to conform to certain architectural roof lines.

They are made in a full range of sizes and in all metals.

"Arin" Anti-draft Window Ventilator

An adjustable sash ventilator, especially adapted to windows in schools, hospitals, shops, offices, hotels, apartment houses and residences for providing fresh air without creating a draft.

The "Arin" Window Ventilator bears the endorsement of architects, health commissioners, school committees, etc., and complies with every requirement of states and municipalities.

Construction—"Arin" is constructed throughout of hard brass, making it absolutely rustproof and durable. All connections are rigidly reinforced, there being no parts to be damaged through misplacement or careless handling. The workmanship is of the highest class and the entire ventilator is beautifully finished in statuary bronze. Being small, neat and part of the window, it represents a practical, permanent installation of ornamental appearance.

Adjustable Deflector—The sectional details and perspective view herewith illustrates the adjustable deflector plate that permits control of the volume of air admitted to the room and its distribution within the room as well.

Installation Details, "Arin" Ventilator When Closed

Method of Removing or Replacing the "Arin" Removable Screen

Installation—Some architects and engineers when installing "Arin" Window Ventilators in new buildings prefer them placed in the top window rail as well as in the bottom rail.

When desired in buildings already erected, the most practical method of installation is to place them on a 4 or 6-in. panel which will set under the window and may be removed entirely when desired.

Preparation of Rail—Rabbit outside surface of rail around opening $\frac{1}{8}$ in. deep and $\frac{5}{16}$ in. wide. This gives outer hood flush fit and allows $\frac{1}{8}$ in. margin to prevent binding.

Air Filter—Every atom of air entering the "Arin" Ventilator filters through a fine screen mesh which keeps out dirt, soot and insects.

Thus, "Arin" provides a double service—positive protection against draft and dirt.

Standard Specification for "Arin" Ventilators—All window ventilators to be "Arin" Anti-draft ventilators as patented and manufactured by the AREX COMPANY, 1577 Conway Building, Chicago, Ill.

DIMENSIONS AND CAPACITIES OF "ARIN" WINDOW VENTILATORS

Style	No.	Projection inside, in.	Outside dimensions including flange, in.	Outer hood, in.	Minimum depth, in.	Opening in rail, in.	Size, in.	Rail depth, in.	Free area, sq. in.	Capacity, cu. ft. air per hour
A-1	1	2x12	2 $\frac{1}{2}$ x12 $\frac{1}{2}$	2 $\frac{1}{2}$ x12 $\frac{1}{2}$	4	2x12	2x2x12	3	17.4	5,660
A-2	2	2x18	2 $\frac{1}{2}$ x18 $\frac{1}{2}$	2 $\frac{1}{2}$ x18 $\frac{1}{2}$	4	2x18	2x2x18	3	26.5	8,620
A-3	3	2x24	2 $\frac{1}{2}$ x24 $\frac{1}{2}$	2 $\frac{1}{2}$ x24 $\frac{1}{2}$	4	2x24	2x2x24	3	35.4	11,515
A-4	4	2 $\frac{1}{2}$ x12	3x12 $\frac{1}{2}$	3x12	4 $\frac{1}{2}$	2 $\frac{1}{2}$ x12	2 $\frac{1}{2}$ x2 $\frac{1}{2}$ x12	3 $\frac{1}{2}$	23.25	7,563
A-5	5	2 $\frac{1}{2}$ x18	3x18 $\frac{1}{2}$	3x18	4 $\frac{1}{2}$	2 $\frac{1}{2}$ x18	2 $\frac{1}{2}$ x2 $\frac{1}{2}$ x18	3 $\frac{1}{2}$	35.25	10,572
A-6	6	2 $\frac{1}{2}$ x24	3x24 $\frac{1}{2}$	3x24	4 $\frac{1}{2}$	2 $\frac{1}{2}$ x24	2 $\frac{1}{2}$ x2 $\frac{1}{2}$ x24	3 $\frac{1}{2}$	47.25	15,270

Note: The rail depth is the clearance required in the lower rail above stool when window is closed. The free area is the sum of the openings for the flow of air. When ordering, be sure and state thickness of window rail which is usually about $1\frac{3}{4}$ or 2 in. Prices on application.

"Arin" Adjustable Louvers

Adaptability—These high grade louvers are installed to insure adequate fresh air supply in connection with any heating and ventilating system, in schools, factories, power plants, transformer vaults, etc.

Advantages—(1) Easy to operate—no sticking. (2) Absolutely foolproof. Practically indestructible.

(3) Absolutely stormproof and weatherproof.

(4) Blades do not protrude when louver is open.

(5) Can be installed in series of two or more units to fit any size opening.

(6) Blades can be removed entirely in case of emergency.

(7) Furnished with birdscreen if required.

(8) Reasonably priced, considering the high grade material and workmanship.

(9) Also made of cold rolled copper or any other special material.

Construction Features

—(1) Frame and blades made of No. 16 gauge galvanized steel.

(2) Bronze bearings in frame.

(3) Bronze pivots in blades.

(4) Bronze setscrew and slide.

(5) Adjustable device to lock in any position.

(6) Standard depth 4 in. for any brick or concrete wall.

(7) Perfectly balanced.

Interior view—open

Roof Ventilators for All Requirements

Our 26 years' experience in the roof ventilator business has proven beyond doubt that *no one type* of ventilator will adequately meet all conditions.

We have designed *various* types and are prepared to tell exactly which of these types of the proper size will handle any particular requirement. Some installations require revolving type ventilators, others require metal top sliding sleeve damper ventilators, still another will need a fire retarding type, and weave sheds will best be served by our double damper ventilator.

Conclusive tests have proven that under certain conditions one of these ventilators will exhaust its maximum per cubic foot while another type will hardly pull anything.

At Akron, we maintain an engineering department which will expeditiously co-operate with architects, engineers, contractors and others in selecting the proper types and sizes of ventilators to suit particular conditions and requirements.

Blue prints of our various types will be furnished on application. Send your specifications, rough pencil sketch or blue print to our engineers, and they will, without cost or obligation, send a detailed analysis of your situation, together with recommendations and quotations.

Materials Used in Burt Ventilators

Burt Ventilators are made of prime open hearth galvanized steel. They can be made of zinc, copper, lead clad sheets, toncan metal, armco iron, aluminium or monel metal at slight additional cost.

Burt Patented and Exclusive Features

Among the many features that account for the popularity of Burt Ventilators are the sliding sleeve damper, the spring clip, the notch rim, the condensation gutter and heavy construction.

The sliding sleeve damper efficiently regulates the flow of the air. The spring clip holds the damper rope in place after changing adjustment. The notch rim holds the glass in place on top of ventilator. The condensation gutter gathers the condensation and carries it off to the roof. Burt Ventilators are from 4 to 6 gages heavier throughout than is customary in many makes of ventilators.

The above are more fully described under the various ventilators of which they are a part.

Uses

No single type of building, classified either as to use or construction has been missed by Burt engineers in their surveys. Their experience includes ventilation of buildings from capitol buildings to chicken houses, from power plants and weave sheds to public auditoriums.

Residence Ventilation—Ventilation is also necessary in a residence. It is almost the only way many houses can get fresh air without causing a draft. The top floors in summer months are usually uninhabitable because of the sweltering heat. A Burt Stationary Ventilator in the roof will allow this air to escape. The line of Burt ventilators have been so simplified that they can be made to harmonize with the general design and construction of the house.

Garage Ventilation—A ventilator placed on roof of a small garage will carry off the carbon monoxide fumes fast enough to make conditions comfortable and safe.

Farm Building Ventilation—Burt Rotary or Stationary Ventilators on barns, assures keeping the animals in a healthy condition. Ventilation of poultry sheds is necessary to obtain the maximum production of eggs and the maximum increase

in weight. The smallest of Burt Ventilators will be ample to assure the best ventilation.

Ventilator Capacities

We are very much opposed to publishing ventilator capacities because as a general proposition they simply confuse the person desirous of securing information. We have reliable tests, and will furnish copies with comprehensive explanations to any one interested.

We believe, however, that our guarantee in proposing to place any of our ventilators of any type side by side with any other ventilator, allowing the engineers of the companies interested to be the sole judges of the merit of our product, is the best proposition that we can offer.

We give this in lieu of capacities, because the Bureau of Standards, at Washington, a reliable authority, has given reports which indicate that Burt Ventilators of all types are the equal or superior of any ventilator on the market.

Again, there are so many variables entering into a problem of this kind that a published table is very confusing. We are, therefore, prepared and willing to give you data as to why we take this stand along with information which will enable you to arrive at the number and size of ventilators that might be required. As a matter of fact, the best way to handle this, provided your engineers are not familiar with the situation, is to submit a rough proof of your building and let us place the ventilators for you.

The Liberal Burt Guarantee

We guarantee Burt Ventilators to be free from defects in workmanship and material and will replace at any time free of charge, f.o.b. factory, any Burt Ventilator proven defective.

Burt Sliding Sleeve Damper Ventilator

Marketed for over twenty years, this ventilator is not an experiment—it is used by many of the largest industrial plants in the United States.

These ventilators may be had with either metal tops or glass tops. The metal top ventilator serves as a ventilator only, while the glass top serves as a *combination skylight and ventilator*.

Exclusive Features—(1) The patented damper in this ventilator consists of a sliding (telescopic) sleeve, which is operated from below by means of a cord or chain running over a rust resisting pulley. Each ventilator is equipped with a patented clip so that it can be set in any position and held

Sectional View of Glass Top Sliding Sleeve Damper Ventilator Showing Some Burt Patented and Exclusive Features

Sectional View of Burt Sliding Sleeve Damper Ventilator

there without fastening the cord to a nail, hook or post. As the sliding sleeve damper is not affected by air currents, it maintains its position and requires no attention. This construction is a marked improvement over the flat damper type.

(2) The sliding sleeve damper has no flat surface, therefore, it does not collect dust or refuse to be shaken off into the building.

(3) The air shaft is open and unobstructed at all times. Air currents are not deflected downward, and it is possible to adequately ventilate with a smaller number of Burt Ventilators than most competing types.

(4) The sliding sleeve damper makes our glass top ventilator an ideal skylight, as the light is never obstructed.

(5) The glass top ventilator is equipped with heavy ribbed wire glass held in place by a patented notched rim, and made absolutely watertight by means of waterproof cement. Glass can be replaced quickly by merely removing the notched rim, without removing ventilator from the roof.

(6) Our patented trough or lip is placed below the glass top, into which runs any condensation which may gather on the glass. A similar trough on the lower part of the base collects all condensation forming on the air shaft.

How to Specify—See specifications on the following page.

Prices f.o.b. Akron, Ohio, and include sliding sleeve damper. Ventilator bases are charged for extra, for which prices will be quoted on receipt of specifications. Operating rope or chain not furnished. Discounts on application.

New Burt Fire Retarding Cone Damper Ventilator

In this type of ventilator, an inverted cone is used as a damper, which is operated from the floor (moved up and down) by a copper chain running over a rust resisting pulley as shown.

The damper of this ventilator is furnished with fusible link which insures it automatically closing in case of fire. When the damper is thus equipped this ventilator passes the approval of the Underwriters' Laboratories, Inc.

The elongated slot in the damper can be used as a clip when the fusible link is placed above the damper. When it is desired to place the fusible link below the damper, the elongated slot is omitted and the chain simply falls through a round hole in the damper. The patented clip furnished then can be placed anywhere within reach of the operator.

The elongated slot and fusible link, of course, obviate the necessity of tying the chain to a post, nail or hook in the building itself.

The construction of this ventilator embodies all the essential features of construction recommended by the American Society of Heating and Ventilating Engineers.

The patented raising and lowering device is simple and positive in action, and is guaranteed not to stick or bind. The air shaft is open and unobstructed at all times—there are no braces of any kind in the air shaft or neck. The inverted cone damper permits easy flow of air outward—there are no sharp turns or obstructions, and no air pockets.

The extra wide wind band makes this ventilator absolutely storm-proof and creates a larger low pressure area,

Fig. 500-X
Sectional View, Burt Sliding
Cone Damper Ventilator
With cone damper closed

and a better exhaust. The location of the louvers, top and wind band have been scientifically worked out so that regardless of the direction of the wind, it can not pass through the ventilator head and get into the building—guaranteed against back-drafts.

Exhaust area is larger than cross-sectional area of pipe, which assures guaranteed exhaust capacity.

How to Specify—See specifications on the following page.

Prices f.o.b. Akron, Ohio. (Discounts on application.) Bases extra. Bird screens furnished at slight additional cost.

Burt Ball Bearing Revolving Ventilator

A neat and well constructed ventilator of the revolving type that has been perfected to the highest point of efficiency.

Its design and open back construction causes the air currents to pass not only over the top and sides, but directly through it, thus creating a partial vacuum in front of the air shaft, which greatly increases its capacity or pulling power. This construction also holds the ventilator steady with the wind.

Each Burt Ventilator is erected and tested in our factory before shipment, insuring perfect balance.

This ventilator is equipped with two sets of high grade steel ball bearings—it is positively guaranteed not to stick or bind.

There are no louvers in the revolving head, consequently maximum efficiency is obtained. If bases are furnished by us, we will install flat dampers without charge (see illustration). When specified, we furnish dampers of the fire retarding type which close automatically in case of fire.

This ventilator has proven a success under a wide range of conditions and thousands are now in use.

How to Specify—See specifications on the following page.

Fig. 800-Z
Burt Ball Bearing Revolving Ventilator

Burt Fan Ventilator

This ventilator effectively and quickly removes excessive fumes, smoke, odors, etc., from theaters, schools, churches, laundries, blacksmith shops, dyehouses, foundries, and other buildings.

Being power driven, it will exhaust, approximately, ten times more vitiated air than a stationary or revolving ventilator.

Other features are quietness of operation, inverted cone damper, fire retarding, low power consumption, and with power off, normal ventilation continues.

There are three distinct types of Burt Fan Ventilators their grouping depending only upon the way in which they are driven.

Continued on next page

Direct Connected Fan Ventilators—Group One— Small sizes from 14 to 20 in. The one illustrated is 20-in. size. This size delivers 1750 cu. ft. of air per minute alternating or direct-current motor. Four-blade fan.

Group Two— Larger sizes 24 to 48 in. Motors available are of five models. Alternating or direct-current motors, 670 to 700 r.p.m. The 24-in. ventilator will remove 4500 cu. ft. of air per minute, the 30-in. 8500, the 36-in. 11500, the 42-in. 13200, and 48-in. 14275 cu. ft. Cost of operating 36-in. size at 8c per kilowatt hour is 22c for 10 hours.

Belt Driven Fan Ventilators—Group Three— Made in four types, classified entirely as to method of handling belt drive. Can be driven from line shafting or from individual motors. The two types operating from a line shaft drive are arranged so the idlers can be placed outside the ventilator shaft to operate on a line shafting installed outside on the roof, or with the idlers in the ventilator shaft directly under the fan so as to be driven from a line shafting in the building under the ventilators.

Type 1 has the outside drive.

Type 2 has the inside drive.

Type 3 employs separate motor to drive belt with motor housing outside of building.

Fig. 260-Z
Burt Direct Connected Fan Ventilator

Fig. 265-Z
Burt Double Damper Ventilator

Type 4 also has separate motor, but motor is placed inside of the building.

Fans have 6 blades. Motors are standard, 1750 r.p.m. with fans made to be driven between 500 and 650 r.p.m.

Burt Double Damper Ventilator

Designed for weave sheds and places where the condensation forming on the air shaft and the cowl must be prevented from entering the building.

Adopted by many of the largest textile mills in the United States.

The condensation trough in the air shaft of the Burt Double Damper Ventilator collects most of the moisture and passes it out on the roof through the condensation drain. When condensation is severe, the trough-shaped lower damper acts as a drip pan and collects the moisture, the latter being quickly evaporated.

The lower drip pan (below bottom damper) is a safety device that collects any overflow from the bottom damper. It can be piped to pass water out on the roof.

The two dampers are operated simultaneously by means of a cord from below. The cord is held firmly by a patented clip fastened to the roof. Made in all sizes.

How to Specify—See specifications below.

Burt Rectangular Ventilators

Made in all sizes, of any metal desired, with either metal or glass tops, and equipped with our patented sliding sleeve damper described on preceding page.

Suitable for public buildings, foundries, schoolhouses, etc. Can be adapted to any size or shape of roof opening.

How to Specify—See specifications below.

Ventilator Bases

Ventilator bases are made to conform to the pitch of the roof, either round or square. Square bases are recommended for maximum efficiency, capacity and rigidity. Extra heavy (of the same gauge metal as the ventilator itself).

Burt Bases have the following features: condensation trough in every base, 4-in. flashing or more on every base to insure stormproofness, four different types, a type for every condition, and every base made separately for each particular job.

Burt Ventilator Bases

How to Specify Burt Ventilators

Metal Top Ventilator—(1) Furnish and install on roof, where shown on drawings, Burt Metal Top Ventilators, as manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio.

(2) Ventilators shall be of diameters shown and shall be constructed of prime open hearth galvanized steel sheets of THE BURT MANUFACTURING COMPANY'S standard gauge, strongly braced with galvanized steel bands and properly riveted.

(3) Ventilators shall be provided with sliding sleeve dampers, operating by chains or cords over rust resisting pulleys and equipped with clips so that they can be set in any position and held permanently. When sleeve is at its highest point it shall completely close ventilator.

(4) Ventilators shall be guaranteed against defects in workmanship and material by the manufacturer, who shall agree to replace or repair without charge, f.o.b. factory, any ventilator proving so defective.

(5) Ventilators shall be thoroughly flashed to the roof and be made absolutely watertight.

Glass Top Ventilator—(6) Furnish and install on roof, where shown on drawings, Burt Glass Top Ventilators, as manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio.

(Insert paragraph 2 here.)

(7) Ventilators shall be provided with notched rims as manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio, for holding glass in place so that same can be replaced if necessary without removing ventilators from roof.

(8) Ventilators shall have troughs or lips placed below glass so as to conduct any condensation or moisture that may form to the roof.

(Insert paragraphs 3, 4 and 5 here.)

Double Damper Ventilator for Weaving Rooms—(9) Furnish ventilators for weaving rooms, as shown on drawings, to be provided with double dampers as manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio.

(Insert paragraphs 2, 4 and 5 here.)

Fan Ventilators—(10) Ventilators in, as shown on drawings, shall be Burt Fan Ventilators, provided with 6-blade fan mechanism which can be operated by belt from line shafting, belt from motor or 4-blade fan mechanism operated by direct-connected motor.

Note: 24-in. fan to have 1/4 hp. motor; 30 and 36-in., 1/2 hp. motor;

above 36-in., 1/2 hp. motor; to be standard as furnished by THE BURT MANUFACTURING COMPANY, Akron, Ohio, unless otherwise specified.

(11) Fan ventilators shall be provided with cone dampers, operated by cord or chain and rust resisting pulleys with fusible links which will cause dampers to drop and completely close in case of fire.

(Insert paragraphs 2, 4 and 5 here.)

Sliding Cone Damper Ventilators—(12) Furnish and install on roof, where shown on drawings, Burt Fire Retarding Sliding Cone Damper Ventilators as shown on drawings, and manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio.

(13) These ventilators shall pass the approval of the Underwriters Association of America.

(13a) Ventilator is to have an extra wide wind band as per THE BURT MANUFACTURING COMPANY'S standard for this type. Wind band to be located so as to prevent any entrance of outside wind into the ventilator head, whether up from a sloping roof or any other angle.

(Insert paragraph No. 11, but substitute "cone damper regulators" in place of fan. Follow with paragraphs 2, 4 and 5.)

Ball Bearing Revolving Ventilators—(14) Furnish and install on roof, where shown on drawings, Burt Ball Bearing Revolving Ventilators as manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio.

(15) Ventilators shall be equipped with two sets of hardened steel ball bearings, and shall have open back construction so as to hold ventilators steady with the wind.

(Insert paragraphs 2, 4 and 5 here.)

Note: In order to satisfy people who are not convinced as to our type of bearing, we are prepared to install at no additional charge bronze ball bearings in place of the hardened steel bearings. We do not recommend nor guarantee this type, but will furnish them if specified.

Square and Rectangular Ventilators—(16) Furnish and install on roof where shown on drawings, Burt Square or Rectangular Ventilators as manufactured by THE BURT MANUFACTURING COMPANY, Akron, Ohio. These ventilators shall be equipped with sliding sleeve dampers or common flat dampers, and with glass or metal top.

(Insert paragraphs 2, 4 and 5 here.)

Note: If ventilators are to be constructed from copper, zinc, lead clad sheets or any other metal, insert these words in proper space above.

Liberty Roof Ventilator

The most scientific roof ventilator made and the highest expression of modern ventilating engineering. So ingeniously does it harness and utilize outside air currents that their ventilating action is positive, constant and unfailing, regardless of their direction, angle or velocity.

Upward, downward, horizontal or swirling air currents are all brought under control and made to perform the task in hand—that of drawing heat, vitiated air, fumes, steam, smoke or floating dust up and out of the building.

Positive and Constant Ventilation—The Liberty ventilator is the result of many years of experimentation and tests. It has no moving parts—there is no rattle or wear, and no oiling or other attention is necessary. It requires no mechanical power and does not depend on certain wind direction or velocities—it is always "pointed" for action.

It functions in the slightest zephyr. The poor ventilator stops functioning in low wind velocities—the Liberty continues to function under such conditions long after ordinary ventilators cease.

TRADE-MARK
Reg. 197990

Liberty Ventilator

Black arrows indicate foul air coming from building. White arrows indicate trend of outside air, which causes impingement on ventilator, creating a vacuum, sucking air from main exhaust or eduction tube

*Tests by Massachusetts Institute of Technology and Carnegie Institute of Technology.

Scientifically Designed—The Liberty ventilator utilizes four principles of physical science: (1) air impingement; (2) positive and negative air action, both pressure and vacuum; (3) siphonage; (4) stack action.

Eight vertical blades or fins are attached to the eduction pipe and covered by a frustrum-shaped skirt, forming eight narrowing chambers or tubes. Those on the positive side (facing the wind) act as air catchers; those on the opposite or negative side become siphons. Horizontal and upward air currents are mainly guided, compressed and accelerated through the funnellike chambers, deflected across the pipe opening, and further drawn along by the partial vacuum created in the negative chambers. Downward air currents, cleverly controlled, create a partial vacuum and suction no less effectual. *Back drafts are impossible.*

In this manner and under every conceivable wind condition is developed a continuous, powerful pulling force that assures positive and constant ventilation.

Does Not Depend on Stack Action—The Liberty ventilator is unique in that it utilizes stack action, yet is not in the slightest degree dependent upon it in order to function properly. When stack action (warm air rising) does occur, it simply accelerates this ventilator's pulling power.

In tests made by the Carnegie Institute of Technology, the Liberty ventilator was shown to pull tremendously where the temperature inside the building was actually ten degrees lower than the temperature outside of the building.

The Liberty ventilator has free areas for unobstructed stack action equal to more than 200% of the area of the pipe opening, thus a "no resistant constant" is guaranteed.

Built Right—The Liberty ventilator is staunchly built, weatherproof, and well designed. It is the most practical, efficient, dependable and in the end the most economical roof ventilator for factories, foundries, train sheds, etc. It is also an invaluable auxiliary for mechanical ventilating systems and for correcting faulty drafts in chimney flue stacks.

Sizes—Made in any size desired, of galvanized iron, copper, aluminum or any special metal. Large stocks carried.

More Than 1000 Prominent Users—Write for list.

Pul-Air Roof Ventilator

A mushroom type ventilator that is correctly and substantially built to serve conditions where the use of the Liberty ventilator is unwarranted. Tested by unbiased engineers in competitive tests and declared superior to the common type of ventilator.

Made of any metal desired.

Large stocks for immediate shipment.

Pul-Air Ventilator

Rotary Ventilators—"Air-Pul"

We are prepared to furnish a highly efficient rotary ventilator guaranteed to meet any condition where rotary ventilators are specified.

Call Protected Metal—"Callmet"

Acid, wear and weather resisting metal. A scientifically prepared steel sheet coated so that it is impervious to corrosion, rust, wear and acid. Also soundproof.

Particularly useful for dyehouses, smoke conditions, railroad use, smoke jacks, etc.

Call Protected Metal may be specified in Liberty or Pul-Air ventilators, making a ventilating product to meet severest corrosion conditions and have extreme long life.

PULLMAN VENTILATING ROOF COWLS;
PULLMAN SASH VENTILATORS.

Also, Pullman Window Ventilators; Automatic Fire Retarding Dampers and Bases.

Improved Pullman Ventilating Roof Cowls

Operation—These consist of three cones of the same diameter and arranged one above the other with large storm band surrounding same.

The ventilator is proportioned correctly to take advantage of the area of low pressure produced by the outside wind back of the ventilator and will not intake under any weather conditions and is absolutely storm-proof.

Pullman Cowls are always in position to work.

(Patented)

Improved Pullman Ventilating Roof Cowl Fitted with Automatic Fire Retarding Damper and Base

Specification Data—Improved Pullman Cowls are regularly made of prime galvanized steel sheets of proper gauges and with galvanized iron braces. Can be furnished made of galvanized armco, toncan or cold rolled copper as specified.

Cowls fitted with Pullman Automatic Fire Retarding Dampers and Bases with condensation troughs to carry the water of condensation from the inside of the ventilator to the roof outside.

Reg. U. S.
Pat. Off.

Pullman Sash Ventilators

Description—These consist of two parts, i. e. an inside diffusion box and an outside hood.

The outside hoods are made in two styles which are called "Standard" and "Louvre." The inside box is the same in both cases.

The opening required is cut in the bottom sash rail at the mill where the sash are made, and the ventilators are screwed fast to the sash after the same are in place.

Ventilators are furnished complete with wood screws for mounting.

Specification Data—Standard Pullman Sash Ventilators are regularly made with inside diffusion boxes made of sheet brass with brushed brass finish and lacquered all over.

Fitted with hinged shutters to stay in any position from full open to closed.

Outside hoods, "Standard" and "Louvre," are made of sheet steel and finished in rubber finish black lacquer.

Fitted with 14-mesh copper screen cloth.

Products

"GLOBE" VENTILATING DEVICES:

Roof Ventilators.
Barn Ventilators.
Chimney Caps.
Car Ventilators.
Lamp Jacks.

Metal Top Ventilator

The "Globe" ventilator is made of heavy rust resisting galvanized open hearth copper-bearing steel, cold rolled copper, Armco Iron, or Toncan Metal and it is strongly and rigidly braced with extra heavy steel bars.

In sizes 18 inches and above, the tops and bottoms are made in sections which overlap and are riveted, making them double at each of these points and exceptionally strong ventilators.

Uses—The "Globe" ventilator has been in operation for many years on practically every known type and class of building.

It is removing smoke, steam, fumes, gases, dust, etc., from factories, foundries, steel mills and other

Metal Top "Globe" Ventilator

industrial buildings, and providing for fresh air in school buildings, churches, theaters, barns, etc. It has back of it years of *proved efficiency*.

Information and Estimates—Prices, blue prints, capacities, working model and complete information will be furnished on request.

Shipment—"Globe" ventilators are carried in stock in the leading cities, and immediate shipment can be made from our factory.

Glass Top Ventilator

The "Globe" glass top ventilator possesses all the qualities of the metal top ventilator and is designed to secure the greatest degree of ventilation and the largest area of light.

72	111	80	12	18 & 20	28	4071.5	480.00

The heavier weights of material are placed in bands and collars of ventilators.

Fire-retardant dampers furnished when desired.

*Galvanized iron ventilators only. Prices of copper ventilators on request.

"Globe" Ventilator with Square Base

Ventilator Bases and Dampers

The "Globe" ventilator is furnished with either round or square base when desired, to fit any type of roof construction.

The bases are made of extra heavy rust resisting steel. We would recommend square bases for maximum strength and efficiency.

We furnish the regulation damper or fire retardant damper at a small additional cost.

Chimney Caps

"Globe" chimney caps prevent downward currents in chimneys and increase drafts in sluggish flues.

Effico Fan Equipped Rotary Ball Bearing Roof Ventilators

Construction and Principle of Operation—The Effico rotating cowl exterior is covered by wind propelled blades; interior by suction blades. There are no moving parts. Effico shaft rotates on ball bearings, fitted with clock precision in solidly enclosed dusttight and oil-tight housings, and is flooded in inches of non-freezing oil (furnished by us); no oiling required for years (proven), and the Effico is absolutely noiseless.

Great Air Volume Exhaust at Low Wind—All Efficos will draw considerable air at a 1-mile breeze (an apparent calm) without stack or heat assistance. The 30-in. size will rotate (standing start) at .7-oz. pressure, 1/2-mile breeze. Cowl outlet is over 50% larger than its stack area, which is ample, as no wind enters ventilator to gain the so-called siphonage effect. Suction fan is same size as rotating cowl (note dimension chart). Thus each Effico is equipped with fan over 50% greater in diameter than its stack area. Fan pulls air up stack at even the slowest turning movement and wind blowing across the outlet adds to its efficiency.

Symmetry—The Effico has artistic lines and pleasing appearance. Lowest in height of rotary ventilators by over 50% average. Note dimension chart.

Weatherproofness—The Effico Rotary Ball Bearing Ventilator operates during all kinds of weather—rain, ice, snow or sleet does not affect or hamper its exhausting. No drip pans or bird screens are needed.

Suggested Specifications—The roof ventilators to be of the sizes as shown in plans and are to be constructed of [galvanized steel] [Armco iron] [copper]. They shall be the Effico Rotary Ball Bearing Ventilators as manufactured by the W. F. HIRSCHMAN Co., Inc., Le Roy, N. Y. The bases to be

[square type] [round type] of same gauge metal as the ventilator neck. The ventilator stack to be sufficiently high to elevate the ventilator propelling blades above coping.

Detail of Effico Patented Rotary Ball Bearing Ventilator

Effico Internal Louver Unit Ventilators

The Effico internal louver unit comprises the Effico rotary ball bearing ventilator head constructed with a specially short base, or neck. In this base is built a circular multiple blade louver damper. The damper is carefully balanced and heavily constructed. The blades lap and are fitted in a circular frame. It is adaptable for manual control, but is intended for a thermostatic control system. The roof base is very low, is part of this unit and is supplied with either the square or round base.

The roof base and the ventilator head are connected by means of angle iron companion rings, which give solidity and facilitate the taking down of the ventilator when required. Each ventilator neck has also a tight fitting door to give free access to the louvers and to the operating motor. The operating motor is suspended underneath the damper to a cross brace. The object of the specially low base and the low roof base is to make the entire unit as low to the roof as possible.

Effico Louver Dampers—Made of stretcher leveled sheet steel. The pneumatic damper motor is supplied and installed with these units unless not desired. (Note specifications below.)

Effico Louver Unit—Low height. The Effico louver unit sets very low (note dimensions at right).

Height above Coping—Louver Unit "C" dimension should be above coping.

Effico Rotary Ball Bearing Ventilator Head—The Effico rotary ball bearing ventilator head is already lower in height by 50% than other rotary types of ventilator. By using the construction as outlined above, the entire unit is brought as low to the roof as is permissible to still allow the air free exhausting, and to maintain the outlets above the snowline. By adopting the circular multiple louvers, of which we are the inventors, we can standardize on sizes and build the round louver for considerably less than the square or rectangular styles, many of which we have built in the past years.

By installing same in the neck of the ventilator at our shop, we not only give a perfect fit, but also eliminate all indefiniteness as to the correct location and size of the damper and cut the installing cost to one-quarter. It is also easier to install the operating motor and makes it more accessible. The size of the damper is the full size of the stack, and yet is about 40% smaller in area than those heretofore used in the square or rectangular louver, again reducing the cost considerably. By supplying the contractor with the complete unit the builder is assured of a well designed, uniform and complete apparatus.

Heretofore, the contractor purchased the ventilator from one manufacturer, probably built the roof base himself, and purchased the dampers elsewhere, or even the dampers were supplied and installed by another contractor. This added materially to the cost.

Suggested Specifications—The roof ventilators shall be of the sizes as shown in plans, [square base] [round base] style. Shall be made of [galvanized steel] [Armco iron] [Toncan metal] [copper]. [The pneumatic damper motor to be supplied with these units]. [The pneumatic damper motor to be supplied by the heating and ventilating Contractor]. They shall be the Effico Internal Louver Unit Ventilators as manufactured by the W. F. HIRSCHMAN Co., INC., LeRoy, N. Y.

Effico Ventilator Puttyless Skylight Unit
Patented

Effico Ventilator Puttyless Skylight Unit

Serves the dual purpose of giving real ventilation and allowing daylight into building, with one roof opening. *Weatherproof* at all times. Standard sizes from 3x3 to 6x12 ft. Write for further information.

Design and Construction

Effico products are carefully designed, all parts carefully tested, and manufactured on a production basis—in the most modern ventilator plant in the United States.

Effico Wind Electric Ventilator

Principle of Operation—When the wind is blowing sufficiently to remove the desired amount of air from the building being ventilated, the electric motor is still. Instantly, when the wind turbine moves below a previously determined number of revolutions, the electric motor starts automatically and carries the load. The entire apparatus is noiseless, the motor is of fully enclosed type, will run for six months without oiling, will not heat under constant running, and is designed for normal operating conditions.

Self-contained Unit Construction—The Effico Wind Electric Ventilator comprises the wind turbine, the same type head as described on previous pages, electric motor, fan, and roof base which form a complete exhaust unit. The motor is furnished and installed by us in the ventilator. The Effico Wind Electric Ventilator, like all Effico products, has been fully tested and is guaranteed by us.

When to Use—The Effico Wind Electric Ventilator is the very best roof ventilating apparatus of the W. F. HIRSCHMAN Co., Inc., line. It will successfully ventilate any type of building and is especially desirable for exceedingly difficult installations. For requirements where Effico ventilator heads (wind driven), due to location, are not practical, use the Effico Wind Electric.

Patented
Effico Wind Electric Ventilator

Power Consumption—Efficos of 12 to 24-in. sizes are equipped with 1/30 hp. motor. All Efficos utilize fully all stack assistance (temperature difference between air in room being ventilated and outer air), thus requiring very little power.

Exhaust Capacity—Same as that of Effico Rotary Ball Bearing Ventilators. Note capacity on second preceding pages. This apparatus is adjustable to exhaust various quantities of air within the limits of given sizes and is regularly supplied at capacities of 5 miles per hour wind and 10° temperature difference rating.

Any other capacity can be supplied as the ventilator is adjustable to any constant capacity after installation.

Special Advantages — Besides the regular automatic operation, the motor may also be so connected as to give a maximum exhaust capacity (running full speed) by manual control, thus allowing a great volume of air to be exhausted at will.

Finish—Handsomely painted in red or any desired color and is made of galvanized sheets. Also furnished in copper, monel metal, lead clad, aluminum, Armco iron, or Toncan metal.

Specifications—The roof ventilators to exhaust from—to be the Effico Wind Electric Ventilators as made by the W. F. HIRSCHMAN Co., Inc., Le Roy, N. Y., the sizes to be as shown on the prints. The current for motors is: current—, voltage—, cycle—.

Effico Reliability

Your installation bearing the Effico trade-mark means that you have the highest grade apparatus of its kind installed and that there is no necessity for worry as to expenditure for inspection and maintenance.

Le Roy Internal Louver Unit Ventilator with Inverted Cone

Like the Effico louver unit, the Le Roy Ventilator includes a multiple circular damper, short base with access door, and pneumatic motor. The head and base are connected by means of companion angle rings. The inverted cone assists very much in the free exhausting of air. Its exhaust area through the head is 50% greater than its stack area. The Le Roy Unit is especially desirable for installations where a pressure is maintained in the building.

Capacity and Construction—Le Roy Louver Unit

Ventilators will exhaust as much air via the siphonage principle as any stationary ventilator made. This unit is especially designed to set low on the roof. It is exceedingly substantially built of very heavy sheets.

Cost—For buildings where very low price ventilator is desired and heavy ventilating supply apparatus is required, we highly recommend this unit as there is no expense for installing the air control damper. The damper itself, being circular, is produced at a minimum cost.

Products

"Star" Ventilators: Standard, Fire Retarding, and Glass Top Types.

For "Almetl" Doors and Shutters, see page A878.

Standard "Star" Ventilators

A scientific combination of the injector and siphon principles applied to stationary roof ventilators, which in conjunction with large exhaust outlets protected to defy the elements, gives a maximum of efficiency at a minimum of investment cost.

Furnished with flat glass top when desired by replacing the conical metal top with wire glass. In no way are the exhaust and stormproof qualities affected.

Fire Retarding "Star" Ventilators

Of the same appearance and construction details as the Standard with the addition of a patented gravity damper. A chain connected by a fusible link holds the damper in any position between open and closed; and is arranged to auto-

Closed

Open

Fire Retarding "Star" Ventilator with Automatic Gravity Damper (Patented)

matically drop the damper to a closed position when exposed to a high temperature. This style is particularly recommended for factories, warehouses and buildings where control of heat losses during winter months is desired.

Fire Retarding Skylight "Star" Ventilators

This device is a combination skylight and dampered ventilator. It is provided with annular damper connected to a chain with fusible link. The outstanding feature of this ventilator is the admission of light even though the damper may be in closed position. This type differs somewhat in appearance and construction details from the standard type, is weather-proof and has ample exhaust capacity.

Bases

Bases are regularly made of the same weight material as the ventilator proper. Regulation bases are made square at the bottom, and gradually taper to cylindrical shape at the top. Straight pipe bases furnished when requested. All bases have roof flanges of suitable width. All seams and joints riveted and thoroughly soldered to prevent leakage.

Flat disc counterbalanced dampers, strongly reinforced for rigidity, operated by either cord or chain, also furnished when required. These flat dampers are held on specially designed pivots, made of brass to prevent corrosion.

Exhaust Capacity

Recent comparative tests based on wind action only of roof ventilators conducted at Engineering Experiment Station, Kansas State Agricultural College, developed the "Star" to have a greater average exhaust capacity than any in the following groups of types tested: open pipe, plain stationary, siphoning stationary, and plain rotary, with wind velocities at 4, 6, 8 and 10 miles per hour.

*According to comparative tests made by engineering experiment station, Kansas State Agricultural College.

Prices on copper and other metals will be furnished on application.

Prices on glass top ventilators on application.

Ventilators larger than 50-in. diameter shipped in sections. Discounts on request.

THE IONA VENTILATOR COMPANY, INC.

OFFICE AND WORKS

2821-29 West Dauphin Street, PHILADELPHIA, PA.

BRANCH OFFICE: 709 Sixth Avenue, SAN FRANCISCO, CALIF.

Products

IONA VENTILATORS, Round or Rectangle, with metal or glass tops.

XIT VENTILATORS, Round or Rectangle, metal tops.

XIT AUTOMATIC TEMPERATURE-CONTROLLED DAMPERS.

XIT Ventilators

The super XIT is designed to meet perfectly those cases where the highest possible efficiency is demanded. Its unusually substantial construction is indicated in the illustration below. It is warranted storm proof, and its exceptional efficiency has been repeatedly demonstrated in actual comparative tests with the best ventilators previously available. We believe the XIT to be the most efficient ventilator ever built because it has larger area of vertical exits and a greater total exit area.

Basic Principles of Design—(1) Head 80% greater in diameter than shaft of ventilator. (2) Width of storm band 80% of diameter of shaft and so placed as to exclude external air from ventilator head. (3) Area for air leaving ventilator head (not including bottom opening at head) 75% greater than cross-sectional area of shaft. (4) Principle of action or suction is that of chimney or stack, which is doubled by a second or internal band, thereby making two points of suction which are always to the lee side of ventilator, resulting in greater increased movement of air therefrom.

Increase in velocity of wind over five miles, increases exhaust 8% per mile. Higher inside temperature increases exhaust 1¹/₂% per degree. In elevation over 25 feet, exhaust increase varies as square root of height.

Dampers—Flat, butterfly, skylight, fire retarding or temperature controlled types, with felt edge when desired to be airtight.

Guarantee XIT Ventilators—Our guarantee is of the most substantial character, providing not only against defective materials, but backing our claims for this unusual ventilator to the extent of offering to take back within 60 days of date of purchase at our expense, refund any payments made and bear transportation costs both ways, any XIT ventilator that fails to fulfill what we specify for it at the time of sale. And we make only the simple provision that we have opportunity to be present at a comparative test.

The Iona Ventilator

A standard and successful ventilator for 20 years.

Fire Retarding Damper—Damper used exclusively in this ventilator automatically opens or closes, as desired, in case of fire. It requires no attachment inside of building to hold it in any desired position.

Xit Automatic Temperature-Controlled Dampers

Operation—Xit Automatic Temperature-Controlled Dampers are operated through The Fulton Company's Sylphon Regitherms (which, as used on this damper with patented operating connections, are complete operating units, regulating the temperature at a set point) or they may be locked in open or closed position. It is

obvious that even temperature is desirable in all rooms with varying exposures without loss of heat through improper operation of ventilating controls. This may be accomplished through the use of Xit Automatic Temperature-Controlled Dampers.

Two Systems of Installing Xit Automatic Temperature-Controlled Damper

Explanation—Figure (1) represents joint unit operation from temperature of room, by Xit Automatic Temperature-Controlled Damper (A) with heat flue damper (E) which is operated by sylphon regitherm (D) through connecting rod (C). Air enters room from heat flue (G) and register (F) and is drawn from room through register (L) and duct (K) to loft, and out of building by Xit ventilator (1). Figure (2) represents connection to room through loft flue and ceiling register (I) Xit Automatic Temperature-Controlled Damper (A) connected to sylphon regitherm (J) by operating rod (H) which operates damper from temperature of room, or flue (K) may be used. (B) flange for connecting to roof.

Specifications—Furnish and install Xit Automatic Temperature-Controlled Dampers as made by the IONA VENTILATOR CO., INC., Philadelphia, Pa., and sylphon regitherm with necessary registers and connections.

(2) All damper blades to be made of aluminum with brass connections and ball bearings.

(3) The regitherm shall operate ventilator damper to which it is attached at a variation not to exceed 2° above or below any given point.

Heat Register—The regitherm shall operate ventilator damper and heat regulating damper to which it is attached at a temperature variation not to exceed 4° above or below a given point.

Bases—All bases to be of the box to transformer type and of material not lighter than that of which ventilator is made, with flange of sufficient width to guarantee a watertight connection at roof.

Further Information and Prices—Furnished on request.

KERNCHEN COMPANY

Ventilating Engineers

113 West Washington Street, CHICAGO, ILL.

EASTERN OFFICE—15 Beekman Street, NEW YORK, N. Y.
AGENCIES IN PRINCIPAL CITIES

FACTORY
SOUTH GARY, IND.

Product

"K-S-V's" (KERNCHEN SIPHONAGE VENTILATORS).

"K-S-V's" Are Correct Siphons

The correct siphon is the most powerful pulling force known to this field of ventilation. It not only exhausts, but it pulls terrifically. The siphons harness the lightest air currents, compressing and compelling them to co-act in mightily increasing the suction of air out through the ventilator.

Construction

Simplicity of construction and complete absence of the friction inevitably involved in old-style rotary mechanisms make the "K-S-V" a troubleproof, lasting investment. Free area of outlet over 200% of pipe area. Nothing to choke or hinder. Friction at minimum, exhaust at maximum.

The eduction pipe is cylindrical with V-shaped notches or openings at the top, each covered by a siphon tapered inwardly toward the top, the total of four siphons being covered by a jacket of conical shape, whereby other siphons (four) are formed, greatly increasing the terrific pulling power. In addition, a top construction of two specially designed hoods is used, augmenting considerably the pulling force and making the unit storm proof.

The absence of friction, no revolving mechanism being present, means silent performance, nothing to wear out, nothing flopping around, no maintenance cost. A rotary requires a certain wind energy to swing it around *before it gets ready to ventilate*. The "K-S-V" *uses this wind energy to ventilate*.

Furnished in any size and made of any metal desired such as galvanized steel, Keystone copper steel,

Armco iron, Toncan metal, cold rolled copper, aluminum zinc, monel metal, etc.

Furnished with or without base (see opposite page) damper or condensation arrestor.

Special Ventilation Service

The KERNCHEN COMPANY specializes in ventilation and its engineers are always available, gratis.

Particular attention given to difficult or unusual problems involving great heat as well as temperatures below the freezing point; steam conditions; elimination of condensation, moisture, fumes, gases or smudge, foul or vitiated air, in every type of building or room.

Specifications

Roof ventilators to be "K-S-V's" as manufactured by the KERNCHEN COMPANY, 113 West Washington Street, Chicago, Illinois, in the following sizes (specify sizes by neck diameter and quantity of each size).

Bases are to be "K-S-V's" as manufactured by the KERNCHEN COMPANY, 113 West Washington Street, Chicago, Illinois, and furnished in following types to fit ventilators (specify by type number; see opposite page and give pitch of roof in inches per foot).

Caution—Beware of imitations and infringements; protect yourself by specifying "K-S-V's."

52 "K-S-V's" Installed on This Sawtooth Roof with Pivoted Sash

Where Used

For all buildings and all bad air conditions. A "K-S-V" does the work of three others. Save this cost!

Booklet—"It Pulls"

A postal will bring our latest illustrated booklet, "It Pulls," containing complete information concerning "K-S-V's" (Kernchen Siphonage Ventilators).

Five 42-in. Ordinary Ventilators Replaced by Five 36-in. "K-S-V's"

This is one of hundreds of instances where ordinary ventilators have had to be torn out and replaced by "K-S-V's." But there is *not one* instance we know or ever heard of where "K-S-V's" were replaced by any other kind of ventilator

Official Tests

Nothing is more deceptive than irresponsible, theoretical tests.

Exaggerated performance figures will appear to be justified at times by laboratory tests conducted under conditions which are more favorable than those found in actual service.

It is only when laboratory and *field* tests agree, that the results can be taken as conclusive.

Note particularly the consistent figures in the two accompanying tests by national authorities, one conducted in the laboratory, the other on the Leader Building installation in Cleveland, Ohio.

OFFICIAL TEST OF "K-S-V's" (KERNCHEN SIPHONAGE VENTILATORS) CONDUCTED BY ARMOUR INSTITUTE OF TECHNOLOGY, CHICAGO

SHOWING EXHAUST UNDER DIFFERENT WIND VELOCITIES, AND WHICH SCIENTIFICALLY PROVES THE TERRIFIC PULLING POWER AND 100% TO 300% MORE EFFICIENCY THAN THAT OF OTHER VENTILATORS

DUBUQUE, IOWA

Products

MONITOR SUCTION VENTILATORS.
MONITOR VENTILATING SKYLIGHTS.
KLAUER'S "DOUBLE LOCK SEAM" CONDUCTOR PIPE.

KLAUER'S "HEMD-EDGE" EAVES TROUGH.
KLAUER'S CONDUCTOR FASTENER.

Also Faultless Stationary Ventilators, Spouting Trimmings, "Perfection" Metal Ceilings, Underground Garbage Receivers, Corrugated Culverts, Metal Shingles and Roofing, Sewer Castings, Fireplace Grates, Andirons, Dome Dampers, Portable Electric Welders, Refrigerator Car Heaters, Road Drags, Maintainers, Scarifiers, Highway Snow Removers.

Monitor Suction Ventilators

Highly efficient in design, construction and operating principle. The planar, curvilinear top (a patented feature), increases low pressure area. The top design also adds strength to construction and enhances the appearance. Suitable for either a high or low pressure, gravity or forced exhaust, permitting a free flow of air at all times.

Phantom View of Monitor Suction Ventilator

The storm louvers are stationary; therefore positive, always in the proper position and add to rigidity of construction. Dampers furnished when ordered. Damper operates easily—fits tight when closed—and is not affected by weather elements.

Revolving Device and Bearings—Monitor pivot bearings are designed to meet the demands of ventilator users. The spindle rests on one large tempered steel ball and is guided in an upright position by the cold drawn tubing housing fitted with bronze bushings at upper and lower ends.

The head is counterweighted so that it rests with perfect equilibrium on the tempered steel ball thus reducing friction to a minimum. Years of continuous service do not produce

"Makers of
Good Goods
Since 1870"

excessive wear and increased friction in this pivot device. The bronze bushings and steel shaft will not corrode together. It will function without question, with no attention, adjustment or care of any kind. It is

of importance to the engineer, architect and contractor to know that the ventilator he installs is equipped with a pivot device that will last as long as the ventilator lasts.

Bases—Bases can be furnished to any desired specification. Square bases to set on built-up curbing are recommended.

Materials—All Monitor Suction Ventilators are made of the best materials; all braces are oversize and galvanized. Sheet metal is Keystone copper-bearing steel galvanized.

Workmanship—Each and every Monitor Suction Ventilator is made up complete in our plant and is tested and approved by our engineer and labeled with a serial number.

Salient Points—Those who must make a selection of a ventilator should be guided by the following four general points: (1) quality of material; (2) design; (3) construction; (4) capacity.

Revolving Device and Bearing of Monitor Suction Ventilator

Vertical Section of Monitor Suction Ventilator

SIZES, EXHAUST CAPACITIES, ETC., MONITOR SUCTION VENTILATORS

Exhaust capacity given is the number of cubic feet of air exhausted per minute with wind velocity of 5 miles per hour 20° F. temperature difference, and ventilator head 35 ft. above floor.

Monitor Ventilating Skylights

The Monitor Continuous Ridge Ventilating Skylight is built in the following sizes: 6x24 ft., 7x20 ft., 8x16 ft., 9x14 ft. and 10x12 ft., or multiples (in length) of these sizes. Each section is

Cross Section of Monitor Continuous Ridge Ventilating Skylight

operated separately by rack bars and worm gearing. Skylight is substantially constructed and truss reinforced where necessary.

The illustrations below show the Monitor single unit type of ventilating skylight. These are made in any size not exceeding 6 ft. in width or 10 ft. in length.

Value of Ventilating Skylights—Ventilating skylights perform a service which cannot be equalled with any other type of apparatus. When open for ventilating purposes they set up a circulation of air within a building, allowing large amounts of fresh air to enter and foul and heated air to escape. Top floors of buildings are turned into useful workrooms where production had previously been impossible in hot weather.

The use of this type of skylight is very desirable for packing plants, paper mills, foundries, garages or any building in which maximum light and ventilation are paramount.

Gearing—The gearing in both the single unit and continuous type ventilating skylights is composed of cut semisteel worm wheels and steel worms and semisteel rack bar pinions. The rack bars are of rolled steel, accurately punched and all castings are designed extra heavy. The gearing is easy operating, strong and durable, and easy to install.

Monitor Ventilating Skylight—from above

Monitor Ventilating Skylight—open

Monitor Ventilating Skylight—closed

Klauer's "Double Lock Seam" Conductor Pipe

Eliminates open seam trouble on spouting jobs.

Made in plain and corrugated, round. Illustration shows the ordinary single lock seam and Klauer's "Double Lock Seam" construction.

Single Lock

Double Lock

Ordinary Single Lock Compared with Klauer's "Double Lock" Construction

Klauer's "Hem-Edge" Eaves Trough

Klauer's "Hem-Edge" Eaves Trough is manufactured so as to provide rigidity and consequent strength at the outer edge. The one-piece miter construction is an additional feature.

In the strictly one-piece miter, the bead is unbroken and requires no extra reinforcing clip at corner of bead. This means that there is no loosening due to expansion and contraction. Miter is made of heavy terne plate and then dipped in molten zinc after miter is completely formed, thus giving double protection. One of the strongest and greatest capacity miters made.

A Strictly One-piece Miter

Galvanized by hand dipping in molten zinc after miter is completely formed

Klauer's Conductor Fastener

Made for plain round, corrugated round and square conductor pipe. Wood or brick drives with offset on shank which holds pipe 1 in. from wall. Strong, rigid and neat in appearance. Manufactured of copper, also steel hot galvanized after forming.

Round Conductor Fastener

Square Conductor Fastener

Spouting Materials

We manufacture a complete line of rain carrying equipment, including all trimmings or accessories. This insures uniformity and best quality and warrants the particular builder or architect specifying Klauer for these materials. Line made complete in copper—Horsehead brand zinc—Keystone copper-bearing steel, and commercial galvanized.

For Robertson Skylights, see pages A510-511.

Robertson Ventilator

The successful ventilation of industrial and commercial buildings depends directly on the achievement of correct answers to these fundamental questions:

How many roof ventilators will be needed to ventilate the building effectively and economically?
What should be the *size* of these ventilators?
Just *how* and *where* should the ventilators be installed for best results?

Equipped with an installation of Robertson Ventilators, a building will be ventilated with *maximum* efficiency and at the lowest cost obtainable with such efficiency. For every Robertson Ventilator installation is based on *facts*. Guesswork and rough estimates of ventilator requirements have no place in Robertson Ventilation Engineering.

The services of the Robertson Ventilation Engineering Department are available without cost or obligation to architects, engineers and plant officials. Robertson Ventilation Engineers make a thorough and comprehensive study of each ventilation problem. They get at the facts underlying every particular requirement. They bring to bear

Robertson Ventilator

on each specific problem the *facts* which they have accumulated through years of experience in the ventilation of buildings of almost every type.

Then, after having determined the building's ventilation requirements with scientific accuracy, our engineers specify an installation of Robertson Ventilators that meets each specific need in every respect. A Robertson proposal will call for exactly the size and number of ventilators required for the efficient and economical ventilation of the building. Robertson Engineers specify no more ventilators than are needed and no less.

These are the reasons why a Robertson Ventilator installation—based on facts throughout—can be depended upon to maintain proper air conditions in industrial and commercial buildings at all times, and assures *most ventilation per dollar*.

Structural Features of the Robertson Ventilator

Robertson Ventilator Construction and Advantages

The Robertson Ventilator has an exceptionally powerful exhaust capacity—a superiority which is due primarily to the Robertson *suction band*. This band, scientifically designed as to size, proportions and position, multiplies the displacement or air pulling area of the ventilator more than six times.

Passing winds blowing across the top and bottom of the *suction band* create a partial vacuum in the *ventilator pipe*—a strong, continuous suction which literally pulls foul air, fumes, smoke, steam, etc., out of the building.

The condensed table of capacities below shows the exhaust capacity of Robertson Ventilators of various sizes under the following conditions: wind velocity—8 miles per hour; difference in temperatures of indoor and outdoor air—20° F.; height of ventilators above air intake—50 ft. These figures are dependable. They represent *actual* discharge capacities, not the so-called “rated” capacities which are widely used in connection with roof ventilators and which are, as a rule, merely a matter of estimate.

Enlarged Air Displacement Area

Gives powerful exhaust capacity

Cap and the Louvre Ring

Make the ventilator positively stormproof

Advantages of the Robertson Ventilator lies in the fact that the *cap* and the *louvre ring* render it positively stormproof and make it impossible for downward air currents to enter the ventilator and interfere with its natural discharge.

The *wind baffle* of the Robertson Ventilator is the invention of Robertson Engineers and is to be found on no other ventilators. This feature has solved one of the most difficult problems in roof ventilator design. It positively overcomes the adverse effect of wind currents deflected upward from pitched roofs. Upward air currents entering a ventilator from below seriously interfere with the discharge of air. The Robertson *wind baffle* deflects such air currents, as shown in the illustration, and thus prevents them from entering the ventilator. This is the reason why no other ventilator on the market today can compare with the Robertson Ventilator in efficiency on pitched roofs.

Wind Baffle

(A patented feature)
Produces remarkable efficiency on pitched roofs

CAPACITIES OF ROBERTSON VENTILATORS

Size, in.	Discharge cap. per min., cu. ft.	Size, in.	Discharge cap. per min., cu. ft.

16	898	48	7398
18	1041	54	9341
20	1499	60	11560
24	1848	66	13872
30	2882	72	16646
36	4160	84	22472

**Braces Efficiently Designed,
Placed and Secured Provide
Exceptional Rigidity
and Strength**

The modern tendency is distinctly towards ventilators of the *stationary* type—ventilators with no moving parts that require a perfectly level setting for efficient operation. The Robertson Ventilator is of the *stationary* type. Once erected, it requires no further attention, no adjustments of any kind, no repairs.

**Robertson Ventilator Operates
Efficiently Regardless of
Wind Direction**

Robertson Ventilators are made of Robertson Protected Metal (RPM), copper, galvanized steel, or any other material that may be specified. In cases where ventilators will be exposed to severe corrosive conditions, Robertson Protected Metal is the ideal material.

For ventilators made of Robertson Protected Metal are rust and corrosion proof and never require painting.

Dimensions, Gauges and Weights—As can be seen from the table below, Robertson Ventilators are made in all sizes used in standard practice. You will note, too, that the Robertson Protected Metal or galvanized iron used in each size is of a gauge which assures rigidity, strength and endurance.

Complete erection instructions are forwarded with each ventilator.

The various component parts of the Robertson Ventilator are joined together into a strong, rigidly constructed unit by an efficient system of bracing (as shown in the accompanying illustration and also in the phantom view on opposite page). The ventilator parts are bolted to the braces and held permanently tight by lock washers. The result is a ventilator of exceptional structural strength and rigidity.

**A Ventilator of the Stationary
Type**
No moving parts

Because it is of the *stationary* type—with no moving apparatus to be caught and operated by the wind—and because it presents a uniform surface in all directions, the Robertson Ventilator operates efficiently at all times *regardless of the direction of the wind*.

Robertson Ventilator Bases

Bases can be furnished with Robertson Ventilators to meet the requirements of any kind of roof. The three types diagrammed below are most commonly used. Types 1 and 3 are made to fit roofs of any slope; in ordering specify roof pitch. Type 6 is made to fit over concrete curbs; in ordering give size of opening and curb. Round to square bases are strongest and are shipped unless special construction is ordered.

Typical Robertson Ventilator Bases

Prices and Complete Descriptions

Prices, tables of capacities and complete descriptive data for Robertson Ventilators of all sizes will be sent on request.

Robertson Ventilation Data Book

The 4th Edition (52 pages) of the Robertson Ventilation Data Book contains a wealth of interesting and valuable data on ventilation. So far as we know, it is the first book that has ever been published containing data on ventilation exhaust capacities under every probable combination of severe conditions. An invaluable book for architects, engineers and plant operators. A copy is yours for the asking.

Robertson Protected Metal (RPM)

A metal building material with a steel core, which is fully protected from the most severe weather conditions, smoke, gases, fumes, condensation and all other corrosive influences, by three impervious protective

**Robertson Protected
Metal
(RPM)**

coatings: (1) asphalt, (2) asbestos felt, (3) waterproofing, applied under heat and great pressure. It is made in sheets and bars for use as roofing, siding, downspouts, gutters, general build-

ing trim, skylights and ventilators.

Advantages—RPM sheets are light and easily erected. They are not affected by the corrosive action of acids, fumes, and other destructive conditions. RPM practically eliminates upkeep expense, for it never requires painting and seldom, if ever, needs repairs of any kind. Write for complete descriptive literature and sample of the product.

ROYAL VENTILATOR COMPANY

412 Locust Street
PHILADELPHIA, PA.

Products

Manufacturers of "ROYAL" VENTILATORS of Galvanized Steel, Copper, Toncan Metal, Armco Iron, etc.:

Glass Top Ventilators; Rectangular and Square Ventilators with fire retarding dampers; Smoke Jack and Combination Ventilators; Insectproof and Birdproof Ventilators.

Features of "Royal" Ventilators

Actual tests have developed the necessity of the following parts, in combination, for producing the greatest efficiency in ventilators:

- The inverted cone
- Tapered frustrums
- Identical areas of neck and outlet

The above are standard features, embodied in every "Royal" Ventilator. It is not necessary to specify these in ordering; simply specify "Royal" Double Cone Ventilators—they are made that way.

Construction

In the selection of materials and in the construction the greatest care is taken to maintain the highest standard.

Superior and exclusive constructive features include lapped seams, giving three thicknesses of metal at joints, usually the weakest point. Edgewise braces of malleable iron running the complete length of the ventilator head, wired edges of the deflectors and standing seams in the cones all add strength and durability. The double cone has standing seams and gives two thicknesses of metal instead of one. Made in standard sizes 2 to 96 in.

Operation of the "Royal" Double Cone Ventilator

The "Royal" is so designed that full advantage is taken of the wind to produce additional draft. Complete renewal of air is accomplished under the most difficult and unusual conditions by installing "Royal" Double Cone Ventilators. The many unique and original principles embodied in the design of the "Royal" make it 100% effective and insure positive ventilation under any weather condition. Tapered frustrums deflect the outer air over and under the

edges of the frustrums resulting in a powerful suction in the tube; this means maximum exhausting capacity. Foul gases, etc., will readily pass out even when no wind is blowing. The inverted or bottom cone of the "Royal" avoids the creation of eddies, the outgoing air having free outlet unimpeded by excess friction. The upward moving foul air, etc., strikes the inverted cone and is drawn directly upward and outward. The "Royal" is not affected by down-drafts. It is adaptable to every type of building.

LOUIS S. RYSDON & CO.

Manufacturers of "Rysdon" Exhaust Ventilator

3319 Wallace Street

CHICAGO, ILL.

LICENSED MANUFACTURER: SIOUX FALLS CORRUGATING CO., SIOUX FALLS, S. D.

Rysdon Exhaust Ventilator (Patented)

The Rysdon (Patented) Exhaust Ventilator is rigidly constructed of heavy gauge armco iron, toncan metal or cold rolled copper.

The outer windshield and inner flanges form a flue which creates a vacuum in the ventilator and prevents down-drafts, regardless of the direction or angle of the wind. A freezing sleet, snow storm or driving rain does not impair the efficient operation of the Rysdon Ventilator—it is stationary and weatherproof.

As the Rysdon Ventilator is stationary, there are no moving parts to squeak, rattle, require adjusting, freeze up or wear out. This ventilator is absolutely noiseless. There is nothing to get out of order. There is no operating expense since the Rysdon Ventilator is *always* sucking foul air out—without any loss or cost due to friction—without the original expense or continued operating cost of fans, motors, etc.

Note the Symmetrical Appearance of the Rysdon Ventilator

A Severe Test

While the Strauss Building in Chicago was being erected the air currents were deflected down the chimney of the Illinois Theatre until the natural up-draft of the flue was counteracted. The smoke, which consequently backed into the building, forced the theatre to close for three days until a Rysdon 6-ft. ventilator was installed.

After installation of the Rysdon Ventilator the up-draft in the chimney was increased 20% and the smoke was silently and efficiently sucked out.

Efficiency

As the result of competitive tests conducted by the United States Gypsum Company, we have contracted to supply Rysdon Ventilators on all their buildings.

Specification

All ventilators to be Rysdon (Patented) Ventilators of stationary type, constructed of [galvanized] [copper] rust resisting metal of proper gauge, with all bolts, braces, etc., used in construction of said ventilators to be of rust resisting metal as furnished by LOUIS S. RYSDON & Co., Chicago, Ill.

Rysdon Scientifically Constructed Ventilator—Never a Down-draft

Results of Tests

The table below gives the results of tests conducted by Armour Institute, Chicago, Ill., on June 3, 1924, on Rysdon Ventilator and other well known makes. The official report of these tests, signed by G. F. Gebhardt (per Lynn Davies, Testing Engineer) reads as follows:

"Average barometric reading 29.4 in.

"Average temperature during tests 66° F.

"In addition to the normal tests with the wind blowing horizontally or perpendicular to the axis of the ventilator, No. 1 was tested with the air blowing from

different angles varying from 35° below the horizontal to 90° above—or straight down on the ventilator. From 35° below to 45° above the horizontal the efficiency was only affected by a small amount. At greater angles it was found that the results were considerably affected by the distance between the ventilator and the roof. At 10-in. distance no air movement could be detected, at 15-in. an appreciable up-draft was observed which rapidly increased in value as the distance was made greater. At no time during the tests was there a backdraft."

F. O. SCHOEDINGER

Manufacturer of Rotary Suction Ventilators

COLUMBUS, OHIO

Products

FOSCO ROTARY SUCTION BALL BEARING VENTILATORS; FOSCO SYPHONIC VENTILATORS; FOSCO QUAD LOCK JOINT METAL CEILINGS.

Also "Columbus" Stationary Ventilators; Puttyless Skylights; Underwriters' Tin Clad Fire Doors; Underwriters' Fireproof Metal Windows; Aseptic Metal Hospital and Surgical Furniture.

Fosco Rotary Suction Ball Bearing Ventilators

Description—The Fosco rotary suction ventilator is rigidly constructed from Armco iron or copper and supported by an adequate framework of rust resisting steel and malleable iron.

It is equipped with high grade, high speed hardened steel ball bearings, which are immersed in heavy acid resisting lubricant, fully weatherproofed and easily accessible.

Bronze bearings with highest grade bell metal balls furnished, if desired.

Operation—The Fosco rotary suction ventilator contains the *inner air passage* through which the passing winds and breezes blow with accelerated force, unhampered by conflicting cross currents, causing a pronounced vacuum in the head of the ventilator.

The head of the ventilator is much larger than the stem, allowing the rising foul air to spread out along the horizontal line of the diaphragm, where it is caught by the suction of the swiftly moving air currents discharging from the passage above and carried out.

The diaphragm consists of a smooth, curved galvanized surface, which greatly assists in the free passage of the air, especially at low wind velocities.

The ample vane always holds the mouth of the ventilator away from the wind, making same proof against weather, rain, storm and down-drafts.

As no mechanical power is used, no operating expense results.

Fosco Rotary Suction Ventilator
Mounted on square base

TRADE-MARK

Fosco Syphonic Ventilators

Description—The Fosco Syphonic Ventilator is constructed from Armco iron or copper and is rigidly braced and supported by a framework of rust resisting steel.

The discharge area is amply sufficient to take care of the stem capacity and friction.

The Syphonic embodies features which have been worked out through years of experience and great efficiency has resulted.

Operation—The Syphonic has three large discharge areas. When passing winds and air currents strike the ventilator, an unusual suction is created and large quantities of air are pulled from the three discharge areas.

Fosco Syphonic Ventilator
Mounted on square base

Fosco Quad Lock Joint Metal Ceiling

Description—The Fosco Quad Lock Joint Metal Ceiling has grooves formed on two right angled sides of the panels and tongues on the other two sides.

The nailing is done on projecting flanges of the panels and when panels are slipped together, all panel nails are concealed from view.

These lock joint panels are made on special accurately machined steel dies thus assuring absolute uniformity. Deep and clear stamping is assured by large, powerful draw presses.

Operation—When erecting Quad lock panels the wood furring strips are required 2 ft. apart only, one way of the room. No cross furring or cross nailing necessary.

Joints are tight with this construction, preventing dust from sifting through panels. These ceilings are fire resisting to a very great degree.

Quad Lock Joint Design No. 4934-A

ESTABLISHED 1909

STANDARD VENTILATOR COMPANY

Manufacturers of "Standard" Rotable Ventilators

LEWISBURG, PA.

DISTRIBUTERS IN ALL PRINCIPAL CITIES

MANUFACTURED IN CANADA BY GEO. W. REED CO., LTD., MONTREAL

"Standard" Rotable Ventilator

The "Standard" Rotable Ventilator is built in the form of a cone with a vane hooded opening. The cone shape offers least resistance to the wind and gives a greater ease of balance as the wind does not have a flat surface to strike.

The vane hooded opening keeps the mouth away from the wind. The wind passing the mouth induces a siphon effect causing a continual up-draught.

The operation is noiseless and as there are practically no wearing parts it is almost costless.

PLAN SECTION THROUGH VENTILATOR.

The "Standard" Rotable has been used extensively since 1909, giving complete satisfaction. During this time the manufacturer has been continually experimenting to produce, if possible, greater results and has introduced several new features. The new features, cone-tip suspension, bronze bushings and cross bracing of skirt, have resulted in a highly improved ventilator in the following ways; greater durability, greater efficiency, quieter operation and better balance.

Uses—The ventilators are used by factories, schools, garages, public buildings, poultry houses, dairy barns, etc., to carry off gases, smoke, moisture, steam, vapor, foul air, odors, heat fumes and dust.

Body Material—The "Standard" is made of heavy Armco ingot iron in gauges of Nos. 22, 24 and 26, according to size.

Pivot Point Spindle—The body of the ventilator turns on the simple pivot point spindle. The slightest current of air will move the ventilator.

Cone Tip Suspension—The entire weight of the ventilator body is carried on a concave thrust bearing nested in the apex of the conical body. This bearing turns upon the pivot point of the stationary center spindle.

Bronze Guide Bushings—Bushings are of non-corrosive bronze. They carry no weight and serve only to keep the body vertical under stress. They minimize the friction and reduce the tendency to screech.

Cross Braced Skirt—The skirt of the conical body is provided with cross brace to increase the rigidity. The lower guide bushing is carried in this cross bracing.

Method of Attachment—The "Standard" is made with round sleeve to slip over the permanent base, or exhaust pipe.

Sizes and Siphoning Rates—Made in flue diameter sizes from 4 to 24 in. and siphoning rates of 30 cu. ft. to 1110 cu. ft. as shown in table.

"STANDARD" ROTABLE VENTILATORS

Opening or flue diam., in.	Gauge iron	Weight, lb.	Minimum siphoning rate per min., cu. ft.*	Code word	List Price
4	26	1 1/4	30	Ruddy	\$ 2.20
5	26	1 1/2	50	Rub	2.40
6	26	2 1/2	68	Rotary	2.60
7	26	3	93	Rotate	2.80
8	26	3 1/2	122	Rotula	3.20
9	26	4 1/2	162	Rotund	3.50
10	24	6	201	Rouge	4.20
12	24	8 1/2	272	Round	5.40
14	24	9 1/2	373	Rouse	8.50
16	24	13 1/2	488	Route	12.80
18	24	15	650	Rover	16.50
20	22	20 1/2	804	Royal	21.00
24	22	28	1110	Rope	26.50

*In tests the ventilators invariably show a considerably greater siphoning capacity than the ratings here given. The figures presented here represent the minimum siphoning rate with a wind velocity of 5 miles per hour which is approximately one-half the average wind velocity of the United States.

Products

"SWARTWOUT" ROTARY BALL BEARING VENTILATORS.

Other products manufactured are Hydromatic Steam Traps, Low Pressure Traps, Cast Iron Exhaust Heads, Feed Water Heaters, Sediment Strainers, Industrial Ovens, Steam and Oil Separators, Air Separators.

Swartwout Principle and Operation

Swartwout principle is very simple. It actively compels the flow of air. Rotating on accurately machined ball bearings, the Swartwout Rotary Ball Bearing Ventilator always faces away from the wind; the passing breeze continually creates an active suction above the mouth of the ventilator, thus pulling out a steady flow of used air from the room it is connected to.

The entire area of the opening is always efficient. As it responds to every change in wind direction made possible by perfect bearing, no part of the ventilator is ever inoperative. The wind always blows past, never into, the ventilator.

Swartwout Rotary Ball Bearing Ventilator

Standard Type—Made of rust resisting galvanized Armco Ingot Iron sheets of ample gauge covering a framework of sturdy angle iron, cadmium coated after accurately forming and punching. Built for lasting resistance, it is practically indestructible.

The ventilators are also constructed of copper, lead clad sheets, or zinc, on specification. Bearings on all ventilators are bronze, all large size to insure correct balance, and practically frictionless. No grease or oil is necessary, which is a valuable feature.

Operates easily and effectively. Only one right angle turn is required for air flow, which is accurately controlled by stormproof louvers or dampers operated simultaneously from within by means of rustproof chains over brass pulleys.

Louver-setting device permits setting of the louvers at open or closed positions. Distinctly efficient without sacrificing appearance and on account of its great capacity, fewer Swartwout ventilators are required.

Air-light Type—The standard construction, except for the substitution (on specification) of a full size, strong, wire glass top for the metal top, providing a combination skylight and ventilator. The top, steeply pitched, is self-cleaning. No obstruction of the direct passage of light is possible.

An Analysis of Ventilator Requirements

For those in whose mind there is still some confusion as to the fundamental requirements in the choice of an efficient ventilator, we offer the following:

(1) Gauge of material in regard to relative over-all dimensions and weight.

(2) Quality of material. Select a factory assembled ventilator built to endure, one built of heavy rust resisting galvanized metal or copper sheets with cadmium coated interior bracing, non-corrosive bronze bearings, bell-metal balls.

(3) Completeness. The selection of a ventilator complete with dampers, without additional cost.

(4) Capacity and general design. The years of service given under unusual conditions and the greatest possible capacity consistent with good substantial and practical design must be compared.

(5) Complete, ready for erection.

Testing Ventilators and the Swartwout Ventilator Testing Room for the Use of Architects and Engineers

So many laboratory ventilator tests have been made on identical ventilators in various parts of the country and with such varying results, that we now maintain a testing room, installed under natural conditions, for the testing of ventilators. This room is for the use of architects, engineers and prospective customers.

It is located where the wind has free access to it which avoids unfavorable eddies and uncertain results. It is equipped with the most accurate and reliable instruments obtainable, the measuring instruments being similar to those used in the United States Weather Bureau.

Comparative tests will be made or the reports of various tests of the Swartwout with other ventilators will be given upon application to this company. These tests extend over a considerable length of time and are as accurate as it is possible to make tests of this nature.

Fresh Air Requirements for Various Services

Figures in cubic feet per person per hour from table prepared by Prof. John R. Allen, Department of Mechanical Engineering, University of Michigan:

Workshops and barracks.....	3000
Office rooms.....	1800
Schools.....	2400
Hospitals.....	3600
Churches and theaters.....	2000
Dining rooms.....	1800
Toilets and bathrooms.....	2400

Capacities and Sizes of Swartwout Rotary Ventilators

For capacities, sizes and data on Swartwout ventilators, see detail drawing on following page.

Standard Specifications for Swartwout Ventilators

All ventilators to be of the rotary ball bearing type [metal top] [glass top] of [galvanized] [copper] metal, all interior members of angle iron cadmium coated after forming and punching or stamped from galvanized metal. Ventilators to turn sensitively on accurately machined special hard bronze bearings, employing bell-metal balls, and counterweighted on outside. Ventilators to be equipped with outside louver dampers to throw accumulated dirt outside of building, louver to be operated from within by chains over brass pulleys.

Gauge of metal to be THE SWARTWOUT COMPANY, Cleveland, Ohio, standard, as furnished in Swartwout Rotary Ball Bearing Ventilators at regular prices. Top of collar and bottom of hood to be stiffened with cadmium coated angle iron rings. (If desired, give standard gauge for each size, as shown.)

Note: Specifications and data for both ventilators and

bases will be gladly furnished, on request, in convenient card form to fit your card index.

When specifying, inquiring or ordering, state character and pitch of roof, and whether ventilator will rest on peak or slope of roof.

Determining Proper Ventilator Sizes

The volume of air handled by any roof ventilator is affected by many conditions. Among these conditions are wind velocity, direction of wind, location and sizes of surrounding buildings or other obstructions to free movement of air, inside and outside temperatures, location and size of open windows or doors, and methods of heating.

In planning an installation, it is essential to use a sufficient factor of safety to be certain of complete ventilation at all times. The cost of a few more or larger ventilators is insignificant when compared to the difference between satisfactory and unsatisfactory ventilation. The table in the lower right-hand column is for your guidance in determining ventilator sizes. The actual capacity will, in most cases, be much greater than that shown.

Specifications for Bases

Build each base individually for its job.

Ventilator bases to be of galvanized rust-resisting metal, two gauges heavier than ventilator, according to THE SWARTWOUT COMPANY standard for ventilator bases, and of sizes corresponding to nominal size of ventilators. Collars to be 5 in. high, grooved and riveted to body of base with 1-in. lap and 5-in. spacing. Body of base to be a square-to-round section with opening of the square 4 in. larger than the collar. Bases 18 in. and smaller to be 23 in. high over all, and larger sizes 27 in. high.

All bases to fit roof dimensions accurately with 5-in. flange, bent out, not sharp (if concrete roof, to fit detail shown), and must form an absolutely watertight juncture with the roofing material and be left so on completion. Seams at roofing line can not be allowed, except to fill in corners of base. Top of base to be absolutely level and round.

Note: For capacity, rigidity, tightness, economy, use square bases only.

DIMENSIONS, WEIGHTS AND GAUGES OF SWARTWOUT VENTILATORS

For dimensions, "A," "B," "C," "D," "E," "F," in inches see table below. In ordering, only dimension "A" is required.

INSTALLATION

To insure proper installation and immediate satisfaction, complete directions for mounting are supplied on each ventilator.

The Swartwout Standard Ventilator is constructed of heavy gauge galvanized Armco Ingot Iron. Also copper, lead clad steel or special materials

All joints are double seamed. No bolts used

All interior members cadmium coated after forming and punching

Accurately machined bronze bearings revolving on ball-metal balls. No oiling necessary

Vane keeps ventilator in proper direction to wind, preventing back draft and leakage of snow and rain

Full area opening; no restrictions

Adjustable louver damper with ratchet attachment and chain

VAN NOORDEN VANCO-SYPHON VENTILATORS.

VANCO STEEL DOOR BUCK.

For "Anchor-Bar" Rolled Steel, Puttyless Skylights, see page A513.

Van Noorden Vanco-Syphon Ventilator

The Van Noorden Vanco-Syphon Ventilator is a stationary type roof ventilator. It has an inner cone at the head and a group of scientifically designed syphons around the upper part of shaft. Air currents striking the shaft are sucked into the syphons, and due to the diminishing area of same are compressed so that a rapid syphonage is created. These currents do not enter the shaft. Their movement is up and out, causing a powerful accel-

eration around the mouth of the shaft. Other currents striking the flaring surface of the inner cone, are similarly compressed and cause an up-draft in the center of the shaft.

The Vanco-Syphon Ventilator is stormproof and is equipped with a hinged damper.

Bases—Bases are provided with ventilators only when so required and stated.

Material—Made of sheet copper or genuine galvanized rust-resisting iron.

*CAPACITIES

Size, in.	Cu. ft. exhaust per hr.	Size, in.	Cu. ft. exhaust per hr.	Size, in.	Cu. ft. exhaust per hr.

16	49,062	30	163,421

*Based on an average wind velocity of 5 miles per hour.

Vanco Steel Door Buck

These new, time-saving steel bucks can be handled exactly as though they were wooden bucks. Wood frames and trim can be nailed in the same manner as wood buck. No drilling, tapping or bolting necessary. No shimming of trim.

Another feature is the movable lock anchors and perforated plaster flanges.

They do away with loose frames and wavy plaster lines and, what is very important, they minimize erection labor.

RIESNER VENTILATING BRICK. (Pat. Jan. 5, 1926.)

Riesner Ventilating Brick

Description—A ventilating brick, made of cast iron or bronze with galvanized iron flue, the size of a standard brick, having a louvered face with waterdrip at top and bottom.

Three Types—"Type A" transforms to a 3-in. diameter flue and has a 3-in. brass collar as inside of wall.

"Type B" carries through wall with a 2x8-in. duct and has a register face at inside of wall.

"Type C" transforms to a 6-in. diameter flue and has a 6-in. brass collar at inside of wall.

All types are 13 in. from louvered face to inside of wall. Ventilating bricks required longer or shorter than 13 in. can be made specially.

Construction—Made of cast iron with galvanized iron flue or bronze with copper flue.

Where Used—These ventilating bricks are especially suited for use in kitchens, kitchenettes, pantries, closets, hung ceilings, attics, cellars, mausoleums, bathrooms, utility rooms and clothes closets for schools.

Advantages—Does not take up any room, it is bricked into the wall.

Particularly useful in kitchens to remove gas fumes, steam cooking odors and foul air, where there is no room for vertical vent shafts and bulky ventilators.

When kitchens are properly ventilated and gas fumes, steam and cooking odors removed, the walls do not discolor and kitchens do not require painting as often.

Weatherproof, Durable, Economical—Riesner Ventilating Bricks are absolutely weatherproof by their design, durable because of the material used, and economical—for the first cost is the only cost.

Installation—The ventilating brick is "bricked" into the wall by the mason as the wall goes up, 6 in. below the ceiling line with the louvered face to the outer air and flue or register face in the room.

Specifications—Specify under masonry heading: "Install Ventilating Bricks as manufactured by BENJAMIN RIESNER, INC., 260 East 78th Street, New York, N. Y., in the wall 6 in. below bottom of ceiling beam." (Specify type, where brick is to be installed, and whether cast iron or bronze.)

Prices—"Type A"—Cast iron 13 in. long with 3-in. diameter brass collar, \$5.50 each, net f.o.b. New York, N. Y.

"Type B"—Cast iron 13 in. long with 2x8-in. register face, \$6.50 each, net f.o.b. New York, N. Y.

"Type C"—Cast iron 13 in. long with 6-in. diameter brass collar, \$11.50 each, net f.o.b. New York, N. Y.

Note: Cast bronze prices on application.

SHEET STEEL TRADE EXTENSION COMMITTEE

Use of Sheet Steel for Cornices
Oliver Building, PITTSBURGH, PA.

For List of Supporting Members, see page A796

For Sheet Steel Roofs, see page A440; for Interior Uses of Sheet Steel, see pages A796-797

Advantages

- Easy adaptability to any unusual design.
- Great strength with comparative lightness and lasting safety.
- Life equal to that of the building.
- Lowest first cost and negligible maintenance.
- Incombustible and impervious.

Service

The research and engineering facilities of the SHEET STEEL TRADE EXTENSION COMMITTEE are at the instant service of any architect upon request and without obligation.

Specifications

Complete standard specifications for the fabrication and setting of sheet steel cornices should be found under the A.I.A. file No. 12L2 in your files.

Copies sent free upon request.

By the use of this standard specification the architect can eliminate most of the detail drawings of supporting members and joints and can confine his efforts to the showing of a simple cross section and front elevation, inserting the following short form specification into his general specification:

Short Form Specification for the Fabrication and Setting of Sheet Steel Cornices

General Conditions—The general conditions of the American Institute of Architects, Fourth edition (1925) shall form a part of this specification and contract and all work shall be subject to the provisions thereof.

Work Included—The work included in this contract comprises the furnishing of all materials and all labor, transportation, etc., necessary to fabricate and set all sheet steel cornices in accordance with the contract drawings and these specifications.

Materials and Workmanship—It is hereby mutually understood and agreed by all parties to any agreement arising from the use of this specification that the standard specification for the fabrication and setting of sheet steel cornices as issued by the SHEET STEEL TRADE EXTENSION COMMITTEE shall be and is hereby made a part hereof for the class appropriate to this operation as fully as though recited herein in detail. Copy of said specification is on file in architect's office and may be examined on application or copy thereof can be obtained free of cost from the SHEET STEEL TRADE EXTENSION COMMITTEE, Oliver Building, Pittsburgh, Pa.

BERLOY STEEL CEILINGS and SIDEWALLS in wide variety of attractive designs to harmonize with various styles of architecture and furnishings.

For Floor Cores, see page A108; for Metal Building Material, see pages B1286-1289; for Lockers and Shelving, see pages B2096-2097.

Steel Ceiling Advantages

Briefly stated, the advantages of Berloy Steel Ceilings are beauty, safety, permanence, fire resistance, bacteriological cleanliness and ultimate economy.

Berloy Modern Steel Ceilings

Berloy Ceilings are formed on a draw press under a pressure of 900 tons. This brings out beauty, accuracy and sharpness of detail which can never be secured by the old drop hammer process which has been discontinued in the making of Berloy Ceilings and Sidewalls.

Berloy Designs

Berloy Steel Ceilings are made in beautiful and practical modern designs. These designs are made in wide variety to offer a range of choice for every service.

Berloy Metal Ceiling in Masonic Temple, Wilmington, Ohio

Various types of cornice border and field plates can be combined to form an endless variation of finished effects. Many of the best combinations are clearly illustrated in the big Berloy Catalogue D27 which will be sent to any architect on request to the nearest Berger office.

Berloy Steel Sidewalls

For many uses steel sidewalls are also desirable and a variety of practical and attractive modern Berloy designs are available for the purpose.

Popular Priced Plates

For garages, lofts, basements, factory rooms and similar places where the more artistic designs are not required, Berloy popular priced ceiling and sidewall plates can be used with a considerable economy both in cost of ceiling material and in erection costs.

Details of Erection

Berloy Steel Ceilings can be erected on any supports to which nailing strips can be attached or they can be suspended, if desirable.

The ceilings are furnished with practical working drawing and erection instructions. They go into place without difficulty and workmen experienced in building can erect the ceilings without any special skill or training.

Experienced steel ceiling erectors are, however, available in nearly every city.

All Berloy Ceiling Plates are supplied painted both sides with a good ground coat. Further painting can be in any desired color.

Estimates and Drawings

The corps of experienced Berloy Ceiling Draftsmen are at the service of any architect in planning the use of Berloy Steel Ceilings and Sidewalls, with estimates of cost.

This service is free to architects. Send sketch and exact dimensions of room, state height of ceiling, indicate preference as to style or design of ornamentation desired, with any other information which will assist our ceiling experts in meeting your desires.

Ask for Information

As one of the world's largest manufacturers of steel ceilings, with a wealth of experience in planning

Berloy Ceiling in St. Clement's Church, Minneapolis, Minn.

and erection, we are glad to answer questions, supply information about steel ceilings and send catalogues of designs, etc. Address nearest Berger office.

Steel Ceiling Users

Modern designs and modern methods have combined to make Berloy Ceilings more practical and desirable than ever before, and their use is increasing rapidly. They may be used wherever finished ceilings are desirable.

Following is a list of representative buildings in which Berloy Steel Ceilings have been used:

Regent Hotel, St. Louis, Mo.
American Athletic Club, Chicago, Ill.
Knoxville Power & Light Co., Knoxville, Tenn.
Dance Hall, 308 West 52nd Street, New York, N. Y.
Manhattan State Hospital, Ward's Island, New York, N. Y.
Citizens National Bank, Covington, Ky.
High School, Athens, Ohio
General Motors Corporation, Muncie, Ind.
Plaza Theater, White Sulphur Springs, W. Va.
Kissam Hall, Vanderbilt University, Nashville, Tenn.

Edwards Metal Ceilings and Walls

Metal ceilings are no longer a luxury—they may almost be said to be a necessity. Where formerly they were used almost exclusively in churches, stores, halls and other buildings, they are now extensively used also in private residences.

There are a number of excellent reasons for this growing popularity. From every viewpoint the metal ceiling is the ideal ceiling.

In the first place, it is unusually attractive. With the wide variety of patterns which comprise the Edwards line to choose from, any architectural effect can be obtained.

Nor do the advantages of a metal ceiling end with its beauty and attractiveness. It is economical, the first cost being slight, and, with proper care, no subsequent expense for repairs.

It is the most sanitary and easiest to keep clean of any ceiling; is absolutely proof against fire, moisture and vermin.

Makes the room cool in summer and warm in winter; and eliminates danger from falling plaster.

Edwards Metal Shingles and Metal Spanish Roofing Tile

Are made from best qualityterne plate, furnished painted or "Tightcote" galvanized, also in copper.

Their exceedingly attractive appearance is only one of the numerous advantages which commend them to builders and architects.

They are proof against fire, lightning, rain, snow and wind.

Do not warp or rot as wooden shingles do; and when laid according to the simple directions, will last a lifetime.

All Edwards metal shingles and metal Spanish tile are made with a patented side lock. Their interlocking device permits of a tight interlocking of each shingle or tile with the one lying next to it, so that, when the entire roof is laid, it is practically the same as

one solid sheet of metal, without a crack or crevice anywhere through which a drop of water can seep. Although the seams are absolutely watertight, the lock is so devised as to allow for expansion and contraction

DETAILS OF APPLICATION, EDWARDS METAL CEILING

Furring strips, $\frac{3}{8} \times 1\frac{1}{4}$ in. soft wood, can be applied over old plaster direct to joist or wood ceiling.

of the metal due to heat and cold, and thus there is never any danger of the roof buckling, warping and springing leaks.

Patented Pressed Standing Seam Corrugated Steel Roofing

Edwards patented pressed standing seam corrugated steel roofing is especially adapted for use on structural steel buildings, as will be seen by the accompanying details. This roof has perfectly tight seams and can be applied directly to the purlins without rivets of any kind. Made in Nos. 16 to 28 gage, painted or galvanized.

In the use of this new roofing, a saving of 11% can be effected on side seams alone, and a much tighter side lock is assured. The method of cleating makes the cleats absolutely tight and at the same time allows for vibration. It makes a 50% more water-tight job. It has another advantage in that it can be placed on the roof and worked entirely from above, no scaffolding of any kind being necessary; and an entire roof can be put on without puncturing the sheets in the least, preserving the galvanized coating intact.

While the cost of this material is somewhat more than the regular corrugated sheets, the saving in side laps and application more than makes up for the difference.

This roofing has been applied to a number of large buildings in various parts of the country and is giving absolute satisfaction. One roof, put on 6 years ago, covers a single building requiring over 1000 squares.

AMERICAN ROOF TRUSS COMPANY

WM. H. WADDINGTON, PRESIDENT

Engineers and Constructors of Roof Trusses

5 North La Salle Street
CHICAGO, ILL.

TELEPHONE

FRANKLIN 1720, 1721

Products

Manufacturers and erectors of AMERICAN WOOD BOWSTRING TRUSSES.

Where Used

Public garages, service stations, machine shops, warehouses, schools, banks, gymnasiums, bowling alleys, aeroplane hangars, grandstands, dance halls, and other buildings where clear floor space is needed.

Span and Spacing

Trusses designed for 25 to 135-foot spans. Spacing is usually 16 to 20 feet on centers, depending on length of building.

Height at Center and Ends

The standard height at the center on all spans is one-eighth of the length of the truss. The height of the ends is governed by the size of the lower chord timbers varying from 6 to 12 in. according to span and loading.

Service

Trusses are built on the job by us and erected in place as soon as pilasters are up, completely installed,

ready for the roof joists, anywhere in the United States.

When requested, we can figure on building trusses on the job and buyer can do his own erecting.

Information Required for Estimates

- (1) Number of trusses required.
- (2) Span out to out of walls or center of columns.
- (3) Spacing between trusses.
- (4) Loads. Regular roof load in pounds per square foot. State if any ceiling load. For unusual loading conditions send plan or photostat.
- (5) Address of job, nature of building, owner's and architect's names.

Specifications

Roof trusses shall be American Wood Bowstring trusses furnished by AMERICAN ROOF TRUSS COMPANY, 5 North La Salle Street, Chicago, Illinois.

Literature

Send for illustrated folder and valuable suggestions covering economical layout and brick saving features.

Products and Service

Design, Construction and Erection of LONG SPAN ROOF ARCHES for public garages, auditoriums, convention, exhibition and fair buildings, warehouses, theaters, factories, airplane hangars, gymnasiums, bowling alleys, skating rinks, and all buildings where unobstructed space, maximum light and ventilation are desired.

ARCH ROOF CONSTRUCTION CO., INC., will design the arches, supply all materials and do the erection, or ordinary materials can be supplied and erection done by local contractors.

Construction and Materials

By using straight lengths of the usual structural materials combined with special castings, a practical way has been evolved of applying the arch principle with its beauty and great strength to the economical construction of buildings having spans up to 200 ft. or more, where unobstructed space is desired.

Columns, posts and trusses are eliminated with this construction, and a clear interior giving a maximum amount of light and ventilation obtained.

Strength

Arch roof construction can be of timber or steel or a combination of both. Standard structural shapes and sizes are employed in a patented design with patented castings to produce a roof of unusual strength. It may be fireproof, fire-retarded or non-fireproof.

While designed for ordinary roof loads of 40 lb. per sq. ft., in a test by Columbia University it successfully carried a uniform load of 80 lb. per sq. ft. and then, for an unsymmetrical test, half of the sand on one-half of the arch was removed. This loading was considerably increased when the sand absorbed about 2 in. of rain, and also by the effect of wind at velocities from 48 to 70 miles per hour on this open structure. This test was made while building was in course of construction, unenclosed, with only part of roof in position.

Advantages of Arch Roof Construction

Maximum strength and long life.
Unobstructed light and ventilation.
Sidewalls of brick, wood sheathing, sheet iron, canvas, or folding or rolling doors.
Full use of all floor space.

Economy of material and labor.

Temperature economically warm in winter and cool in summer.

Reduced fire hazards, ease of controlling fires and low insurance rates.

Added dignity, distinction and character to all long span buildings.

Can be dismantled and erected with 100% salvage.

Adaptable to practically every type, style and size of building.

Engineering Service

ARCH ROOF CONSTRUCTION CO., INC., will co-operate with architects, engineers and contractors in planning the most economical and efficient design for particular buildings. A request will bring additional information.

Queens Country Motor Vehicle Dealers' Association Exhibit

Arch roof construction permitted free use of all space for exhibition purposes and provided a place large enough for the complete display

Fig. A. Simplest Type, Built with or Without Sidewalk Overhang
Sidewalls may be replaced by doors, rolling shutters or canvas. Unusually high salvage value

E-Z-BILT MANUFACTURING CO., INC.

Manufacturers of Heavy Mill (Slow Burning) Trusses and Buildings

Hillside Avenue and 175th Street

JAMAICA, N. Y.

FACTORY: SUFFOLK, VA.

Products

HEAVY MILL (SLOW BURNING) TRUSSES.
HEAVY MILL (SLOW BURNING) BUILDINGS.
CONCRETE CAPS AND BASES.

Heavy Mill (Slow Burning) Truss

This is strictly in accordance with the specifications of both the National and the Mutual Fire Insurance Underwriters, and is acceptable to them at as low a rate of insurance in one-story buildings as an unprotected steel truss, and at a lower rate in buildings of two or more stories.

Only long leaf yellow pine in solid timbers is used, none of which measure less than 6 in. in the rough in their narrowest dimension.

All rods, plates and bolts used are in accordance with the current specifications of the American Society for Testing Materials.

All rod verticals are covered with heavy grade asbestos pipe tubing, the rods and nuts at the ends with a coating of plaster, so as to develop the full resistance of the truss.

Low Price—Due to our source of supply, improved machinery, low labor cost, and methods of production, we are in a position to place same on the market at as low a price as a wood truss made of light material.

Shipped Completely Assembled—Where height does not exceed railway carrying facilities, trusses are shipped completely assembled or built up in two or three sections, depending upon the length and quantity ordered, and when shipped in sections all that is necessary is to bolt them together on the job.

Where height necessitates knocked down shipments all members are marked numerically, in which case the detailed erection drawings furnished by us are marked with corresponding numbers, so that the assembling on the ground is simplicity itself.

All knocked down trusses are assembled at our factory prior to shipment.

Sizes—We manufacture all spans from 25 to 125 ft.

Quotations—In writing us for quotations kindly give us the following information:

Number of trusses needed.
Spacing between trusses.
Regular roof loads in pounds per square foot.
Distance out-to-out walls.
Ceiling loads or special loads.

Heavy Mill (Slow Burning) Buildings

We can furnish at a great saving in price any type or size wood frame building of Heavy Mill or ordinary type construction either from your plan or from one prepared by us.

We are in a low price labor market and fabricate and prepare all our material with the most modern machinery and methods. The same methods are employed with wood as are used by steel fabricators.

We save on freight, as buildings are cut to size, shape and fit complete, ready to erect. You pay freight on actual material used, not on waste also.

E-Z-Bilt buildings can be erected by unskilled labor, in accordance with detailed erection plans, which we furnish with every building.

Concrete Caps and Bases

Precast, reinforced concrete caps and bases to support any weight.

THE MACOMBER STEEL COMPANY

Manufacturers of Standardized Steel Roof Trusses

1929 Tenth Street, N. E.
CANTON, OHIO

Products

MASSILLON STEEL ROOF TRUSSES.

Also Massillon Reinforcing Trusses and Steel Forms, Bank Vault Reinforcing, Metal Lath, Steel Windows and Doors.

For Massillon Bar Joists and Massillon Light Joists, see pages A574-575.

Massillon Purlins, Monitors and Columns

Massillon Bar Joist Purlins are standardized and provide an economical construction for carrying concrete roof decking on metal lath. Massillon Light Joist Purlins with wood nailer affixed are standardized for economically supporting wood sheathing or other light roof decking.

Massillon Monitor Frames are standardized for both types of trusses and adapted to the standard steel window openings.

Massillon "H" Columns are standardized with caps and bases for the usual single story building. These are fabricated from Bethlehem "H" sections. Such additional structural steel as may be required can be fabricated and shipped complete with the trusses.

When the above Massillon products are specified all erection plans are prepared by our engineers and the material is consolidated in one shipment. This consolidation speeds up the erection of the building and reduces cost.

Massillon Steel Roof Trusses

Massillon Trusses are standardized in both the curve chord (bow string) and hip ("A" frame) types. Each truss is built up of heavy single angle sections and electric arc-welded to heavy gusset plates and bearing angles at the ends.

Curve Chord Type

"A" Frame Type

Standard structural angles and plates with 1/4-in. minimum thickness of metal are used throughout. Special trusses are built with double angle sections for certain special load conditions.

Trusses Used with Structural Steel Frame

Where Used—These trusses are used for roof supports where clear open floor space without supporting columns or walls is required. They are used primarily over gymnasiums, auditoriums, assembly rooms, dance floors, and in garages, industrial and commercial buildings.

Standardized Features—A complete series of trusses is standardized for both light roof decking, such as wood sheathing, and for heavy roof decking, such as fireproof concrete slab on metal lath construction, providing a maximum efficiency for all load conditions. Standard bracing is provided for each truss for different center-to-center spacing of trusses. Wall anchors are standardized for anchorage in masonry supports. Standard punching is provided in the top chords for all types of purlin construction. Standard punching is provided for truss bracing, for anchoring trusses to supports, and for attaching standard monitor frames when used.

Through standardization each truss is suitable for a range of spans. This enables us to produce the highest quality product at a moderate cost and keep trusses in stock for prompt shipment for all normal span and load requirements.

Designing Features—Published safe loading tables permit the architect and engineer to select and lay out Massillon Trusses for his particular building. The trusses are used with or without suspended ceilings. They are adaptable for carrying concentrated loads such as balconies, trolley beams, etc. They allow the architect complete freedom for designing the building for its particular purpose.

The use of Massillon Standardized Trusses eliminates the preparations of individual shop drawings for approval. Erection plans are rapidly prepared from the architect's general plans and easily checked. This materially speeds up the shipment of trusses and completion of the building.

Construction Features

Many trusses are sold in smaller towns where erection facilities are limited. Massillon Trusses are specially designed for ease in handling and erecting with labor that is available in all parts of the country. The longer trusses are shipped in two sections with provision for splicing in the field. All field connections are made with turned bolts carefully fitted.

Trusses Bearing on Steel Columns and Wall

Roof Truss Specifications

The trusses shall be Massillon Steel Roof Trusses as manufactured by THE MACOMBER STEEL COMPANY at Canton, Ohio. All truss members shall be standard structural steel shapes proportioned to carry stresses at designed full load in accordance with the American Institute of Steel Construction specifications. No metal less than 1/4 in. thick shall be used.

All shop connections shall be electric arc-welded and designed with a factor of safety of five on their ultimate strength. A minimum weld of 4 in. shall be provided for each connection. All connections shall be shop tested to twice the stress developed in the design for full load conditions. Where trusses are shipped in sections for assembling in the field, all field connections shall be made with turned bolts with holes reamed to a neat fit.

Trusses shall be braced with Massillon standard bracing as designed for specified load, span, and center-to-center spacing of trusses. Trusses shall be punched for attaching purlin construction as shown on the general plan.

Trusses shall be painted with one shop coat of aluminum paint prepared from pure aluminum, ground to a fine powder and applied with proper fluid vehicle.

Scope of Service

The Massillon Roof Truss Pamphlet will be mailed to architects and engineers upon request. The sales representatives of THE MACOMBER STEEL COMPANY offer a complete engineering service in the use of Massillon products. Offices located in all principal cities.

NEW YORK TERRITORY: LAMELLA ROOF Co., 47 West 45th Street, NEW YORK, N. Y.

Lamella Roof Construction

The Lamella unit system of roof construction has been developed to meet the widespread demand for a simple and reliable type of long span roof construction, which can be built at a reasonable price. It is especially suitable for garages, theaters, exhibition and fair buildings, churches, hangars, armories, and similar enclosures where high clearance or large areas of uninterrupted floor space must be housed. Within the last five years over 12,000,000 sq. ft. of Lamella roof has been constructed. Single spans run as wide as 130 ft. and in any length desired.

Lamella Unit

The Lamella unit is an especially designed timber unit, with beveled ends, bored for bolted connections, and a top curve to suit the radius of the finished roof.

Fig. 1. Lamella Unit

Material

The quality of lumber used for Lamellas is No. 1 common. The strength and the price of the lumber control the kind to be selected, such as long leaf yellow pine, short leaf yellow pine, Douglas fir (Oregon pine) and others. The Lamellas can be manufactured at any planing mill equipped with a circular saw, a band saw and a boring machine.

Assembly

These units are assembled by bolting together, using standard machine bolts and nuts and special washers. It will be observed that lateral shrinkage of the timber after erection has no effect on the alignment of the joints. A netlike construction results, which may be developed into four principal types of arch roofs as follows:

(a) *The Flat Segmental Arch Roof, Fig. 2*, the thrust of which is taken up by tie rods. This is used largely for garages, factories, car barns, hangars and various kinds of industrial buildings. The rise of the arch is about one-sixth of its span.

Fig. 2. Flat Segmental Arch Roof

(b) *The Segmental Arch Roof*, the thrust of which is taken up by buttresses, concrete piers or wooden bents (Fig. 3). This is especially suitable for warehouses and exhibition buildings.

Fig. 3. Segmental Arch Roof

Fig. 4. Gothic Arch

(c) *The Gothic Arch* (in Fig. 4), especially suitable for churches, residences, barns and such warehouses where goods are stored in bulk, such as grain, ore, etc. The Lamella roof construction may start at the ground.

(d) *The Broach or Circular Roof*, used principally for exhibition buildings where a particular architectural design is desired.

Economy

Lamella construction is built up from short length timber which can easily be obtained and handled. Due to its unique arrangement it takes care of all engineering requirements in an ingenious but simple manner. On account of its highly standardized nature the erection itself is merely an assembly proposition. All these factors co-operate in reducing the costs and inaccuracies of erection.

Safety

Accidental damage to Lamella members can readily be repaired, and even if units are destroyed the stresses will be carried by the surrounding network. The great flexibility of the system results in a particularly tenacious and enduring structure, which will absorb and distribute severe concentrations of loading.

A Lamella Roof That Came Through the Florida Hurricane Unharmful

E. E. Norwood Dance Hall, Miami, 3 days after September, 1926, hurricane. Although the storm blew in the front windows and thereby had free access below the roof, the Lamella construction remained intact

Church with Gothic Lamella Roof

Safe Loads

The safe loading of Lamella systems has been very carefully worked out, checked and confirmed by tests and practical construction throughout the United States and abroad. Any licensee of the company will make recommendations as to sizes and types of construction for any loading at any factor of safety. Extremely high wind loading may be carried and we have built structures carrying a 6-ft. snow load.

Fire Resisting Qualities

In Lamella construction there are no trusses, girders or columns to carry fire from the floor and distribute it along the roof. There are no trusses or ribs under concentrated load, the failure of which by fire might cause the collapse of the entire structure. The load carrying members are spread over a great area and are correspondingly hard to destroy.

Architectural Qualities

Lamella roofs allow a maximum utilization of the enclosed space. Distribution of light is not impeded by purlins and trusses. When sheathed on both sides a remarkable insulating quality results, as the air spaces are small in area and entirely separated, preventing the excessive heat transfer in the long channels between double sheathed purlins and joists.

Lamella Roof for Breakfast Club, Los Angeles, Cal.

Lamella roofs are symmetrical and of sweeping graceful design. They lend themselves to a wide range of architectural treatment.

Salvage Value

Unit construction of this type has unexcelled salvage value. Temporary buildings may be dismantled and re-erected with a minimum of loss—an unusual and most valuable feature for timber construction.

Data Required for Estimates

- (1) Type of roof (a, b, c, or d).
- (2) Outside measurements of building and exact information in case building is not rectangular.
- (3) Height of springing line above ground or upper floor and rise of arch desired.
- (4) Loading required in pounds per square foot; give required live and dead roof load (exclusive of Lamella construction); ceiling load if any. If roof carries any concentrated loads such as balconies or cranes, submit plans.
- (5) Sizes and locations of skylights.
- (6) Location of job.
- (7) For roofs *without* tie rods (Type b, c, and d) give the following additional information:
 - (a) Kind of supports (buttresses, wooden or steel bents).
 - (b) Height, width and spacing of supports.
 - (c) Bearing capacity of soil and whether building is on property line.

Specifications

Roof construction shall be "Lamella Roof" to be built and erected or furnished by the LAMELLA ROOF SYNDICATE, INC., 45 West 45th Street, New York, N. Y., or its licensed agencies.

Engineering Service

Our engineers will gladly co-operate with architects in securing an efficient and economical layout.

Literature

Write for pamphlets and illustrations describing buildings erected on the Lamella system.

McKEOWN BROS. COMPANY, INC.

Manufacturers of Wood Trusses

21 East 40th Street
NEW YORK, N. Y.
TELEPHONE, LEXINGTON 10040

5235 So. Keeler Avenue
CHICAGO, ILL.
TELEPHONE, LAFAYETTE 2985

Products

Manufacturers and contractors for roof trusses of wood for all types of buildings, such as: Garages, Machine Shops, Factories, Aeroplane Hangars, Warehouses, Riding Rings, Banks, Stores, Gymnasiums, and Churches.

Experience and Facilities

McKEOWN BROS. COMPANY, INC., is, so far as known, the largest manufacturer and erector of wood roof trusses in the United States. They have been in operation continuously since 1894 and are the pioneers

McKeown "Lattis-Truss" Construction

Lattis Trusses are built of material having a minimum thickness of two inches, thoroughly nailed and bolted to transfer the stresses. An actual loading test, conducted under the supervision of New York City Building Departments, proved its great carrying capacity and substantiated the theory of its design.

This truss, because of its interlacing system of web members, is highly applicable for carrying unknown concentrated loads

in the construction and manufacture of circular upper chord roof trusses.

A modern wood-working plant with latest machinery is maintained at Chicago for the manufacture of "Factory Built" Bowstring trusses and timber trusses of all types.

Our equipment includes special machinery (patented) for gluing laminated timbers to any curvature.

McKeown Bowstring Trusses (System of Webbing Optional)

Bowstring trusses are built of material having a minimum thickness of three inches. All stresses are transmitted through bolted connections. Web members have solid sections.

"Factory Built" Bowstring trusses are fabricated complete in Chicago and shipped knocked-down for easy handling and assembly on the job. The pieces that form the upper chord of the "Factory Built" Bowstring trusses are glued together with waterproof glue, nailed and bolted and the upper chord is independent of the web members for strength and curvature

Data Required for Estimates

Estimates upon Standard Lattis trusses, Standard Bowstring trusses or "Factory Built" Bowstring trusses, will be gladly furnished and without obligation, upon receipt of the following information:

- (1) Outside width of building, thickness of walls and number of trusses required.
- (2) Spacing of trusses.
- (3) Loading required in pounds per square foot; give required live and dead roof load, ceiling load if any.
- (4) If trusses carry any concentrated loads such as balconies or cranes, estimates cannot be given unless plans are submitted.
- (5) Estimates upon Hammer-beam trusses with Gothic Arch, or timber trusses of any type cannot be furnished unless plans or pencil sketches are submitted.

**Crescent Truss**

Crescent trusses have a curved lower chord and can be furnished with either a lattis or Bowstring system of webbing. This type of truss is highly applicable for dance halls, or auditoriums where it is desirable of getting away from the ordinary flat ceiling effect.

756 East 29th Street
LOS ANGELES, CAL.
TELEPHONE, HUMBOLDT 8174

Products

Manufacturers and erectors of Wood Roof Trusses.

Wood Roof Trusses

Spans designed from 30 to 125 ft. in accordance with best standard engineering practice and to comply with various local ordinances.

Trusses can be erected at the building site anywhere. No delays due to inability in obtaining materials; local lumber yards carry in stock all sizes of materials used in the construction of this truss.

Information Required for Estimates

In requesting quotations the following information is necessary:

(1) Number of trusses required. (2) Span out-to-out of building walls. (3) Spacing of trusses. (4) Loads: roof, ceiling or special loadings. (5) Location of building, name of architect and owner's name.

Service

Estimates and details furnished on request.

It is suggested that architects avail themselves of our engineering service in any design calling for special types of roof trusses.

Summerbell Wood Roof Truss

Large solid section web members spaced far apart assure maximum light distribution. Heavy laminated top chord and bottom chord of two large solid sections reduce fire hazard. Note that the arch of the top chord is uniform from end to end and that there are no sharp breaks which cause rain to carry gravel to the gutters, or allow tar melted by the sun to run down

End Details

Section Standard Summerbell "Rigid-roof" Construction

Summerbell trusses save several courses of brick wall on all sides of the building in addition to making a rigid roof

Section of Ordinary Construction

Roof joists set on top of top chord. Trusses of this type can be furnished, if desired

BATES EXPANDED STEEL TRUSS CO.

Bates-Truss Joists
EAST CHICAGO, IND.

Product

BATES-TRUSS EXPANDED STEEL JOISTS.

Description

The Bates-Truss Joist is an expanded one-piece steel truss. In the expansion process, no material is cut from the web of the original section; the web is simply slitted and expanded. The expansion process transforms the web of the I-beam section into an open lattice truss web. The act of expanding increases the depth of the beam and materially increases its strength.

The Bates-Truss Joist functions as a steel truss. Its properties are readily calculable by standard for-

mulae. Its strength is uniform. The process of manufacture automatically tests every joist for any possible defect in either material or workmanship. The human equation is eliminated.

Advantages

The Bates-Truss Joist lends itself readily to all types of joist floor construction. The open web of the expanded truss is an obvious advantage over a solid web, because it permits piping to be run easily through the joists.

The Bates-Truss expanded joist is a one-piece steel truss—neither rivets nor welds are relied upon in stress of shear or tension.

The Bates-Truss expanded joist is without appreciable eccentric stresses, as the centers of gravity of the diagonal members intersect at a point practically on the centers of gravity of the chord members.

Bates-Truss Joist—
A Sound Engineering Product—
One-piece Dependability

Specifications

General Description—The system of floor construction will use Bates-Truss Joists of the sizes detailed. The joists shall be placed parallel to each other on spacings as detailed, and shall be supported at their ends on either structural beams or on masonry. Concrete shall be poured over the joists to form a slab inches thick, supported by (either mesh lath or forms) . Diamond mesh lath is to be attached to the ceiling side of the joists, and inches of ceiling plaster applied.

Bates-Truss Joists—The joists shall conform to the standards established by the BATES EXPANDED STEEL TRUSS CO. and shall be made from structural grade steel expanded. All joists are to be of sizes specified on the plans. Where the sizes of the joists are not indicated, they shall be in accordance with the manufacturer's tables of safe loads.

Bearings—At least 4 inches of bearing shall be provided where the joists rest on masonry, and at least 3 inches of bearing shall be provided where the joists rest on steel supports.

Bridging—Bridging wire is to be placed at suitable intervals in the length of the joists. The wire is to be secured to the flanges of the joists, connecting each joist to its adjacent joist by a system of crisscross bracing. The end joists of each panel are to be suitably side anchored to the structural steel member or masonry.

Steel Lath—The steel lath for the floor shall be ... (plain or rib) ...

lath weighing pounds per square yard. The steel lath for the ceiling shall be (plain or rib, depth of rib) weighing pounds per square yard. The lath is to be securely fastened to the joists with Bates lath clips. Rib lath is to be attached with the ribs up.

Temperature Rods—Temperature rods inches in diameter are to be placed on inch centers.

Note: The use of temperature rods or mesh reinforcing is not universally specified. It is, however, a valuable insurance in certain types of floor finishes to prevent cracks due to expansion and contraction.

Nailing Strips—Where wood floors are called for over the concrete, screed or nailing strips shall be embedded in the concrete slab. The nailing strips shall be 2 in. wide by 1 in. deep (or of greater depth) and shall be held in position by screed chairs, or by other suitable means, while the concrete is being poured. Screed strips shall be run (preferably at right angles) to the joists on inch spacings.

Concrete—Concrete for the floor slabs shall be (usually 1) part cement, (usually 2) parts sand and (usually 4) parts gravel. A comparatively dry mix is recommended to minimize dripping.

Loading Tables

Complete loading tables for Bates-Truss Joists are included in the Bates-Truss Joist general catalogue. The tables are prepared in both 16,000 and 18,000-pound stress values.

CONCRETE STEEL COMPANY

Havemeyer Truss

42 Broadway, NEW YORK, N. Y.

For Sales Offices, Warehouses and Fabricating Works, see page A125

For Havemeyer Concrete Reinforcement Bars, Devices, etc., see pages A125-127

Havemeyer Truss

The Havemeyer Truss is a scientifically designed truss, of the Pratt type, electrically arc-welded, and when used in connection with a concrete floor slab and metal lath ceiling, makes an economical fireproof construction which can be erected quickly and requires no form work.

General Description

Havemeyer Trusses are made up of five bars, four being chord members and one being used as a web member. The top and bottom chords are made of two Havemeyer Bars each, as this section has been found by actual test to be peculiarly well adapted for arc-welding. The web member is composed of a plain, round bar. These five bars are formed in the shape of a Pratt truss and electrically arc-welded at all intersections. The ends of the truss are connected by welding to a tee section, which acts as a bearing plate for the truss. Actual tests made have shown that the Pratt type of truss is particularly well adapted for this construction. Special attention has been given to the design and arrangement of end web members, which are so arranged as to provide for additional stresses at that point—the result of extensive laboratory tests.

The holes in the web of the Tee at each end provide best means of anchorage when used on masonry or concrete walls.

All steel used is made from highest quality open hearth structural grade steel, with a minimum ultimate tensile strength of 55,000 lb. All welds are carefully made by experienced welders and a rigid system of inspection and testing insures a uniform product. All trusses are dipped in black paint before shipment, the paint used containing no volatile driers, such as gasoline or naphtha.

General Use of Trusses

Havemeyer Trusses can be used economically on many different types of buildings. Where a building is erected of structural steel columns and girders, trusses are used in forming the slab. As these trusses are very simple to erect and are placed on top of the beams or girders, no extra fabricating is necessary. Havemeyer Trusses are also

used on structural concrete buildings for carrying the floor slabs, the columns and girders being reinforced concrete. They are used on residence work and are particularly recommended for the first floor even if the house is to be built of frame, and when properly put in place in connection with concrete slabs, they form an effective fire-stop for fires originating in the basement or cellar. The trusses are particularly suited for use in such buildings as hospitals, schools, apartment houses, hotels, institutions, garages, etc., built for light loads.

Havemeyer Trusses, with open webs, allow space for running pipes, electrical conduits, etc. This has been found of great advantage in most types of buildings.

These trusses are made to fit all spans from 4 to 31 ft.

Where a truss is laid on steel beams or girders, a clip is driven over the end of the truss and the upper flange of the structural support to hold the truss firmly in place.

A metal lath ceiling can be readily attached to the underside of the truss.

Metal Lath and Specialties

In making bids, our estimate includes furnishing of trusses, rib lath for floor slabs, ceiling brackets, anchors, clips for fastening trusses to girders in the case of steel buildings, sleeper clips, lath wedges, and annealed wire for bridging, also metal lath for ceilings when it is required.

Where small openings are required in the floor, we furnish headers which are easily attached and form a simple method of providing for these conditions.

Engineering Service

CONCRETE STEEL COMPANY maintains at all its district offices experienced engineers who will be pleased to co-operate with architects, engineers or contractors in planning the uses of Havemeyer Trusses. Estimates will be gladly furnished, and where an order is placed with us, complete erection details and full information will be given to the contractor.

Havemeyer Trusses are made in standard units and are carried in stock at our factory in Akron, Ohio, ready for prompt shipment.

Catalogue and Descriptive Literature

Our catalogue and descriptive literature is available to all architects, builders and owners and will be cheerfully sent on request.

construction in all types of light occupancy buildings. They are adaptable to either wood or concrete flooring and insure practical fireproof construction without the delays coincident with reinforced concrete construction. Constructed from standard rolled steel sections, they are really steel trusses in miniature. They weigh approximately only half as much per foot as wooden joists of equal strength. Top chord of specially designed section affords maximum rigidity both vertically and horizontally.

Advantages of Use

Their advantages of usage, aside from their natural reduction of fire hazard, lie in their strength and the ease, speed and economy with which they can be installed. Framing of openings is properly taken care of. Individual joist capacity warrants a comparatively wide spacing which gives economy in installation of plumbing, heating and electrical work. No cutting is necessary. Plaster cracks due to wood joist shrinkage are entirely eliminated.

Sizes and Capacities

Gabriel joists are furnished in two types: Type "W" joist for use with wood floors, Type "C" joist for use with concrete floors. Gabriel Type "W" joists have a capacity of from 100 to 130 lb. per ft. of joist. Gabriel Type "C" joists, 170 to 200 lb. per ft. of joist. Variations in length of both "W" and "C" type joists are closely graded. A bearing plate is attached to all joists.

In design a complete analysis of all main and secondary stresses has been made. In the case of each joist, all stresses in every joist member have been carefully computed by analytical methods, and checked by graphical solution. We will gladly send loading tables upon request.

can be applied as a soundproofing and dustproofing subfloor and subflooring nailed through this into the nailing strip. Finish floor is nailed in the usual way. For fireproof construction we recommend laying a non-combustible plaster board on top of joists before laying wooden floor.

When structural floor is to be concrete, the Gabriel "C" Type joist should be used. For reinforcing the usual concrete slab, we recommend the use of a non-sagging metal lath. An important feature of the Gabriel joist is the ease and economy in attaching this lath rigidly to the steel joist. Ceiling lath can be attached very easily to either the "W" or "C" type joists.

Pipe and Conduit Installations

Because of the design of the top cord member, it has been possible to provide a relatively large spacing of panel points and give ample space for the installation of pipes, conduit, etc., concealed between the floor and the ceiling. The illustrations below show this factor clearly.

Erection Drawings

A steel joist layout showing location and mark of all joists is made by our engineering department. In preparing architectural or structural drawings, it is only necessary to specify the type of Gabriel joist required and the center to center spacing. The Gabriel nomenclature gives the depth of the joist, the type of joist and the over-all length. Mark numbers simplify the spotting and placing of joists on the job. Indestructible metal tags upon which the mark is clearly stamped are attached to every joist.

Shipping

Gabriel joists are always carefully loaded and securely braced against movement in transit. The number of joists, joist mark and over-all length are carefully checked. Every care is taken to insure joists being delivered to the building site in perfect condition.

Application and Advantages of Gabriel Joists

Left is shown wooden floor being applied to Gabriel "W" Type joists.

Upper and lower illustrations show how easily conduit and pipes can be installed

THE MACOMBER STEEL COMPANY

Manufacturers of Standardized Bar Joists and Light Joists

1929 Tenth Street, N. E.
CANTON, OHIO

Products

MASSILLON BAR JOISTS.
MASSILLON LIGHT JOISTS.
Also Fabricated Structural Steel and Steel Reinforcing.
For Massillon Steel Roof Trusses, see page A565.

Massillon Bar Joists

Each joist is a rugged, shop-fabricated, structural unit built up from two round top bars, two round bottom bars and an interconnecting web bar. They are solidly arc welded to bearing and vertical plates at the ends.

The use of round steel bars furnishes a perfect welding surface at all connections, insuring a solid

structural unit. No bars less than $\frac{3}{8}$ in. in diameter are used. No metal less than $\frac{1}{4}$ in. thick is used, insuring permanence and strength. The open web construction produces economy and convenience in the installation of piping.

Each joist is standardized and suitable for a variation in spans. A complete series of joists is provided for efficiently carrying all loads for spans from 4 ft. to 30 ft. 6 in.

Where Used—Massillon Bar Joists are used for building fireproof floors (and roofs) for the most rigid fireproof require-

ments. They are specified by foremost architects for their finest buildings and approved by practically all city building departments. Standardized for any sizes or shape floor panels, they are used in all types of buildings.

Typical Floor (or Roof) Construction—The joists are placed on masonry walls, steel or concrete beams in the same manner as other joists. The center of gravity of the joist is below the points of support. They rest in their natural position.

The joists are covered with rib lath fastened to the top bars of the joists. A concrete slab poured on the metal lath serves as a base for the finished floor surface. This floor finish may be wood, terrazzo, tile, cement or any other surface.

Wood floors are nailed to wooden nailing strips embedded in the concrete slab. Conduits and piping are run through as well as parallel to the joists. Ceiling below the joists is finished by applying plaster on metal lath attached to the bottom bars of the joists.

Standard Features—Standard joists cover the complete range of spans from 4 ft. to 30 ft. 6 in. All joists of each size are uniform and identical in dimensions. The distance from the top of the top bars to the bottom of the bearing plates is a uniform depth of $2\frac{1}{2}$ in.

All connections are solid steel arc-welded. Each weld is individually tested and inspected prior to shipment. Rigid inspection of each and every operation to the final painting insures a uniform workmanlike product. Standardization enables us to make shipments from stock on practically all orders.

Construction Features—Each joist is tagged with a metal tag giving the symbol. Layout drawings show the quantity of each joist going in every panel and the spacing. Shipments are loaded in cars by floors or sections of the building. Joists when unloaded may be stocked in stock piles on the job or placed in position.

Two men can handle the heaviest joist. They are placed in position without the use of special erection equipment. Except where the ends would project through the face brick or some structural member, no cutting is required. In the few cases where this occurs, the

ends are cut to specifications and cut ends identified by painting yellow. This does not affect the structural strength.

After joists are put in position they are braced laterally. This holds them in position until the floor slab has set. The top lath is placed and held fast by driving Massillon lath wedges through the lath in between the top bars. Nailing strips, if used, are held by a special screed clip or wired in place. The concrete is usually poured as fast as the lath is placed.

As the structural strength is not dependent upon the slab a rough flooring of 2-in. boards may be placed on the joists as soon as the joists have been braced. This can be used for storage of materials.

Construction View—Joists, Floor Lath and Nailing Strips in Place

Piping Installations—The open web construction permits plumbing, electrical conduits, soil pipes and other floor accessories to be run through as well as parallel to the joists. This eliminates suspended ceilings. The clear space of $2\frac{1}{2}$ in. over supporting beams assists materially in placing smaller pipes to best advantage.

Future changes and relocation of piping are made through the ceiling—there is no need of tearing up floors or cutting out concrete.

Economies—Massillon Bar Joist Floor Construction is so designed as to secure the most practical benefits from each material involved and provide a maximum of efficiency. The saving in dead weight results in more economical designs for columns, beams and foundations. Heavy and expensive construction equipment is not required. Wood forms are eliminated. There is a tremendous saving in the volume of materials to be transported, hoisted and man-handled. No delays are occasioned by floor construction—immediately the joists are in place the next operation can proceed. The result is a saving of from 20 to 30% in time of erecting the building.

Standard Specifications Massillon Bar Joists

General—The floor [roof] is to consist of a finish surface laid on a slab of concrete poured on metal lath supported by Massillon Bar Joists. A plastered ceiling is to be applied below on metal lath furred to or suspended from the bottom bars of the joists.

Massillon Bar Joists—Massillon Bar Joists as manufactured by and with dimensions to conform to the standard as published by THE MACOMBER STEEL COMPANY shall be used. No bars less than $\frac{3}{8}$ in. diameter and no metal less than $\frac{1}{4}$ in. thick to be used. All connections on the joist to be electric arc-welded. Full facilities to be provided by the manufacturer at all times for the proper inspection, chemical or physical, of the material used and workmanship employed in manufacture.

Paint—All joists to be painted before leaving the factory. No volatile driers such as gasoline or naphtha to be used in the paint.

Placing of Joists—Joists are spaced to conform to safe loading tables published by the manufacturer. They are to be placed in position exactly in accordance with layout. The end joists in each panel are to be securely anchored and intervening joists braced to them by means of one or more lines (as specified in layout) of Massillon bracing wire wrapped around the top or bottom bars and pulled taut.

Steel Lath—The steel lath used on top of the joists for reinforcing the floor slab shall be $\frac{3}{8}$ -in. rib lath weighing not less than 4 lbs. to the square yard. The steel lath used under the joists for ceiling shall be flat diamond mesh lath weighing not less than 3 lbs. to the square yard. All lath to be painted before leaving the factory. $\frac{3}{8}$ -in. rib lath with the ribs up to act as furring may be used as ceiling lath. The lath in all

cases to be securely wired to supports with No. 16 gauge soft iron wire.

Furring—The bottom of the joists to be furred with $\frac{1}{4}$ -in. round rods or $\frac{1}{2}$ -in. box furring channels spaced not more than 16 in. center to center. (If $\frac{3}{8}$ -in. rib lath with ribs up is used, the furring is not required.) This furring to be placed at right angles with the joist and securely wired to the bottom bars of the joists with No. 14 gauge soft iron wire. The ceiling lath in turn to be securely wired to the furring.

Concrete Floor Slab—Where top lath is used, cover the lath to required depth (usually 2 in.) with concrete. If wood floor finish is specified, lay all nailing strips before placing concrete.

Nailing Strips—Where wood floor finish is specified, a 1x2-in. ($\frac{3}{4}$ x1 $\frac{1}{4}$ in.) screed or nailing strip shall be placed on top of the lath at right angles or angling with the joists. Where the screed crosses the joists it is to be blocked up from the lath about 1 in., using Massillon screed clips, small pieces of wood, broken tile or concrete, and then securely fastened by Massillon wedges or wire to the top bars of the joists. The concrete fill is then placed between the screeds, care being taken to completely fill the space under the screed. Wood finish is nailed directly to the screeds.

Bearings—Where the bar joists are supported by masonry walls the joists shall have an end bearing measured along the length of the joist of at least 4 in. When supported on steel plates or sections the bearing to be at least 2 in. In no case are the joists to be rigidly connected to supporting members.

Plaster—On all moderate sized buildings use lime or gypsum (hard wall) plaster. The total thickness for all coats to be not less than $\frac{3}{4}$ in. For larger buildings in congested areas, use a cement plaster for the ground coat. The second and third coats to be gypsum or lime plaster, mixed and applied as per the manufacturer's specifications to a total thickness, including all coats, of $\frac{3}{4}$ in. The cement ground coat to be mixed and applied as follows—the first coat (ground or scratch):

1 sack portland cement	15 lbs. wood fibre
2 $\frac{1}{2}$ cu. ft. clean sharp sand	2 lbs. long cattle hair or cocoanut fibre
10 lbs. hydrated lime	

All to be mixed together until of uniform color and then water added to the required consistency. Apply with considerable pressure, obtaining a good key, and then roughen the surface by scratching diagonally in both directions. This coat to be applied to a thickness of $\frac{3}{8}$ in. over the lath.

Massillon Light Joist

Each joist is a rugged shop fabricated structural unit made from wood and steel. The top member consists of a wood nailer affixed to a structural steel angle. The web section consists of round steel bars (minimum diameter $\frac{3}{8}$ in.) electro-welded at their intersections and to the top member and bearing angles.

These joists are standardized in the same manner as the Massillon Bar Joist. Shipments are made from stock for all spans up to 23 ft. 6 in. Special joists are provided for longer spans on specification.

Where Used—Massillon Light Joists are used in place of wood joists, in the same manner as wood joists, for providing a rigid floor (or roof) with a high degree of fire resistance.

Typical Floor (or Roof) Construction—The joists are placed and braced in the same manner as wood joists. Wood flooring or subflooring is nailed directly into the top member. Piping and conduits are placed through as well as parallel to the joists. Metal ceilings, metal lath and plaster, plaster board and other standard types of ceilings are readily attached to the bottom bars of the joists.

Advantages of the Construction—As this construction is used in buildings where wood joist construction is permitted, a comparison with wood joist construction will best bring out its features.

The published safe loading tables are based on the American Institute of Steel Construction specifications with deflection under full load less than 1/360th the span.

There is less deflection and less vibration with Massillon Light Joists than with wood joist construction.

Steel is not affected by changes in weather. The use of Massillon Light Joists eliminates the shrinkage and warping that is present in all wood joist floors. This eliminates the

cracking of plaster so common to wood construction.

The open web construction eliminates cutting of joists in placing piping. This results in a workmanlike and dependable job. It saves headroom and reduces the cost of installing piping and other floor accessories.

The Massillon Light Joist gives a high degree of fire resistance. This is greatly in excess of that afforded by wood joists, as steel forms the bottom and web members.

Scope of Service

The Massillon Bar Joist and the Massillon Light Joist are two of the line of steel building products manufactured and marketed under the "Massillon" name by THE MACOMBER STEEL COMPANY. Descriptive literature and designing data furnished on request.

A complete engineering service is provided in preparing drawings and estimates based upon the use of these products. This service may be obtained from our authorized sales representatives or by sending plans to our home office at Canton, Ohio.

RIVET-GRIP STEEL JOISTS.

RIVET-GRIP RIGID SHOP FABRICATED TRUSSES.

Bridge Roadway Reinforcement (description on request).

For Rivet-Grip Bank Vault Reinforcement, see pages A1104-1105.

Literature

Folder giving complete details and loading tables will be mailed upon request.

Uses

Rivet-Grip Steel Joists are used for fire-safe floor and roof construction, or wherever a rigid, permanent, fire resisting and economical type of construction is desired in light occupancy buildings.

Rivet-Grip Steel Joists have been in the market for four years and have been used in several hundred buildings, which include apartment houses, banks, office buildings, schools, churches, libraries, theaters, hotels, garages, stores and residences.

Design

Rivet-Grip Steel Joists are fabricated from specially rolled, heavy steel sections. The truss construction gives light weight with the greatest possible carrying strength. The top and bottom chords consist of heavy rolled flange sections and the lightest web members are $\frac{3}{8}$ in. thick. The web members are joined to the chord members by the Rivet-Grip process, which produces a uniform and positive mechanical connection and develops the full strength of component members of the truss.

These joints are so rugged and completely encased by the chord sections, that they are positively protected from damage in shipment or rough handling in the field. There are no welded connections except on bearing plates and no thin metal members subject to corrosion. All joists are painted with rustproof paint before shipment.

Our special continuous notched angle and double diagonal galvanized wire bridging is always furnished with our Rivet-Grip Steel Joists. This bridging not only serves to hold the joists in place before concreting, but also acts as a series of transverse trusses for distributing concentrated loads, which come on the completed floor.

Advantages

Rivet-Grip Steel Joists are lighter, unit for unit, than ordinary structural member of equal strength. They are easily handled by workmen, as individual units or in bundles by cranes,

Rivet-Grip Steel Joists in Place Ready for Top Lath

Note that joists are simply dropped into position with ends resting on top of beams or walls. Also note the two rows of notched angle and double diagonal bridging at the third points of the joist

in order to obtain uniform ceiling heights. They are delivered complete with erection marks on metal tags fastened to each joist.

Designing and Estimating Service

THE RIVET-GRIP STEEL CO. or nearest representative will gladly submit estimates upon request. The following items can be included in the estimate: Rib lath for floor slabs, temperature steel, furring rods, beam clips for fastening joists to steel beams and screed or sleeper clips and metal lath for ceilings, in addition to our standard notched angles and galvanized wire bridging.

Assistance in preparing the most efficient and economical layout for any building will be given without incurring any obligation.

Continued on next page

TOTAL SAFE LOAD IN LBS. PER SQ. FT. ON STANDARD RIVET-GRIP STEEL JOISTS, SPACED 11¼ IN. ON CENTERS

[illegible]

Maximum fiber stress, 16,000 lb. per sq. in. Special tables for Series R. joists for 18,000-lb. fiber stress will be furnished on request.
Loads to the left of heavy lines are limited by shear.

Weights per lineal ft. include bridging angles and wire and bearing plates.

Rivet-Grip steel joists made up of heavier sections can be furnished for unusual conditions of loading or spans over 30 ft.

*To Find Loads per Square Foot for Standard Joist Spacings—*For 11½-in. joist spacing, multiply loads in above table by 1. For 13½-in. joist spacing, multiply these loads by 6/7. For 15-in. joist spacing, multiply by ¾. For 18¾-in. joist spacing, multiply by ⅔. For 22½-in. joist spacing, multiply by ½.

To Determine Safe Superimposed Load—Find safe load per sq. ft. as indicated above. From this figure, subtract (1) weight of slab, joists and ceiling, and (2) weight of finish and fill. Rivet-Grip steel joist floors including top slab and ceiling, but not including finish and fill, weigh approximately 40 lb. per sq. ft.

Note Network of Piping Extending Through Rivet-Grip Joists

Floor Construction Details, Rivet-Grip Steel Joists

Specifications for Rivet-Grip Steel Joist Floor Construction

(1) **Steel Joists**—Provide and set Rivet-Grip Steel Joists, as manufactured by THE RIVET-GRIP STEEL CO., Cleveland, Ohio, as shown or noted on drawings. Where sizes of joists are not indicated on drawings, same shall be in accordance with manufacturer's tables of safe loads. All joist trusses shall conform to standard details of THE RIVET-GRIP STEEL COMPANY.

(3) **Furring Rods**—Where ceiling lath is attached directly to bottom chords of joists, provide and place Rivet-Grip furring rods for extending bottom chords of joists full length between supports to carry ceiling lath.

(4) **Centering**—For centering and reinforcing, a rib lath of (specify weight) shall be laid on, lath side down, and wired or clipped to top chords of joists with ribs extending at right angles to joists.

(5) **Concrete Slab**—Place temperature rods of size and at spacings specified and pour 2-in. concrete slab of 1:2:4 mix.

Where integral or monolithic finish is specified, same must be applied before slab has taken final set, and mix of finish must be kept as dry as it is possible to work. The absorption of excess water by dusting on dry cement is not permissible.

Where finish is to be applied after the rough slab has set up and thoroughly hardened, the slab surface must be left roughened so as to provide adequate bond for the finish.

Note: (a) While finishes as thin as $\frac{3}{4}$ in. may be applied after slab has hardened, for best results the finish should be of 1:2 mix at least $1\frac{1}{4}$ in. thick.

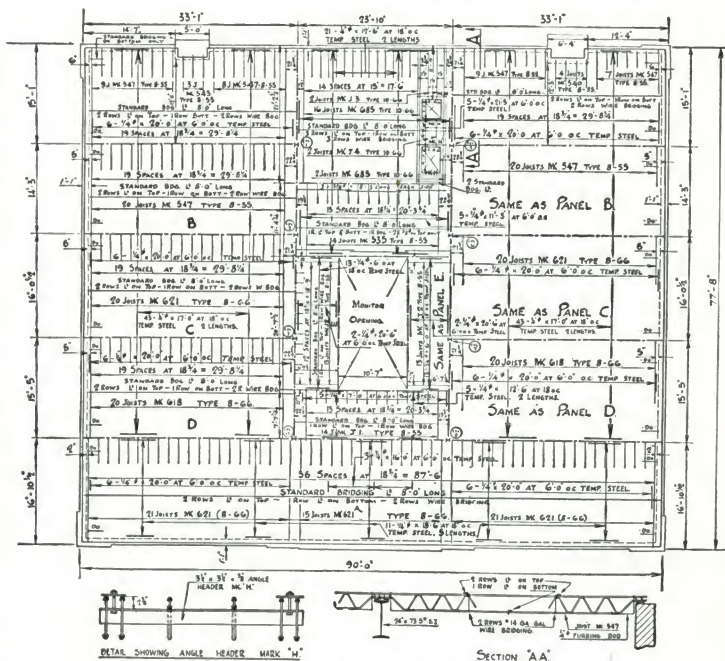

(b) Temperature rods are essential when monolithic finish is used and must be left as near to the top of the rough slab as possible.

(c) The use of $\frac{1}{4}$ -in. rounds 18 in. on centers parallel and 24 in. on centers at right angles to joists is recommended.

(d) In garage floors or other structures with heavy line loads the rough slab should be at least 3½ in. thick.

(6) (*Where Wood Floor is Specified*)—Insert approved clips in concrete slab and attach 2x2-in. [$1\frac{3}{4}$ x $1\frac{3}{4}$ -in.] screeds or nailing strips evenly leveled, on top of slab.

(7) **(Optional Method—Embedding Screens in Slab)**—Place 1½ [1¼ x 1½-in.] screens or nailing strips over lath and at an angle with The screens shall be supported 1 in. above lath to allow concrete between them and lath. The screens shall either be supported l attached to Rivet-Grip screed clips or supported by blocking and securely to joists.

TYPICAL LAYOUT AND PLACING PLAN FOR RIVET-GRIP STEEL JOISTS

(8) **Ceilings**—Ceilings shall be constructed by furring bottom of joists with ¼-in. round rods or furring channels spaced not more than 16 in. on centers. A flat lath shall then be wired to the furring rods or channels.

Note: (a) The furring rods or channels may be omitted if a $\frac{3}{8}$ -in. rib lath is used with the rib side against the bottom chords of joists.

(b) Where extreme fire resistiveness is desirable, we recommend the use of 1-in. furring channels in place of $\frac{1}{4}$ -in. round rods.

TRUSCON STEEL COMPANY

Manufacturers of Steel Joists

YOUNGSTOWN, OHIO

Products

P-G (Plate Girder) STEEL JOISTS.

O-T (Open Truss) STEEL JOISTS.

For Concrete Reinforcement, see pages A134-135; for Steel Roof Decks, see page A171; for Steel Windows and Doors, see pages A1082-1085; for Metal Lath, etc., see pages B1306-1307.

Truscon P-G (Plate Girder) Steel Joists

The Truscon P-G (Plate Girder) Joist is made of structural shapes, combining utmost efficiency of design with economy of material. This joist is a combination of the most perfect grade of structural steel angles welded by the high pressure electric welding method to

a rolled strip, the whole forming a plate girder of great strength. Being made in depths from 6 to 14 in., inclusive, they give the engineer considerable leeway in arriving at the most efficient design.

Truscon Service

Truscon's organization of Sales Offices completely covers the country. Through any of these offices you can obtain the services of a competent engineering force thoroughly acquainted with the most economical practice in the application of Truscon Steel Joists.

TRADE-MARK

Truscon O-T (Open Truss) Steel Joists

The Truscon O-T (Open Truss) Steel Joist is a Warren truss in which the top and bottom chords are specially rolled "tee-shaped" members providing the greatest resistance to buckling strains.

The web member is continuous from end to end to positively transmit the stresses, and is carefully welded to the top and bottom chords.

The entire design is efficient and exceptionally economical of materials.

These joists can be furnished in depths varying from 8 to 16 in., inclusive.

Floor Finishes

Truscon Steel Joist Construction adapts itself readily to any type of floor finish. Wood nailing screeds, embedded in the concrete fill, simplify the laying of wood floors; while a cement topping over the concrete fill makes an ideal base for linoleum, carpets, or composition floors.

Wood Finish

Cement Finish

System "M"—A Steel Construction at the Cost of Concrete

System "M" is a patented type of light structural steel beam, designed so when combined with concrete that it will make savings of 40% to 60% of tonnage of structural steel required for the frame of a fireproof building.

This construction combines all the best features

of structural steel frame construction, such as *speed and safety of construction*.

The use of structural steel columns with the System "M" beams permits them to be erected in the *same manner as a steel frame building* floor on floor regardless of the balance of the

Southern Hotel

War Risk Bureau
WYATT & NOLTING, Architects

construction which follows the steel frame. (See note 1 on illustration.)

All wood forms being hung from System "M" steel beams permit uninterrupted *placing of forms during the poorest weather conditions*, so that there are always forms ready for concrete pouring when the weather permits. (See note 2 on illustration.)

All steel beams are fastened to structural steel columns with bolts fastened to beam seats riveted to columns carrying full load to be supported at column. System "M" beams are designed to be the *same over-all depth as similar capacity structural steel beams* fireproofed with concrete. Any type of floor slab may be used with System "M" beams. (See note 3 on illustration.)

System "M" beams are in use for spans up to 50 ft. and carrying loads up to 1500 lb. per sq. ft., and in buildings up to 20 stories high.

System "M" construction, *covering a period of many years*, has been successfully used with economical results in hundreds of large buildings, a list of which will be gladly furnished on request.

Co-operative Service

For the benefit of any who may wish to use, or have information on this construction, a well organized engineering service is maintained. This service covers making complete structural plans, specifications and foundation designs, checking over all shop and detail drawings, and supervisory inspection of erection. Preliminary engineering service is free of charge.

For buildings where System "M" is used a royalty charge, based on square footage of building, is made to the owner of the building, who benefits from the saving made by this construction.

Manufacturers of CREX PATENT COLUMNS.

Construction

Crex Patent columns consist of an outer shell of steel filled with concrete, and only the best materials are employed in their manufacture.

Especial care is taken in filling these columns so that the concrete filling shall be perfectly solid and uniform throughout, thus obtaining the full strength of a solid concrete interior.

The caps and connections are made of steel, of sufficient strength to receive the superimposed loads.

CREX PATENT COLUMN CO. holds the original patent for an all-steel cap. The cap being entirely of steel, its strength can be reliably computed.

The connections are made in such a manner that only a steel plate separates the shaft of the lower column from the one above, securing the full strength of the column at the connection. Crex columns can be

furnished in about one-fifth the time required for other columns.

CREX PATENT COLUMN CO. was formed for the purpose of supplying the increased demand for this class of columns with the best that can be made, both as regards strength and appearance.

Installations

Crex columns have been installed in thousands of buildings in various parts of the United States. This fact gives proof of the economy, reliability and fine appearance of Crex columns.

LALLY COLUMN CO.

Manufacturers of Concrete Filled Columns
CAMBRIDGE, MASS.

FACTORIES

CHICAGO, ILL., 4001 Wentworth Avenue

CAMBRIDGE, MASS., Erie and Albany Streets

BROOKLYN, N. Y., 211-249 Lombardy Street

Products

LALLY COLUMNS with patented Steel Connections and Bracketed Caps securely fastened, making a rigid tie between beams and columns.

Patents

Various improvements on Lally columns are covered by numerous patents under different dates extending from 1898 to the present time.

Infringements will be prosecuted.

Manufacturing Process

LALLY COLUMNS are manufactured by the LALLY COLUMN CO., INC., of New York, the LALLY COLUMN CO., Cambridge, Mass., and the LALLY COLUMN CO. of Chicago, representing an annual production of hundreds of thousands of columns.

The column is a *shop-made* unit manufactured under the most thorough and careful supervision and inspection, and is shipped to the job ready for erection.

Standard tested mild steel pipes, $3\frac{1}{2}$ to $12\frac{3}{4}$ inches outside diameter, are cut to the lengths required by plans and specifications, slotted to receive beam connections and splice plates, set up perpendicular on level bases and held in a vertical position by lateral supports. A machine-mixed stone concrete fill is deposited in the shell and, to insure dense concrete, shaft is agitated before initial set takes place by an electric hammer operated on exterior of pipe. The vibration compacts the concrete, liberates the confined air and eliminates all air holes and cavities in the aggregate. The resulting material is of considerably greater compressive strength than ordinary cast-in-the-field concrete. When seasoned, the column is lifted out of position, sandpapered on the exterior surface to remove all cement, and then painted.

Reinforcements for Lally Columns

To meet various requirements, including the amount of load to be carried, Lally columns can be reinforced as shown in the accompanying illustrations.

In all cases the concrete is *compressed*, eliminating all air voids (Fig. 1).

Outer Shell Filled with Compressed Concrete

Single Steel Bar Reinforcement

Pipe Reinforcement

Four Angle Iron Reinforcement

Fig. 1. Sectional Views Showing Manner of Reinforcement of Lally Columns

Note: The angle iron reinforcement above makes a compact fireproof column; column is designed so that load is carried by the four angle irons and concrete within radius of same; outer shell and outer concrete act as fireproofing, making a column practically indestructible

Plain, with Ordinary Plate for Wood Beam Connection

With Beam Supports at Different Elevations

Fig. 2. Types of Lally Columns

Bracket and Beam Support

Where one column sets over the other, our latest construction of bracket and beam support is used, as shown in Fig. 3. This style of cap consists of crown plate and steel bracket inserted through slots in column shaft and firmly affixed thereto.

Fig. 3. Steel Bracket and Beam Support

Fig. 4. Steel

Fig. 5. Cast Iron

Bracket Caps

Fig. 4. Cross section of a typical Lally steel bracket cap showing diagrammatically with arrows how all the load on the cap plate is distributed to the column, eliminating the chance of failure due to improper distribution of the load

Fig. 5. Cross section of a typical loose cast iron cap showing by means of arrows that only part of the load is distributed directly to the column, thereby causing failure by shear at the points marked "x." Load between points "x-x" is the only load carried by the column

Approvals

The Lally column is endorsed by engineers throughout the country, and approvals have been granted for its use by all the leading city building departments after extensive tests and investigations. Its adaptability to all forms of building construction, its economy in first cost and in floor space occupied, its speed of erection, as well as its strength, durability and practical performance, have been demonstrated by successful and uniformly satisfactory use under especially severe conditions.

Fire Resistance

The value of the Lally column in fire resisting construction has been frequently demonstrated both in actual fires and scientifically conducted fire tests. This type of column section, without additional exterior protection, has withstood the flames and high temperatures of some of the greatest fires; such as the Chelsea conflagration in April, 1908, the Salem fire in June, 1914, the Standard Oil fire at Greenpoint, N. Y., in September, 1919, and the fire in the Edison Phonograph Works at West Orange, N. J., in December, 1914. In this latter fire, large pieces of steel and cast iron melted in the same building in which concrete-filled pipe columns were used and there were evidences of exposed concrete having been fused. The defect produced on the concrete-filled steel pipe columns was a slight lateral bend which was generally less than 1 inch. A complete report on the fire in the Edison Phonograph Works was prepared under the joint auspices of the National Fire Protection Association and the National Board of Fire Underwriters and gives in detail the effects of fire on the various materials which entered into the construction.

In the Underwriters' Laboratories at Chicago, Ill., 1917-1919, two types of Lally columns were tested in a series of fire tests of structural steel, reinforced concrete, steel pipe and cast iron columns. The Lally columns were unprotected on the exterior surface. These columns were tested under Standard time-temperature fire curve conditions while supporting loads in excess of the recommended design loads. As a result of the tests, the comparative fire resisting ratings of Lally columns were determined as 25 minutes for the unreinforced, which was 11% overloaded during the test, and 45 minutes for the reinforced section, which was 3% overloaded during the test. Actual test runs were 36 minutes and 1 hour 11¼ minutes, respectively. Compared to these ratings, unprotected structural steel and round cast iron columns were granted tentative ratings of only 10 and 20 minutes, respectively. Lally column ratings would probably have been still further increased if the test loads had not exceeded the safe working values recommended.

Safe Loads

We call attention to a material change in the safe loads, as shown in the table below, increasing the accepted safe loads for Lally columns. Please bear in mind that when a project is designed for Lally columns according to this strength list they should be specified, and no other concrete filled column substituted unless the sizes are increased to a diameter that will be equal in carrying capacity to the genuine Lally columns.

References

The names and addresses of the principal purchasers and satisfied users of Lally columns will be furnished on request.

THE DUPLEX HANGER CO.

East 53rd Street and Lakeside Avenue
CLEVELAND, OHIO

BRANCH OFFICES

NEW YORK, N. Y., 16 Warren Street
PHILADELPHIA, P.A., 2216 W. Columbia Avenue

NEW ORLEANS, LA., 1508 Masonic Temple Building
BOSTON, MASS., 88 Broad Street

Products

"Duplex" JOIST, WALL, CONCRETE BLOCK and I-BEAM HANGER; "Duplex" POST CAPS, POST BASES, WALL PLATES and WALL BOXES, for warehouses, factories, heavy mill construction and all other wood constructed buildings.

For Incinerators, see page C3357.

Specifications

"Duplex" hangers and post caps are designed with a large factor of safety to carry the timbers for which they are intended. If architects and engineers will, when using hangers and post caps, specify "Duplex," the proper hangers and post caps for the timbers will be furnished.

"Duplex" Joist Hanger

"Duplex" Hangers

Single Joist Hangers—Are made of malleable iron and every hanger is thoroughly tested.

The best and most economical hangers for timber framing.

"Duplex" Joist Hangers reduce the shrinkage of joists to a minimum.

"Duplex" Wall Joist Box

"Duplex" Concrete Block Joist Hanger

The best hanger for concrete block construction. It is made with a larger bearing plate than our ordinary wall hangers so as to distribute the load over a greater area of the concrete block. Very practical where it becomes necessary to frame joists into old brick walls or party walls. Avoids the cutting of a large hole.

"Duplex" Concrete Block Wall Joist Hanger

R & L Joist Hangers—The best hangers for the heaviest type of mill construction. By using this type of hanger, the entire building is tied together laterally. No other method of construction does this. Made in two parts and can be adjusted to fit the various timbers for which they are intended.

R & L Joist Hanger

"Duplex" I-beam Shelf Hanger

I-beam Box and I-beam Shelf Hangers

Are noted for being one of the most economical devices for framing wood joists to I-beams. All of the load is carried on the lower flange of the I-beam, this being the only correct method.

For Very Heavy Mill Construction

Heavy Duty R & L Joist Hangers—This hanger combines all the features of the R & L hangers, but is made in one piece, instead of pairs.

"Duplex" Wall Joist Hanger

"Duplex" Steel Post Caps

The "Duplex" Post Caps are made of mild, open hearth steel and consist of three pieces; a bearing bracket and two side plates bolted together with four heavy bolts. All engineers who have investigated and used this cap are unanimous in declaring it to be the best design for rigid construction. Tests have fully proven the great strength of this design and that it

is not possible to break the cap when even more than six times the ultimate safe load of the timber is applied.

These caps are furnished for 1-way, 2-way, 3-way and 4-way construction and may be had for timbers larger than the post.

Four-way Construction

"Duplex" Steel Post Bases

Are made of steel plates and angles to fit the post. More economical than cast iron plates.

"Duplex" Steel Post Base

Girder Same Size as Post Below

"Duplex" Wall Hanger, Extra Heavy
"Underwriters' Type." For heavy mill construction

Steel Wall Hangers—Have no equal in carrying timbers clear of the wall. Distribute the load perfectly over the bearing surface of the masonry. Furnished for standard and extra heavy construction.

THE IDEAL HANGER COMPANY

1270 East 53d Street
CLEVELAND, OHIO

Products

IDEAL JOIST HANGERS (Wall Hangers, Wall Boxes and Metal Lumber Hangers); POST CAPS; POST BASES.

Also Barn Framing Fittings.

Ideal Joist Hangers

Introduction—Ideal hangers are made of the best grade open hearth steel bars and are formed so the hanger fits flat against the timber, increasing the carrying capacity of the hanger. This hanger fitting close on all sides does not interfere with furring and permits the use of spikes or lag screws to fasten the hanger to the girder.

No costly framing. Easily applied and neat in appearance. The same section of bar is used throughout, giving the strongest construction at an economical cost.

Single Hanger, Style "A"

—These hangers are standard construction and are carried in stock for every size timber.

Double Hanger, Style "B"

—For use where joists frame opposite each other on wood or I-beam girders. The double hanger consists of two single hangers, each riveted to strap connections to hang over the wood or I-beam girder. Unquestionably, the strongest construction.

Directions for Ordering—Give size of joists and also width of girder over which hanger must span, or, in case of an I-beam, exact width of flange, or if more convenient, height of I-beam and weight per foot, so that flange width can be obtained.

Single Hanger, Style "C"

—Used where a single joist frames against an I-beam channel or wood girder, the arms of the joist hanger running over the top.

Directions for Ordering—Give size of joist and dimensions over which hanger arms must go, namely: width of timber header, or, in case of I-beams or channels, width of flange or height and weight per foot so flange width can be obtained.

Metal Lumber Hangers

—Are the most economical and

Ideal Single Hanger,
Style "A"

Ideal Double Hanger,
Style "B"

Ideal Single Hanger,
Style "C"

Metal
Lumber
Hanger

satisfactory method of framing steel I-joists and save from 60 to 75% of the cost of shelf angles. Being a shop-fabricated product of known strength and integrity, the use of Ideal metal lumber hangers follows the simplest possible design. Easily placed, safe, strong and secure. Send plans for estimate.

Ideal Steel Post Caps

Cap No. 2—Combines all the features necessary to strength in construction. Easily installed, no framing being necessary. The angles on the bottom of the cap are bent to form a socket into which the post fits, preventing any twisting of the cap. Channel is of open hearth plate steel riveted to the socket. Brackets are riveted to channel to carry beams framing on the side. Girders and beams will be flush unless otherwise noted.

Directions for Ordering—In ordering 3 or 4-way construction, give the following information: size post below; size post above; width and height of main girder; width and height of beams on side of cap.

Cap No. 3—Forms a complete bearing channel for the girder. Heavy angles underneath give necessary strength for lighter type of construction. Holes are punched in the cap for tying the girders and post to the cap. This cap permits the use of wider or smaller girders than the post. Furnished in any size from warehouse stock.

Directions for Ordering—Always give size of post on which cap is placed, size of post which rests on top of cap and size of girder.

Ideal Post Bases

Made of heavy steel plates with angles riveted on to form a socket for the post, providing necessary spread for standard construction.

Ideal Steel Post Cap No. 2

Ideal Steel Post Cap No. 3

Ideal Post Base

Service

Ideal post caps, Ideal hangers and other Ideal products are made of the best material obtainable by competent workmen on modern machines. Prompt shipments are made from stock. Estimates and quotations cheerfully furnished and designs submitted by engineers who are specialists in timber construction.

THE VAN DORN IRON WORKS COMPANY

Manufacturers of Post Caps and Joist Hangers

TELEPHONE
RANDOLPH 6630

2685 East 79th Street, CLEVELAND, OHIO

EASTERN DISTRIBUTORS: THE ROTHROCK COMPANY, INC., 404 Washington Avenue, LONG ISLAND CITY, N. Y.
Telephone, Stilwell 8282. A complete stock carried at this point

Products

STEEL POST CAPS; POST BASES; WALL BOXES; JOIST, WALL and I-BEAM HANGERS; WALL and FLOOR PLUGS.

Also manufacturers of Anchors, Metallic Furniture, Structural Steel Work, Ornamental Iron Work, Metal Filing Cabinets and Desks, Steel Shelving, Iron Fencing and Fire Escapes; Dump Truck Hoists and Bodies.

For Steel Office Equipment, see page B2186; for Steel Jail Construction, see pages C3410-3411.

Materials and Guarantee

The steel used in all Van Dorn products is the best obtainable. All goods are guaranteed to be first class, both as to materials and workmanship, and "just as represented."

General Description

Van Dorn post caps are made to sizes which will permit close framing of all timbers, being made to conform to actual timber sizes as published by the Southern Pine Association. The construction is such that every ounce of metal is used to the best advantage.

Blue Prints—Blue prints showing the exact details and dimensions of the various Van Dorn post caps, hangers, etc., will be furnished on request.

Van Dorn Steel Post Caps

Van Dorn steel post caps are made to meet all conditions of timber framing. They are manufactured to carry timbers either one, two, three or four ways. They are made from special steel plate, which adds greatly to their carrying capacity.

Description—Van Dorn standard steel post caps have a girder carrying channel 6 in. deep, made of $\frac{1}{4}$ -in. mild steel plate. The bearing is 6 in., reinforced by the riveted leg of the angle, which forms a closed socket fitting closely around the post.

Two-way Cap

Four-way Cap

Griptite Wall Plug

Post Base

No. 1 Hanger

No. 4 Wall Hanger

No. 7 I-beam Hanger
(Hooking over flange at back)

No. 6 Double Hanger

A Van Dorn post cap, identical to those illustrated, of standard stock material, tested at the Case School of Applied Science, carried a sustained load of 150,000 lb. Substantiated by other tests, the carrying capacity of Van Dorn post caps is assured.

Van Dorn Steel Wall Boxes

Van Dorn wall boxes have a close fitting cover and ample anchorage at back of box; timber is self-releasing. Ventilation is provided around the beam.

Van Dorn Hangers

Van Dorn steel joist hangers are made from specially rolled ribbed bar and special rolled angle. Superior to any other make on the market. By adding bent plates of the desired shapes, the standard (No. 1) joist hanger is readily adapted to the production of a number of different styles for use over steel I-beams, or in brick or concrete walls.

No. 1 or Regular Joist Hanger—The side flanges are wrought with a groove and ridge, the ridge serving as additional strength, especially at the angle of the prong where the severest strain comes. The spikes hold joist and headers together—season cracks will not affect the strength of the connection.

Completeness of Line

Van Dorn post caps and joist hangers are made in standard types to take care of regular framing conditions, and also in special types to take care of unusual framing conditions.

We can supply post caps and joist hangers as well as wall plugs, post bases and wall boxes for whatever your requirements.

Send blue prints or plans for estimate.

AMERICAN FLAG POLE CO., INC.

Distributors of "Lingo" Swaged Tubular Steel Flag Poles

102 Atlantic Avenue
BOSTON, MASS.

Products

"LINGO" SWAGED TUBULAR STEEL FLAG POLES.

WOOD FLAG POLES; TOPMAST FLAG POLES; SPECIAL FLAG POLE FITTINGS, including Non-tangle Flag Rod and Weatherproof Rotating Truck.

"Lingo" Swaged Tubular Steel Flag Poles

We are the New England distributors for this sturdy and long-lived flag pole. We are prepared to furnish "Lingo" poles complete with ornamental bases and all accessories. For detailed information on these poles, see pages of John E. Lingo & Son in this volume.

Non-tangle Flag Rod

The scientific fixture for use with horizontal flag poles. Light, durable and efficient. The light metal rod having a ring and a hook at one end and a swivel clamp at the other end can be attached instantly, and absolutely prevents the colors from tangling in any wind or twisting around the pole. Longer rods have intermediate swivel clamps. With this non-tangle rod, flags last much longer and always present a proper appearance when flown.

Made of brass or galvanized iron in various lengths to suit any size flag.

Non-tangle

Weatherproof Bronze Rotating Truck

For use on vertical wood or metal flag poles. It swings from a pivot point up inside the ball, thus permitting the flag to swing around the pole at the slightest change in the direction of the wind, and preventing the flag from tangling. There is much less friction than ball bearing. Furnished with automatic spring cleat which eases the tension in the halyards when the flag rotates.

As the fixture caps the top of the pole, it prevents wood poles from rotting and protects metal poles from moisture. Snow and ice will not interfere with its action.

Made of weatherproof bronze with gold-leafed copper ball.

Steel and Specially Made Poles

Prices and catalogue on steel poles will gladly be sent on request. Estimates promptly furnished on specially built pole installations.

BABCOCK-DAVIS CORPORATION

Manufacturers of Steel Flagpoles

474 Dorchester Avenue
BOSTON, MASS.

Product

B-D EASY ACCESS POLE, Tubular Steel or Wood (patents pending).

For Precast Concrete Stairs, see page A633.

B-D Easy Access Pole

Designed to overcome the difficulty of inspection and repairs to halyards, painting, etc. No more climbing the pole. One man can raise or lower the pole in a few minutes. Pole can be canted over parapet at any angle desired. The saving in one year's inspection, repairs and painting will offset the additional cost of B-D Pole over the ordinary pole.

Send in your construction plans and we will detail your flagpole supports.

Anchorage

Base plate and braces are integral and anchored securely to roof beams; the base plate being galvanized so that flashing can be readily soldered to it. This gives a tight roof and does away with all the slipshod bracing ordinarily used.

B-D Poles are constructed of steel pipe in graduating sizes according to length of pole, each length being

shrunk into the next largest size and then welded to make an absolutely watertight joint. Wood pole can be used.

Lengths

Poles are carried in stock in lengths of 20, 25, 30, 35 and 40 ft. and can be shipped in two days. Other lengths are made to order.

Specification Form

Furnish and erect B-D Easy Access Vertical [canted degrees] Steel Flagpole high, equipped with 8-in. Gilded Ball and Non-fouling Ball Bearing Swivel Top, Halyards, Cleat and Hoisting Wrench, manufactured by BABCOCK-DAVIS CORPORATION, 474 Dorchester Avenue, Boston, Mass.

ELMER E. CARR

Manufacturer of the Carr Tilting Flag Staff

228 North La Salle Street

CHICAGO, ILL.

TELEPHONE
FRANKLIN 5320

Advantages

The Carr Tilting Flag Staff is designed to overcome the objections to the rigid, fixed pole. It is a recognized building accessory and is in use throughout the United States.

When it is desired to bring the pole to a horizontal position for any purpose, the key and locking bar are removed and pressure exerted with the foot against the counterweight to start the pole from the vertical; then the pole is grasped with the hand and pulled over.

The strains encountered in service cause an upward pull on the holding-down bolts instead of the pull-and-tug effect met with when ordinary flag poles are anchored with structural shapes or other means of bracing.

This is conceded to be a valuable feature.

Construction

Each unit is complete, ready for foundation. The pole is made up of suitable lengths of tubing with joints welded, and is mounted in a strong Tilting fixture, adequately counterweighted so that it can be brought to a horizontal position with little effort.

The pole trimmings consist of a seamless copper ball covered with gold leaf, a truck with two pulleys, a brass nipple for connecting ball to truck, a half-yard of good quality provided with two snap hooks, and a cleat.

When the pole is in an upright position it is securely locked between the supporting brackets with a steel bar and key. The side standards serve as the bracing or supporting structure, the parts connected to form a rigid base. This, when fastened to the holding-down bolts, makes a fixed and rigid anchorage. These bolts are embedded in the concrete roof slab or are otherwise provided for attaching the flag pole base.

Sizes

- No. 0—20 ft., for buildings 1 to 3 stories.
- No. 1—25 ft., for buildings up to 10 stories.
- No. 2—32½ ft., for buildings as high as 16 stories.
- No. 3—40 ft., for buildings 12 to 24 stories, or higher.

Erection

Erecting a Carr Tilting Flag Staff is a simple and inexpensive procedure, no gin pole being necessary. After the supporting castings are set, with the pole socket castings in place and shored in a horizontal position, the pole is inserted and bolted, the counterweights bolted on, the trimmings attached to the top of the pole, and the shoring then removed and the pole raised to a vertical position.

With the material at the building before facilities for taking it to the roof are removed, a minimum of expense is incurred, the time of two or three men, according to the size of the unit, being all that is necessary for a period of one and one-half to two hours to complete the erection.

Service

The manufacturer will co-operate in planning settings to suit various building requirements, and to architects and engineers will furnish, on request, drawings for their office records.

CAMDEN 487

28th and Buren Avenues
CAMDEN, N. J.

Products

SWAGED SECTIONAL FLAGPOLES, fabricated of copper bearing tubular steel pipe in three patterns for ground setting: Light, Heavy and Extra Heavy; and fabricated in two types for roof setting: Heavy and Extra Heavy.

CONTINUOUS TAPER WELDED FLAGPOLES, made in either steel or bronze, with smooth exterior surface, tapered conically or with entasis; resemble in contour the appearance of wooden flagpoles and have no visible joints throughout.

Also Tubular Steel Masts and Booms, Radio Masts and Topmasts, Trolley and Transmission Poles.

General

Our swaged sectional poles are designed to withstand wind stresses up to 90 miles per hour with a conservative bending resistance. They are constructed of copper bearing tubular steel pipe with the joints shop shrunk and swaged without the use of bolts, pins, rivets, screw couplings or lead calking. Every pole, except the continuous taper welded poles, is shipped in one or more knocked down sections and assembled on the ground by means of our field joints. Each section may contain two or more pieces to produce the proper reduction.

Specification "A" for Swaged Sectional Copper Bearing Tubular Steel Flagpoles for Ground Setting or Roof Setting—with Standard Fittings

For Ground Set Poles—Furnish and erect flagpole complete with all standard fittings as listed below, as made by JOHN E. LINGO & SON, INC., Camden, N. J., and build concrete foundation as shown in their drawings No. B5 and B11. Pole to be ground set [Light] [Heavy] [Extra Heavy] pattern with butt x above ground. After erection apply over the shop coat of red lead and oil one coat of white lead and oil followed by a finishing coat of white pole enamel.

For Roof Set Poles—Furnish and erect flagpole complete with all standard fittings as listed below, as made by JOHN E. LINGO & SON, INC., Camden, N. J. Pole to be roof set [Heavy] [Extra Heavy] type with butt x above roof (parapet or brace line). After erection apply over the shop coat of red lead and oil one coat of white lead and oil followed by a finishing coat of white pole enamel.

Flagpole—To be fabricated in sections of standard full weight copper bearing tubular steel pipe of diameters, thicknesses, lengths and joints as detailed by JOHN E. LINGO & SON, INC., for this type pole. Shop joints to be swaged, shrunk and calked steel to steel. Field joints to be calked

steel to steel, airtight and watertight to prevent interior corrosion and deterioration. All joints to be constructed without the use of bolts, pins, rivets, screw couplings or lead calking.

Ball—To be as indicated on detail drawing No. B5 for ground set poles (or to suit height of building if for roof set poles). To be constructed of 20-oz. copper, covered with Hastings XXXX gold leaf over three coats of Galvanum and one coat of waterproof size. Ball to be fastened to truck with $\frac{3}{4}$ -in. seamless brass tube and $\frac{1}{2}$ -in. diameter galvanized rod.

Truck—To be "Lingo" standard ball bearing revolving truck, cast iron body galvanized, revolving on manganese bronze spindle, with top and bottom ball races, for twenty-six $\frac{1}{4}$ -in. diameter bronze balls each; truck to be fitted with two 2 $\frac{1}{2}$ -in. diameter bronze roller bushed sheaves and $\frac{3}{8}$ -in. diameter bronze pins.

Halyards—To be $\frac{3}{8}$ -in. diameter U. S. standard manila bolt rope with bronze swivel snaps, at each end for securing to flag. Provide double set of halyards.

Cleats—To be two 9-in. cast iron galvanized, and tapped to pole with two $\frac{1}{2}$ -in. galvanized flat head stove bolts.

Ground Protector—To be copper bearing steel, 18 in. long, extending 12 in. above and 6 in. below the grade. Shall be shrunk to the pole, calked on the upper edge and electric welded on the lower edge to the flagpole.

Specification "B" for Roof Poles Penetrating Roof to Loft Floor

Omit first and last paragraphs of specification "A" and add the following fittings: *Roof Tube* (if concrete slab), or *Guide Flange* (if steel or wood roof), of size to suit flagpole butt diameter as previously mentioned, to be fastened to roof construction and calked steel to steel after roof flashing has been installed.

Flash Collar of copper bearing steel to be provided for proper means of making a watertight connection and shall be placed on the flagpole at the height indicated and calked steel to steel after roof flashing has been installed. *Pole Socket and Plate* to be provided of size to suit flagpole and secured with a bolt and bearing plate fastened to concrete [wood] [steel] construction as indicated on JOHN E. LINGO & SON, INC. drawing No. B5.

Specification "C" for Roof Poles Not Penetrating Roof

Omit first and last paragraphs of Specification "A" and first paragraph of Specification "B" and provide suitable number of *Turnbuckle* [Telescope] *Braces* to be of sufficient length and sizes as detailed on JOHN E. LINGO & SON, INC., drawing No. B5. Braces to be made of copper bearing tubular steel with suitable anchors and brace collar. *Brace Collar* to be calked to flagpole after erection at the proper height to rigidly support the pole.

All the necessary drilling of steel (or wood) beams (or placing of anchors in concrete) to be located in accordance with JOHN E. LINGO & SON, INC., detail drawings to be submitted to the architect for approval.

pital, Battle Creek, Mich.

Small Continuous Taper Welded Outrigger Flagpoles

Made in either *steel* or *bronze* and are suitable for banks, office buildings, etc., where it is desirable to fly a flag at lower levels than a flagpole located on the roof. These poles are extended out from the face of the building at an angle of 45 degrees above the horizontal plane and vary in length from 16 to 30 ft. The minimum top diameter is 1½ in. with a wall thickness of approximately ⅜ in. increasing downward to the butt. They can be tapered conically or with entasis as selected by the architect. For details see drawing B-12 above.

Continuous Taper Welded Flagpoles for Ground Setting or Roof Setting

Especially designed for monuments, plazas and all other buildings of exceptional architectural value. The poles are made in either *steel* or *bronze* with a smooth exterior surface throughout and tapered conically or with entasis. They resemble in contour the appearance of the wooden flagpoles and have no visible joints throughout. Ground set poles and roof set poles of this construction are not standardized, but can be proportioned to any entasis as selected by the architect. The wall thickness of these flagpoles is ¼ to ⅝ in. at the top and the thickness increases downward to the butt. These poles are made with as

small as a 3½-in. top diameter and we suggest the following butt diameters:

Visible height of pole ... ft.	30	40	50	60	70	80	90	100
Advisable minimum butt in.	7½	8½	9½	10½	11½	12½	14	15

It is advisable and economical to design the lowermost one-third of the visible height cylindrically and to an outside diameter of standard wrought steel pipe as given in the above table, and confine the taper to the remaining visible height.

Partial List of Recent Installations

Madison Square Garden, New York, N. Y. (twenty 50-ft. heavy type roof poles)
 Delaware River Bridge, Philadelphia and Camden (four 75-ft. taper welded poles, 18-in. butt)

We carry in stock a complete line of flagpole bases in painted and galvanized cast iron. Bronze flagpole bases to order. A ring collar is cast separate and furnished with the base to make a proper "joint" between the flagpole and the collar for hot lead calking.

**Design No. 1990**

Suitable for poles with butt diameters from 12¾ in. to 15 in.

**Design No. 2110**

Suitable for:
 Light Pattern
 65½'x71½' 73'x79'
 80'x87'
 Heavy Pattern
 60'x66' 70'x77'
 Extra Heavy Pattern

Two Types of Poles

Two distinct types of poles, dissimilar in construction and greatly varying in cost, are available. To avoid confusion and unfair bidding they should be distinctly specified as either Steel Tubular Poles or as Taper Welded Poles as may be the case. Terms such as Taper Poles with Welded Joints or Taper Welded Steel are ambiguous.

(Taper Welded Poles are described under separate heading further on).

Steel Tubular Poles

The usual, commercial Steel Tubular Poles are graduated (not actually tapered) by joining consecutive, diminishing diameters of standard steel pipe; the joints being either *shop* type, swaged, telescoped and shrunk, or of the *field* type, similarly swaged; to be telescoped in the field. Field joints are inevitable for transportation of poles in excess of railroad car lengths and for economical trucking. The field joints are self-aligning (conical rest collar), without pins, bolts, lead, cements and calked steel to steel with only a hand hammer and a common plumber's calking tool.

In all our steel tubular poles the following *outside diameters* of pipe in consecutive rotation (without skipping any one size) are employed as follows:

TABLE "A." OUTSIDE DIAMETERS OF PIPE

16, 15, 14, 12 $\frac{3}{4}$, 11 $\frac{3}{4}$, 10 $\frac{3}{4}$, 9 $\frac{3}{4}$, 8 $\frac{3}{4}$, 7 $\frac{3}{4}$, 6 $\frac{3}{4}$, 5 $\frac{3}{4}$, 5, 4 $\frac{1}{2}$, 4, 3 $\frac{1}{2}$, 2 $\frac{3}{4}$, 2 $\frac{1}{2}$, and 1 $\frac{1}{2}$ in.
--

Standard Poles—For ground or roof setting.

The bending resistance at the uppermost support (brace collar or roof tube or ground line) is calculated to a formula accepted in conservative engineering and all building departments.

The following table gives the safe diameter (bend-resistance) for standard tubular poles at their *uppermost* support:

TABLE "B." SIZES OF STANDARD POLES

Exposed or unsupported height of pole—ft.	15	20	25	30	40	50	60	70	75	80	90	100	125
Standard diameter at uppermost support—in.	3 $\frac{1}{2}$	4	4 $\frac{1}{2}$	5	5 $\frac{5}{8}$	6 $\frac{5}{8}$	7 $\frac{5}{8}$	8 $\frac{5}{8}$	9 $\frac{5}{8}$	10 $\frac{5}{8}$	11 $\frac{5}{8}$	12 $\frac{5}{8}$	14
Tip diameter—in.	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$

Light Pattern Poles—Lighter than Standard and designed for ground setting *only*, therefore subject to lesser stresses of handling.

TABLE "C." LIGHT PATTERN POLES

*Height above ground—ft.	17	25	33	41	49 $\frac{1}{2}$	57 $\frac{1}{2}$	65 $\frac{1}{2}$	73	80	90	100
Light Pattern diameter at ground—in.	3 $\frac{1}{2}$	4	4 $\frac{1}{2}$	5	5 $\frac{5}{8}$	6 $\frac{5}{8}$	7 $\frac{5}{8}$	8 $\frac{5}{8}$	9 $\frac{5}{8}$	10 $\frac{5}{8}$	12 $\frac{5}{8}$
Diameter at tip—in.	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$	2 $\frac{1}{2}$	2 $\frac{3}{8}$

*Not alterable in this type.

For full specification of light pattern and standard poles fully trimmed for ground setting see catalogue page two in A.I.A.14F folder in your file or sent on request.

Extra Heavy Poles—Made to meet the demand for poles of larger than Standard diameter to resemble proportions of wooden poles.

TABLE "D." EXTRA HEAVY POLES

*Unsupported or exposed height—not less than—ft.	20	25	30	35	43	51	59	67	75
Extra Heavy pole, diameter—in.	5	5 $\frac{5}{8}$	6 $\frac{5}{8}$	7 $\frac{5}{8}$	8 $\frac{5}{8}$	9 $\frac{5}{8}$	10 $\frac{5}{8}$	11 $\frac{5}{8}$	12 $\frac{5}{8}$
Practical tip, diameter—in.	2 $\frac{3}{8}$	2 $\frac{1}{2}$	3 $\frac{1}{2}$	3 $\frac{1}{2}$	3 $\frac{1}{2}$	3 $\frac{1}{2}$	3 $\frac{1}{2}$	3 $\frac{1}{2}$	3 $\frac{1}{2}$

*Keep above this minimum height to avoid an unreasonable multitude of joints.

Additional Butts—All steel tubular poles are standardized on the basis of their exposed or unsupported height, to which we add necessary *additional butt* to meet requirements. Thus a pole 45 ft. above roof braced 5 ft. up should be specified as a standard steel tubular pole 40x45 ft. (5 $\frac{5}{8}$ -in. diameter). A pole 70 ft. above roof and set on top floor 10 ft. below roof should be specified as 70x80 ft. (8 $\frac{5}{8}$ -in. diameter). A call for a 30-ft. pole would result in a 5-in. diameter, but if braced above roof can be specified as 25x30 ft. (4 $\frac{1}{2}$ in. diameter).

Taper Welded Poles

These are an artcraft product, welded up from rolled plates; are actually *tapered* either conically or with the Venetian entasis, have a perfectly smooth exterior surface unbroken by visible joints.

The tip diameter is limited to a minimum of 4 $\frac{3}{4}$ in. while the largest visible diameter can be chosen from any of these given for steel tubular poles (see Table "A"); but must be proportionate to the selected tip and the visible height by assuming a taper of from $\frac{1}{8}$ to $\frac{1}{4}$ in. per foot of exposure and then compromising to the nearest Table "A" diameter.

The majority of architects prefer the Venetian entasis. This curve leaves the lower one-fifth to two-fifths of the visible height almost cylindrical, therefore we employ pipe for this portion, and the more costly taper construction to the balance of the height. We suggest that architects so visualize this type of pole and preferably consult us before specifying.

Taper welded poles have been used occasionally on roofs of buildings of outstanding prominence (Morrison Hotel; Chicago Tribune Tower; A. T. & T. Building, New York; Newark Chamber of Commerce; and twenty or more others) but are more usually accepted for flag pole monuments. The taper portion of these poles in steel costs approximately \$16.00 to \$20.00 per running foot.

Bronze Poles—Taper welded poles are also produced by us now in *bronze* at reasonable prices, considering their evident imperishability without painting.

Customary Pole Supports and Fittings

Usual Bracing Plans

Usual Bracing Plans—Sketch shows braces CT for compression and tension or T for tension only. We list braces accordingly.

Braces—Three types of braces are available as illustrated.

Typical Brace Collar—Calked to pole prevents corrosion unavoidable with the old style of forged and bolted clamp bands.

Bottom Forks—Bottom forks of all braces fitted to various brace anchors, as shown in illustrations.

Suggestion—In the interest of efficiency, installation and simplicity of specification we suggest that you call upon us for proposal of "Standard Construction" which we will gladly submit *without obligation on your part*.

We will invariably suggest bracing best suited to your individual project and yet the least costly. Injudicious selection of braces frequently causes unreasonable costs without adequate superiority of installation. Ask us first—then specify, and avoid costly, sometimes irreparable errors.

Pole Socket and Rest Plate—See Brace Anchors for various forms of securing to various types of roof structures.

Customary Pole Trimmings

Gilt Ball Finials—20-oz. spun copper and finished in 23-kt. gold leaf over weatherproof sizing, mounted on $\frac{3}{4}$ -in. brass tube. Stock sizes: 4, 5, 6, 8, 10, 12, 14, 16, 18 and 24 in.

Trucks—Poletube truck for poles up to $3\frac{1}{2}$ -in. tip (not applicable to taper welded poles.)

Similar Simmons truck for poles up to $5\frac{1}{2}$ -in. tip. Similar Giant truck for poles up to 10-in. tip.

Weather vanes—See catalogue page 5 in A.I.A.14F folder.

Poletube Truck

Cleats—9-in. galvanized, attached to poles with two $\frac{5}{16}$ -in. cap screws.

Halyards— $\frac{3}{8}$ -in. diameter bolt rope or Silver Lake No. 10. We furnish no metallic (wire rope or chain) halyards under any circumstances, because they are impractical, dangerous and injurious to the pole.

Cleat Covers, Flash Collars—See catalogue page 5 and 8, in your folder A.I.A.14F.

Guide Flange

For wood or steel roof construction. Can be screwed either to bottom or top of rafters.

Roof Tube

For concrete roof construction. Can be moulded into new concrete roofs or grouted into existing ones. One inch larger than pole diameter.

Window and Outrigger Poles

Steel poles of tubular construction, as well as Continuous Taper Welded poles, have been largely adopted as window or outrigger poles. They offer the advantages of our *hinged* construction, which permits righting the poles for repainting or repairs at a minimum cost. It avoids the risk of climbing out and saves the expense

WINDOW POLES—TUBULAR STEEL CONSTRUCTION
(TELESCOPED JOINTS)

Length, ft.	Light diameters	Medium diameters, in.	Heavy diameter, in.
12	2 3/8 x 1 7/8	2 7/8 x 2 3/8
14	2 7/8 x 1 7/8	3 1/2 x 2 3/8
16	2 7/8 x 1 7/8	3 1/2 x 2 3/8	4 x 2 7/8
18	2 7/8 x 1 7/8	3 1/2 x 2 3/8	4 x 2 7/8
20	2 7/8 x 1 7/8	3 1/2 x 2 3/8	4 x 2 7/8
22	3 1/2 x 2 3/8	4 x 2 7/8	4 1/2 x 2 7/8
25	4 1/2 x 2 3/8	4 1/2 x 2 7/8	5 x 2 7/8
30	4 1/2 x 2 3/8	5 x 2 7/8	5 1/8 x 2 7/8

of scaffolding or dismantling, or the expensive operation with a boatswain's chair swung from the roof. Window poles are fitted with a special shackled, heavy cast bronze block (the usual truck is impracticable).

These poles are galvanized all over after fabrication.

Ask for plates WP-50a and WP-5a.

Monument Flag Pole Construction—Practical for flag pole monuments facilitating erection and protecting against corrosion and damage by freezing, vibration, etc.

Pole Pedestals

We have Patterns for a variety for iron or bronze castings; ask for circular.

Taper Welded Steel Flag Pole—War Memorial at Plainfield, N. J.

Typical Installation Plates

Consult "Typical Installation Plates" in your folder A.I.A.14F sent (or yours for the asking).

Service

If you will send us a rough sketch showing setting conditions we will gladly submit suggestions for installations, saving your time and assuring first class work and lowest consistent prices.

ÆOLUS DICKINSON

INDUSTRIAL DIVISION PAUL DICKINSON, INCORPORATED

Scuppers, Exhaust Heads and Roof Drains

TELEPHONE

LAFAYETTE 1862, 1863

3324-3354 South Artesian Avenue

CHICAGO, ILL.

Products

DICKINSON CAST IRON SCUPPERS.

DICKINSON CAST IRON ROOF DRAINS

DICKINSON CAST IRON EXHAUST HEADS.

For "Æolus" Ventilators and Dickinson Floor Vents, Mushroom Type, see page A522.

Dickinson Cast Iron Scuppers

Reduce insurance rates 2% to 5% on contents of buildings to which applied.

They are constructed of light gray cast iron and are simple, effective, durable and easily installed.

The portion which protrudes beyond the wall is covered by a hinged flap which is held in place by a hinge pin of bronze to prevent corrosion and consequent sticking.

Cast Iron Scupper

Inside grating prevents clogging with papers, etc.
Outside grating prevents birds from building nests to block the purpose of the scupper

Size—Underwriters' requirements call for 15 sq. in. for each 1000 sq. ft. drained. Dickinson scuppers have a capacity of 16 sq. in. at the smallest point. The outside or smaller end is 4x4 in.

List Price—Dickinson scuppers may be had for the following thicknesses of wall:

9-in. wall.....	\$3.30
13-in. wall.....	4.40
17-in. wall.....	5.50
22-in. wall.....	6.60
24-in. wall.....	7.70

Prices are f.o.b. Chicago.

Specifications—Furnish and install where shown on plans gray cast iron scuppers which are to have outlet of 4x4 in., as manufactured by Æolus Dickinson, 3324-3354 South Artesian Ave., Chicago, Ill. Inlet to have a protective grating and outside to have a flap hinged on a bronze pin. The bottom edge of the inside end shall be set at the level of the floor or slightly below it so that water will drain clear. Scuppers must have a pitch of from 2 to 2½ in. to the foot. Upon completion of the building and before being turned over to the owners, the contractor shall see that all scuppers are clear of all material, are clean and that the hinged flap moves freely and is in perfect working order.

Dickinson Cast Iron Roof Drains

Constructed of light gray cast iron.

All sizes for threaded and cast iron pipe.

Cast Iron Roof Drain

Top: 12 in. square, 6 in. high.
Bottom section: 16½ in. square, 4 in. deep.
Roofing felt is brought over flange

Dickinson Cast Iron Exhaust Heads

Dickinson exhaust heads are the only make constructed entirely of cast iron. They are simple in design, yet none the less effective in operation. On entering the head the gradually expanding steam strikes the concave surface of an inner shell which quickly reverses its direction. Then the steam flows upward along the sides until it strikes the top, where it is again deflected and is permitted to exhaust into the outside air. Constantly impinged against these inner surfaces, the particles of oil and water are separated from the steam vapor leaving nothing but the dry vapor to escape.

Purpose of Scuppers

It is a well-known fact that water damage often exceeds the fire damage and also causes large losses through disruption of business. A small fire on an upper floor may cause enormous damage to goods, machinery, etc., by flooding the floors below. Scuppers allow this water to escape outside the building and save this enormous and unnecessary loss.

Underwriters recommend the use of scuppers (especially in sprinklered buildings) and the insurance rate for both owner and tenants is favorably affected by their use.

Construction of Type R Scupper

Windproof Valve—To exclude cold air, a heavy cast bronze valve is hung in bronze bushings overlapping the outer end of the scupper.

The locating of the valve in this manner provides for its free action, which cannot be expected from a valve recessed in the scupper mouth subject to clogging by incrustations of dirt or sealing by ice or sleet. As the scupper is an emergency device it must be ready to function at all times, else it is useless.

Important Installations

Please note that our scuppers were selected by Government architects and used in the two largest army base depots ever built, at Brooklyn and New Orleans. Also used in other important Government work.

Underwriters' Approval Is Your Guarantee

Our scuppers have been tested, approved and listed as standard by the Chicago Laboratories of the National Board of Fire Underwriters. This secures their acceptance by all local exchanges and the maximum allowance in the rate.

As the scupper is an emergency device it must be ready to function at all times and it would be folly to install a cheaply made scupper that through rust, corrosion or incrustations of dirt, or sealing by ice in winter, would fail to function through any defect of design or construction.

Hood—A small hood protects the valve from being clogged by mortar during construction, and from dirt and ice.

If desired, we can furnish the "complete hood," shown here, enclosing the valve on three sides. This form is favored by New England Underwriters, as giving greater protection to the valve.

Grid—The grid protecting the inlet is removable, being secured by two brass setscrews.

Fender—The fender projecting 4 in. into the room is designed to prevent storing goods against the inlet of the scupper. Fender can be omitted, if desired.

Pitch—Our scupper has a downward pitch of 2 in. to the foot, providing a good head of water to open the valve.

Discharge Capacity—Tests made by Underwriters' Laboratories developed that our scupper will discharge 60 gallons per minute under 1-in. head of water on the floor and 100 gallons per minute under 3-in. head.

Necessity of Bronze Fittings—As the scuppers may not be called into use until years after they have been installed it is necessary that the valve be of a material not subject to rust—ours are of bronze hung in bronze bushings.

have a cast bronze gravity valve overlapping the end of the scupper (not recessed). Valve shall be hung in bronze or brass bushings. Above the inlet there shall be a cast iron fender extending 4 in. into the room (can be omitted if floors are not for storage purposes). All iron parts shall have one coat protective paint (or be galvanized) before shipping. Scuppers shall have the approval of the National Board of Fire Underwriters and be included in their list of Approved Mechanical Devices. All as manufactured by the WATERTITE DRAIN & SCUPPER Co., Inc., 243 East 44th Street, New York, N. Y.

Type R Scupper with Fender

Tested, approved and listed as standard by the National Board of Fire Underwriters

Variation of Type R Scupper—The illustration on preceding page shows a Type R scupper having a secondary brass air check valve placed in the neck of the scupper, an additional security against the entrance of cold air. No fender is shown in this cut but can be provided if desired. The air check adds but one dollar to the cost of the scupper.

Number Required

In sprinklered buildings, it is advisable to provide one scupper to every 500 sq. ft. of floor surface. In unsprinklered buildings one to every 1000 sq. ft.

Scuppers are usually placed in the curtain walls below the windows.

Sizes and Prices

The scuppers are made for any thickness of wall and prices will be quoted on application. State thickness of wall and type of scupper required, also number required.

Specification for Type R (Approved) Scuppers

Furnish and set in exterior walls, where indicated, cast iron scuppers with inlet not less than 12 in. wide, outlet to have an area of not less than 16 sq. in.; outlet to

Set the scuppers about 1 in. below the finished floor line. Grade a channel to it in the cement finish of the floor.

For Wood Floors on Cement

The illustration shows a special scupper made for wood floors laid on sleepers bedded in the cement slab. The inlet is 7 in. high and the bottom of the scupper is set flush with the cement floor to take off any water that might seep through the wood floor.

Purpose of Windshield Scuppers

To provide a quick escape for water in case of fire, defective or overheated sprinklers, bursting pipes, etc., thereby reducing damage to a minimum.

It is a well-known fact that approximately 75% of so-called fire losses are actually caused by water, and the progressive architect or engineer can not afford to omit provision for the emergency. Aside from actual water damage, five lines of fire hose, discharging 300 gal. per minute, would strain the structure to the extent of 12,000 lb. for each minute, or 30 tons every 5 minutes the fire ensued.

Every mercantile building, such as warehouses, factories, lofts and stores, should be equipped with Windshield Scuppers.

Reduced Insurance Rates

Insurance companies, recognizing their value, allow a reduction in rates applying to both building and contents when Windshield Scuppers are installed in accordance with recommendations. This saving usually pays their entire cost in a few years. Buildings so equipped will also command a higher rental and reduce vacancies on account of the insurance saving afforded tenants.

Underwriters' and Factory Mutuals' Approval

Windshield Scuppers have been tested and approved by the Underwriters' Laboratories, Inc. at Chicago, and are listed as Standard by the National Board of Fire Underwriters. This assures acceptance by all insurance exchanges throughout the country and the maximum reduction in rates.

The Associated Factory Mutual Fire Insurance Companies have also inspected and approved this device.

Value of the Improved Windshield

Being an emergency device, it is essential that it be at all times prepared for instant duty. A scupper which permits drafts to enter is not likely to be ready when called upon, as

it has been found that employees, putting their own comfort ahead of any thought of the consequence, will stuff the scupper, thereby rendering it useless. The *windshield positively prevents drafts*. This also means a distinct saving in heat and fuel.

The Standard Type Windshield Scupper, as recently improved, is provided with a seat which insures a tight fit when windshield is closed and gives a positive clearance between the sides of the casing. The windshield is hung on a frame at the floor level, where it can be readily inspected and by the removal of two nuts can be replaced. This is an exclusive feature of the Standard Type. (See illustration.)

Underwriters' Approved Grate

The approved projecting grate prevents close stock piling and is so designed as to avoid possibility of tripping or injury to occupants. Its construction is such that a packing case, dropped from a hand truck, would be deflected.

These improvements eliminate the disadvantages of the old style stock fender, which, while readily subject to breakage, can not be replaced as the attaching bolts are embedded in masonry.

Distinct Advantage of One-piece Scupper

The body of every Windshield Scupper is a solid one-piece casting. This is far superior to an assembled scupper, with the top or cover cast separately, as it is impractical to provide a tight fit, and this not infrequently permits a leakage of concrete into the scupper which clogs the valves, rendering them inoperative. The one-piece scupper assures proper setting in a complete unit, requiring no re-assembly of parts on the job by inexperienced mechanics.

Other Structural Advantages

The exterior bronze weather valve, being hung inside the housing, is afforded the maximum of protection against the elements. The method of hanging assures accuracy of fit, making it as airtight as is possible, and the bronze bushings

"Standard Type" Windshield Scupper with Underwriters' Grate, Showing How Windshield Can Be Renewed
(Patented and other patents pending)

guarantee ease of operation. It can not be blown open, as is possible with the old type door which rests on the outer end.

The drip under the outlet gives positive assurance against water flowing back under the scupper and staining the building.

Each valve is provided with a seat. It is obvious that a valve without a seat can not be windproof and still operate freely.

Only the best grade, high-silicon iron is used, producing a soft tough casting and, being $\frac{3}{8}$ in. thick, ample strength is provided to withstand undue strain or blow imposed by careless handling.

Appearance

Windshield Scuppers, having no unsightly hood at the exterior, harmonize with the architecture of the building. When located symmetrically, they provide a relief and aid the architectural scheme.

Location and Quantity Required

Windshield Scuppers are usually placed in each bay, and should be set in the wall so bottom of scupper will be 1 in. below the finished floor line. By keeping the face of the scupper parallel with the wall, proper incline toward outside will be maintained.

One Windshield Scupper should be provided for each 500 sq. ft. of floor space if the building is sprinklered, otherwise one for each 1000 sq. ft.

Sizes and Prices

Windshield Scuppers are made for walls of any thickness and can be furnished galvanized, if desired. Prices will be quoted on request by local sales representatives, or direct.

Specification for Standard Type

Provide and install, where shown in plans Standard Type (SG, S, KG or K) Windshield Scupper, of proper size for wall thickness shown. Body to be cast in one piece, $\frac{3}{8}$ in. thick, with bronze exterior weather valve, hung with bronze hinge pins and bronze bushings. To have improved, detachable (polished brass or galvanized iron) windshield hung on brass hinge pin, attached to grate or frame at entrance so that it can be replaced (and with Underwriters' Approved Projecting Grate to prevent blocking.)

(Italics denote optional features, which should conform to type selected. See Guide below.)

SPECIFICATION DATA

Symbol	Description	
Standard Type, Heavy $\frac{3}{8}$ in.		
"SG"	With grate	Polished, lacquered brass windshield
"S"	Without grate	
"KG"	With grate	Galvanized windshield
"K"	Without grate	
Special Type $\frac{1}{4}$ in.		
"E"	With grate	Double valve
"M"	With grate	Single valve

"Standard Type"
without Grate

In department stores, and similar high class buildings, architects have shown a preference for the Standard type without grate, as the polished and lacquered brass windshield gives the base a finished, neat appearance, or the galvanized windshield may be painted to match the base

"Special Type"
with Double Valve

While lighter than the Standard, compares favorably in weight with any other manufacture and is priced to meet competition. The following advantages place it in a preferred position:

Cast and cored in one piece; exterior drip prevents staining; every valve provided with seat; Underwriters' approved projecting grate furnished at no additional cost, flat grate optional; exterior valve cast bronze, inner valve brass, both hung with bronze hinge pins and bronze bushings.

Type "W" for Wood Floor on Concrete

Note that removability of grate is not obstructed by flooring. Can be furnished with double or single valve

Products

DEAN'S CHICAGO TYPE SCUPPERS.

DEAN'S CONCRETE INSERTS.

Also Reinforcing Steel, Wire Mesh, Beam Wrapping, Spirals, Spacers, Griptite Sleeper Anchors.

Dean's Chicago Scuppers

Advantages—Windproof and rainproof, designed to meet the requirements of the National Board of Fire Underwriters. Reduce insurance rates 3 to 5 per cent. Initial cost low in comparison to this annual saving. Reduce water losses and interruption to business in case of fire by draining the water directly to the outside of the building. Protect goods on the floor in case of breaks in water or sprinkler system. Protect wood floors from standing water.

Therefore use scuppers in every building.

Inside View

Outside View
Dean's Chicago Scupper

Construction—Our Chicago scupper has 48-sq. in. capacity at the inlet and 16-sq. in. capacity at the outlet.

The wide inlet increases the water pressure on the flap at the outlet. This flap is hung on bronze pins at such an angle that its weight holds it snug against the walls of the scupper making it windtight and watertight, but a very small flow of water from within will open it. A small shelf projecting from the outside of the scupper protects the hinges and valve from clogging with mortar, dirt or ice. The grating within prevents clogging from the inside of the building and allows a clear inspection of the interior of the scupper at all times.

Check Valve—While the careful fitting of the outer flap makes the Chicago scupper windproof, we can, if desired, insert an additional check valve in the box.

Installation—The National Fire Protection Association

recommends under ordinary conditions, one scupper having an outlet area of 16 sq. in. to every 1000 sq. ft. of floor, or, in a building equipped with a sprinkler system, one to every 500 sq. ft. of floor. The Dean Chicago Type Scupper complies fully with this recommendation.

It is not necessary to slope the floor with a Dean scupper. If the inside end is placed well below the finished floor line and the scupper given a pitch of 2 to 12 in. outward, perfect drainage will be secured.

Specification

The mason contractor shall furnish and set one Dean Chicago Type Scupper in each bay of the exterior wall as shown on plans. The scuppers are to meet the recommendations of the National Board of Fire Underwriters, having well fitted and non-clogging outside flaps hung on bronze pins and removable inside gratings. They shall have inlets at least 12 in. wide and outlet areas of at least 16 sq. in. They shall be set in the masonry walls at each floor level above the ground floor as shown on details. Care must be taken in setting the scuppers to see that the pitch is not less than 2 in. in 12 in., that the lower inside edges of scuppers are set 1 in. below finished floor line, and that scuppers are set true to wall lines and are not sprung or broken during construction work.

On completion of the job, flaps must be cleaned and left in perfect working order and all exposed parts of scuppers are to be cleaned and given a heavy coat of paint.

Service

A complete stock of all sizes of scuppers is kept in the Chicago warehouse.

Chicago being centrally located with exceptionally good package car service on all railroads, delivery can be made within a few days' time to all points. This is an important consideration in regard to scuppers, as they are very often forgotten until actually needed on the job.

THE STEPHENSON MANUFACTURING COMPANY

Manufacturers of The Stephenson Underground Garbage Receivers

48 Farrar Street, LYNN, MASS.

ALL GOODS SOLD DIRECT FROM FACTORY

Products

"THE STEPHENSON" STANDARD UNDERGROUND GARBAGE RECEIVER; UNDERFLOOR ASH AND REFUSE RECEIVERS.

Also Underground Street Sweepings Receiver; Spiral Truss Ribbed Ash Barrel; Half-round Garbage Bucket; All-steel Ash Barrel Truck; Indoor Chemical Closets.

The Stephenson Has Many Exclusive Features

(1) **Odorless**—The Stephenson Garbage Receiver is constructed with a 2-in. air space around all sides of the inside receptacle as well as beneath it, allowing a free circulation of air at all times—thus preventing odors.

(2) **Neat**—The deep 4-in. chute extends down into the garbage receptacle absolutely preventing spilling of garbage on outside of the bucket. As all but the cover of the receiver is underground, it is practically out of sight, yet always handy.

(3) **Will Not Retain Surface Water**—The outer casing has an open frame at bottom which holds the can centered, but lets any moisture sink into the ground below. A patented feature.

(4) **Built to Last for a Generation**—Not only is the inside garbage receptacle built for long service, but the outside casing is constructed in an especially sturdy manner. The heavy galvanized iron cylinder is supported by a strong casting top and bottom, tied together with 6 heavy rods.

(5) **Heavy Cover Opens at Touch of Foot**—The cover of The Stephenson Garbage Receiver is of very heavy cast iron that cannot be broken even if the wheels of a cart should run over it. Impossible for dogs or cats to move, yet cover lifts easily with a slight pressure of the foot.

(6) **Cast Iron Superior to Cement**—Cement absorbs grease and moisture. The heat of the sun's rays ferments the grease, giving forth noxious odors. The action of frost on the moisture filled cement cracks it. A cement receiver is a most *unsanitary* and *impractical* garbage receptacle.

The Stephenson Standard Underground Garbage Receiver

As it appears when in the ground

The Stephenson Standard Underground Garbage Receiver
Nos. 2A and 3A

As it appears out of the ground, with casing cut open to show construction

(1) Cast-iron bottom ring with special three-point centering device.

(2) Two of the three lugs for centering bucket.

(3) One of the pipes connecting top and bottom rings.

(4) One of the eight special spiral truss ribs on The Stephenson Inside Bucket No. 3A.

(5) 2-in. ventilating space—a vital feature.

(6) Outside casing broken away to show construction of receiver with The Stephenson Spiral Truss Ribbed bucket No. 3A, 18 in. diam., 25 in. high. No. 2A bucket, without spiral truss ribs, 14 in. diam. 22 in. high.

(7) One of the twelve connecting pipe bolts.

(8) Cast iron top ring.

(9) Bail to lift out spiral bucket.

(10) Cast iron removal cover with special conical chute 14 in. diam. at top, 9 in. diam. at bottom and 4 in. deep.

(11) This deep chute prevents any chance of garbage falling outside of the bucket.

(12) Cast iron self-closing receiving cover 14 in. diam. with special foot trip and hand lift.

(13) Removal cover guarded hand lift. Very important.

(14) Receiver in the ground with maid using foot-trip, leaving both hands free to empty garbage.

Sizes

No. 2A Stephenson Standard Underground Garbage Receiver—Inside bucket 14 in. diameter, 22 in. high, capacity 12 bulk gallons. Receiver 20 in. diameter, 29 in. high over all. Weight complete, 121 lbs.

No. 3A Stephenson Standard Underground Garbage Receiver—Inside bucket 18 in. diameter, 24 in. high, with special spiral truss ribs. Capacity 23½ bulk gallons. Receiver 24 in. diameter, 31 in. high over all. Weight complete, 175 lbs.

No. 4 Stephenson Standard Underfloor Refuse Receiver—Inside bucket 18 in. diameter, 24 in. high, with special spiral truss ribs. Capacity 23½ bulk gallons. Receiver 29 in. diameter, 29 in. high over all. Weight complete, 200 lbs.

Installation

Just dig a hole about 6 in. deeper than the receiver—throw in a few broken stones as for a blind drain—set the receiver on this stone flooring and replace earth around it. The Stephenson Standard Underground Garbage Receiver is now ready to give a generation of service to the owner.

RECEIVADOR SALES COMPANY

418-419 Ashton Building
GRAND RAPIDS, MICH.

The Receivador

Description—The Receivador is a metal parcel receiver of two or more compartments installed in the exterior or interior walls or doors of a building. Its purpose is to receive and safeguard delivered packages in the absence or pre-occupation of the owner. Each compartment has two doors, one inside and one out, provided with a non-pickable lock and operated by the simple turn of a thumb bolt. An interlocking device makes it impossible to open both doors at the same time, thereby preventing ingress through the Receivador.

Operation—The delivery man inserts the package and turns the thumb bolt which automatically engages the interlock and prevents outside door being again opened until package is removed by way of the inside door. When the inside door is closed and the thumb bolt turned, the outside lock is automatically released, permitting door to be opened. The design of the lock makes its action reliable and unfailing.

In apartments, where deliveries are made from a central station, we can furnish Receivadors with Master Key Locks, permitting service man to make deliveries at will.

The installation of the Receivador cabinet in no way interferes with the normal operation of the door.

Construction

The standard Receivador consists of two compartments, upper and lower. The lower compartment as shown below, contains a regulation suit box, shoe box and corset box with ample room for other small parcels.

The cabinet is made of sheet steel and possesses the utmost strength and rigidity. Its parts are electrically

"The Automatic Servant"
TRADE-MARK

welded; no bolts or screws are used in its assembly. The doors are built up of two sheets of steel electrically welded together with a sheet of insulating material between. This insulation is effective against extreme heat and cold.

Sizes

For special requirements we furnish single compartment cabinets, or the number of compartments may be increased to three or more arranged either horizontally or vertically. The rigidity of multiple compartments is accomplished by welding and bolting the units together.

Where Used

The Receivador is used in service entrance doors or walls of residences and clubs, also in corridor doors or walls of apartments, clubs, etc. It is extensively specified by leading architects for the better class of homes and apartments.

Specifications

It is suggested that the following be written into the general specifications.

Receivador—Furnish and install complete and finish according to architect's directions double Steel Receivadors, manufactured by the RECEIVADOR SALES COMPANY, Grand Rapids, Mich., as shown on the plans. Where Receivadors are to be installed in a door, the door must be furnished by the contractor with the proper opening for the Receivador Cabinet.

Where Receivadors are to be installed in a wall, frames and trim must be furnished by the contractor. For door installations, stiles must be 5 in. wide. For wall installations, allow ¼ to ½-in. clearance in the rough opening.

STANDARD

FRAMES MUST BE SET SQUARE...

Double Receivador Cabinet in Wall of Brick Building

Double Receivador Cabinet Installed in Wood Door

Flange Trim for Receivadors

Flange trim is electrically welded to the Receivador, off center for installing in a door, or flush for wall installation.
For corridor wall installation leave proper opening and, after plastering, insert Receivador from corridor side, thus saving carpenter's time and insuring a neat, tight job. Flange trim can be supplied with all Receivadors, whether single or multiple units, at small extra cost.

Finish

All cabinets finished with one coat best non-rust, baked olive green enamel. Special grained finishes in mahogany, walnut and quartered oak at slight extra cost.

THE SAMUEL J. CRESWELL IRON WORKS

Twenty-third and Cherry Streets
PHILADELPHIA, PA.

Products

ARCHITECTURAL WROUGHT and CAST IRON WORK, and GENERAL FOUNDRY WORK, including Columns, Stairways (straight and spiral), Wheel Guards, Standards, Manhole Doors and Frames, Fenders, Roadway Drain Grates and Frames, Vault Plates and Frames, Ash Pit Doors and Frames, Cleanout Doors and Frames, Trench Covers and Frames, Cesspools, Drain Gutters, Pavement Doors, Gates and Grilles, Post Caps, Railings, etc.

Facilities

THE SAMUEL J. CRESWELL IRON WORKS is one of the largest and best equipped plants in the vicinity of Philadelphia for the production of the various kinds of architectural wrought and cast iron work mentioned above. Further, this company is prepared to submit estimates, or designs and estimates, for any ornamental work for large or small buildings, etc., on short notice.

General Foundry Work

In addition to architectural work, a fully equipped foundry is prepared to produce special castings and do general foundry work, including cast iron ornamental or plain columns from stock designs (sent on request) or to architects' designs.

Stock Specialties

The accompanying illustrations show a few specialties regularly carried in stock. The prices quoted are f. o. b. Philadelphia.

DONLEY PACKAGE RECEIVERS; COAL CHUTES; ASH DUMPS; FIREPLACE DAMPERS; ASH PIT DOORS; FIRE BASKETS; ANDIRONS; METER BOXES; GARBAGE RECEIVERS; MAIL RECEIVERS and other Building Specialties.

Donley Coal Chute

Replaces old-fashioned, battered coal windows. Protects foundation and siding. Locks when closed. Unlocks from within by pulling chain outside of coal bin.

Burglar-proof. Frames of unbreakable, malleable iron. Solid metal doors of copper-bearing steel, close fitting and rust-resisting. Glass doors protected by steel shield when open. Body of heavy weight, rust-resisting copper-bearing steel, reinforced upper edge. Hinges and latch of malleable iron. Latch and chain attachment galvanized against rust. Entire chute has neat, attractive design.

*Hopper optional. Hopper weights: small, 11 lb.; large, 19 lb.

Grade Line Coal Chute—For low set and terraced residences. Also frequently used for stores. This improved chute has provision for drainage. Drain has a strainer and can be connected with sewer. Constructed with checkered steel door, malleable iron frame and reinforced steel chute. Latch and chain galvanized.

Donley Package Receiver

A steel receptacle built into the outer wall of kitchen, for delivery of groceries, etc. Outer door locks automatically when closed; released automatically when inner door is opened. Installation detail furnished with every receiver. See following page. Approved by Good Housekeeping Institute.

Donley Package Receiver
Size: Outside height, 11 in.; width, 13½ in.; wall depth, 9 in.

Donley Underground Garbage Receiver

Prevents nuisances arising from ordinary garbage can. Consists of outer shell and inner receptacle that can be removed for emptying. Service lid of Parkerized steel operated by foot lever, which fits snugly, excluding flies. Made in 6, 10, 14, and 21-gal. capacities. Approved by Good Housekeeping Institute.

Donley Garbage Receiver

Donley Electric Meter Box

A steel cabinet built into basement wall where service wire enters. Supplied with 60-amp., 250-volt safety switch operated from basement. Meter read through glass pane from outside.

Large inner and outer doors. Height, 13½ in.; width, 16½ in.; wall depth, 10⅝ in.; shipping weight, 45 lbs.

Donley Fireplace Damper

A correctly formed throat and draft regulator combined, the Donley damper simplifies correct fireplace construction and promotes clean, economical fires through proper draft regulation. Two types of control, as shown. See following page for correct damper size. For intermediate size openings use next largest damper.

Dampers crated separately. Instructions for building fireplaces and installing dampers attached to each crate.

GABRIEL STEEL COMPANY

Manufacturers of Rolled Steel Products

2441 Bellevue Avenue, DETROIT, MICH.

Products

GABRIEL ROLLED STEEL COAL CHUTES; ASH PIT DOORS; DOME DAMPERS; FIRE-PLACE ASH DUMPS; PACKAGE RECEIVERS; INSERTS.

For Steel Joists, see page A573.

Gabriel Rolled Steel Coal Chute

The Gabriel Coal Chute is neat and attractive in appearance. Made of rust resisting rolled steel, which entirely eliminates broken hinges, doors or frames. Joints are electrically welded throughout. Hinges are of very heavy rolled steel and designed to hold the door in a vertical position when open. Automatic spring latch is made of heavy rolled steel. Hopper is easily attached or removed, and is designed to lie perfectly flat on bottom of chute when not in use. Equipped with roller and chain attachment which permits of operation from any point desired.

S-2408 Chute
with Solid Steel Door

Furnished either with rolled steel or glazed door. In the glazed doors, 1/4-in. glass is attached by means of special glazing clips. Glass is bedded and face puttied and protected on the inside by heavy wire guard.

Sizes: 16x24 and 22x32 in. for 8, 12 1/2, and 17-in. walls.

G-2408 Chute
with Wire Reinforced Glass Door

Gabriel Ash Pit Door

Ash Pit Door

Made entirely of rust resisting, rolled steel. Door and frame are true fitting, insuring practically an airtight closure. Frame of door is electrically welded and door is a single piece of heavy rolled steel plate.

A deep lug anchor is turned up at each of the four corners to facilitate installation and insure secure anchorage in chimney.

The hinges and keeper are practically unbreakable.

Made in four sizes: 8x8, 8x10, 10x12 and 12x16 in.

GABRIEL
ROLLED STEEL
PRODUCTS

Gabriel Rolled Steel Dome Damper

The Gabriel tank steel dome damper accurately controls the draft, promotes cleanliness, saves fuel and is conveniently operated. Its vertical front flange permits its use regardless of

Dome Damper for Fireplaces
Showing Pushrod Operator

the construction of the fireplace and seals the joint between the rough brick and the fireplace facing. It is substantially constructed, operated with ease, stays in position and can be had for handle, poker, chain or pushrod operation. Furnished in five sizes: 24, 30, 36, 42 and 48 in., with or without horizontal front angle.

Gabriel Ash Dump

The Gabriel ash dump is unbreakable, with an unremovable leaf. Frame is electrically welded, and heavy enough to withstand any usage. It is very neat in appearance and will not warp or twist with use. Made in one size only, 5x7 in.

Gabriel Ash Dump

Gabriel Package Receivers

Neat, inconspicuous and weathertight. Design and quality insure satisfactory operation year after year. Made of heavy rolled steel plate, with two latched doors—one outside and one inside. Handles designed to permit installation in an inverted position, if necessary. Made for 12x14-in. wall opening. Width permits installation between studs of standard spacing, 16 in. on centers. Body of receiver is made in three depths: 5, 9 and 13 in.

Package Receiver
Inside Door

Gabriel Inserts

Gabriel inserts are made from structural grade new billet steel. All sections used in the fabrication of insert are rolled sections. Pressed metals, cast and malleable irons, have been entirely eliminated. Structural sections, especially rolled, give the necessary fillets at points of maximum stress. Specially designed anchors assure a maximum holding power.

Average ultimate capacity of several Gabriel plug inserts, by test, 12,000 lb. each. Average ultimate capacity per foot of Gabriel slotted insert, 11,000 lb. Standard lengths of 1, 2, 3, 4, and 5 ft. Furnished with or without end caps. Made in 3/4, 1, and 1 1/2 in. size. Height of plug insert, 3 3/8 in.; weight, 3/4 lb. Height of slotted insert, 1 1/2 in.; weight, 2.1 lb. per ft. Anchors 3 1/4 in. high.

TRADE-MARK

Value of Copper Steel Coal Doors

Steel coal doors have become standard equipment in modern American dwellings. Home owners are demanding them both for the protection of the foundation walls and as a guard against intruders.

The YPS Copper Steel Coal Door is good looking and sturdy. It will prevent the unsightly marring of the window frame so noticeable in the foundations walls of buildings where coal is chuted through the ordinary cellar window.

Most home owners have been through the annoying and expensive experience of broken windows due to coal being chuted through the ordinary frame window. Broken windows are eliminated by the use of YPS Copper Steel Coal Doors.

YPS Coal Door

Style, in.	Wall thickness, in.	Masonry opening, in. width, height	Weight lb.
18 x 24	8	21 3/4 x 18	46

Details of Construction—All the skill in design which has made an enviable reputation for the YPS designers, is brought out in the YPS Coal Door and the quality of materials is up to the high standard which builders all over the country have come to expect in every product of this great YPS plant.

The frame of the YPS Coal Door is one solid piece of deep drawn, heavy copper steel tank plate 1/8 in. thick. The same material is used throughout the doors construction.

The self-closing lock is exceptionally strong with a heavy spring which insures positive locking when the door is closed. Locks may be equipped with a chain in order to release catch from the floor above.

Unbreakable hinges automatically hold the door, when open, against the foundation to give perfect protection to the wall when the coal is being put in.

Heavily coated with red oxide at the factory, the YPS Coal Door comes ready to go into the foundation with the least effort and the greatest amount of satisfaction possible.

YPS Copper Steel Basement Windows

Heavy one-piece frames of YPS basement sash are the stiffest on the market. Hanger hinges, an exclusive feature, permit ready removal or placing of ventilators, though ventilator comes out only when lifted to horizontal. Ventilators and frames are interchangeable; detachable jamb bar strips, new design, can be supplied for brick or stone wall; positive lock is simple, yet unbreakable. YPS sash admits as high as 80% more light than wood sash, and gives greater ventilation when open.

Five standard sizes.

Products

KEWANEE COPPER STEEL BASEMENT COAL CHUTES: Window, Store, and Grade Line.

For Kewanee Copper Steel Basement Windows, see page A1041.

General

Kewanee Chutes afford efficient facilities through which to deliver coal to basements of buildings. They withstand hard knocks which shatter ordinary construction, protect the building from damage and defacement, and are simple and convenient to operate. The saving in repair bills alone quickly overcomes the difference in cost between a Kewanee Coal Chute and makeshift arrangements.

All parts, even the rivets, are of heavy Keystone Copper Steel—a special alloy which is not only rust resistant but tougher than ordinary steel. Kewanee Chutes harmonize perfectly with the foundation wall, whether it be of brick, concrete, stone or other material.

They can be readily installed in old as well as new buildings.

In order to meet various conditions, Kewanee Chutes are manufactured in three distinct types: Window Chutes, Store Chutes and Grade Line Chutes. Each type is furnished in two standard sizes and one or more styles.

Every Kewanee Coal Chute is *guaranteed* against breakage and warranted to give satisfactory service.

Kewanee Window Coal Chutes

Kewanee Window Chutes are the type most commonly used, being designed to take the place of the common basement window in buildings with foundation walls extending sufficiently above the grade line. These chutes are furnished in two sizes—with plain or glass doors, with or without hoppers, and with bodies for 8, 12 and 18-in., or thicker, foundation walls. Three typical styles of Kewanee Window Chutes are illustrated at the left.

Frame—Frame and bottom of all Kewanee Window Chutes are pressed out of one piece of heavy Keystone Copper Steel. Frames of the regular size (the "100" series) chutes have a clear net opening for the delivery of coal 21 in. wide by 15½ in. high, and those of the large size (the "200" series) have a net opening 28 in. wide by 20 in. high.

Body—Kewanee Window Chutes are regularly furnished with flat bottom bodies 8 in. deep or sloping bottom bodies 12 in. deep.

Sloping bottom bodies 18 in. or more deep for extra thick foundation walls will be supplied on special orders.

Door—Two styles of doors are supplied, the style P door ("Plain" door), admitting coal alone and the style G door ("Glass" door), for use where light also is required. All top hung doors have slotted hinges which automatically hold the door upright when open.

Hopper—In style PC Chutes ("Plain" door, "Combination" hopper), the door is hinged at the bottom, and in combination with wings, forms a convenient and substantial hopper for the reception of coal. The shield for protecting the wall above is automatically raised and lowered with the opening and closing of door. In style GI Chutes ("Glass" door, "Independent" hopper), the hopper is independent of the door. A chute with hopper prevents scattering and is desirable where coal will be shoveled in directly, or delivered in bag, basket or wheelbarrow.

Lock—All styles of Kewanee Window Chutes lock automatically and positively.

By attaching a chain or cord the lock can be easily operated from any place in the building.

*Also furnished with body 18 in. deep (19½ in. high at back).
†Also furnished with body 18 in. deep (24 in. high at back).

Advantages of Kewanee Window Chute Construction

(The glass door chute is chosen for reference as the style best illustrating the various features of Kewanee construction.)

(1) Stronger glass door construction—two smaller glass panels instead of a single large one. Panels simply and efficiently protected during coal delivery by heavy wire guards, readily removed for cleaning glass.

(2) Pressure on glass is evenly distributed—retaining clips bear on a steel binding angle and not directly on the panels, which are cushioned in putty.

(3) Lock is actuated positively by a strong spring, not by gravity.

(4) Appearance is clean-cut and attractive—the smooth lines of Kewanee Chutes are due to pressed steel construction.

(5) The rugged, pressed steel hinges are slotted so as to automatically hold the door up when in the open position.

(6) Greater throw-in space for coal—the pressed steel frame is less bulky than brittle cast iron. The maximum throw-in space is particularly important in the regular size chute.

(7) Bottom of body, where wear is greatest, formed out of same piece of heavy Keystone Copper Steel as the frame. All parts, even the rivets, are made out of this rust-resistant alloy.

The Kewanee line also includes plain door chutes of exceptionally strong and simple hopper construction, opened and closed by a simple pull or push.

Kewanee Store Coal Chutes

Kewanee Store Chutes are adapted for use in buildings where the first floor is too near the ground level to permit the installation of the regular window type of chute.

These chutes are provided with convenient and automatic locking arrangements same as Kewanee Window Chutes. Slotted hinges hold the door open. A foot attached to the sloping bottom supports the chute in upright position while the foundation wall is being built around it.

No.	Hopper	Dimensions in inches										Net and ship. wt., lbs.

31-PI	Independent..	26	22	24	21	17	16½	18	29	18	12	145
32-P	None.....	34½	26	31½	24	17	16½	18	34	18	12	170
32-PI	Independent..	34½	26	31½	24	17	16½	18	34	18	12	190

Kewanee Grade Line Coal Chutes

Kewanee Grade Line Chutes are also used in buildings with low first-floor levels. Kewanee heavy, Copper Steel construction is particularly essential in chutes of this type, because the door and frame are liable to be driven over with heavy loads and otherwise subjected to great stress and strain.

Majestic Coal Window

This popular, sturdy window has won universal preference because of the protection it gives to the entire opening and sidewall when coal is being deposited in the bin. It gives the greatest protection to the building above the window where it is most needed—thus it saves its initial cost many times over and enhances property value by its permanence, sightliness and convenience.

Built for permanent service—will withstand the most severe conditions of usage.

Backed by 20 years' experience in building quality coal chutes.

Guaranteed Breakproof Doors—The doors of Majestic coal windows are made of heavy pressed steel, electro-galvanized to resist rust. When raised, the door holds itself open automatically, thus protecting the building above the opening.

Breakproof Frames—Frames are made of certified malleable iron. They set true in the masonry—no installation difficulties.

Frame and door fit snugly, making the window weathertight.

Breakproof Hinges—Hinges are made of certified malleable iron, making breakage at this point a practical impossibility.

Hinges are flat with support on each side of the hinge pin. Neat and inconspicuous, eliminating the necessity of cutting the water table to provide hinge clearance.

Reinforced Bodies—Bodies and hoppers are made of Keystone copper steel and heavily reinforced at points of strain. Angle iron reinforcement allows masonry to be laid directly on the body without the use of a lintel.

Burglarproof Automatic Locks—Unfailing burglarproof and troubleproof. Doors are unlatched (from inside only) by a chain which may be extended to any part of the house. Lock drops shut automatically when door is closed.

Styles—Majestic coal windows are made in solid steel and in glass panel styles as follows:

No. M101 (Steel Door Style)—Equipped with sloping bottom body and chain to gravity catch.

Style B has a copper steel hopper for coal delivery with bags or wheelbarrow.

Style D is without hopper.

No. M203 is the same as No. M101 but larger in size.

No. M500 (Steel Door Style)—Differs only from No. M101 in that it has a 9-in. straight bottom body, without hopper.

No. M520 is the same as No. M500 but larger in size.

No. M10 (Glass Panel Style)—Used when daylight is desired in the coal bin or basement. Has three lights of 1/4-in. plate glass set in a 1/2-in. angle iron frame with two pressed steel dividing strips to give still more strength. Rubber packing is used instead of putty. The door is heavy, electro-galvanized steel, the glass being protected by a steel shield when open. Otherwise the No. M10 is the same as No. M101.

Style A has a hopper.

Style B is without hopper.

No. M20 is the same as No. M10 but is larger in size.

No. M600 (Glass Panel Style)—Differs only from No. M10 in that it has a 9-in. straight bottom body, without hopper.

No. M620 is the same as No. M600 but larger in size.

Majestic Grade Line Coal Chute

The Majestic grade line coal chute is designed for buildings having little or no foundation above ground, as in low set or terraced homes, apartments, stores and office buildings.

Door swings upward and, when raised, forms part of the hopper and becomes a shield which protects the building when coal is delivered. When closed, the door locks automatically and is burglarproof.

Breakproof construction throughout. Frame, door and hinges are of certified malleable iron, with solid brass pins; body of Keystone copper steel, reinforced with angle iron. The door fits snugly over the top of the frame when closed. This feature, with the waterproofing ridge around the inside edge of the frame, gives an absolutely watertight job.

Strong and durable — will outlast any building in which it is installed.

Majestic Grade Line Coal Chute

Majestic Store Coal Chute

The Majestic store coal chute is designed particularly for store and office buildings, where the first floor is on a line with the sidewalk or alley.

It does away with the dangerous sidewalk coalhole and the necessity of putting up a bond for the protection of pedestrians.

Frame and hinges are certified malleable iron; doors of heavy gauge pressed steel, electro-galvanized to resist rust.

Two sizes, with or without hoppers.

On special order, the Majestic store chute can be supplied with a duplex body so that coal can be deposited either under the sidewalk or in the basement as desired.

Majestic Store Coal Chute

Majestic Milk and Package Receiver

Designed to hold 6 or more quart bottles of milk, depending on the thickness of the building wall in which it is installed. It consists of two cast iron frames and doors, connected by a steel body, adjustable to the thickness of the wall in which it is placed. Castings and steel body are coated with *bitumastic solution*, the enduring protection against rust.

The burglarproof gravity latch on the outside door can be unlocked only from inside. The kitchen side door is provided with a refrigerator type latch and handle and can not be opened from outside. Doors can be reversed at time of installation—either door can be installed inside or outside to open either to right or left by simply changing the gravity latch from one door to the other.

How Operated—A chain attached to the gravity latch runs through two cast iron eyes to the inside frame, where a cast iron ball is suspended. When empty bottles are placed in the receiver, the ball is pulled down. Its weight, and the friction of the chain holds the latch on outside door unlocked. The inside door is then closed and locked by the refrigerator latch.

When the outside door is opened, the chain is drawn outward and held by friction. This leaves the gravity

latch in locking position, and when the door is closed, it locks automatically.

Sizes—Made in two depths of adjustable bodies, adapting them to walls of any thickness.

No. 1 body adjustable to walls from 5 to 8 in. thick; No. 2, from 8 to 14 in. Bodies of special depths furnished at additional cost.

Outside dimensions of package receiver frames, 16 $\frac{1}{4}$ in. wide by 14 in. high; wall opening required, 14 in. wide by 12 in. high.

telescoping sections, one fastened to the front casting and the other to the back or outside casting, therefore the body is adjustable for 8 and 12-in. walls. For narrow walls, casings may be used inside and outside.

3A and 5A Apartment Receiver—Consists of a heavy cast iron frame and door, a galvanized iron body which recesses in wall, and a galvanized iron garbage pail which sets on a cast iron shelf fastened to the door. When door is opened, can is ready to receive garbage, as shown. The receiver is vented through the wall by two 4x2 $\frac{1}{4}$ -in. heavy cast iron ventilators furnished with each receiver.

9A Apartment Receiver—Has a front casting only, with a steel body that is recessed in the wall to receive the garbage can. Front is provided with a hopper garbage door and two doors below for removal of can. Doors fit closely and lock with a refrigerator type latch.

Underground Garbage Receiver—Offers an out-of-sight, odorless, flyproof, waterproof, sanitary and convenient method of garbage disposal. Consists of a receiver shell made of Keystone copper steel, and ring, lid and foot lever of cast iron. Entire receiver is treated to prevent deterioration, and formation of rust.

Comes complete with either a heavy plain can or an extra heavy Witt corrugated can.

The receiver shell is buried in the ground (in any convenient location) to the upper band. Lid is opened by a slight pressure of the foot on the trip. When foot pressure on trip is released, lid snaps tightly shut and no odors can escape. When can is full, it is easily lifted out.

Supplied in 5, 8, 12, 15 and 20-gal. capacities.

practically correct, due to the built-in lintel, which assures the correct height of damper throat above finished opening—also correct position of damper. Installed in

Plan

Elevation

Detail of Damper Operation

Fireplace Section Showing Application of Damper

The making of the lintel integral with the frame of the damper makes it certain that the distance from the top of the opening of the fireplace to the top of the throat is correct—and this is the most important dimension of the whole fireplace. It also makes it necessary to place the damper forward in the fireplace, thus leaving room for a smoke shelf behind.

Ease of operation is accomplished by the *trouble-proof friction principle for opening and closing the door or valve*. The operating lever is out of sight and easily moved forward or backward with a poker, and it stays in position until again adjusted. The throat opening is subject to the best minute adjustment, and there are no knobs or handles to protrude through the front of the fireplace.

The Majestic Type X, however, is supplied for those who prefer the handle or knob control.

The valve or door is hinged at the back, which permits heat to be thrown out into the room, draws the smoke off from the nearest possible distance from the face of the fireplace, and aids the smoke shelf in turning the down-draft back up the chimney.

With the Majestic throat and damper any mason can build a perfect fireplace by following the drawings and instructions furnished with each damper.

Made for 5, 6, 7, 8, 9 and 10-in. smoke pipe. Over-all size of thimble is ½ in. greater than smokepipe size.

BENNETT HEATER COMPANY, INC.

The Bennett Heater and Ventilator for Open Fireplaces
NORWICH, N. Y.

The Bennett Heater

The *Bennett Heater* can be had for almost any fireplace, old or new, and saves two-thirds of the heat usually lost up the flue.

It consists of an air duct through the back of the chimney from which heating tubes lead over and through the fire to a register at the top of the fireplace opening.

Pure fresh air entering from the outside is heated as it passes through the tubes, then discharged into the room at a high temperature, with the result that the room is uniformly heated, unhealthy drafts are eliminated and the fuel expense cut to a minimum.

The heater delivers a constant flow of pure warm air into the room and takes the place of the main heating plant for many weeks in the spring and fall.

For New Fireplaces—We furnish stock sizes with which are included plans and specifications covering the fireplace opening, throat, smoke chamber and flue. Also, a 3x3-in. angle bar cut to proper length for the fireplace opening and with brackets attached to receive the heater front. Also, a wood form for the air duct, around which the mason work is built up. Data for the plans and specifications are from United States Government recommendations on fireplace design.

For Old Fireplaces—The *Bennett Heater* is assembled to meet the size requirements of each fireplace and installation is primarily a matter of cutting the air duct through the chimney.

Throat Dampers—A throat damper should always be used. We can supply one at extra charge which will give economy and general satisfaction.

Basket Grates—These are very desirable for both wood and coal. We can furnish special grates in which the heater itself forms the grate back and with a special lug which keeps the grate in proper relation to the heater.

Advantages of the Bennett Heater

Can be constructed to fit almost any fireplace, old or new.

Does not require the fireplace to be built around the heater.

Can be removed in ten minutes when it is desired to clean the chimney flue.

Utilizes the heat, which generally goes up the chimney, to heat fresh cold air from outside.

These Advantages Secure—(1) Increased heat value from the fuel burned. (2) Added circulation of heated fresh air in the room.

Other Advantages—The high efficiency of the *Bennett*

BENNETT
FIREPLACE HEATERS
TRADE-MARK

Heater is secured through the concentration of its heating surfaces at the hottest part of the fireplace. These heating surfaces have a larger area than the total area of bottom, back and sides of the fireplace.

The greatest advantage of the *Bennett Heater* is due to the large quantity of fresh air heated and discharged into the room, thus counteracting

the leakage of cold air into the room around windows and doors. The *Bennett Heater* heats the whole room, not just around the fireplace.

Its economic advantages and mechanical construction are the results of years of study, experiment and development, based on the scientific principles of heating and ventilating, skillfully worked out and practically applied.

Special Basket Grate and Heater

Air Intake Fitting for Back of Chimney

Guarantee

The *Bennett Heater* is guaranteed to give satisfaction when installed in any usable fireplace which already burns satisfactorily without smoking.

The *Bennett Heater* will not warp or crack from heat. There are no flat heating surfaces to warp or buckle, the flexible heating tubes provide for all expansion and contraction.

HEATILATOR COMPANY

Manufacturers of the Heatilator, a Practical Heating and Ventilating Unit

MAIN OFFICE AND PLANT

Glen and East Brighton Avenues
SYRACUSE, N. Y.

Distributed Through Leading Mason Supply Dealers

The Heatilator

The Heatilator modernizes fireplaces. It has double walls on both sides, top and back with an air space between and an opening through the back wall to the outside. It is especially valuable in building new fireplaces and is equally desirable for remodeling.

Principles of Operation—Fresh air enters the double wall from the rear, passes through and around the three sides and top of the fireplace where it is heated and emerges into the room through the grille opening above the open fire. This heated fresh air circulates to the top of the room, cools, descends where it feeds the fire and passes up the flue.

A Modern Heatilator Fireplace

The principle is similar to a hot air furnace with fresh air intake, heating chamber and warm air register or grille. Instead of being entirely enclosed like a furnace, it becomes an open hearth or fireplace adding charm and attractiveness to the home and insuring an efficient and satisfactory fireplace. Adapted to use with brick, stone, tile or stucco.

Advantages—The Heatilator fireplace corrects common faults of fireplace design and construction—such as smoking, cold air drafts, insufficient heat and waste of fuel.

Saves one-half its cost in material and labor.

Saves much heat formerly wasted.

Makes fireplaces an economy.

Furnishes perfect fresh air ventilation at all times.

Insures scientifically correct construction.

Prevents drafts by furnishing plenty of fresh, pre-heated air to warm the room and feed the open fire.

Popularizes the use of fireplaces.

Adds greatly to value of home for owner's use or resale.

Construction—The inner shell or part exposed to the fire is of $\frac{1}{8}$ -in. copperoid, non-rusting, boiler plate iron. The outside or back wall of the heating chamber is of 14 gauge, copperoid iron. All seams are electric-welded.

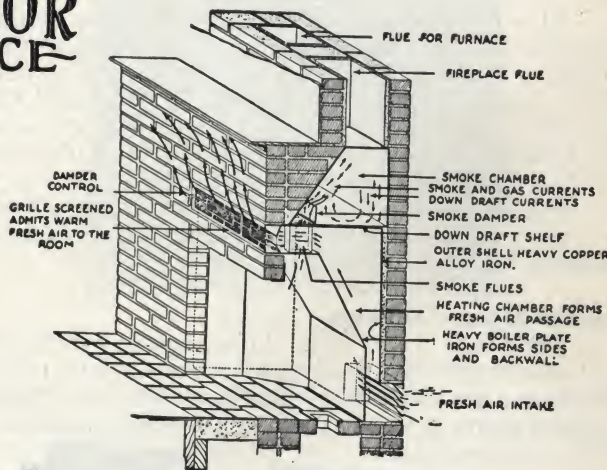

Front grille outlet for warm air is of bronze, size $5 \times 33\frac{1}{2}$ in. Louver type of grille at back furnishes the intake for fresh air. If located in the center of the building a fresh air box is used to carry the air to the bottom of the heating chamber.

The smoke damper and control are part of the Heatilator. The same attachment controls the intake of fresh air, making a perfect ventilating system at all times.

Floor Plan for Outside Installations

HEATILATOR FIREPLACE

Dimensions

Size of Fireplace Opening— $34\frac{1}{2}$ in. wide by about 28 in. high; depth 21 in. from face of brick to inner wall.

Area of Smoke Flues—96 sq. in.

Area of Air Intake— $7\frac{1}{4} \times 16\frac{1}{2}$ in., 70% unobstructed or 90 sq. in. net.

Area of Grille Warm Air Outlet— $5\frac{1}{2} \times 34\frac{1}{2}$ in., 60% unobstructed or 114 sq. in. net.

Chimney Flue Recommended—About $8\frac{1}{2} \times 13$ in.

Installation Directions

Simple installation directions and a plan drawing are included with each unit.

Shipped for Free Inspection

Shipment will be made to any reliable dealer for inspection. If not satisfactory in every way shipping instructions will be given and freight refunded.

Price and Shipping Weight

The price of the No. 34A Heatilator, complete, ready to install, carefully crated, is \$78.00. The shipping weight is 340 lb.

Products

DOME DAMPERS, ASH PIT DOORS and ASH TRAPS.

Dome Dampers

Design and Construction—The three types of dome dampers shown are designed with the single idea of efficiency. This has been attained to an unusual degree by so constructing the dampers as to eliminate all pockets or cut-ins, which tend to impede the free passage of the smoke, thus overcoming the principal weakness of the ordinary dome damper. The flange of the damper forms an arch bar of ample strength to support the weight of the masonry above the fireplace.

Operation—Extreme simplicity is the cardinal point in the operation of these dampers. All that is required to operate Styles "A" and "B" is a common poker. Style "C" operates with a straight thrust, by means of a rod through breast or side of fireplace. It contains no cogs, gears, worms or springs in the throat to rust fast or give out. *One damper that never fails to operate.*

CHICAGO, ILL.

Products and Service

THE IMPROVED COLONIAL HEAD THROAT and DAMPER for Fireplaces; GLO-HOT ELECTRIC GRATE.

Also complete Fireplaces in brick, stone, marble, tile, and wood mantel bases; complete Fireplace Furnishings: Fenders, Grates, Andirons, Fire Sets, Trimmings; Special Brass and Wrought Iron Work for fireplaces.

Special Service to Architects and Builders

Through the experience of a quarter of a century we have successfully encountered the difficulties of all types of fireplace construction as well as many unusual conditions, and we will gladly put this knowledge and experience at your command. For many years a growing number of leading architects have written us freely regarding their fireplace problems. We will gladly serve you also.

Colonial Damper Works Right in Any Fireplace

With the new "Style G" lever arm operating device (patent applied for) the Colonial Damper may be set one, two or three courses above the opening or even higher with a long shaft. Operating handle is out of sight yet easily accessible.

Colonial Damper Takes Up Heat Expansion

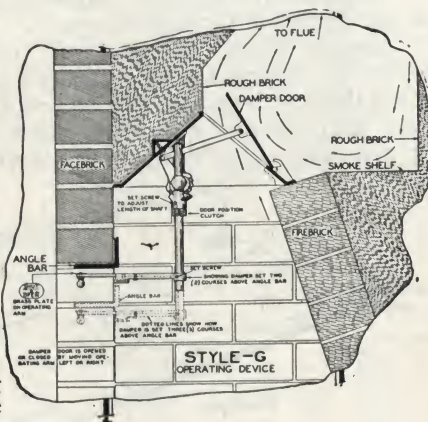

Built in sections of best iron castings reinforced with steel angle bar so as to sustain great weight and intense heat. The overlapping joints between sections take up heat expansion and prevent cracking the face of the fireplace.

Colonial Dampers are available in Styles A, E and G as illustrated in circulars which will be mailed upon request. The Colonial Head compels correct formation of the fireplace throat—the vital part—and saves its entire cost in labor. May be

used with any type of fireplace, arched or square opening.

For genuine fireplaces the Colonial Damper is without a peer. The Style-G operating device perfectly regulates the opening of the throat. The operating handle slides forward and moves right or left to open or close and when the draft is adjusted, slides back again under the opening out of sight. The Colonial Damper backs up beauty of your design with the assurance of successful operation.

Sectional View, Style-G

Showing method of operation and adjustments. With this device the Colonial head may be set anywhere in throat as high up as desired

"Glo-Hot" Electric Fireplace Grate (Patented)

Approved by the Underwriters' Laboratories, Inc.

No. 2710

Cross Section

Details of construction and air space between copper reflector and back. Steady circulation drives hot air into the room

Enables the architect to produce real fire effect *with heat* where no flues are provided in the plan. The heat flows out from the "Glo-Hot" heating element under the hood. The scientifically designed copper reflector throws all the heat rays straight into the room. Gives the fascinating flicker as of real fire in glowing coals, and heats as well, without requiring any flue.

Standard size: 1000 watts, 110 volts. Installation requires No. 12 wire on separate circuit. Also in 500-watt and 2000-watt capacities. The 500-watt size may be connected with ordinary house lighting circuit.

Fireplace Blue Print Details Free on Request

A very informative blue print, "How to Avoid Common Mistakes in Fireplace Construction," showing the best and latest practices of correct design sent free on request. Special details if required. Complete catalogue free when requested on business stationery.

COVERT
FIREPLACE DAMPERS
TRADE-MARK

for use in large and deep fireplaces.

Made in three series, 10, 12 and 16 ins. deep in the base opening, of extra heavy construction, as shown at the bottom of the next page.

"Old-Style" Damper Series A, B, C and F

Damper plate, operated by a lever reached with a poker, is adjustable to three positions: open, closed and half closed.

Covert Rotary "Face or Side Control" Damper

This type is especially adaptable for use where it is desirable to operate the plate from the face or side of the fireplace by a brass handle.

Covert Rotary "Face or Side Control" Damper

Avoiding the usual worm gear (which is likely to become clogged by accumulations of soot), the Covert damper makes use of a simple crank movement that can be connected up to operate from the face or the side of the fireplace with the mechanism accompanying each damper.

Cross section is approximately the same as Series C "Old-Style" with 9-in. depth and 5-in. height, made for fireplaces up to 48 ins. wide.

Covert Steel Smoke Chamber

To secure the best results a Covert steel smoke chamber should be built above the damper, forming a smooth and properly shaped approach to the flue, thereby reducing friction, increasing the flue power, saving mason's time and insuring proper form of construction.

Since a successful fireplace depends largely upon the elimination of friction to the rising smoke, it is evident that if the smoke chamber is constructed with ragged brickwork, friction is bound to occur, thus resulting in poor draft.

Installation Showing "Improved" Damper and Steel Smoke Chamber

Covert "Improved" Fireplace Damper

This type is very efficient in action due to its curved front and wide, unobstructed smoke opening. Inrushing air follows the curved front up into the smoke chamber with a minimum of resistance.

"Improved" Damper Series D and E

The ratchet handle allows the damper plate to be adjusted to any size opening, from the front of the fireplace.

The operating mechanism is very simple and the valve plate is easily removed during construction or for removing accumulations of soot.

Used in fireplaces 20 ins., or less in depth at the hearth.

Covert "Old-Style" Damper

This type is preferred by some architects, especially

The Covert steel smoke chamber eliminates this difficulty in fireplace construction.

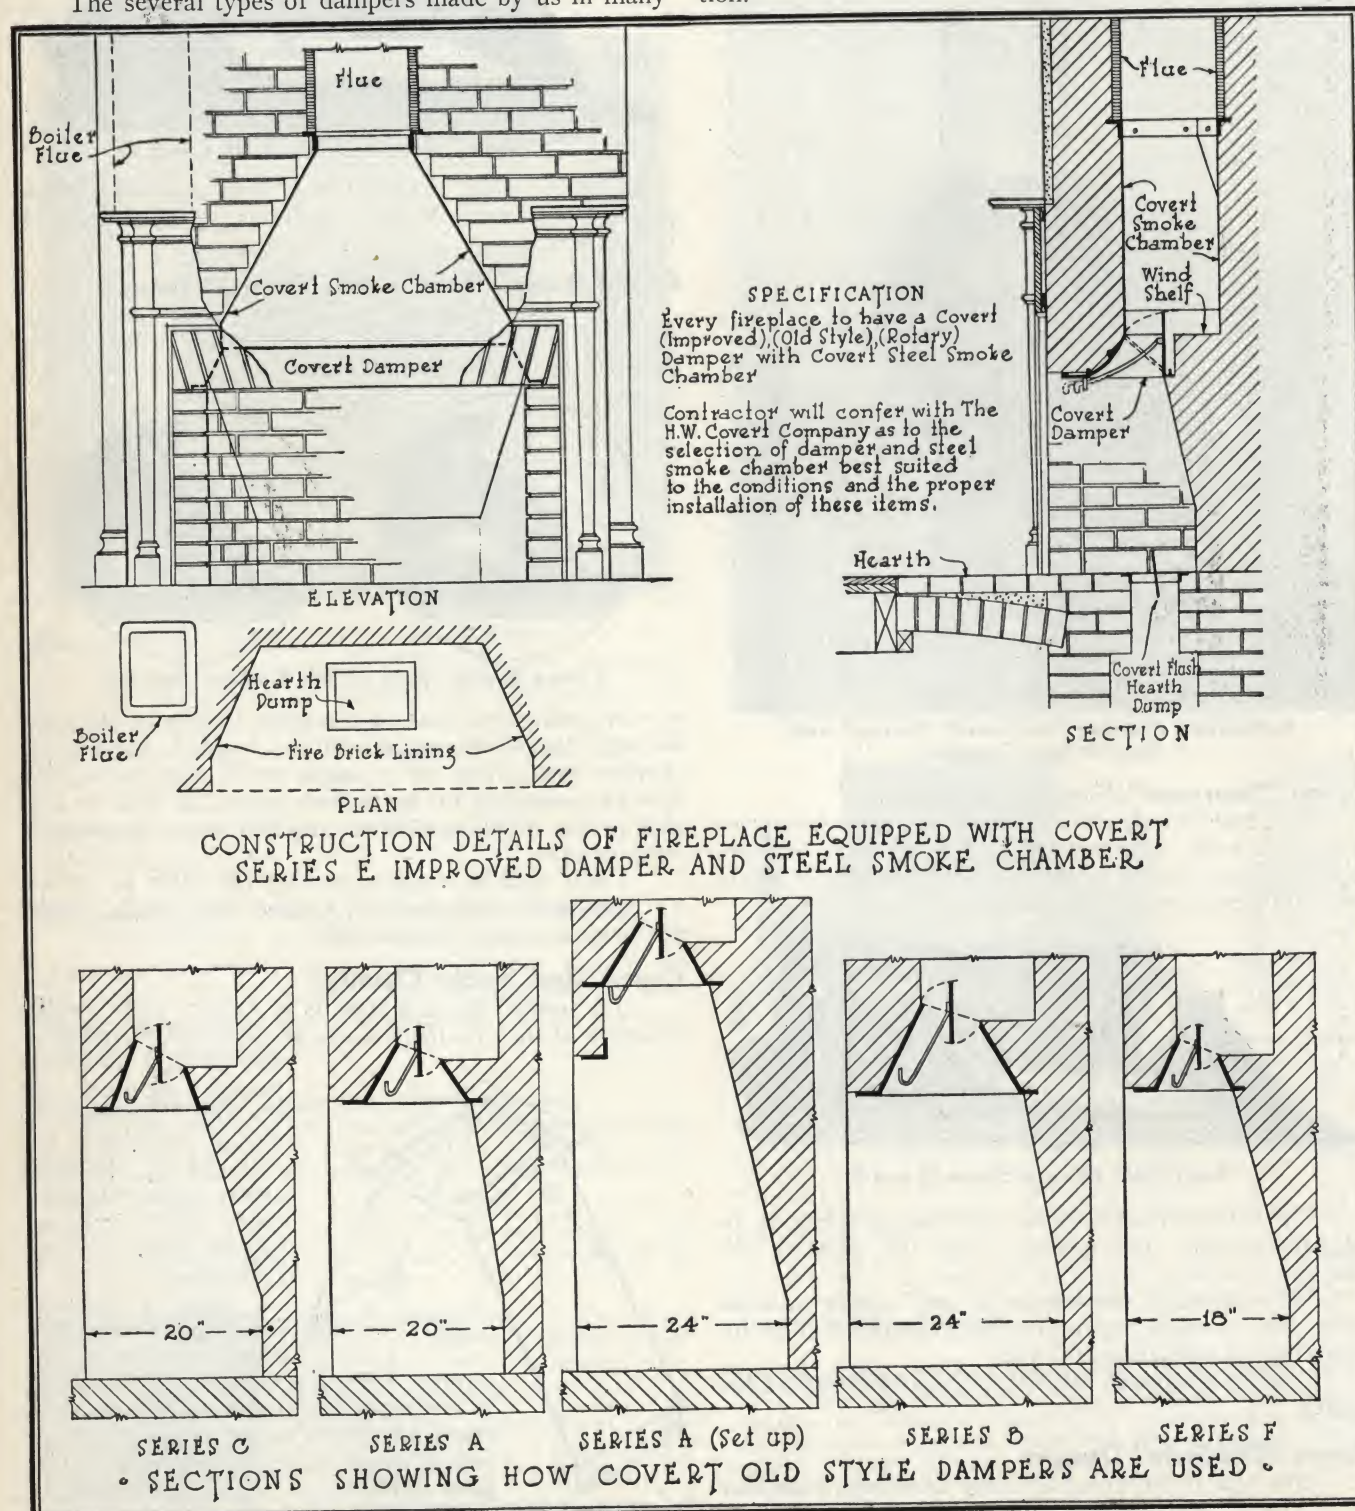

This smoke chamber consists of two steel plates, a collar the same size as the flue lining, and four bolts for fastening. The mason bolts the two plates to the collar, places this frame over the damper, and builds his brickwork around it. Thus we have a smoke chamber with smooth steel sides which practically eliminates friction. This is impossible in brick facing. Moreover we have a chamber of correct form scientifically designed for ample capacity, and installed in much shorter time than under the old method.

Service

The several types of dampers made by us in many

different sizes, covering fireplaces up to seven feet wide, provide the architect, when detailing his fireplaces, with a large choice to meet the many varying conditions encountered in fireplace construction. The following page shows sectional views of each separate type of damper, with their exact dimensions; and the accompanying table gives all further necessary information together with the size of flues recommended in both rectangular and round shape.

We are always pleased to have architects, owners or builders consult with us regarding details of construction of fireplaces and are glad to give them without charge, the benefit of our long experience. Our booklet of fireplace construction will be sent on application.

EDWIN A. JACKSON & BRO., INC.

Manufacturers of Jaxon Fireplaces and Building Specialties

50 Beekman Street; also Lexington Avenue and 65th Street

NEW YORK, N. Y.

Products

JAXON DAMPERS, SMOKE CHAMBERS, DUSTLESS ASH TRAPS, BUILT-IN and UNDERGROUND GARBAGE RECEIVERS, WOOD MANTELS, ANDIRONS and FIREPLACE FIXTURES.

Also manufacturers of Jaxon Sidewalk Chutes, Windo-Shutes, Package Receivers. For Wood Mantels, Franklin Stoves and Ventilating Grates, see page B1237.

Jaxon Dampers

These dampers are made in three styles, namely, throat, rotary and push. They are designed to insure best possible draft under all conditions.

Our throat type is the latest and best style of fireplace damper. The patent arm holds the door in any desired position. Operation is by poker; no handle shows on the face. Also made in extra width for very deep fireplaces.

Jaxon Throat Damper

No.	Dimensions, in.				Flue size
	Width fireplace opening	Extreme of flange			
		Front	Back	*Depth	
24-28	24	28	20	12	8x 8
30-34	30	34	25	12	8x12

36-40	36	40	31	12	8x12
42-46	42	46	37	15	12x12
48-52	48	52	43	15	12x12
54-58	54	58	50	15	12x16
60-64	60	64	58	19	16x16
72-76	72	76	70	19	16x16
84-88	84	88	82	19	16x20

*Also made in extra width for very deep fireplaces.

Jaxon rotary dampers and Jaxon push dampers operate from the front of the fireplace by a rotary rod or push handle. Rotary style can also be had to operate from end of breast.

Jaxon Smoke Chambers

These are designed to prevent the irregular brickwork often carelessly laid in the throat running from the damper to the flue. Each chamber includes two metal sides, fitting damper below and attaching to a metal collar which fits flue above. When specifying, state whether greatest dimension of flue is parallel with face of breast. Also made to fit round flues.

Jaxon Dustless Ash Traps

For dropping ashes without dust from open fireplaces, kitchen ranges and coal grates to ash pits. The ash trap is set with the top flush with the hearth.

The trap is operated by a rod passing through the lower part of the range or grate, permitting the ashes to be passed from the fire to the ash pit without dust entering the room.

The door is easily operated and there are no springs to get out of order.

Jaxon Dustless Ash Trap

No.	Dimensions, in.		
	Outside flange	Brick opening	Trap opening
9	15 x 9	11 1/2 x 6 1/2	10 7/8 x 5 1/2
6	9 x 7	7 1/2 x 5 1/2	6 3/8 x 5

Jaxon Built-in Garbage Receivers

The Jaxon receiver is made of heavy cast iron, including the door and frame. The front of the receiver opens into the kitchen and is so arranged that, when the door is opened, the can is brought forward convenient for use. The door shuts tight and locks securely.

No. 3—Wall opening is 14 1/2 in. wide, 12 in. high and 10 in. deep.

No. 3K, same size and construction, also has an outside door for suburban use.

No. 4—Is similar, and fits a wall opening 19 in. wide, 19 in. high and 10 in. deep.

No. 4K, same size and construction, also has door at back for removal of can through the yard.

No. 3. Garbage Receiver

Wood Mantels

We manufacture wood mantels, copies of good Colonial designs, in stock for prompt shipment. We also make accurately from architect's designs.

For description see page B1237.

Andirons

We import Italian and English andirons, and also make reproductions. We also manufacture other fixtures that will be needed in fireplaces, including grates, fenders, spark screens, etc.

Catalogues

Our catalogues describing in detail all of our products will be gladly sent on request.

For Metal Lath, Corner Bead, Korerite, Base Bead, Cold Rolled Channel, see pages B1304-1305.

Economy Dome Dampers

Provide, as far as is mechanically possible, a positive means of regulating an open fire. They overcome the annoyance of a smoky or stubborn fire. There are

no working parts to become easily detached or broken. Operated by a ratchet or rod control. Ratchet control dampers are used where it is not desirable to cut through the mantel face. In ratchet control the operating mechanism is underslung and out of sight. By inserting the end of a common poker in the handle of the ratchet the door can be opened or closed to any degree and will stay in that position.

FIREPLACE DIMENSIONS AND DOME DAMPER SIZES

Fireplace			Damper

Depth of dome, all sizes rod control type, 8½ in., poker control type 8 in. Height 4½ in.

Area of fireplace opening should not exceed 12½ times the net flue area.

Sykes Economy Ash Dumps

Provide a quick and economical means of allowing the ashes to drop. A slight pressure of the poker on the counterbalanced door dumps the ashes, and the door swings back into place shutting off up-drafts or dirt from the basement.

Size 5x7½ in.

"The Pyramids Are Permanent Too"

Ash Pit and Cleanout Doors

Installed in the base of the chimney for removal of the soot and ashes. Made in 4 sizes:

6x8 in. weight, 18 lb.
8x8 in. weight, 23 lb.
8x10 in. weight, 28 lb.
10x10 in. weight, 40 lb.

Ash Pit Door

Economy Coal Chute Doors

Solve the problem of getting coal into the cellar without disfiguring the outside walls. They cost no more than any ordinary glass window. Made entirely of steel with exposed parts galvanized and then painted to prevent rusting. No cast iron to break and no movable parts to get out of order. A simple automatic burglarproof lock is also a feature.

Coal Chute Door

O. K. Adjustable Thimbles

Help the mason in forming the smokepipe hole, hold the pipe snugly in the hole, and prevent sagging or slipping. Made of 26 and 28 gauge galvanized steel.

O. K. Thimble

Economy Wall Plugs

A standard nailing base for interior trim or furring when

Wall Plug

attached to brick, tile or masonry walls. The sides are closed to prevent admission of wet mortar and the deep corrugations grip the nail firmly.

Economy Wall Ties

Made from good quality galvanized sheets, of uniform size and gauge. Punched with 2 holes at one end which makes them suitable for use in veneer or solid brick construction. Size 7/8x7 in.

Wall Tie

Sykes Copper Alloy Steel Basement Windows

Extra heavy, easy to install and absolutely water-tight. Have double contact weathering, cam acting lock and two-piece frame. Fit perfectly in concrete, brick or cement block walls. Sash can be removed from the frame by merely lifting from the hooks.

Basement Window

Shipped unglazed.

PEERLESS MANUFACTURING CO., INC.

Fireplace Dampers and Builders' Specialties

LOUISVILLE, KY.

Products

DOME (Fireplace) DAMPERS; COAL WINDOWS; ASH PIT DOORS; ASH TRAPS; IN-THE-GROUND GARBAGE RECEIVERS.

Also manufacturers of Fireplace Furniture (Andirons, Baskets, Screens, Fire Sets, etc.), Gas Ranges, Combination Coal and Gas Ranges, Coal Ranges, Gas Heaters, and other Builders' Specialties.

Peerless Dome (Fireplace) Damper

This damper is designed to insure a good draft under all atmospheric conditions. It consists of a flanged dome with a door at the top and is manufactured from select gray iron. The front flange is sufficiently strong to support the fireplace arch without the use of angle iron or bar lintel; when a segmental brick arch is used this flange may be cut off as shown on Drawing No. 1. The door is so constructed that it can be readily removed (without the use of tools) giving access to the flue at all times.

Types—There are three types, A, B and C. The dimensions of each of these types are given in the table on drawing No. 1 on the following page. Dampers A, B and C are illustrated to the right. These letters do not indicate in any way the method of operation. There are three styles of control:

Face Control—Operated by means of a brass handle attached to a shaft extending through the face of the mantel. By means of a worm gear and cam arrangement, a three-quarter turn of the handle completely opens or closes the door. The mechanism is exposed inside the dome so that it can be adjusted after the fireplace is built.

Underslung Ratchet Control—Door is operated by means of an underslung forged steel notched lever with brass handle which operates in a cast iron loop fastened underneath the right front flange.

Chain Control—Operated by two pull chains, marked S (shut), O (open). This control is necessary when damper is placed high in the flue.

Note Carefully: Styles A and B dampers can be furnished with face, underslung ratchet or chain control. Style C furnished with chain control only. These different styles of controls are interchangeable on the same damper.

Specification for Peerless Dome Dampers—Peerless Dome Dampers are to be installed in accordance with detailed drawings and instructions issued by the manufacturers. Damper is to be placed immediately above the fire chamber, covering its full length, back of damper to rest on top of smoke shelf, the flange at the front of damper to act as an arch bar.

Furnish and set Peerless Dome Dampers as manufactured by THE PEERLESS MANUFACTURING CO., INC., Louisville, Ky., for all fireplaces throughout. To be (mention here the style and size and the particular type of operation desired as described above).

Blue Prints

Blue prints and booklet showing complete line sent free on request.

Style A Dome Damper
(Sectional End View Illustrates Face Control)

Face, underslung ratchet or chain control

This damper is slightly deeper (front to back) than Style B or C. The principal differences between the three styles is in the measurements which can readily be seen by referring to the table on the following page

Style B Dome Damper
(Sectional End View Illustrates Underslung Ratchet Control)

Face, underslung ratchet or chain control

A really improved damper. The front flange is extra wide, about 2½ in., and is paneled, thus giving a better seating for mortar and added strength when flange is used as arch bar. This damper has about 2 in. less depth (front to back) than Style A

Style C Dome Damper
(Sectional End View Illustrates Chain Control)

Chain control only

Operates by chains attached to door. Pulling down on chain "O." opens door. Pulling down on chain "S." closes door. A very simple arrangement for operating door when damper is placed far up the flue. Chains may be lengthened to suit the requirement of any fireplace

The differences in Dome Dampers A, B and C can be noted by referring to the table of dimensions below.

STYLE	METHOD OF CONTROL
A	Face, Underslung Ratchet or Chain.
B	Face, Underslung Ratchet or Chain.
C	Chain Control Only.

IMPORTANT: Be careful to specify control desired.

FACE CONTROL: Operated by means of a brass handle attached to a shaft extending through the face of the damper. By means of a worm gear and cam arrangement, a three-quarter turn of the handle completely opens or closes the door.

UNDERSLUNG RATCHET CONTROL: Door is operated by means of an underslung forged steel notched lever with brass handle which operates in a cast iron loop fastened underneath the right front flange.

CHAIN CONTROL: Operated by two pull chains, marked S (shut) O (open). This control is necessary when damper is placed high in the flue.

Peerless Coal Windows

No. 1 Coal Window—Completely automatic. Recommended for the better type of houses, apartments, stores and public buildings.

A gentle pull of the chain, which is usually placed in the kitchen, releases the lock and opens the chute, bringing the door back into the wall and at the same time pushing the hopper forward into place. The chain is then fastened to a peg. When the chain is released, the hopper recedes and the door swings gently into place, at the same time locking securely.

Automatic Coal Window No. 1 with Wire Glass Panel

Cast iron frame and heavy cast iron door fitted with 1/4-in. wire glass panel. Heavy gauge boiler plate hopper.

No. 2 Coal Window—Equipped with pull chain control like No. 1 and has a gravity catch. Malleable iron frame and extra heavy boiler plate door. Furnished with or without hopper. Can also be equipped with 1/4-in. wire glass door panel.

No. 2 Coal Window

No. 3 Coal Window

No. 3 Coal Window—Malleable iron frame and hinges, heavy boiler plate door. When door is closed it locks automatically. No hopper or chains.

No. 9 Automatic Ash Trap

Peerless In-the-ground Garbage Receiver

Buried under ground with only the top exposed. Garbage deposited by simply stepping upon lever arrangement which raises the lid. To empty the contents the garbage man has only to lift top and remove can. Top hinged to shell to prevent being carried away.

Comes in three sections, a copper-steel rust resisting outer casing, with its attached cast iron lid and a galvanized iron pail. Easy to install. Simply dig a hole wherever you wish the receiver placed—near kitchen door, sidewalk or street curb—and insert outer casing.

Peerless Fire-place Lining Set No. 42

Each set consists of a back and two sides or wings. Made of high grade cast grey iron. Design of sides matches back.

Back: 20, 24, 27, 30 or 36 in. wide by 30 in. high. Sides: 12, 15, or 18 in. wide by 30 in. high. Also made in special sizes.

Folder illustrating complete line of Lining Sets sent on request.

BABCOCK-DAVIS CORPORATION

Manufacturers of Pre-cast Concrete Stairs with Steel Stringers

474 Dorchester Avenue

BOSTON, MASS.

Products and Services

BABCOCK-DAVIS PRE-CAST CONCRETE STAIRS WITH STEEL STRINGERS. (Patented.)

Also manufacturers of Ornamental Iron Work: including Cast and Wrought Iron Stairs; Railings, Marquises; Wire Grilles; Elevator Fronts, Frames and Thresholds.

Our engineers invite consultation during preparation of plans and will gladly co-operate in making working drawings and computing proper sizes required. Estimates submitted on request.

For Steel Flagpoles, see page A588.

Pre-cast Concrete Tread and Riser

Strength (Factor of Safety, 10)—At the Massachusetts Institute of Technology tests were made by Professor Irving H. Cowdrey on 4 units. Each unit consisted of a pre-cast concrete tread, 4 ft. long by 11¼ in. wide, and 8-in. riser mounted on steel channel iron stringers. The average of these tests shows:

First hair crack in riser at 2300 lb. total load. Maximum load 3575 lb.

Construction—"Pre-cast concrete tread and riser" construction is economical to install and maintain, and is made from a scientifically prepared formula which makes the stair as hard as stone and practically indestructible. The Babcock-Davis "Pre-cast Tread and Riser" stair marks a decided advancement in stair construction for either inside or outside installation. As the name suggests, it is a combined reinforced concrete tread with steel nosing and riser cast in one interlocking unit. This work is done in our own shop and the units are shipped to the building under construction, where they are applied to the steel stringers furnished by us.

Advantages

Its very practical principle of interlocking, replaceable units has many advantages:

It is of lighter construction, is installed more quickly, at a smaller cost than stairs made entirely of concrete, has a steel nosing and *stringer buttress* as required by insurance engineers.

Wood forms, and such obstructions which delay building operations while the cement is hardening in all-concrete stair construction, are done away with.

There is no ringing sound or vibration to Babcock-Davis "Pre-cast Concrete Stairs" when in use, for they are practically noiseless. They are attractive in appearance. All joints are tight. Their upkeep is reduced to a minimum, as steps need not be painted, and, being dustless, they are easily kept clean.

Babcock-Davis "Pre-cast Concrete Treads and Risers" treated with our Non-slipping Formula and with our steel nosing cast into the tread is a fine safety tread, with no opportunity to chip the nosing.

Specifications

In writing specification, state: "BABCOCK-DAVIS CORPORATION, 474 Dorchester Avenue, Boston, Mass., Patentee, will furnish steel stringers, railing and 'Pre-Cast Concrete Treads and Risers' with steel nosing complete."

For schools, hospitals and public buildings, where non-slipping qualities are desired, specify "To be treaded with BABCOCK-DAVIS CORPORATION Non-slipping Formula."

Installations

We have installed our pre-cast concrete stairs in a great many buildings in the United States and in every case they have received the highest praise and approval of every engineer and architect who has investigated them including the Building Department of the City of Boston.

Products

BOIS PATENTED INTERLOCKING SHEET STEEL
TREADS and RISERS.

Also manufacturers of Sheet Steel Stairs.

Advantages

Bois interlocking tread and riser offers distinct advantages of economy, rigidity and rapid erection. The *interlocking* feature eliminates the labor of bolting or riveting, and makes rapid installation possible with unskilled labor.

Heretofore the nosing on sheet metal stairs broke away from the composition steps. Bois interlocking tread and riser prevents breaking away the nosing from the composition step under the heaviest traffic. Its superiority and economy in construction can be readily seen.

Interlocking Feature

The interlocking tread and riser combined is formed from a single sheet of steel with flanged member that interlocks at the nosing line. The metal becomes double thick which reinforces the steps.

Labor Saving Installation

A tie rod is inserted under each tread through the stringer. The installation consists only of setting the tread, bolting up the tie rod and inserting two bolts for each tread where the tread meets the flange of stringer, doing away with the bolting or riveting as in ordinary types of stair work, and speeding up the erection.

Varied Standards

The gauge of metal varies with the width of the stairs and weight to be carried. The interlocking treads and risers can be used with any type of stringer such as sheet steel construction or concrete.

The treads are adaptable to any kind of composition fill, slate, marble, asphalt or concrete, also for any desired safety tread.

Deliveries

When sheet steel stringers are used, the stairs can be assembled at the factory and delivered at the building ready for installation. Each section can be installed as the building progresses, eliminating the use of temporary stairs or ladders, doing away with unnecessary expenses.

If concrete stringers are to be used, the treads and risers are interlocked and put in position from floor to floor, after which the stringers are moulded as usual.

Inquiries

Make all inquiries for estimates to the Manufacturer (list in heading) controlling the territory in which the building is to be erected. State number of treads and risers, width of stairs; type of stringers, and nature of tread. Include sketch or drawing on which all dimensions and quantities are indicated.

Specifications

All metal stairs throughout the building shall be of the Bois Interlocking Tread and Riser construction type.

Each tread and riser shall be of one continuous piece of No. 12 or No. 14 gauge sheet steel. The tread metal shall be continued up and bent into an inner nosing, around which the outer (wearing) nosing shall be bent and secured by an interlocking, depending flange, reinforcing the step and preventing the nosing from breaking away from the concrete.

The junction of the treads and risers shall be securely fastened to the lower flange of the stringers with $\frac{1}{8}$ -in. diameter round machine bolts.

The face and wall stringers shall be of No. 10 gauge sheet steel, with outward top flange and inward bottom flange. Stringers shall be securely tied together with $\frac{1}{8}$ -in. diameter tie rods, placed under each tread, near the nosing.

Platforms or landings shall be of No. 14 gauge corrugated steel plates, with interlocking nosing for connection with riser and shall be securely fastened to angle iron supports connected to stringers.

Newels, railings and balustrades to be of design and construction as indicated on plans.

All work to have 1 shop coat of approved paint.

Information and Catalogue

For full information and illustrated catalogues and detail drawings apply to agent or N. Bois, 2846 California Street, San Francisco, Cal.

FEATURE OF THE BOIS PATENT INTERLOCKING TREADS AND RISERS FOR STAIR CONSTRUCTION;

It eliminates all bolting and riveting thus saving considerable labor when assembling the stairs. Where the tread interlocks at the nosing the metal becomes double thick, reinforcing the step and preventing the metal breaking away from the concrete.

It is the most practical, economical, superior stair construction.

as it Interlocks

TYPICAL SECTIONS SHOWING CONSTRUCTION OF BOIS PATENTED INTERLOCKING TREADS AND RISERS

TEST OF BOIS PATENT INTERLOCKING SHEET STEEL STAIR
MADE BY E. VAN NOORDEN CO., BOSTON, MASS.
December 9, 1924

In order to determine accurately the safe loading for the Bois Interlocking Sheet Steel stair, a test was conducted by Professor H. W. Hayward of the Massachusetts Institute of Technology, Cambridge, Mass. A summary of this test is as follows:

"The full load of 600 pounds per square foot was allowed to remain upon the stairs for two weeks. The load was then removed and after four days the inspection was made.

"The slight distortion in channel header (at top) straightened out when the load was removed. The deflection in the top flange of runner was reduced to a negligible amount upon removal of the load. The general appearance of the stairs was good. No indications of overstrain could be noted either as regards lateral or vertical deflections.

"It should be noted that during the time the load was on the stairs the temperature varied approximately from 0° to 50° F. This variation in temperature would cause additional indeterminate stresses on the stairs."

Full report of test will be sent on request.

GUARSTEEL SAFETY STAIR COMPANY

CIRCULAR STAIRS.
GUARSTEEL THRESHOLDS.
STAIR NOSINGS.

Guarsteel Stairs

The unusual success and wide use of Guarsteel Stairs is largely due to the safety tread feature, the application of which is clearly shown in the illustration below.

In making the treads, small bosses or buttons are first pressed into the plate; a $\frac{1}{8}$ -in. hole is then perforated through the center of each boss. The result is a long lived, non-slipping tread.

Treads and risers can be made in any shape or form as shown on the following pages, and are made of Nos. 12, 14, or 16 gauge blue annealed or copper-bearing rust resisting sheet steel, depending upon conditions. The antislip feature of the Guarsteel Safety Tread is permanent, and while this feature is patented, Guarsteel Stairs can be sold at the price of ordinary steel stairs because of their simplicity of design and correspondingly low shop cost.

Hard usage does not affect the Guarsteel Safety Tread, as the cutting edges of the holes are worn sharper by continued service, and remain effective against slipping.

The installation of Guarsteel Safety Stairs relieves owners of the constant worry of the possibility of accidents in which

people slip and sustain injuries such as broken bones, etc. Guarsteel Safety Stairs constitute one of the best forms of accident insurance that an owner can provide for his own protection.

Engineering Service

We maintain a department of experienced draftsmen and designers, ready to serve architects and builders at all times. We assist in the designing or re-designing of any type of stair that may be desired for any building.

Circular Stairs

Guarsteel Spiral Stairs are 40% lighter than cast iron stairs; they are slip-proof and are provided with Guarsteel safety features. A big saving in price, less weight to carry on floor or supports, less freight charges. All materials being made of steel, there is no chance of breakage in shipping or installation; no patterns to be made or changed, and no waiting for castings from foundry. The result is a light stair throughout, which is very simple to erect.

Thresholds

Guarsteel Thresholds are less than half the weight of cast iron, and can be made in any required length. The same safety feature is applied to the surface of these thresholds that is used on our stairs.

Catalogue

Our complete catalogue is ready for you and contains very useful data and pleasing designs. Co-operation with agents is one of the features of our service.

GUARSTEEL SAFETY STAIRS

Guarsteel Safety Stair Company

GUARSTEEL SAFETY STAIRS

THE HUGHES-KEENAN CO.

Pressed Steel Stairs and Architectural Iron Work

MANSFIELD, OHIO

Products

SAFETY-LOCK and SAFETY-NOSE INSERT PRESSED STEEL STAIRS.

Also Ornamental and Pipe Railing, Fire Escapes and miscellaneous Ornamental Iron Work.

General

Both types of pressed steel stairs are the result of many years of practical experience in the design, manufacture and installation of steel stairs for all types of buildings and for all purposes. They combine great strength with minimum weight and can be easily adapted to any requirements of the architect or builder and made plain or highly ornamental as desired. They meet the requirements of all State and city building codes.

All special features such as our safety-lock tread and riser and safety-nose insert are covered by patents allowed and applied for.

Safety-Lock Pressed Steel Stairs

Made with a continuous steel plate tread and riser firmly interlocked at nosing, each tread bolted rigidly to the lower flange of a Z-shaped stringer and all tied together with a tie rod running under the angle of each nosing from stringer to stringer. With channel shaped stringers light steel carriage angles are used with tread bolted to carriage angle. See following page for construction details.

Safety-Nose Insert Pressed Steel Stairs

These eliminate exposed sheet metal on treads, providing a safety tread as a part of the stair at a cost considerably below that of special safety treads. Tread and riser is a continuous steel plate formed at nosing into a channel or trough section in which a lead insert is firmly bolted, providing a lead safety nosing in edge of the tread where most needed. This insert is easily and quickly installed. Can be renewed when worn at very low cost and does not affect the tread filler when replacing. Cement, composition or asphalt filler can be used. Tie rods with Z-shaped stringers or carriage angles with channel shaped stringers may be used. See following page for construction details.

Write for our special folder describing these stairs.

Detail of Safety-Nose Insert Pressed Steel Stairs

Stringers

Details of various stringers are shown on following page. Face strings are either plain or ornamented with drawn steel moulding at top and bottom. Cast iron rosette is used on end of tie rod with ornamental face stringers. With carriage angles, rivets are countersunk in face stringer except on heavy service stairs.

Pressed steel or structural channel stringers furnished as desired.

Newels and Railings

Newels are furnished either in cast iron or pressed steel. Newels and railings are furnished to any design to suit architects' requirements. A few standard railings and newels are shown on following page.

Pre-built Erection Method

The Hughes-Keenan Pre-built Erection Method reduces the cost of the stairs installed in building 25% below usual cost. There is no reduction in quality of stairs—the saving resulting only from low engineering and erection costs and shop standardization. Stairs are on the job to be installed as building progresses, giving contractor use of them instead of requiring erection of temporary ladders or stairs. Cutting and fitting and patching of plaster is avoided.

Write for our special folder describing this method.

Installation

Stairs are shipped in completely assembled units so that they can be easily and quickly installed at low cost. Experienced erectors furnished when desired.

Standard Construction Details

Standard stringer, tread and riser, railing and newel details, drawn to large scale, are furnished to architects upon application.

Stairs to Architects' Designs

In addition to our patented pressed steel stairs, we can furnish steel stairs of any design and to meet all architects' requirements.

We can also furnish the Bois Interlocking Steel Stairs in the states of Maryland, Delaware, District of Columbia, Colorado, Wyoming, Utah.

Information and Estimates

For catalogue, complete information regarding construction and typical installations and estimates, write THE HUGHES-KEENAN CO., Mansfield, Ohio.

Typical Installation of Hughes-Keenan Safety-Nose Insert Pressed Steel Stairs

Construction Details

Treads and Risers—Illustrated above are standard Safety-Lock and Safety-Nose insert treads and risers. Treads are made to receive cement, composition or asphalt filler. Risers are made either plain or with sunken panel and have sanitary cove.

Standard tread and riser for slate or marble treads are also shown with risers plain or paneled and sanitary cove omitted. The tread and riser is continuous and the gauge of metal used is determined by the width of stair.

Stringers—Sections of various types of standard stringers are illustrated above. Z-shaped, pressed steel stringers are used for both Safety-Lock and Safety-Nose insert stairs when tie rods are used. Pressed steel

or light structural channels are used with carriage angle construction.

The gauge of plate and depth of stringer or size of structural channels is determined by span and width of stair, using a high factor of safety.

Newels and Railings—A few standard railing designs are illustrated above. Pipe railings or railings of any other design can be furnished.

The cast iron and pressed steel newels shown are stock designs with square shaft and base. Newels of any design can be furnished. Pressed steel newels are either 3 or 4 in. square, have perfectly smooth surfaces and are very rigid and strong.

MESKER BROTHERS IRON COMPANY

Combination Steel and Concrete Stairs

ST. LOUIS, MO.

Product

MESKER COMBINATION STEEL AND CONCRETE INTERIOR STAIRS. Also Steel Fire Escapes, Steel Stair and Elevator Enclosure.

For Solid Steel Sash, Solid Metal and Hollow Metal Windows, see pages A1071-1075.

Mesker Combination Steel Concrete Stairs

Mesker stairs are specified as a "Standard" of construction throughout the country and are installed in some of the best buildings erected within the past 25 years.

Specifications—Stringers shall be $\frac{3}{8}$ -in. steel plate, bent in channel form and of width shown on plans. Treads and risers shall be made of one continuous steel plate No. 12 or No. 13

gauge, bent to form as indicated. Treads shall be supported at ends by special clamps, securely bolted to stringers with acorn heads on face stringers and shall be filled with concrete or other material by others (tread filling $1\frac{1}{2}$ in. more or less in thickness).

Platforms or landings, where required, shall be No. 12 or No. 13 gauge steel plates, with nosings same as treads and supported on a $2 \times 2 \times \frac{3}{8}$ -in. angle frame, riveted or bolted to stringers, and reinforced with tees not over 2 ft. on centers. Newels shall be No. 12 gauge blue annealed steel with cast iron caps and pendants. Newels to be welded at corners, making a continuous one-piece seamless newel. Railings to be of design indicated on drawings. All to have a shop coat of paint.

Erection—Note This Comparison

Mesker's Stairway is practically erected, whereas the other is still in its infancy stage, regardless of the fact that a greater number of mechanics are employed. The reason for this is obvious. *Mesker's Stairways come to you completely assembled at factory, carefully painted, checked and inspected prior to being shipped in sections most convenient to handle, and to facilitate installation. No sorting out and assembling various and numerous parts. No refitting, repunching or rebor-ing, all of which not only adds substantially to the cost, but likewise causes serious delay in the erection of same, as well as being a vital factor in marring the appearance thereof. In some instances a seemingly more attractive price may be offered by others, but do not sacrifice absolute satisfaction in every respect, as the effects of poor quality and a higher erection cost will in no way offset the possible difference in the original price.*

THE RIESTER & THESMACHER COMPANY

Manufacturers of Bois Patented Steel Stairs

1514-1526 West 25th Street
CLEVELAND, OHIO

Products

BOIS INTERLOCKING PRESSED STEEL STAIRS.
For Hollow Metal Doors, see page A837.

Service

A modern plant with complete equipment and an efficient organization qualified to give service. We have a thoroughly efficient estimating and draughting department and are glad to assist in construction details. Typical stair details, estimates and suggestions submitted upon request.

Description

The simple interlocking feature of the tread and riser in this stair, offers distinctive advantages in economy, rigidity, strength and rapid erection. It is also easily adapted to any desired tread material. The treads and risers are formed from one single sheet of steel with flanges that interlock at the nosing line, producing a reinforced edge that is always straight horizontally. This feature of double strength material prevents the nosing breaking away from tread filler. The stringers are tied together with a tie rod running under the angle of each nosing from stringer to stringer. The gauge of metal used is governed by the width of stair and weight to be carried. The entire construction makes for a very

strong and rigid stair and the light gauge steel is not used to reduce cost with a proportionate reduction in strength. Tests of a standard Bois stair have been successfully made carrying a dead weight of 600 lb. per square foot.

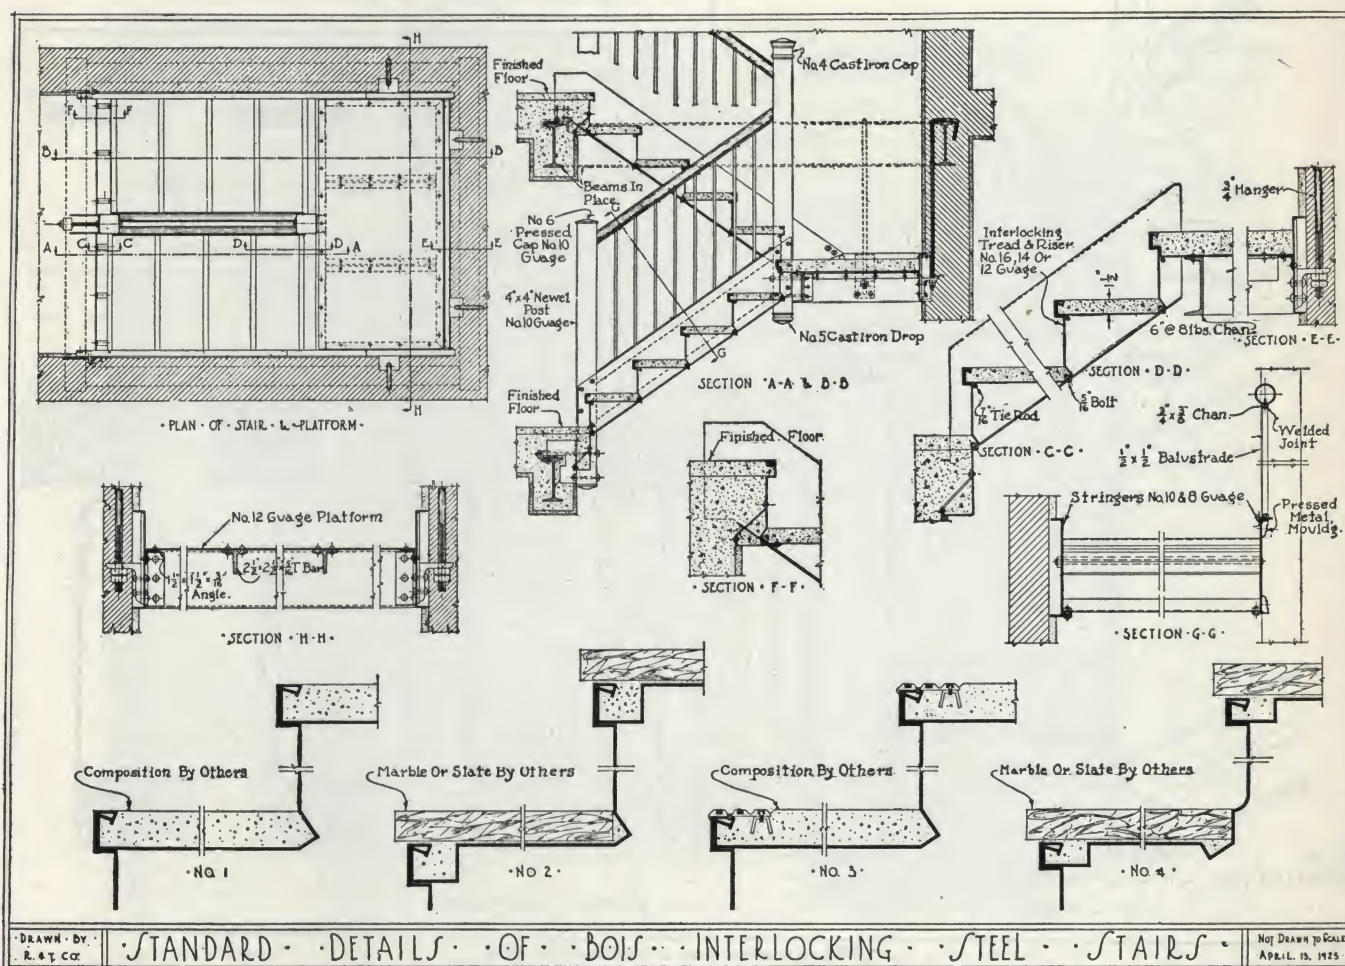

Design

This stair meets the requirements of all state and city building codes and while very simple in design is attractive in appearance and can be readily adapted to the requirements of the architect or builder. Construction may be modified or embellished by ornamenting newel posts, ends of tie rods and stringers, or using cast iron newel posts.

Installation

The interlocking feature dispenses with all riveting and makes for rapid assembling. Each flight of stairs is assembled in a complete unit in the factory and is, therefore, economically erected at the building. This also permits of the stairs being erected with the frame work of the building, giving immediate service before the installation of tread fillers.

For reference we will be glad to furnish names of architects who have specified this product or typical installations which we have made.

SEXAUER & LEMKE, INC.

Ornamental Iron Work, Steel Stairs, and Cast Iron Work
LONG ISLAND CITY, N. Y.

REPRESENTATIVES: SHULTS ENGINEERING Co., Morgan Building, BUFFALO, N. Y.

Products

Manufacturers of ORNAMENTAL IRON WORK, including: "S & L" FIREPROOF STEEL STAIRS, and STEEL FRAMES for Doors and Partitions.

Also General Iron and Steel Staircase Construction; Iron Grilles; Railings; Entrance Doors, Marquises; Elevator Enclosures; Store Fronts; Gratings; Fire Escapes; Fur Racks for cold storage plants, etc.

Service

The thoroughly equipped estimating and draughting departments are at the service of architects. Estimates and suggestive working details will be gladly submitted on request.

Facilities

Our plant is complete in every respect and equipped with the most modern types of machinery and tools, enabling this organization to meet promptly and efficiently all demands for its products.

Our plant is situated at the East River and provided with own docking facilities.

Sexauer & Lemke ("S & L") Steel Stair Construction

Simple, strong, rigid, exceptionally light and easily erected, these steel stairs lend themselves admirably to every type of public office, warehouse, hospital, school and factory building construction.

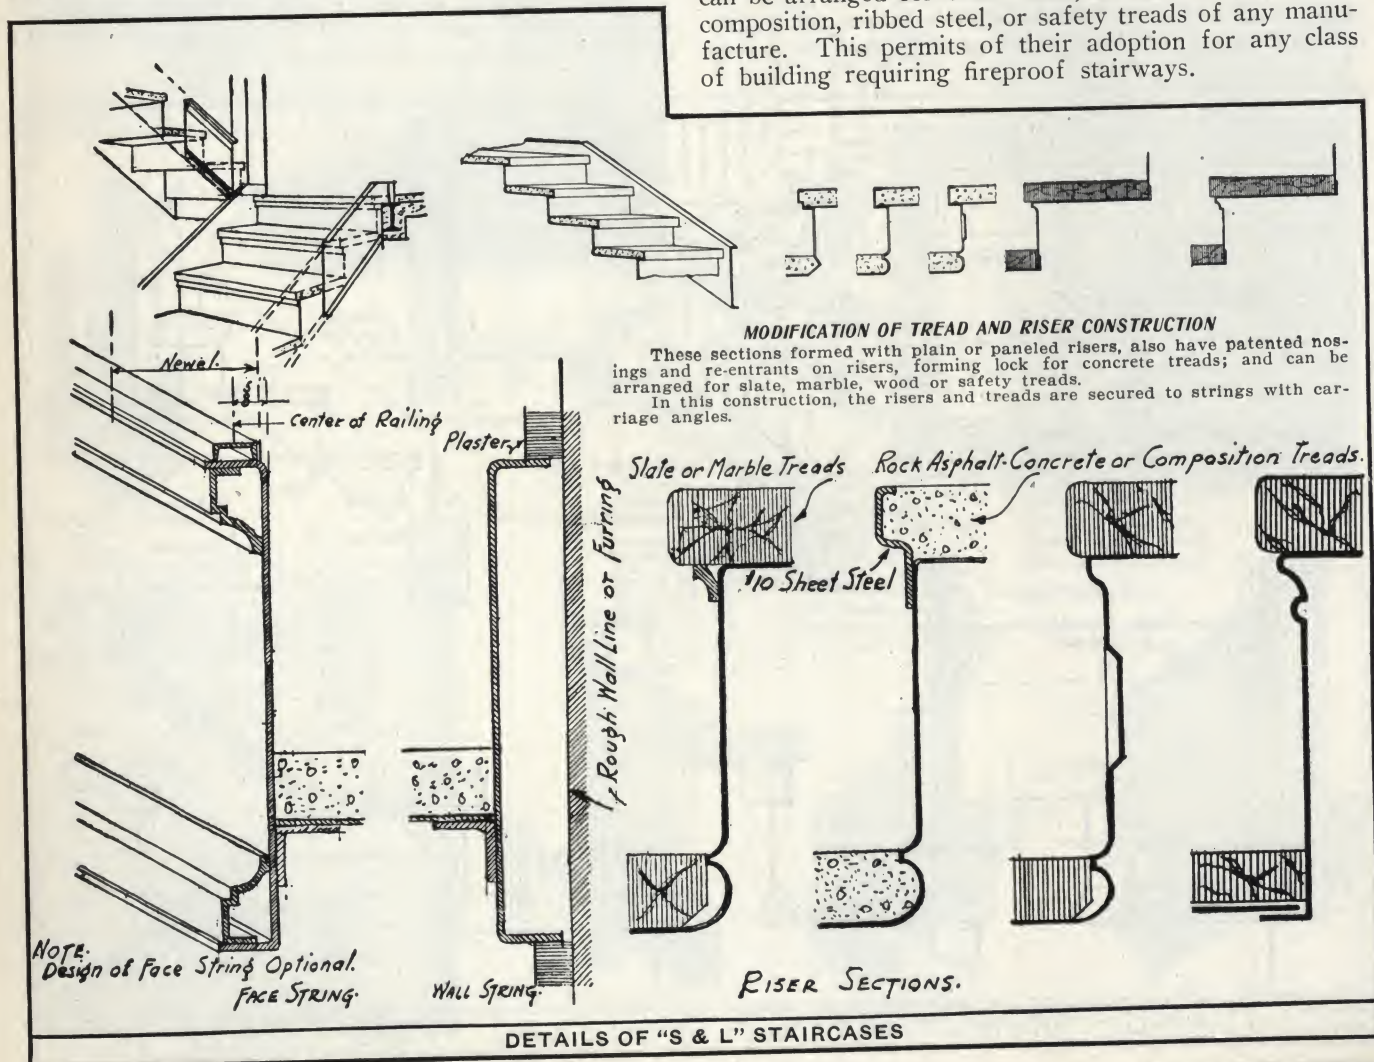

They are formed, primarily, of rolled steel stringers and bent plate steel risers and treads, securely bolted together as shown in line details herewith. The stairs can be furnished to accommodate any condition.

The strings are formed in one piece with flanges, the depth of string, thickness of metal, etc., being governed by the loading, and strings can be made either plain or ornamental with mouldings or otherwise as may be desired.

For stairs for export, the various strings, risers, etc., could be nested to insure compactness and against danger of damage.

All stair structures are figured for a safe live load of 100 lb. per sq. ft. and designed accordingly.

Design—"S & L" stairs can be built plain, or ornamented to any extent to suit architectural requirements and design, with railings and newels to match. Risers may be plain, or paneled and ornamented; treads can be arranged for either slate, marble, wood, cement, composition, ribbed steel, or safety treads of any manufacture. This permits of their adoption for any class of building requiring fireproof stairways.

For cement or composition treads, a patented nosing and re-entrant construction is provided, which forms a pocket or lock for the treads and provides a sanitary cove treatment to the risers.

See detail drawing on preceding page.

The soffits of stairs are left open for painting, and present a neat finished appearance, but can also be arranged for plaster finish, if desired.

Installation—These stairs are particularly easy to erect, as each run is manufactured and fitted in shop before shipment or delivery. This feature insures quick and economical installation; and also permits of the stairs being erected with the framework of the building, thus insuring immediate serviceableness, before the installation of the finish treads.

General Cost and Estimates—These stairways, furnished complete with railing and newels (with concrete treads), are practically as low in cost as stairways of concrete construction with iron railings, and have the advantage of providing a neater and more durable installation. They permit, moreover, a saving in cost of structural supports, on account of special lightness. The thickness of metal employed, depth of strings, and so forth, are governed by the size of stair, loading conditions and so on.

If general layout of stairs together with memoranda of requirements is furnished, the estimating department will be pleased to submit specifications and estimates.

Circular Stairs, Special Stairs, Cast Iron Stairs

Details and information furnished upon request.

Cast Iron and Wrought Iron Front Work

We specialize on all types of this work.

Steel Door Frames

These frames can be formed to meet requirements of all classes of fireproof partition construction. They are formed of No. 14 or No. 12 gauge steel and the miters and connections are all welded, making a one-piece frame.

THE A. L. SMITH IRON WORKS

Manufacturers and Erectors of Steel Stairs

CHELSEA, MASS.

Products, Organization and Experience

SMITH STEEL STAIRS.

Also Designers, Fabricators and Erectors of Structural Steel and Ornamental Iron and Bronze Work of every description.

We have been building stairs of all types for nearly 30 years. This broad experience, together with the use of sound engineering

principles, has developed the Smith Steel Stair, the features of which have been fully patented.

Our modern plant, modern production methods, efficient workmen and standardization of parts enables us to produce Smith Steel Stairs economically, but consistent with substantial and permanent construction.

Smith Steel Stairs

The general description and features of construction of Smith steel stairs are completely covered by the standard specifications and illustrations shown on these pages.

Smith steel stairs are suitable for all classes of buildings and are being specified by leading architects and engineers because of their strength, pleasing appearance and low cost. They have been subjected to severe tests, including the following:

A stair loaded with 48 men weighing 7200 lb., on 71 sq. ft. (101 lb. per sq. ft.), showed no evidence of strain. Another stair loaded with 43,000 lb. of steel plates on 71 sq. ft. (equivalent to 600 lb. per sq. ft., which, on the basis of 100 lb. per sq. ft. gives a factor of safety of 6), showed no indication of failure.

These tests clearly show the relation of maximum possible human loading in actual practice against the ultimate carrying capacity of the stairs.

Features of Smith Steel Stairs

Standard Specifications for Smith Steel Stairs

All stairs marked steel on plans shall be Smith Steel Stairs made (and erected) by THE A. L. SMITH IRON WORKS, Chelsea, Mass.

Stringers shall be 10-in. pressed steel channels $\frac{3}{8}$ in. or $\frac{1}{4}$ in. thick as required.

Treads and risers shall be of the Smith one-piece nosing type and shall be No. 10 or No. 12 gauge as required. Treads shall be attached to carrier with two bolts. Fill and reinforcing shall be furnished by others.

Carriers shall be $1\frac{1}{4} \times 1\frac{1}{4} \times \frac{3}{8}$ in. angles, machine riveted to stringers with three rivets. Rivets shall be countersunk on outside face of face stringer.

Landings shall be of the Smith one-piece pressed-rib type of No. 10 gauge steel. Ribs shall be supported by angle at wall and sides and by steel channel at head of stairs. Fill and reinforcing shall be furnished by others.

Posts shall be Smith Type, made of in. square, with standard cap and drop.

Railing shall be Smith No. attached to channels top and bottom. Wood handrail shall be furnished and attached to top channel by others. (See details of posts and railings for various types and their numbers.)

Safety treads, where shown on plans, shall be Smith replaceable steel safety nosing.

TITCHENER IRON WORKS, INC.

Structural, Architectural and Ornamental Iron Work

25 Griswold Street
BINGHAMTON, N. Y.

Products

ORNAMENTAL IRON WORK:

Iron Stairs, Fire Escapes, Spiral Stairs, Steel Ladders, Iron and Bronze Railings, Pipe Railings, Folding Gates, Area Gratings, Window Guards, Grilles, Side-walk Doors, Coal Chutes, Coalhole Covers, Marquises, Trusses, Beams, Columns, Metal Lumber, Balconies, Flagpoles, Steel Sash, Store Fronts, Iron Fences, Entrance Gates, Wire Fences, Wire Partitions.

Stair Specifications

All iron stairs shall be pressed steel as made by TITCHENER IRON WORKS, INC., Binghamton, N. Y.

Stringers—Shall be of 10-inch channels formed from 13x $\frac{3}{16}$ -inch steel plates with moulding on top and bottom flanges as detailed.

Tread and Riser—Shall be one unit formed from No. 12 gauge steel sheets with nosing and shall be recessed to receive 2 inches of composition or concrete filling. All treads and risers shall be supported by and bolted to angle iron hips which are riveted to the stringers.

Platforms and Landings—Shall be of No. 12 gauge steel sheets supported and reinforced by structural tees and angles riveted to stringers and platform channels.

Newel Posts and Railings—Shall be as per details.

All iron work to have one shop coat of approved paint.

Note: The above specification may be changed to meet all architects' requirements.

Gate Specifications

Horizontal rails shall be of 2-inch channels. Hinge bars shall be $\frac{3}{4}$ -inch by 2 $\frac{1}{2}$ -inch flat iron, hung on hand wrought hinges to be laid into masonry. Latch bars shall be the same size as hinge bars. Pickets shall be

$\frac{3}{4}$ -inch square bars spaced 5 inches on centers with hand forged top either pointed or upset. Pickets shall extend through horizontal rails and be securely hand calked into place. All to receive one shop coat of approved paint.

WATT MANUFACTURING CO., INC.

Manufacturers and Erectors of Steel Stairs, Plain and Ornamental
217 Martin Building, PITTSBURGH, PA.

Product

STEEL and CAST IRON STAIRS: Ornamental, Plain and Commercial.

Service

We maintain a modern plant fully equipped to execute any size order, and an efficient organization qualified to give complete service. We have an estimating and draughting department and are glad to assist the architect or engineer in the construction and designing of stairs. Typical stair details, estimates and suggestions submitted on request. Send for our new catalogue.

Erection

We are equipped to erect our products anywhere in the United States. We especially plan to erect all stairs in tall buildings along with the structural steel in proper sequence, resulting in considerable saving in erection cost, also making them available for the use of all building trades.

General Construction

We manufacture stairs of every type and construction, employing only skilled mechanics in all departments. We aim to maintain the highest standard and quality of workmanship at a reasonable cost. Our stairs meet the requirements of all state and city building codes.

Our standard stairs are attractive in appearance and can be readily modified to meet the requirements of the architect. They can be ornamented by applying plain or ornamental mouldings on strings and facias, cast iron caps and drops on newel posts, scrolls and leaf motifs on railings, etc.

Welding and Riveting—We employ both welding and riveting as required and according to best shop practice.

Stringers—Made in four types:

- A—Plate and angle
- B—J. & L. stair channel
- C—Pressed steel channel
- D—Structural channel

Types A and C are made of Universal Mill steel plate, especially rolled for stair work.

Type B is a channel section especially rolled for stair work.

Type D is a standard structural steel channel.

Treads and Risers—Treads and risers are made of a continuous piece of blue annealed pressed steel plate with provision for marble, slate, cement, composition, or any standard safety tread. Risers are also made of pressed steel, cast iron, or plate and angle. Also made with or without panels, sanitary coves, and nosings.

Safety Nosing Strip—Where non-slip safety nosing strips are used—our construction allows for replacement by the removal of several brass screws, without damaging treads.

Newels—Made of cast iron or steel. May be plain or ornamental.

Facias—Made of plate and angle, or channel, as required to correspond with strings.

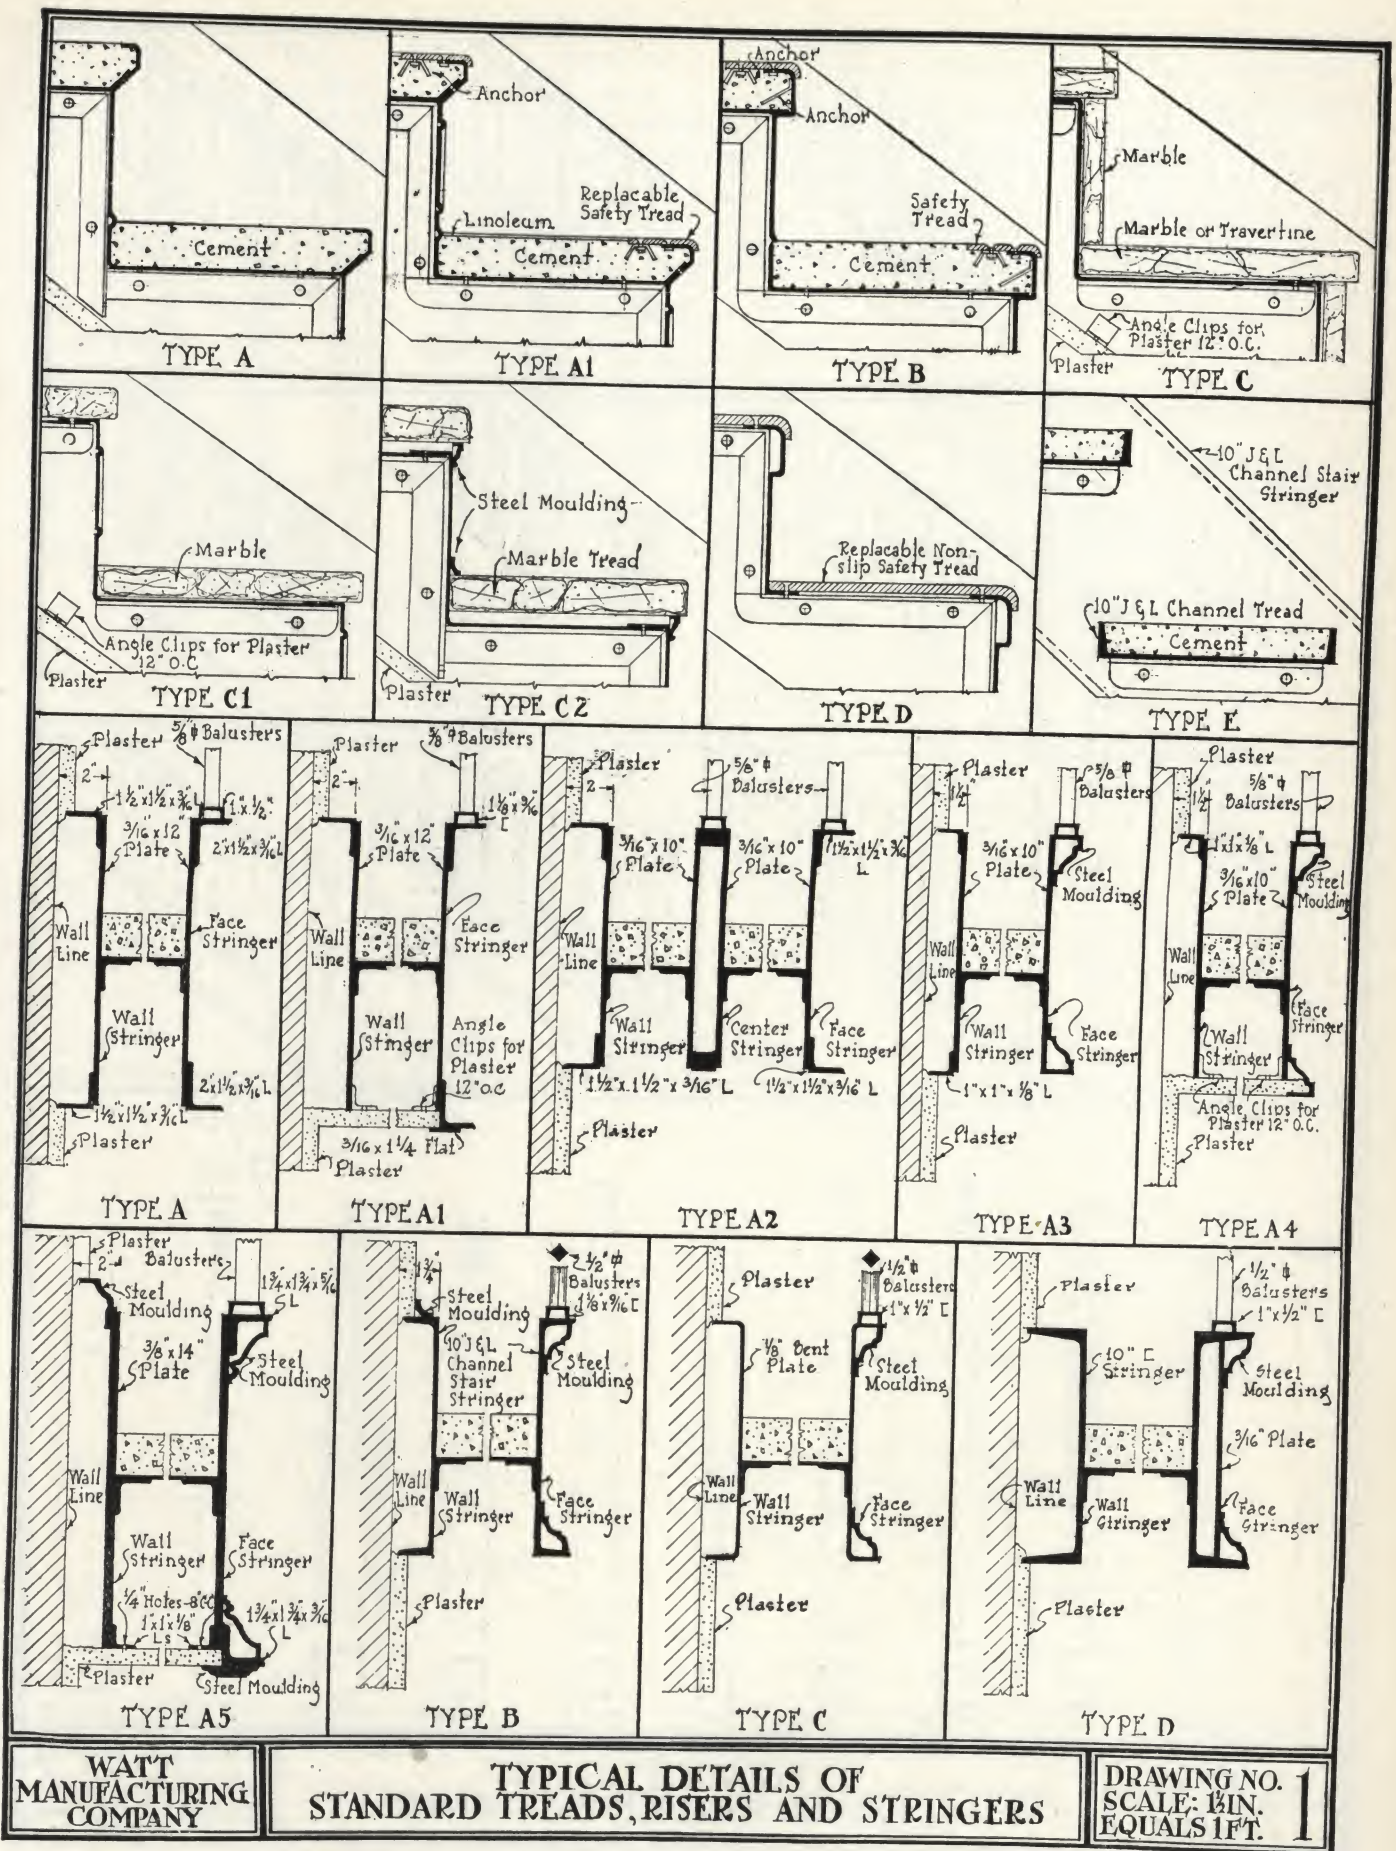

Railings—Made of wrought or cast iron, plain or ornamental, according to architect's details.

Platforms—Made of 1/8-in. blue annealed steel plate supported by angles, tees and channels where required.

Painting—All material receives one good coat of protective paint in shop. We do no field painting.

"Ideal" Steel Stairs

"Ideal" steel stairs are the result of fifteen years of experience in stair building and are built and designed by experts.

Their construction permits utmost strength without sacrificing in any way the neat appearance that makes a building attractive.

Architects specify "Ideal" steel stairs because they can secure fireproof construction in any combination of designs necessary to properly harmonize with the surroundings.

Contractors and builders endorse them because they know from experience that their installation is very simple, therefore we suggest the use of local labor for erection, wherever possible. We can, however, send erectors to any part of the country.

Our organization is complete in every detail to insure quality, workmanship and excellent service. Our designers are thoroughly experienced in this field.

Write to us for further information regarding estimates and agencies.

WOLVERINE IRON WORKS

Manufacturers of Steel Stairs and Ornamental Iron Work

6782 Goldsmith Avenue

DETROIT, MICH.

Products

"WOLVERINE" STEEL STAIRS (a specialty).

Also Ornamental Iron Work, including cast iron Store Fronts, Spiral Stairs, Ornamental Railings, Window Guards, Elevator Enclosures, Marquises, etc.

"Wolverine" Steel Stairs

Stringers—Of rolled steel cut channel section, 10 to 15 in. wide; also of plate, 10 to 14 in. wide; $\frac{1}{8}$ to $\frac{1}{2}$ in. thick. Face stringers are covered with heavy steel mouldings, paneled.

Treads and Risers—Formed of Nos. 10, 12 or 14 gauge steel in one piece with nosing, and can be used for the various tread materials as illustrated in the details.

Newels—Are of steel; either plain square newels of sizes ranging from 2 to 5 in. square, or paneled steel newels of sizes ranging from $2\frac{1}{2}$ to $5\frac{1}{2}$ in. square, as illustrated in the details, with cast iron caps and drops attached.

Erection

Correctly and scientifically constructed, these steel stairs are designed to be erected by ordinary tools as found on any job. Being so easily assembled, they are suitable for a wide range of use, from the checkered tread of fire escape stairs to the staircase decorated with period ornamentation, as used in buildings of the highest grade.

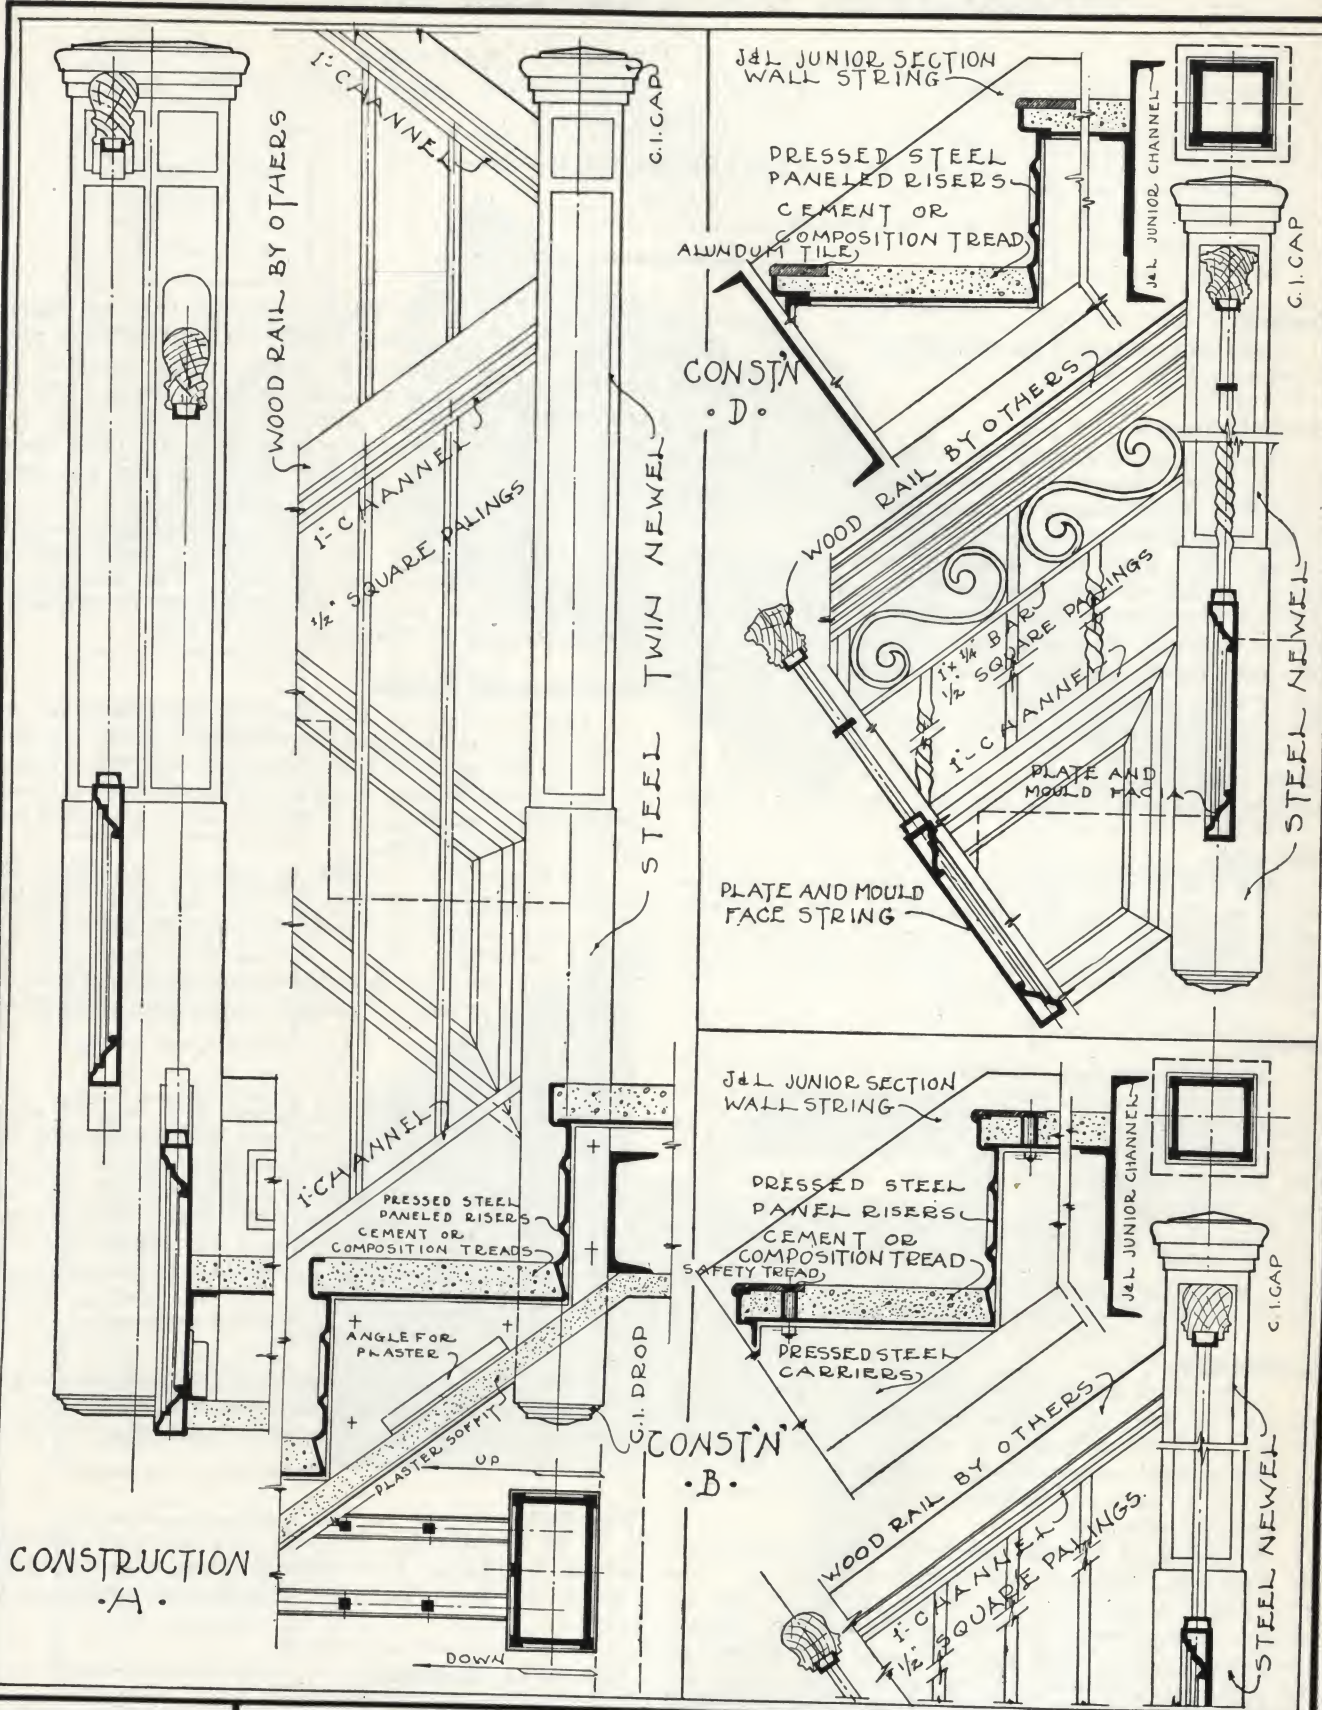

Costs

"Wolverine" steel stairs compare favorably in cost with any other metal stair. Not only is their installation cost low, but the cost of manufacture has been reduced to a minimum through the use of specially designed machinery.

Information

Information relative to weights, costs, deliveries, construction details, designs or existing installations will be furnished on request.

Strength Tests

Woodbridge Standardized Pres-Teel Stairways have been tested for strength. These tests were conducted at the Armour Institute of Technology, Chicago, Ill. Tests were made not only on completed stairways, but on each stringer, tread, riser, platform channel, tee, hanger rod connection, newel post connection, stringer connection and stringer lug. In each case the ultimate load was applied and from these loadings we are enabled to design stairways with not only the proper size stringers, but also all the component parts.

Each stair built by us is designed according to tables compiled from these tests, thus eliminating all guesswork as to the actual live load that can be carried.

Guarantee

We unequivocally guarantee, without any exception whatever, the satisfactory completion of any work with which we are intrusted; and, without reservation, guarantee all workmanship and materials against defects and to be exactly as represented.

Design

The Woodbridge Standardized PresTeel Stairways can be furnished plain or ornamental to suit any architectural design, with railings and newel posts to match. The risers may be plain or paneled, the treads can be arranged for marble, slate, cement, terrazzo, rezilite, alberene, asphalt, mosaic, cork, carpet, wood, linoleum, or any composition filling, with or without sanitary cove. The soffits of stairs are usually left open and present a neat finished appearance, but can also be arranged for plastering if desired.

Construction

Our construction provides a light, inexpensive, strong, durable, non-combustible and easily assembled stairway. It is adaptable to office, hotel, warehouse, factory, school, church, lodge hall and hospital construction; in fact, any building where fire-resistant construction is required.

Woodbridge Stairways are built with stringers made of PresTeel, thickness not lighter than $\frac{3}{16}$ in. The treads and risers are made of one piece of blue annealed steel pressed into the form required, platform plates are made of blue annealed steel reinforced with the necessary channels and tees, all securely bolted and riveted together. All rivets in our stairways are driven by machinery, insuring a permanently rigid and, therefore, noiseless connection. The thickness of metal used for the treads and risers as well as stringers depends upon the safe live load requirement and the length of span.

The Woodbridge Patented Standardized PresTeel Construction is reinforced at nosing, which prevents the nosing from breaking away from the tread filling. This stair tread will absolutely stand up at this point under the constant wear and tear the tread nosing must withstand.

The stair assembled forms a solid mass which is free from vibration under loading stress, both vertically and laterally. The strength of our construction insures the maximum of efficiency against damage or failure in case of fire.

Manufacturing Details

Special attention is called to the details of the Woodbridge standardized manufacture. Only the best of materials and workmanship goes into the makeup with a view to making these stairs last forever—if such a thing were possible—and thus reducing your cost and upkeep to a minimum.

Our product is made to last—to withstand the hardest usage—to embody all the necessary requirements and to give the greatest value possible for the money expended.

Cheap material and construction only increase the cost of an article, in added repair and replacement charges.

Installation

Woodbridge Stairs are exceedingly easy to erect. Each flight is erected, inspected and marked in our factory, then knocked down for shipment. If contractor desires to do his own construction work, we furnish shop details and printed erection instructions when shipment is made. A good man and helper can erect two flights of stairs per day, unless stair is extremely complicated. This company will be glad to handle the erection for those unable to take care of this work.

We often erect these stairs with the framework of the building, thus putting the stairs into immediate service, the tread filling is afterwards put in when the structure is nearing completion.

Painting

All Woodbridge Stairways are given one shop coat of battleship gray rust inhibitive metal coating, applied by the air brush process. We do no painting in the field.

Service to Architects

Our thoroughly organized Engineering, Estimating and Sales Departments are at the service of architects, engineers and builders. For those interested in designing and detailing stairway construction, our standardized construction, in $\frac{3}{4}$ -in. scale drawings for use in the drafting room, will be furnished upon request.

The Woodbridge Patented PRESTEEL Tread and Riser

Plaster Soffits unnecessary with this construction.

Made of one piece of No. 12, No. 14 or No. 16 Gauge Blue Annealed Steel, depending upon safe load required and length of tread

Construction allows for variation in width of treads.

By placing angle iron in this position one man can set treads and risers. No scaffolding or ladders necessary

Cement or Composition Filling

Construction strengthens risers, making braces or anchors unnecessary. Nosing positively will not break away from concrete or other fill.

No. 12, 14 or 16 Gauge Steel

All angle irons cut to the same length and carried in stock.

This construction partially conceals bolt heads.

All holes in angle iron are punched in 2 operations.

No unsightly construction from below.

The recess in treads positively gauges and positions treads.

Full strength of angle iron utilized in supporting tread.

Treads are recessed and punched in 1 operation.

Note how accessible these bolts are from the top for tightening.

Only lower side of angle iron exposed.

No. 12, 14 or 16 Gauge Steel

We do not depend on these 2 bolts to support treads.

THIS type of stair construction has passed the experimental stage as we have installed them in all principal cities of the United States. It meets all the requirements of the building and fire ordinances, and is recommended by leading Architects and Engineers.

Type J Newel—4 in. square cast iron.

Design No. 12 Rail—Spindles are $\frac{1}{2}$ -in. square wrought iron bars, 3 in. on center, set in $1\frac{1}{2}$ -in. channels and with a $1\frac{1}{2}$ -in. flat bar at top and a $1\frac{1}{2}$ -in. channel at bottom.

Type G Newel—4 in. square cast iron, rounded corners.

Design No. 14 Rail—Spindles are $\frac{1}{2}$ -in. square wrought iron bars, 6 in. on centers; ornament is $\frac{1}{2} \times \frac{3}{8}$ -in. wrought iron bar with ornamental iron separators between.

Type L Newel—4 in. square cast iron tapered shaft, bronze urn top.

Design No. 3 Rail—Spindles are $\frac{1}{2}$ -in. square wrought iron bars, 3 in. on centers, arranged in panel form with single spindle between panels. Spindles set in $1\frac{1}{2}$ -in. channels at top and bottom.

Type G Newel—4 in. square cast iron, rounded corners.

Design No. 20 Rail—Spindles are $\frac{1}{2}$ -in. square wrought iron bars, set 3 in. on centers, in a $1\frac{1}{2}$ -in. channel at top and bottom. Also available with two twisted spindles between panels.

Type F Newel—4 in. square cast iron, rounded corners.

Design No. 19 Rail—Spindles are $\frac{1}{2}$ -in. square wrought iron bars, set 3 in. on center, in a $1\frac{1}{2}$ -in. channel at top and bottom. Two cast iron ornaments between spindles at top.

Type D Newel—4 in. square cast iron, beveled corners.

Design No. 22 Rail—Closed rail, adapted to schools, etc., made of No. 12 gauge steel paneled with $1\frac{1}{2}$ -in. flat bars. Can also be furnished with panels omitted.

Combinations of Railings and Newel Posts

Woodbridge Spiral Stairway Design No. 20B

Notice the greater beauty of this latest design. Compare it with other spiral stairways that are on the market.

This new spiral, like all Woodbridge Stairways, is exceedingly easy to erect. All parts are marked and treads and risers are interchangeable.

Description—

Treads are made of cast iron with diamond pattern surface to match steel diamond plate platform.

The same casting is used for right or left-hand

treads. All treads are interchangeable and easily removed.

The risers are made of No. 12 or 14 United States Standard gauge steel.

Each riser is flanged and bolts to the center pipe.

The uprights are made of $\frac{3}{4}$ -in. square bars and are bolted to each riser.

The handrail is made of $1\frac{1}{2}$ -in. inside diameter pipe and is rolled to exact radius required.

Platform is made of $\frac{3}{16}$ or $\frac{1}{4}$ -in. diamond plate steel which matches surface of treads.

Mason Safety Tread (Lead or Carborundum Filled)

Mason safety treads are made of rolled steel or extruded hard brass (delta metal) $\frac{1}{4}$ in. thick with alternate dovetailed and U-shaped grooves. The dove-tailed grooves are filled either with lead, or a mixture containing a large proportion of carborundum and other abrasive substances, firmly held in place by the continuous supporting ribs of hard metal, which give long wear, preserving the non-slipping quality of the tread for a number of years.

The open U-shaped grooves catch and hold any foreign substance, such as pencils, burned matches, cigar ends, wads of paper, etc., giving the foot a sure contact. They can be easily swept or washed out.

The lead can not spread or creep and fill the open grooves. There are no jagged edges for the retention of filth or germs. As the tread wears, it leaves no polished, dangerous, slip-inviting surface.

All wood screws, machine screws and nuts, anchors, etc., can be furnished for each installation, when ordered.

Uses of Mason Safety Treads—Mason safety treads are especially desirable for stairs in school buildings, department stores, industrial plants, factories, and wherever the traffic is heavy; for thresholds of doors, elevator openings and fire doors; for ramps and floors around machinery.

Adaptable to all situations, inside or outside of a building, where the surface is liable to become slippery or where steps have worn to an uneven surface.

They are suitable for use on granite, marble, slate, cement, iron or wood; and can be installed during new construction or on old work.

They are especially desirable on stairs of concrete, as they prevent the raw edge from chipping off. Special anchors are furnished, which are easily worked into the soft concrete.

Mason Safety Tread as Applied to New Concrete

Repairing Worn Stairs with Mason Safety Tread—For repairing purposes, Mason safety tread is

ideal. Badly worn stair treads are repaired as shown, the worn portion being built up to the proper level with Karbolith or cement filling, on which is placed a sheet steel, brass or aluminum pan and nosing; the safety tread is then placed in position.

Our long experience enables us to give directions for the repair of any stairway, of any material and degree of wear. We

Mason Safety Tread as Applied to Worn Treads

will furnish without obligation suggestions, sketches or blue prints, showing just how the work can be done best and at the lowest cost.

STANDARD SIZES OF MASON SAFETY TREAD

Steel Base				Hard Brass Base			
No.	Number of ribs	Width, in.	With nosing	No.	Number of ribs	Width, in.	With nosing
1	7	6	No	7	8	6	No
1A	7	6	Yes	7A	6	5 1/4	Yes
2	5	4 3/4	No	8	5	4	No
2A	5	4	Yes	9	4	3	No
3	5	4	No	10	3	2 1/4	No
3A	4	3 3/4	No	11	4	3 1/2	Yes
4	4	3 1/2	Yes	11A	4	3	Yes
5	3	3	Yes	12	3	2 1/8	Yes
6	3	2 1/2	No	12A	3	2 1/8	Yes
				14	3	2 3/4	Yes
				14A	4	3 1/2	Yes

Cut to length, punched and countersunk for screws. If other than standard widths are ordered, an additional charge will be made for splitting.

For concrete work, treads should be ordered with anchors.

Any combination of Nos. 1, 2, 3, 3A and 6 will make any width tread desired without a nosing. The same is true of Nos. 7, 8, 9 and 10.

Any combination of No. 1A, 2A or 4 with No. 1, 2, 3, 3A or 6 will make any width tread desired with one nosing. The same is true of No. 7A, 11, 11A, 12, 12A, 14 or 14A with No. 7, 8, 9 or 10.

No. 5—with nosing and square back edge; especially made for cement and concrete work.

Insurance

Establishments employing labor find it desirable to equip their stairs with Mason safety tread, as accident insurance companies demand all reasonable endeavor to make the plant safe.

We know of no case where damages have been claimed for injuries from slipping or tripping that has been lost to the defendant when Mason safety treads have been used as a preventive and we have a record of many cases of such claims that have been decided in the defendant's favor. Many hundreds of school buildings are equipped with these treads and not a single accident has ever been reported to us from this use.

Mason safety treads have been used constantly for over 25 years, and over 8,000,000 sq. ft. have been sold.

Mason Structural Tread (Requires no Subtread)

Mason Structural Tread is a complete step and safety tread combined. It requires no subtread, can be installed with or without a riser. Furnished ready to bolt to staircase stringers if so desired.

This tread consists of a channel cast iron base, filled with Mason carborundum filling, which extends to the extreme front edge. The toothed nosing, which is similar to that of Masonco Saftred, prevents any possibility of slipping.

Uses—Mason Structural Tread can be used with any type of iron stair construction. It is particularly recommended for power plants, engine or boiler rooms, industrial plants, factories, schools and for heavy traffic conditions.

How Furnished—Mason Structural Treads are furnished in any tread width; in lengths up to 60 in.; and in thicknesses of $\frac{1}{2}$, $\frac{3}{8}$, $\frac{5}{8}$ and $\frac{3}{4}$ in. The $\frac{1}{2}$ -in. thickness is recommended for treads up to 36 in.; the $\frac{3}{8}$ -in. for treads up to 40 in.; the $\frac{5}{8}$ -in. for treads up to 48 in.; and the $\frac{3}{4}$ -in. for treads up to 60 in. long.

Masonco Saftred (Carborundum Filled Treads with Slipproof Nosing)

Masonco Saftred is designed to meet the present-day demand for a tread that will positively prevent accidents and combine appearance with durability.

Plain nosings of cast iron, steel or other hard materials may prove satisfactory from the standpoint of durability, but even though coated with a thin layer of abrasive, they soon become polished smooth and slippery. On the other hand, nosings which consist solely of tile or other non-slip materials may prevent slipping, but they do not possess durability.

Masonco Saftred is a perfectly flat tread with a nosing consisting of alternate hard metal and carborundum teeth. The two wear down evenly together, thus insuring both durability and non-slip qualities.

This is the only type of metal-base safety tread with a nosing which not only prevents the foot from

apply Masonco Saftred with slip-proof nosing built to fit your stair nosing—thus, all evidence of wear or repair will be concealed.

"Cooper" Stair Nosings in Brass or Aluminum

"Cooper" Stair Nosing is used with cork composition, linoleum, rubber, interlocking rubber tile, carpet, or any other form of stair covering. All sizes have a vertical edge at top which protects the stair covering from wear at its edge and prevents slipping. Four sizes.

**Mason Non-slip Ladder Shoes**

Many thousands of these ladder shoes are in use throughout the country. They are indorsed and recommended by accident liability companies and recognized by the courts as an efficient safety device. Illustrations show method of application and abrasive material in bottom of shoes.

Mason Ladder Shoes

Karbolith Sanitary Flooring

A composition with a base largely of magnesium that produces a hard, durable, sanitary surface, proof against rats, fire and germs. It is impervious to heat, cold and dampness, and will not chip, crack, tear loose nor disintegrate. It can be laid over cement, iron or wood, and binds firmly to the base.

Extensively used for flooring of railway cars, industrial plants, offices, laboratories, garages, railroad stations, steamships, etc. We manufacture this flooring and furnish instructions for installing.

slipping forward over the edge of the step, but prevents it from slipping sidewise as well.

How Furnished—Masonco Saftreds are made in one piece, in widths to fit any tread, and in lengths up to 60 in. Nosings are regularly $\frac{1}{2}$ in. deep, but nosings of any special size or shape will be furnished to meet requirements. The treads are shipped with screw holes countersunk, ready for installation.

Repairing Worn Stairs with Masonco Saftred—Instead of tearing out worn stairs, they can be economically and durably repaired with Masonco Saftred. First build up the worn portions with Karbolith filler, then

Products

Manufacturers of FERALUN, BRONZALUN and ALUMALUN ANTI-SLIP TREAD SURFACES.

United States and Canadian Sales Representatives for CARBORUNDUM ANTI-SLIP TILE.

Feralun

Feralun is specially prepared iron with abrasive grit embedded in the wearing surface to provide an approved, durable and effective anti-slip tread.

This grit, embedded at the time of casting, projects slightly and bites, so that slipping is prevented. Being excelled in hardness only by the diamond and being firmly held by the metal partly surrounding each grain, the abrasive grit in combination with the metal gives to Feralun its extreme durability.

Durability—Feralun anti-slip stair treads are non-porous and "fire-proof," "rust-proof," and "slip-proof."

On the stairs of the New York subway and elevated railroads, where they are the accepted standard, Feralun anti-slip treads last from 5 to 12 years. They carry approximately 14,000,000 people on a stairway 30 in. wide before losing effectiveness.

In floors, 11 years' concentrated wear from trucking loads of 1200 to 1800 lbs. has not caused Feralun to become slippery.

Approval—Feralun anti-slip treads are approved without any qualifications as a fire-safe and anti-slip tread by the Underwriters' Laboratories, Inc., and by Pennsylvania and New York State Industrial Boards.

Sizes and Designs—Feralun may be obtained in practically any form in which metal is cast as a tread surface. Certain forms are so frequently demanded that they have become a standard. These are shown in a set of detail sheets from which tracings may be made, and which will be sent on request.

Uses—Feralun is especially suitable for treads and walkway surfaces where durability and protection against slipping is desired, such as stair treads, coal-hole covers, area covers, gutter plates, elevator door thresholds, freight elevator landings, floor plates, trench covers, shipping platforms, ramps, etc.

Hatch

Surface Design

FERALUN

Anti-Slip Treads

TRADE-MARK

Feralun Stair Treads

Feralun treads are made with a plain or hatch abrasive metal surface. The anti-slip element is carried down over the nosing. No dangerous, slippery nosing edge or heel-catching grooves. Made in the following styles:

Styles A and C—Used on a sub-tread of concrete, iron, steel, wood, marble, etc. Made $\frac{5}{16}$ or $\frac{3}{8}$ in. thick, usually 4, $4\frac{1}{2}$, 5 or 6 in. wide and not exceeding 60 in. long in one piece. Longer treads furnished in sections. On new stairs, length of safety tread Style A is usually 3 to 4 in. shorter than distance between stringers. Width should be not less than five-eighths the distance from nosing to riser and should cover nosing edge. Widths 6 to 9 in. are $\frac{3}{8}$ in. thick; 9 to 12 in., $\frac{7}{16}$ in. thick; over 12 in., $\frac{1}{2}$ in. thick. Style A standard lip extends $\frac{1}{4}$ in. from underside of tread. At times it may be necessary to use a longer lip, especially in repair work, where it is desirable to cover all signs of wear on nosing edges of old and worn steps. For this purpose a Style A lip from $\frac{1}{2}$ in. to 1 in. deep is furnished at a slight additional cost.

Style D—Made $\frac{3}{8}$ in. thick and in same widths and lengths as Styles A and C. Nosing is $\frac{3}{4} \times \frac{3}{4}$ in.

Style O—Requires no sub-tread. Made $\frac{3}{8}$, $\frac{7}{16}$, $\frac{1}{2}$, $\frac{5}{8}$, or $\frac{3}{4}$ in. thick. Treads not exceeding 9 in. wide back of nosing by 60 in. long furnished $\frac{3}{8}$ in. thick, if desired, and should be supported by risers. Treads over 9x60 in., and not exceeding 12x60 in., should be not less than $\frac{7}{16}$ in. thick and should be supported by risers. Platforms and landings in sections not exceeding 20x36 in. should be not less than $\frac{1}{2}$ in. thick; not exceeding 36x48 in. should be not less than $\frac{5}{8}$ in.; and not exceeding 42x60 in. should be not less than $\frac{3}{4}$ in. thick. Platforms usually have a truss rib cast on the underside. Style O nosing extends $\frac{3}{4}$ in. beyond the riser line and $\frac{3}{4}$ in. down from underside of tread. If nosing is required 1x1 in., Style S will be furnished.

Style R—Bolted direct to stringers. Requires no sub-tread. Used extensively for open stairs, fire escapes, around machinery, in engine and boiler rooms, etc. Made $\frac{1}{2}$, $\frac{5}{8}$, and $\frac{3}{4}$ in. thick, according to span and has truss rib. Treads 48 to 60 in. long made not less than $\frac{5}{8}$ in. thick; 60 to 72 in. long, $\frac{3}{4}$ in. thick. This style is reversible, having anti-slip nosing at front and back.

Style R-G—Same as R with drainage perforations.

Style K—Does not require a sub-tread and is made $\frac{7}{16}$, $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ in. thick. Treads not exceeding 48 in. long will be furnished $\frac{7}{16}$ in. thick and 48 to 72 in. will be $\frac{1}{2}$ in. thick. When risers are omitted, treads should be $\frac{1}{2}$ in. thick, and when over 42 in. and not

over 60 in. long should also have a truss rib. From 60 to 72 in. long, treads should be $\frac{5}{8}$ in. thick with a truss rib.

Styles of Treads for Repairs to Worn Steps—Styles A, C or D are applied to existing steps. If necessary to remove old steps, they may be replaced by either Style O or R, without using a subread. If old and worn steps are to be repaired and Style A is preferred, it may be desirable to cover all signs of wear on the nosing edges. For this purpose, a lip $\frac{1}{2}$ to 1 in. deep will be furnished.

Method of Repairing Worn Wood, Concrete, Slate, Iron or Marble Steps with Style A Feralun Anti-Slip Treads

Anti-Slip Thresholds and Saddles—Styles L and T are extensively used. Made $\frac{3}{8}$ to 1 in. thick. Sizes up to 6x60 in. should be not less than $\frac{3}{8}$ in. thick; up to 9x82 in. should be not less than $\frac{7}{16}$ in. thick; and up to 12x108 in. should be not less than $\frac{1}{2}$ in. thick.

Elevator Thresholds—Style V made with one or two door grooves not less than $\frac{1}{2}$ in. thick and not exceeding 12 in. wide and 96 in. long in one piece. Longer saddles made in sections. Grooves are $\frac{1}{2} \times \frac{1}{2}$ in. or $\frac{9}{16} \times \frac{9}{16}$ in. Grooves are machine planed and therefore straight, true and free from fins. Lip at nosing is usually 2 in. over all. If a deeper lip is required the extra length is usually lap-jointed and bolted to the 2-in. piece. Door saddles without grooves are made $\frac{7}{16}$ to $\frac{3}{4}$ in. thick. Style W without grooves for counterbalanced door.

Floor Plates and Trench Covers—Made $\frac{1}{2}$ in. thick, in sections not exceeding 20x36 in. Sections not exceeding 36x48 in., not less than $\frac{5}{8}$ in. thick; 42x60 in., not less than $\frac{3}{4}$ in. thick.

Feralun Spiral Treads

Spiral Treads and Platforms—Cast complete in one piece with collar and flange; according to architects' or contractors' details. Thickness is usually $\frac{7}{16}$ to $\frac{3}{4}$ in. Hole in collar is for 3 $\frac{1}{2}$ or 4-in. outside diameter of pipe.

Safety Coalhole Covers and Frames—Have no heel-catching projections or depressions; flush with sidewalk. Hinges especially constructed to overcome breakage and are concealed. When open, they are enclosed on all sides and top, except toward curb where coal chute is inserted. Made in 3 sizes: 18, 20 and 24 in.

The Feralun safety covers and frames comply with the requirements of New York City Department of Public Works.

Strips for Inclines and Ramps—Made not less than $\frac{3}{8}$ in. thick in sizes up to 9x60 in.

Steeper ramp grades may be used, and much space saved, if Feralun is used. Firm, even traction is essential in garages. When the ramps are tracked or covered with Feralun, they give a feeling of security to every car owner, and are positive protection against the damage

caused by one car skidding into another or into posts and walls.

Bronzalun

Bronzalun is a combination of bronze and abrasive grit manufactured in the same manner as Feralun. It has all the good qualities of Feralun. Architectural superiority is combined with durability and anti-slip effectiveness. It is made in either the hatch, standard fluted or bright fluted surface.

Uses—Bronzalun is largely used for tread surfaces such as entrance door saddles, elevator thresholds, safety treads on marble stairs, etc.

Typical Design of Bronzalun Elevator Threshold, Style V, Showing Hatch and Fluted Surface

Alumalun

Alumalun is a combination of aluminum and abrasive grit manufactured in the same manner as Feralun and Bronzalun. It has the anti-slip effectiveness and architectural value of Bronzalun and is extremely light in weight, weighing 1 lb. per sq. ft. for each $\frac{1}{16}$ -in. thickness. It is immune to the action of sea water and does not deteriorate on account of exposure.

Uses—Alumalun is very desirable for high grade work. Its silver color makes it especially suitable to harmonize with certain decorative schemes.

Alumalun is made in hatch and fluted surfaces.

Alumalun Sidewalk Doors—Light in weight, non-corrosive, durable, anti-slip. Have no projections or depressions and are flush with sidewalk. Hinges are especially strong and are concealed. Standard sizes, 3 ft. 6 in. x 3 ft. 6 in. and 4x4 ft.

Specifications for Anti-Slip Tread Surfaces

Concrete Steps, Platforms and Landings—All concrete steps, including nosing edges of platforms and landings, shall be equipped with "Feralun" [Style A, C or D] as made by AMERICAN ABRASIVE METALS Co. Style A shall extend continuously along the step to within . . . inches (3 to 4 in.) of stringers. Style C and D shall extend from string to string. Treads shall be . . . inches (at least 4 in., and preferably 6 to 7 $\frac{1}{2}$ in.) wide. Treads shall be set flush with the cement surface and firmly secured with anchors. Surface of treads shall be kept free from all cement finish.

Iron Stairs with Risers—All iron stairs with risers shall be equipped with "Feralun" [Style O, S or K] as made by AMERICAN ABRASIVE METALS Co.

Iron Stairs Without Risers—All iron stairs without risers shall be equipped with "Feralun" [Style R or R-K] as made by AMERICAN ABRASIVE METALS Co. Style R and R-K are cast with lugs to be bolted to the stringers. Style K may be used bolted to angles on stringers.

Elevator Door Thresholds—All elevator door thresholds shall be "Feralun" [Style V-1 or V-2] as made by AMERICAN ABRASIVE METALS Co.

Door Saddles, Exterior and Interior—All entrances, interior, and fire door saddles shall be "Feralun" [Style L, T, W or M] as made by AMERICAN ABRASIVE METALS Co.

Walkway Surfaces—All (mention location, such as boiler room floors, floors around machinery, inclines, ramps, elevator floors, vestibules, freight corridors, trench covers, drainage gratings, coal hole covers, etc.) shall be "Feralun" as made by AMERICAN ABRASIVE METALS Co. and as shown on plans.

Note: At locations where architectural effect is desired, "Bronzalun" or "Alumalun" may be substituted for "Feralun" in the above.

Anti-Slip Tile—For specifications for Carborundum Anti-Slip Tile see third page following.

SUGGESTIONS FOR THE USE OF ANTI-SLIP MATERIALS IN BUILDING CONSTRUCTION

Carborundum Anti-Slip Tile

This tile is made of both Carborundum and Aloxite, abrasive products of the electric furnace. These manufactured abrasives have been recognized for years as among the greatest of all grinding materials, and are extensively used for the grinding of steel, iron, brass, bronze and other metals. Both are produced by fusing crude materials in electric furnaces at extremely high temperatures. The resultant crystal masses are taken from the furnace and are broken and crushed to standard sizes of grains or crystals. These crystals are mixed with clays and ceramic materials and moulded into the various sizes and shapes of tile. The tile are then vitrified in high temperature kilns.

Carborundum Anti-Slip Tile presents a gripping, safe surface that can not wear smooth. It is of the same structure and texture, and the same degree of hardness throughout. It retains its safe, anti-slip surface as long as the tile itself lasts.

Advantages of Carborundum Anti-Slip Tile

Carborundum Anti-Slip Tile never loses its anti-slip surface and is practically non-wearing. Under the slight wearing action of traffic it literally renews its safe surface.

It is safe under all conditions. Oil, water or grease does not affect its anti-slip qualities.

The tile is remarkably strong. Tests at room temperature have shown it to have a *transverse strength* of about 5500 lbs. per sq. in.

Carborundum Anti-Slip Tile presents a fine appearance and can be used with any building material such as concrete, marble, granite, brick, steel or wood.

Where this tile is used an even, flat surface is presented underfoot. The tile is laid flush with the stair tread or floor. There are no corrugations, ribs or ridges to cause tripping or to annoy by accumulating dirt.

The resistance of the tile to wear eliminates the cost of maintenance.

Uses of Carborundum Anti-Slip Tile

Stair Treads—For this purpose the tile is made with a rounded nose, giving a safe, secure footing even on the edge of the step.

Treads, such as concrete, slate, marble, wood, metal, etc., may be made safe by the use of Carborundum Anti-Slip Tile suitably applied.

In Concrete—Carborundum Anti-Slip treads can be used advantageously in reinforced concrete stairs, being placed at the time the concrete is poured. In conjunction with tile or terrazzo this tile provides an architecturally pleasing form of stair tread construction, which at the same time is absolutely slip-proof.

Floors—Entrances to shops, stores, moving picture theaters, swimming pool edges, floors in shower baths and lavatories, hotel and theater lobbies, restaurant kitchens, floor landings at elevators, and in industrial plants the floors around dangerous machinery, are made safe from the slipping hazard by the use of Carborundum Anti-Slip Tile. For such purposes the tile may be used solely or in varying proportions with ordinary tile forming designs. It is laid over old floors or incorporated in new construction in the same manner as ordinary tile.

Ramps—In no type of walkway surface is prevention of the slipping hazard so essential as in the construction of ramps. Here the Carborundum Anti-Slip Tile is especially suitable. It will stand up indefinitely under the severest traffic and its architectural

attractiveness for finer work does not preclude its use for heavy duty where its anti-slip qualities give needed foot purchase to workmen handling loads.

Entrances—Stores and building entrance floors are made safe for pedestrians by Carborundum Anti-Slip Tile. It eliminates the menace of slippery doorways, gives long service and provides architectural attractiveness. It can be laid solid or in conjunction with ordinary tile to form various designs.

Swimming Pools—Carborundum Anti-Slip Tile is particularly suitable for use along the edges of swimming pools, presenting a safe, secure footing for swimmers. Water does not affect its anti-slip qualities. Such borders should not be less than 18 in. in width.

Specifications for Laying Carborundum Anti-Slip Tile

In Concrete on Floors, Ramps, etc.—Tile to be soaked in water and laid in same manner as ordinary vitrified tile. (Note: detailed specification will be furnished on request.)

In Mastic on Wood, Steel and Concrete Surfaces—Surface shall be thoroughly cleaned and dry. Tile shall be thoroughly cleaned and dry. Surface shall be coated with boiling asphalt roofing mastic of the proper quality, $\frac{1}{4}$ in. thick, for an area of not more than 4 tile at one time. Lay tile in hot mastic, tamping to level, even surface, keeping joints true to line. Joints shall be $\frac{1}{8}$ to $\frac{1}{4}$ in. wide and filled with hot mastic, trimmed with a knife and ironed with a hot jointer. It is recommended that this work be installed only by experienced men.

In Treads of Concrete Stairways—Pour concrete stairs and finish as usual. When tread is hard enough, just before concrete sets, from area to be covered by tile remove concrete for a depth of $\frac{5}{8}$ in. Tamp water soaked tile into concrete to level, even surface. Joints shall be $\frac{1}{8}$ to $\frac{1}{4}$ in. wide and filled with cement grout.

On Wooden Stair Treads—Tread shall be recessed for a depth of $\frac{1}{2}$ in. and for length and width to suit number and size of tile to be used. Recessed surface shall be thoroughly cleaned and coated with boiling asphalt roofing mastic $\frac{1}{8}$ in. thick. Lay tile in hot mastic, tamping to level, even surface, keeping joints true to line. Joints shall be $\frac{1}{8}$ to $\frac{1}{4}$ in. wide and filled with hot mastic, trimmed with a knife and ironed with a hot jointer.

Tile shall be held in position by 2 wood screws per tile, or by a No. 20 gauge brass, $1 \times \frac{1}{4}$ -in. angle, toe guard, the 1-in. leg being fastened to wood tread by screws.

On Metal Stair Treads—Metal surface shall be cleaned and a $1\frac{1}{2}$ -in. layer of 1:2½ cement mortar placed on tread and finished to proper level. When this bed of mortar is hard enough, just before it sets, from area to be covered by tile remove mortar for a depth of $\frac{5}{8}$ in. Tamp water soaked tile into mortar to level, even surface. Joints shall be $\frac{1}{8}$ to $\frac{1}{4}$ in. wide and filled with cement grout.

110 East 42nd Street
NEW YORK, N. Y.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products

STANDARD NON-SLIP TREADS (Patent applied for).

Standard Non-Slip Treads

Standard Non-Slip Treads are castings of iron, aluminum or bronze with a flat wearing surface of a hard abrasive mixture.

They have three outstanding and distinctive features, viz.: the depth of the wearing surface, the absence of grooves and the design of the nosing.

The wearing surface is not superficial, but extends down almost to the base.

The absence of grooves and corrugations gives more non-slip surface and eliminates all chances of the shoe catching and tripping the wearer.

In the nosing the abrasive is likewise carried down to a considerable depth which affords absolute protection against slipping where the wear is the greatest.

Standard Non-Slip Tread Showing Nosing with Abrasive Carried Down to a Considerable Depth

Absolute protection against slipping where the wear is greatest

This nosing feature, as well as the unusual depth of the abrasive, has resulted in the Standard Safety Tread receiving wide recognition in the profession.

Types

Type "A", with Special Nosing 1 in. Deep—For badly worn wood, slate or marble steps. This style can also be furnished, with square instead of beveled back edges, when safety treads are to be rabbetted.

Type A with Special Nosing

Type "A"—Furnished either with lip nosing as shown or flat and with either square or beveled back, in widths from 4 to 12 in.

Type A

Type "L"—Furnished 3 3/4, 4 3/4 and 6 in. wide with full rounded nosing edges, reversible. Anchors attached complete with treads are to be used in new concrete.

Type L

Type "S"—School tread, structural type, holes drilled ready to attach to either riser or stringer brackets.

Type S

Type "V-1"—Elevator door saddle.

Type V-1

CHICAGO OFFICE: 803 Transportation Building

REPRESENTATIVES IN PRINCIPAL CITIES

Product

STEEL BASE, YELLOW BRASS BASE and WHITE BRASS BASE WOOSTER SAFE-GROOVE TREADS.

WOOSTER KASS SAFETY TREADS.

Also Wooster Architectural Bronze Thresholds.

For Wooster Security Nosings and Edgings, see page A681.

Wooster Safe-Groove Treads

Wooster Safe-Groove Treads are scientifically designed and proportioned in three metal bases to prevent stairs, saddles, thresholds and ramps, or any walking surface from becoming worn or dangerously smooth. They also protect stair steps from disfiguring wear under heavy traffic conditions.

Section of Wooster Safe-Groove Stair Tread

Material—Wooster Safe-Groove Treads are fabricated in black steel, highly polished yellow brass or in silvery white non-rusting and non-tarnishing white brass.

For the steel and yellow brass base treads the anti-slip filler may be of either carborundum or lead. For the white brass sections, lead only is used.

Design—Wooster Safe-Groove Treads are so designed as to present a walking surface of broad ribs of wear-resisting, abrasive material alternating with deep narrow grooves.

These antislip ribs extend clear to the bottom of the treads and the recess in which they are held is so shaped as to be wider at the bottom than at the top. This increases the area of the antislip material as the tread wears down after years of use, and increases the safety factor in proportion to the rate of wear.

Specifications—All stairs, platforms and landings to be provided with Wooster Safe-Grooves [Carborundum] [Lead] Filled Treads, to be 6 in. shorter than the

entire length of the steps and to be installed according to manufacturer's specifications.

Each step shall be covered according to the amount of wear to which it will be subjected. For lightly used stairs, 3, 3½ or 4-in. width with lip nosing is sufficient provided the tread is set flush into the step. Where the tread is not rabbeted or set flush, at least two-thirds of the depth of the step shall be covered. On stairs subjected to heavy traffic the treads shall be 6 to 9½ in. wide.

Methods of Application—Cross section details below show methods of applying Wooster Safe-Groove Treads to various types of stairs. Wherever the treads are to be set in new concrete they are shipped with anchors riveted on, so that after the concrete has set, the treads become an integral part of the steps.

Wood, Slate, Marble, etc. Stairs

Treads shall be fastened to wood sub-treads by means of No. 10 1-in. wood screws. For marble, slate or stone stairs, treads are attached with wood screws in lead shield

Pressed Steel

Treads shall be set flush with cement surface to either extend from stringer to stringer, or if sweeping space is desired to be 6 in. less than entire length of the step. Anchors are riveted on for pressed steel installations

Concrete

Detail shows standard section 3½ in. with lip nosing. To give a wide walking surface 6 to 10 in. wide for stairs subjected to heavy traffic, this could be combined with one or more standard sections. Treads with anchors attached are centered between stringers and even with finish line of step

Concrete

Detail shows tread installation on concrete for stairs subjected to normal traffic. Single tread section with nosing is used to make a walking surface 3 in. wide. Anchors are attached

Sizes of Treads—Sections of Wooster Safe-Groove Treads are made with and without nosing in square or angle back.

Any desired width to fit the amount of wear the stairs will receive may be obtained by combining standard sections.

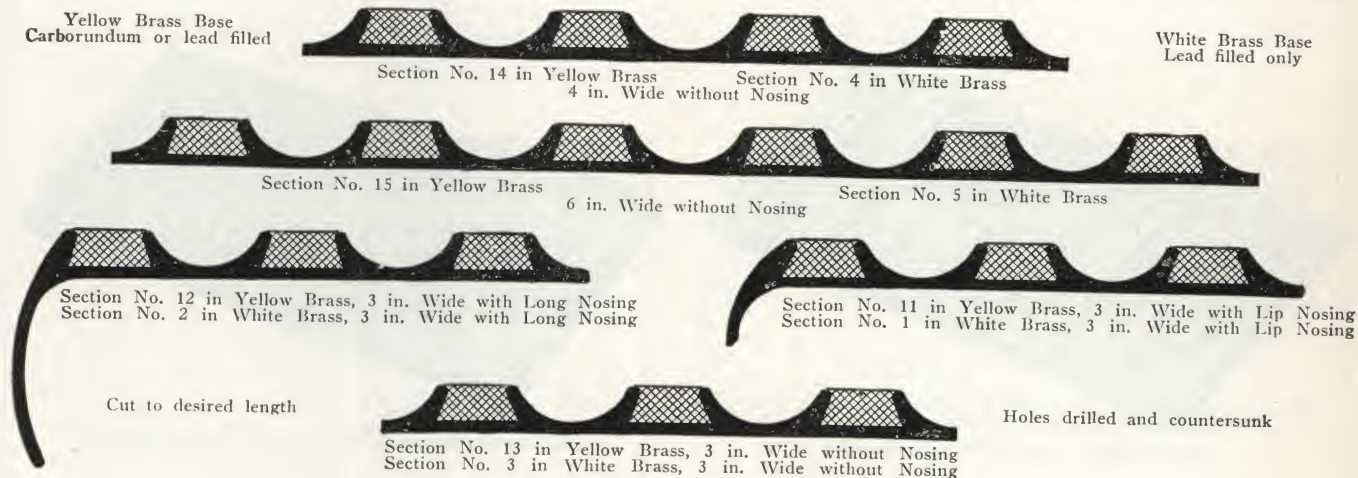

Standard sections are made in the following widths: 3 in. with nosing and square back; 3½ in. with nosing and angle back; 4 in. with nosing and angle back; 4 in. without nosing; 6 in. without nosing. Standard sizes of white brass and yellow brass sections are shown in the table below.

Full Size Cross Sections Wooster Safe-Groove Tread (Steel Base)

Note: Any desired width may be made by combining standard sections. Supplied with anchors securely fastened to tread when tread is to be placed in new concrete.

Full Size Cross Sections—Yellow and White Brass Base

Wooster Kass Safety Treads

Wooster Kass Safety Treads are made of copper-bearing, rust-resisting sheet metal in various gauges, depending on whether they are to be installed as plates upon another base or are to be self-supporting. Wooster Kass Safety Treads are lighter in weight than other types of treads and are made in any shape, with or without flanges, or curved to fit any application. The anti-slip surface of Wooster Kass treads is obtained by punching ⅛-in. holes through a series of bosses or buttons pressed into a steel plate. The cutting edge of these holes remains effective as an anti-slip surface even after years of hard wear.

Wooster Kass Treads are widely used in factory stairways, platforms, runways and in steam and electric railway cars.

UNIVERSAL ANTI-SLIP METAL TREAD (Abrasive)
TYPE I.

UNIVERSAL SAFETY TREAD (Lead-Filled) TYPE II.

General Uses

Surfaces to be protected include all stairs and landings of any material, such as iron, wood, slate, stone, concrete or marble; ramps, runways, platforms, train pits, elevator door thresholds, saddles, ladders, frames around vault lights, coalhole covers, and all surfaces that might become slippery.

Universal Anti-Slip Metal Tread, Type I

This tread is constructed of a tinned steel baseplate to which is attached the hardest known abrasive with a soft lead binder. There are no hard metal surfaces exposed to the foot, but the diamond hard grains properly embedded to withstand the most severe wear under heavy traffic. Owing to the fact that the abrasive material extends throughout the whole thickness of the

tread to the baseplate, renders it non-slip for its entire life. The lead is simply used as a binder and filler between all the voids of the abrasive grains. It is moistureproof, frostproof, non-porous, and scuffproof, and made in a flat or corrugated form as preferred. During many years of experience in the manufacture of safety treads, we have perfected a tread which fulfills the most exacting requirements.

Surfaces and Nosing—Universal "Anti-Slip" Metal Tread Type I, is made with flat or corrugated surface—Style "A" representing the corrugated surface, plain edge; Style "C" representing the flat surface with plain edges; Style "B" representing the corrugated surface with "lip" nosing; Style "D" the flat surface with reinforced nosing.

The idea of having it reinforced as shown in Style "D" is to build the abrasive as a non-slip shoulder to a depth of almost $\frac{1}{2}$ in. on the edge, which is the point of heaviest wear. This reinforcement practically doubles the life of tread. For hospitals and similar buildings a flat surface is recommended for its sanitary advantages.

CORRUGATED STYLE A, PLAIN EDGE

CORRUGATED STYLE B, WITH REINFORCED NOSING

FLAT STYLE C, PLAIN EDGE

FLAT STYLE D, WITH REINFORCED NOSING

Universal Anti-Slip Metal Tread, Type I

FULL SIZE SECTIONS AND APPLICATION DETAILS OF TYPE I SAFETY TREADS

Installation—The above show the methods of attaching Universal Treads on new concrete with special anchors as shown at Figure E, and on old concrete as at Figure F. As applied to old concrete or stone, it is necessary to drill holes about 1 in. deep and fill same with lead plugs or expansion bolts. The safety treads are then attached by means of ordinary wood screws into these lead inserts in the same manner as in the case of wood

stairs as in Figure G. When the treads are to be installed on cast iron or steel, the subtreads have to be tapped and drilled for $\frac{1}{2}$ -in. tap screws, round or flat headed. The flat headed screws are generally preferred.

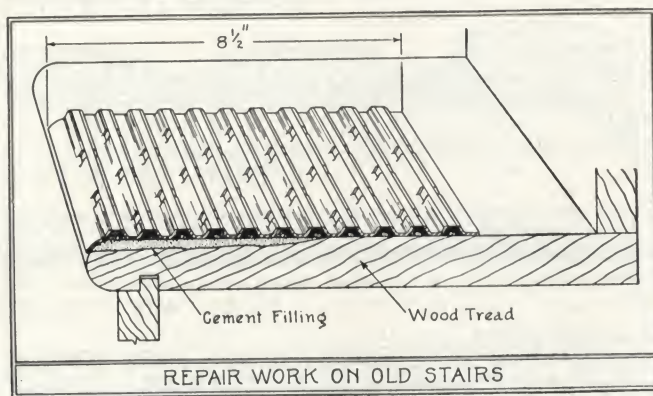

Holes—Universal Treads, Types I and II are provided with the required number of holes in the plates properly countersunk. In concrete work we furnish the special anchors as shown.

Universal Safety Tread (Lead-Filled), Type II

This tread is constructed of a steel, brass or aluminum baseplate, punched to receive the non-slip lead inserts which are rolled in and firmly clamped. The lead fills the perforations and a non-slip surface is presented for its full thickness. There are no continuous metal ribs on the outer edge, which is the danger point on all stairs, but the lead, being exposed between the steel or brass teeth, presents a non-slip edge at all times. This is especially important in descending stairways. A minimum of hard supporting metal and the maximum of non-slip lead form the wearing surface. Baseplate can be extended to form a nosing of any depth required. We can furnish alloy-coated or galvanized steel to resist the action of salt water or dampness. Our brass treads are also recommended where it is necessary to have a rustproof and safe surface.

Sizes—Universal Safety Tread can be furnished in almost any width up to 12 in. and in any specified lengths, either with or without nosing according to the

requirements of the stairs or landings. We show some of the widths which are most commonly specified and used. We also show the way it is used on repair work on which the nosing can be extended to any depth desired to cover evidences of repair.

**Universal Safety Tread (Lead Filled) Type II****Cost of Safety Treads**

The use of safety treads is a paid-up accident insurance during the life of the tread. All casualty companies demand a reasonable degree of safety on stair treads and traffic surfaces in all types of buildings and where their recommendations are followed, there is a consequent saving in the cost of insurance. Damages from tripping or slipping on surfaces where safety treads have been provided have invariably been decided for the defendant. Accidents from falls on stairs in one year

caused the death of 1149 people and crippled for life more than 4000 in this country. In New York City alone there were 118 deaths, and in Chicago 37, deaths in one year.

Although wood, iron, stone, marble or concrete surfaces are supposed to be safe at first, after a short period of wear they are sure to develop to some extent a slippery and unsafe condition. The use of any of the various types of UNIVERSAL SAFETY TREAD COMPANY'S products will reduce these hazards to a minimum.

AMBLUCO NON-SLIP BLUE STONE STAIR TREADS AND FLOORING

QUARRIES AND MILLS
AMBLUCO, WYOMING CO., N. Y.

Produced by
AMERICAN BLUE STONE COMPANY
101 Park Avenue, NEW YORK, N. Y.

Products

AMBLUCO NON-SLIP STAIR TREADS and LANDINGS for interior steel and concrete stairways; AMBLUCO FLOORING, THRESHOLDS and WALL BASE for interior and semi-interior uses.

For Genesee Valley Blue Stone for exterior uses, see page A319.

Facilities

This company has well developed quarries on its own property of about 200 acres, located at Ambluco, Wyoming County, N. Y. The mills and yards are equipped with the most modern machinery so that large volumes of business can be handled without delay.

One building 150 ft. long, devoted exclusively to the storing and finishing of AMBLUCO Products, is heated during the cold weather so that orders can also be filled in the winter.

Ambluco Non-slip Stair Treads and Landings

These treads and landings have established themselves wholly on their own merits, with practically no introduction on our part. By those who have studied their qualifications or used them, they are declared to be superior to and more economical than any other type.

Attractive (Color and Texture)—The uniformity in color, even grained texture and standard sand sawed finish (free from saw marks and imperfections) combine to give a splendid appearance. The distinctive shade of light-blue blends well with adjacent light color surfaces or gives a sharp clean contrast with dark material. It is a fine and close grained blue stone, being made up mostly of pure, hard quartz as shown below:

MINERALOGICALLY CONSIDERED
Fine, hard sand, mostly quartz..... 70%
Clay, as binding material..... 28%
Water 2%

Non-slip—The non-slip property, due to the fine grained quartz, does not grip the foot to cause tripping, but gives ample security against slipping at all times, whether wet or dry, without requiring resurfacing or replacing. These quartz particles are always uniformly distributed throughout the entire stone, a condition that is only produced by nature and prevents the surface from ever wearing smooth.

Durable—The extreme durability of the AMBLUCO Treads comes from the character of the material and the steadily increasing hardness of the stone brought on by the heat of the building, causing the treads to resist wear as they age. The density of the stone's structure

Reg. U. S. Pat. Off.

which helps to give the remarkable wearing quality is revealed comparatively in the following table:

CRUSHING STRENGTH	
Rockport granite (Kidder's Hand Book)	17,750 lb. per sq. in.
Vermont marble.....	13,500 lb. per sq. in.
Genesee Valley blue stone.....	19,970 lb. per sq. in.

This blue stone weighs only, approximately, 150 lb. per cu. ft. (or 25 lb. per sq. ft. 2 in. thick) when cut ready to set.

Sanitary—AMBLUCO Non-slip Treads and Landings are easily kept sanitary. Their great hardness prevents generation of dust and permits clean sweeping and mopping. The flat, non-porous surface has no grooves or pores to collect filth and disease germs. The soffits may be painted without danger of the stain coming through the stone to the top surface.

Quiet—They are practically noiseless and do not resound from footsteps nor become loose and rattle. This quiet feature is a truly essential quality for most buildings, and especially for hospitals where many human beings are undergoing great suffering, and for schools where it is so important that the pupils' minds are not distracted from their work.

Fire Resisting and Rust-proof—The AMBLUCO Treads and Landings offer great resistance to extreme heat and are of inestimable value in fire-proof construction. In contrast to many other treads these AMBLUCO treads do not become rusty themselves nor stain other adjacent materials.

Permanent and Economical—“Lasts the life of a school” is a fitting slogan, for, as indicated by tests and

Ambluco Stair Treads, Hartford (Conn.) Fire Insurance Co. Building

PARKER, THOMAS & RICE, Architects
MARC EIDLETZ & SON, Contractors

Details of Ambluco Stair Treads

reputed records, AMBLUCO Non-slip Treads give satisfactory service in an average school for 50 to 60 years, while observance shows that at the existing rate of advancements in scientific design and construction, a school is considered obsolete in that length of time and is frequently replaced by a new building. In fact, there are records where these blue stone treads have been removed in the wrecking of a school and the same treads later installed in a new school.

The initial cost of the AMBLUCO Treads ($1\frac{1}{2}$ in. to 2 in. thick) is about the same or less than other natural stone treads and the ultimate cost much less even than the cheap metal and composition treads.

The facility with which they can be set on the regular types of fabricated or pressed steel stair construction eliminates the great expense of specially designed steel members.

No maintenance cost is necessary after these blue stone treads are properly installed.

As a matter of fact, the AMBLUCO Treads and Landings can be safely adopted without first experimenting.

Specification Suggestions—AMBLUCO Non-slip Treads and Landings should be called by their trade-name, and although in many localities this name is well known, we suggest (to avoid substitution of inferior material) giving the additional information that they are produced by the AMERICAN BLUE STONE COMPANY, New York, N. Y.

The sand sawed or wet sand rubbed are the only two finishes which should be allowed. The former has proved entirely satisfactory and we endorse it as a standard. Planed and axed surfaces should be avoided.

AMBLUCO Treads and Landings are universally used 2 in. thick, but can be furnished down to $1\frac{1}{2}$ in. Complete specifications will be supplied upon application.

Accepted as Standard by Prominent Users—Subsequently to the standardizing on the AMBLUCO Blue Stone Treads by the City of Boston and its many suburbs in their schools and other public buildings, nearly all the rest of New England, recognizing the superior features of these treads, did likewise. Many of the leading school architects in the Eastern, Southern and Middle Western States specify them. The use has not been confined to schools, but has also been extended to other public buildings, such as hospitals, museums, colleges, churches, clubs, railroad stations and high class commercial buildings.

Also AMBLUCO installations are frequently made to replace worn-out treads of other kinds.

AMBLUCO Treads and Landings are used, for the most part, by architects and engineers long accustomed to incorporating in their specifications the best material for their work.

Ambluco Blue Stone Flooring, Thresholds, Wall Base, and Swimming Pool Coping

In these days of the exacting of high liability for accidents to mankind, the fundamental requirement in flooring is that it does not become slippery under any conditions.

In this blue stone flooring, quartz, the essential constituent, being harder than the accessory minerals, is pre-eminent on the wearing surface at all times and makes the floor slip-proof and very durable. Besides the rust-proof, non-porous, dustless and sanitary qualifications of this flooring, it is quiet to walk on.

AMBLUCO flooring is either $1\frac{1}{2}$ or 2 in. thick and is especially suitable for interior and porch floors in both regular and irregular designs, suggestions of which are shown on the following page. In case of an irregular pattern, it is advisable for economy to limit the number of sizes to about seven. If, however, a greater variety of sizes and shapes is desired, random sawed slabs may be shipped from

Ambluco Flooring, Base, Treads and Risers, Alumnae Hall, Vassar College, Poughkeepsie, N. Y.
 HUNT & HUNT, Architects

the quarries, and then fitted and jointed by local cutters on the job. Joints of $\frac{1}{8}$ to $\frac{1}{4}$ in. are usually used for the regular styles and $\frac{1}{4}$ to $\frac{1}{2}$ -in. joints are more in keeping for the irregular style floors.

Its sawed or rubbed finish gives a level surface on which chairs and other furniture do not rock, a feature so annoying with natural split stone.

Other delightfully artistic effects are gained by several methods. One, by varying the finishes—having some pieces sawed with sand and some with steel shot. Another, by omitting the washing of the stone after sawing, which gives a variegated coloring from the rust stain of the saws.

For interior swimming pools it is claimed to be in a class by itself for the border flooring and coping, for it is not dangerously slippery, does not injure the bare feet, and does not deteriorate and necessitate frequent replacements as do some manufactured floorings.

AMBLUCO Flooring is especially appropriate for,

and is being used extensively in churches, cathedrals, museums, libraries, clubs, hotels, railroad stations, residences, high class commercial buildings, and the vestibules and stair halls of hospitals, schools and college buildings.

Perhaps in no place is there greater and more noticeable wear than in thresholds or saddles, and therefore, for this purpose, this AMBLUCO non-slip sand rubbed product is unapproached. These are furnished $1\frac{1}{4}$ to 2 in. thick by the desired widths, and with a choice of bevels.

The AMBLUCO Wall Base and Plinths should be used to match the flooring and thresholds, landings and treads. The base and plinths are $1\frac{1}{4}$ to 2 in. thick by 7 to 14 in. high. A $\frac{1}{8}$ -in. radius round on the top front arris is usually given or a slight bevel is occasionally applied.

A fine sand rubbed finish is most appropriate, although the sand sawed finish frequently harmonizes better with certain styles of wall.

Specification Suggestions—It is important that this flooring, thresholds and base are specified by trade-name as described under the AMBLUCO Non-slip Treads.

For Flooring—The vestibules, lobbies, lounges (or whatever places desired) shall be of AMBLUCO Blue Stone, 2 in. [$1\frac{1}{2}$ in.] thick laid in regular [semi-irregular] [irregular] design (if irregular describe idea) with $\frac{1}{4}$ in. [$\frac{1}{2}$ -in.] joints. It shall be set over a concrete fill and set in, at least 1 in. of mortar composed of 2 parts sand and 1 part portland cement. The joints shall be neatly pointed flush with surface of floor with same mortar, to which shall be mixed enough lamp black or other coloring to produce the desired effect.

For Thresholds or Saddles—All interior doorways for (.....)

Four Types of Standard Thresholds

floors where cement, terrazzo or tile floor is used on either side, shall have AMBLUCO Non-slip Blue Stone saddles 2 in. [$1\frac{1}{4}$ in. to 3 in.] thick by the full thickness of the partition wall in width, and the full width of the opening in length, with sand rubbed finish and $1\frac{1}{4}$ -in. deep bevel on each side. Joiner strips of AMBLUCO Blue Stone $1\frac{1}{2}$ in. thick by 8 to 10 in. wide shall be used wherever different types of floor meet.

Irregular Design—FD

Random size blue stone slabs, showing variegated effect by combining sand sawed and shot sawed finishes. Laid with broken $\frac{1}{2}$ -in. joints

Suggestions for Care of Ambluco Products

After AMBLUCO Treads, Landings, Flooring, etc., have been installed they should be thoroughly scrubbed with sand and water until clean. No acid or other damaging substances should be used. If the light blue color is desired, coat with one or two applications of Truscon's Super Por-Seal. Repeat this six to eight times a year if needed. If it is preferred to have a darker shade, scrub and then paint with raw linseed oil. This can be done as often as will give the best results.

Regular Design—FA

Oblong blue stone slabs 24x12 in. laid with straight joints and transverse joints uniformly broken. Border of blue stone 8 in. wide

Semi-irregular Design—FC

Five different size blue stone slabs laid to a pattern with broken $\frac{1}{4}$ -in. joints

Semi-regular Design—FB

Oblong blue stone slabs laid herringbone. Border of blue stone 8 in. wide

REPRESENTATIVES IN PRINCIPAL CITIES

Products

WOOSTER SECURITY NOSINGS.

WOOSTER SECURITY EDGINGS.

For Wooster Safe-Groove Stair Treads, see pages A672-673.

Wooster Security Nosings

Wooster Security Nosings are designed to protect from the scuffing wear of traffic, the edges of linoleum, composition, cork tile, rubber tile, or other flooring material when used on stairs, platforms or landings.

Material—Wooster Security Nosings are made of highly polished yellow brass and of silver white, non-rusting and non-tarnishing white brass.

Design—Wooster Security Nosing is of sturdy design and retains its smooth even surface for many years. The body of the nosing which extends down over the front edge of the step cannot be bent or dented by the ordinary shocks of traffic. The nearly vertical lip securely locks the covering material in place, and the horizontal flange holds the nosing rigidly to the step. Flanges are featheredged, an exclusive Wooster feature.

Sizes—Wooster Security Nosings are made in sections of different thickness for use with any flooring material from $\frac{1}{8}$ to $\frac{1}{2}$ in. thick. Full size cross sections are shown below:

Method of Application—All nosings are delivered

cut to desired length, polished and drilled with proper number of screwholes for attachment. Wooster Security Nosings are fastened by means of screws through countersunk holes in horizontal flange. This flange is completely covered by flooring material, leaving nothing to show but attractive face of the nosing.

Detailed drawings below show methods of application to stairs of various material.

Wooster Security Nosing on Wood, No. 8 Wood Screw

Wooster Security Nosing on Pressed Steel Stairs, Installed with Wood Screw in Shield or with Anchors

Wooster Security Nosing on Concrete Stairs, Nosing Installed with Anchor Attached

Wooster Security Nosing on Slate, Marble or Stone Construction, No. 8 Wood Screw in Lead Shield

Wooster Security Edgings

Wooster Security Edgings are designed to protect the edges of linoleum, composition, cork tile, rubber tile or any flooring material, from wear when laid on floors of any kind.

Material—Wooster Security Edgings are made in highly polished yellow brass in $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ -in. thicknesses to match flooring material.

Design—Wooster Security Edgings have a nearly vertical lip which locks the flooring material securely in place. A featheredged flange, screwed or anchored into the floor, holds the edging firmly in position and is entirely covered by the flooring material. This featheredged flange is an exclusive feature in Wooster Security Edging.

Note: Illustrations below show method of application and cross sections of Wooster Security Edging.

DUVINAGE SPIRAL STAIR CO.

(PIERRE DUVINAGE, PROPRIETOR)

Manufacturer of Spiral Stairs

1200-1208 Bush Street, BALTIMORE, MD.

Product

DUVINAGE IRON SPIRAL STAIRS.

Duvinage Iron Spiral Stairs

Duvinage spiral stairs have been erected and approved for their simple, durable construction as well as their economy in floor space, in offices, churches, theaters, stores, mezzanines, boiler rooms, sewage disposal pumping wells, power plants, gas houses, water towers, mines, cement plants, etc.

They are made of the best grade of iron; have single 1-in. pipe railing on stairs and double rail around well; and center pipe 3 in. for 42 and 48-in. stair, and 4 in. for 54 to 96-in. stair.

The regular stock treads of these stairs can be furnished either right or left hand (illustration shows right hand) and 12 or 16 treads to the circle. Riser heights are affected by height between floors.

To provide sufficient headroom under top platform, risers should not be less than $8\frac{1}{4}$ in. high. By calculating number of risers required, the relative positions of starting and landing points can be determined, and a right or left-hand stair decided upon.

In ordering, give diameter, distance between floors, starting point, and position of landings desired. The 60-in. diameter is the best to use.

Send for Catalogue No. 5.

Similar drawing, together with complete bill of materials, is furnished with each order delivered.

Government specifications for post offices require the use of details A and B on preceding page

**Duvinage Patented Design,
Iron Spiral Stairs**

This type of iron stairs is lighter in construction than the Duvinage Riser Design shown on preceding page. For installations where it will receive only occasional use, it will prove perfectly satisfactory up to 5 ft. in diameter. However, where hard and constant use is expected of a spiral stairway, we recommend the Duvinage Riser Design.

Spiral Stair Specifications

For convenience, the following specifications may be copied bodily:

Furnish and erect where shown on plans Duvinage Spiral Stairs as manufactured by the DUVINAGE SPIRAL STAIR CO., 1200-1208 Bush Street, Baltimore, Md.

Stairs in. diameter ft. high, of cast iron diamond surface treads, center pipe 3-in. inside diameter for 42 and 48-in. diameter stair, or 4-in. inside diameter for 54, 60, 66 and 72-in. diameter stair. Hand rail and uprights of 1-in. inside diameter pipe on stairs and around well opening.

Finished size of floor opening to be 2 in. larger than diameter of stair.

THE BESSLER DISAPPEARING STAIRWAY CO.

AKRON, OHIO

Bessler All-steel Disappearing Stairway

Note: For complete description of operation and space saving features, see pages B1228-1229 in Carpentry Section.

The all-steel stairway is fireproof and burglarproof, and is suitable for use where every hazard must be eliminated and every possible feature of safety must be provided.

It will last as long as the building in which it is installed.

Bessler stairways are in use in thousands of homes

Bessler All-steel Disappearing Stairway Ready for Use

Ventilators furnished in panels, if desired

and apartments. Architects everywhere are highly endorsing the all-steel stairway.

Every space-saving and room-making feature that has made Bessler stairways famous is present in the new all-steel type.

Bessler all-steel disappearing stairways are built to architects' specifications. Send us plans and we will submit estimates.

Tables of various sizes for the all-steel stairways are the same as those shown on page B1229 for Model No. 97.

WALTER BATES STEEL FLOOR-GRATING AND STEP-GRATING.

Also Walter Bates Steel Poles, Towers, Substations, Cross Arms, Roof Trusses, Joist Bridging, Railway Structures, Substation Fencing, Fabricating, Galvanizing.

Walter Bates Steel Floor-Grating

Provides all the necessary flooring requirements peculiar to power plants, central stations, and certain types of industrial buildings. It is slipproof, strong, permanent, safe. Facilitates air circulation and light penetration. Relatively light in weight and low in cost. Requires no maintenance. Its even surface makes "easy going" for man or truck.

Non-clogging—Due to elimination of small openings and sharp angles it is impossible for dirt, grease or ice to form or accumulate. Always attractive and sanitary.

Positive Lock Joint—There are no welds, rivets or bolts in the construction of Walter Bates Steel Floor-Grating. The construction details below show how it is made. Once assembled no amount of jarring, loading or trucking can shake the grating loose. In effect, it is a single unit throughout. There can be no rattle or chatter, regardless of age.

WALTER BATES STEEL FLOOR-GRATING

Note that in preparing the members for joining the extreme, or edge, fibres of the Main Bar "A" are uncut. Thus the most important and strongest metal is neither disturbed or reduced.

Applications and Uses—Floors and flooring in central stations, power plants, water works tunnels, galleries, walkways, runways, isles of safety, trolley loading platforms, railings, grilles, guards, fire escapes, ventilation shaft covers, sidewalk elevator covers, elevator and penthouse floors, etc.

Walter Bates Steel Step-Grating

Provides a safe, slipproof stair step for indoor or outdoor use. Construction features including positive lock joint, are similar to those on the floor-grating, assuring maximum strength, permanent life and lasting economy. Outer edge reinforced to prevent sag or wear. Furnished ready to be bolted to stair stringers.

Estimates and Descriptions

We will be glad to furnish additional information about any Walter Bates Steel Products; or to submit suggested layouts and estimates upon receipt of specifications or descriptions of requirements. No obligation incurred on the part of inquirer.

Main bar "A"; rectangular notches "X" punched approximately in center of the section.

Main bar "A"; rectangular notches "X" punched approximately in center of the section. Tongue is curved back, so that it protrudes to one side of Bar "A".

Cross bar "B"; notches "X" made in bar at correct spacing center to center of notch.

Cross bars "B" inserted in slots "W" of main bars "A".

Cross Bars "B" turned up at right angles to entry position so that notches "X" straddle upper portion of main bars "A".

Cross Bars "B" turned up at right angles to entry position so that notches "X" straddle upper portion of main bars "A".

Tongues "X" turned back to original position held before shearing. (Since width of slot "W" was same dimension as thickness of Bar "B", tongue "X" presses tightly against bar "B", forming a positive lock.)

SAFE LOAD TABLE WALTER BATES STEEL FLOOR-GRATING

Explanation of Numerals in Column "X"

(1) Maximum Safe Uniform Load per square foot
(2) Deflection Under Maximum Safe Uniform Load in inches

(3) Maximum Safe Concentrated Load per foot of Width
(4) Deflection Under Maximum Safe Concentrated Load

SECURITY STEEL GRATING & FLOORING

greatest strength. Data as to comparative tests and sample will be gladly furnished to architects upon request.

Seven exclusive features of Blaw-Knox "Security" Steel Gratings are as follows:

Non-slip. Roughened edges of twisted cross bars protruding slightly above surface of bearing bars affords perfect traction.

Greatest strength. Electroforged one-piece construction—free from any cuts in metal—utilizes full strength. Certified tests prove this grating the strongest.

Longest life. "Security" Grating is entirely free from joints and cracks. It is the only grating which can be 100% galvanized or painted.

One-piece. The exclusive method of electroforging cross bars and horizontal bars makes "Security" Grating the only one-piece grating on the market.

Self-cleaning. Because "Security" Grating is free from acute angles or projections. An examination illustrates this fact.

Better light and ventilation. Clean-cut rectangular openings. Minimum opaque surfaces interposed between light and objective assure maximum light and ventilation.

Installation and sizes. "Security" Grating is simple to install because of a simple and secure method of fastening, eliminating need for scaffold and ladder. "Security" Grating is furnished in standard sections, or to meet your order, painted or galvanized.

Security Steel Grating and Flooring

Blaw-Knox "Security" Steel Grating and Open Flooring is made by a resistance welding process in which longitudinal bars and cross bars are electroforged into an actual—not theoretical—one-piece construction. No slots, rivets, nor cuts in the metal. In a series of tests first conducted at Columbia University, New York, and lastly under the auspices of the Pittsburgh Testing Laboratory, in which six leading commercial gratings were tested, as to comparative strength, Blaw-Knox "Security" Steel Grating and Open Flooring was conclusively proven to have the

Steel Steps

Blaw-Knox Steel Steps are made doubly visible by means of an additional set of cross bars placed between the two outer bearing bars as shown.

Blaw-Knox Steel Steps are made in accordance with the same principle as "Security" Grating. These steps are furnished in all sizes.

TRU-TYE STEEL TENSION BRIDGING

Blaw-Knox Tru-Tye Steel Bridging holds joists in tension, clinging with a bulldog grip. Unaffected by shrinkage. Floors bridged with Tru-Tye have been proved under test to remain true under excessive load conditions. Sample free to architects

QUICKSET HANGER FOR I-BEAMS

A prominent architect suggested the Blaw-Knox Quickset Hanger—a hanger which holds joists in position despite shrinkage; which thus prevents sagging floors. Quickset ties joists together across I-beams, and carries full weight of floor. Samples free to architects

JUNIOR HANGER FOR HEADERS

Blaw-Knox Junior Hanger provides non-failing steel support for headers at stairways, fireplaces, etc. Gaining out, loose nails, sagging are all eliminated. Junior Hanger assures against sagging since it holds joists firmly in place before and after shrinkage. Sample free to architects

"Mitco" Interlocked Steel Grating (Patent No. 1,158,154)

Non-slipping, non-clogging steel flooring of great strength and rigidity. Made of high tensile strength, square edge, steel bars, permanently locked in position. No rivets, bolts or welding used in its construction. 90% open area, providing maximum light and ventilation.

Furnished in various types and depths to fit openings of any size and shape. Most requirements are met by panels up to 38 in. wide, in lengths to suit the span. To meet special conditions, panels of greater width can be furnished without additional cost.

Construction—A series of dovetail slots are punched on fixed centers in the deep or bearing bars. Into these slots are set the lateral or transverse bars, also slotted. Under hydraulic pressure of 300 tons the lateral bars are pressed down into the slots, making a flush surface, spreading the metal and completely filling the dovetail slots. As the dovetail slots are always above the neutral axis, and as these slots are completely filled by the transverse bars, the bearing bars develop the full strength of the metal. The lateral bars not only serve as struts, but provide transverse strength, firmly lock the entire construction into an integral unit and distribute any concentrated load over the entire panel of grating.

Applications—Primarily designed to meet the need for non-clogging sidewalk grating for subway construction (approved by the Transit Commission of New York City) "Mitco" Interlocked Steel Floor Grating is now used extensively in chemical process plants, power plants, blast furnaces and steel mills, coal mines and tipples, marine floors and steps, and many other industries requiring strong, non-clogging and non-slipping steel floors.

"Mitco" Shur-site Stair Treads (Patent No. 1,536,636)

Made of 1-in. Type C "Mitco" Grating. A deep nosing bar, bent back (patented), clearly defines the front edge of the tread and prevents accidents caused by overstepping the edge of the step. The nosing bar is self-cleaning and will not collect dirt, snow or ice.

Furnished in five standard lengths and three widths or in special lengths and widths to meet requirements.

Bearing bars punched with dovetail slots; transverse bars slotted and set into place so that they stand about $\frac{1}{8}$ in. above bearing bars (Fig. 2). Grating is then put under a 300-ton hydraulic press and transverse bars forced down flush (Fig. 3). This pressure automatically spreads metal in the dovetail slots, completely filling them and making a perfect and permanent joint. Grating panels supplied with flush sides.

"D"—Deflection in inches for uniform live load.
Types C and E have same deflection for same spans.
Driveway can also be furnished in Type B having same strength as Type C and weighing approximately 6 lb. per sq. ft. more.
For safe concentrated load at center of span multiply tabulated load by span and divide by 2. This applies to both tables above.
Types A, B and F have the same strength for the same size bearing bars.

"Mitco" Shur-site Stair Tread

"Mitco" Armorgrids

For reinforcing concrete floors and platforms. "Mitco" Armorgrids, furnished in convenient sizes, are set on the concrete base so that the finishing fill of concrete or cement brings the surface of floor flush with top of panel. "Mitco" Armorgrids not only protect the surface of the floor but also provide traction for industrial trucking in places subject to oil and grease.

IRVING IRON WORKS COMPANY

Manufacturers of Open Steel Flooring, Walkway, Grating and Safety Steps
Dutchkill Creek and Third Street, LONG ISLAND CITY, N. Y.

Products

This company is the sole manufacturer of IRVING OPEN STEEL FLOORING in "Irvico" and other types, and of IRVING "VIZABLEDGF SAFSTEP" ALL-STEEL STAIR and LADDER STEPS; also of "Subway," "Sunway," "Sublit," "Eggcrate," "Honeycomb," "Reticuline," and other forms of flooring, grating, and accessories.

Trade-marks

The trade-mark names "Irvico," "Subway," "Sunway," "Sublit," "Safstep," "Vizabledg," and "Reticuline" are registered in the U. S. Patent Office, are the exclusive property of this company, and can not be legally used in connection with any grating, grating-flooring or safety step made by any other company.

Irving "Irvico" Open Steel Flooring

Construction—"Irvico" Flooring consists of alternate straight and "reticuline" bars of steel assembled edge-on and solidly riveted together in convenient-sized panels. The straight bars are of greater depth than the "reticuline" bars; the latter have an elongated "S" curve and meet the straight bar at a wide angle. The design embodies the "truss" principle by which a concentrated load is distributed among many bars over a wide area. The rivet holes are punched above the neutral axis of the straight bars, each of which is supported in its upper section where the buckling stress is greatest, by the adjoining reticuline bars. Thus the full tensile strength of each member is usefully employed.

The use of bars of two depths and the curve given the "reticuline" members, give the following structural superiorities distinctive of Irving types: (1) greatest load capacity per unit of weight; (2) greatest effective area for lighting; (3) least opportunity for lodgment of dirt, ash, snow, etc.; (4) all bars absolutely flush on working face of panel; (5) all panels absolutely flat—no warping or twisting; (6) a permanently non-slipping surface; (7) a superior surface for trucks or tractors; (8) a pleasing flooring design, smooth and regular.

Types—"Irvico" Steel Flooring is made in the two standard types pictured below: "M," with 7 inches

Two Standard Types of "Irving Subway" Open Flooring

OPEN STEEL
IRVING
SUBWAY
FLOORING

IRVING
VIZABLEDGF
SAFSTEP

between rivets; "O," with 3 1/2 inches between rivets. There are also several other standard "Irving" Floorings, differing from "Irvico" only in the shape of the "reticuline" bar. Load capacity is the same for all "Irving" types.

Field of Application—The architect, engineer, designer or builder will recognize, in his work, the logical place for "Irvico"

Flooring: a smooth but permanently non-slipping safety flooring; an open flooring for ventilation and lighting; a flooring moderate in first cost and with practically no maintenance costs; a sectional flooring easily installed and requiring a much lighter supporting structure; a flooring easily moved or rearranged, and using no bolts or screws, drilling or tapping, in its installation.

Central Station Floored with "Subway," "Irvico" Type

Facilities—"Irvico" Flooring is manufactured in quantities, to uniform standards, in the world's largest steel flooring factory. Large stocks of steel are always on hand, and specialized equipment makes prompt delivery possible, in any quantity.

Irving "Vizabledg Safsteps"

These are light, strong, all-steel units made of standard type "M" "Irvico" mesh except that the "reticuline" bar next to the nosing bar has the Type "O" crimp. This abrupt change in mesh pattern forms a visible edge (Vizabledg) which makes the "Safstep" miss-proof; while the non-slipping "Irvico" surface makes the "Safstep" slip-proof under all conditions.

There are 24 standard sizes, each a self-contained unit with punched carrier plates ready for mounting.

Irving "Vizabledg Safstep"

Bulletin

Bulletin H16, sent on request, gives complete description with construction drawings, load ratings, spans, weights, etc.

Standard Construction of "Irving Subway"

Spacing—Types "M" and "G"— $1\frac{1}{8}$ inches from center to center of straight bars when $\frac{3}{8}$ inch thick; $1\frac{1}{4}$ inches from center to center of straight bars when $\frac{1}{2}$ inch thick; rivet spacing, 7 inches center to center on straight bars.

Types "O" and "E"— $1\frac{1}{8}$ inches from center to center of straight bars when $\frac{3}{8}$ inch thick; $1\frac{1}{4}$ inches from center to center of straight bars when $\frac{1}{2}$ inch thick; rivet spacing, $3\frac{1}{2}$ inches center to center on straight bars.

Types "Q" and "K"— $1\frac{1}{8}$ inch from center to center of straight bars when $\frac{3}{8}$ inch thick; $\frac{7}{8}$ inch from center to center of straight bars when $\frac{1}{2}$ inch thick; rivet spacing, 7 inches center to center on straight bars.

Standard Made-to-order Units—All types of "Irving Subway" are also made to order for prompt shipment, to fit any opening and to meet any conditions. When made to order, "Irving Subway" is shipped in units or panels properly marked and accompanied by setting plans.

These units—in the $\frac{1}{2}$, $\frac{3}{4}$ and 1-inch depths, if no larger than 24 inches wide by 72 inches long—and in the $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, 2 and $2\frac{1}{4}$ -inch depths, if no larger than $13\frac{1}{2}$ inches wide by 72 inches long—sell at the regularly quoted square foot rates.

If larger than these sizes, there is a small extra charge. Anything smaller than these units is also standard and sells at the regularly quoted square foot rate.

We limit the size of the units, not only to simplify manufacture, but also to facilitate installation and to make removal or rearrangement easy.

Paint and Fastening Devices—Quoted prices always include one shop coat of paint, and fastening devices.

Orders—Orders should designate type, symbol and depth, to avoid mistake; thus, "Irving Subway Type M, 3S, $1\frac{1}{4}$ inch deep."

Show the supporting structure and outline the area to be covered. Let us make the "Irving Subway" layout for your approval.

KERLOW STEEL FLOORING COMPANY

Manufacturers of Steel Flooring, Steps and Allied Products

TELEPHONE
BERGEN 8932

222-238 Culver Avenue, JERSEY CITY, N. J.

Products

STEEL FLOORING, SAFETY STEPS, CONCRETE ARMORING, WINDOW GUARDS, RADIATOR GUARDS for all industrial, marine and architectural purposes. All products are guaranteed.

Design

The original construction of a Kerlow Steel Floor is permanent. Riveted at the center, or neutral axis of the bars, Kerlow Steel Floors cannot become concave nor convex, even after years of service and continuous traffic. There are no integral

tension or compression strains to cause buckling. Kerlow units cannot be knocked apart. There is no wrong side to a Kerlow Floor, and no attempt is made to reduce cost by eliminating steel. Kerlow Floors are all steel.

Uses for Kerlow Grating Products

Kerlow grating floors, steps and guards, have been used repeatedly for powerhouses, coal tipples, smoke-houses, elevator shafts, engine room

floors, sidewalk areas and doors, car platforms, fruit canneries, door mats, armoring concrete floors, loading platforms, refineries, oil stills, dry kiln floors, refrigerator plants, warehouses, steel mills, cement plants, for every conceivable purpose that a walking, working, or ventilating surface should be used.

Type V

Standard mesh for all floors and steps. Straight bars $1\frac{1}{8}$ in. apart. Rivets $6\frac{3}{4}$ in. on center. See table for depths and safe loads

UNIFORM SAFE LOADS—SPANS LESS THAN 6 FEET

Loads, depths and weights per square foot

A Powerhouse Installation

Type E

Car mesh for special floors and steps. Straight bars $\frac{3}{4}$ in. apart. Rivets $\frac{5}{8}$ in. on center

Type R

Close mesh for special floors and steps. Straight bars $1\frac{1}{8}$ in. apart. Rivets 4 in. on center. See table for depths and safe loads

Industrial Safety Steps

Kerlow safety steps are manufactured in regular and special lengths, in widths of $5\frac{1}{4}$, $7\frac{3}{4}$, 9 and $10\frac{1}{4}$ in.—complete with carriers ready to bolt in place.

Kerlow safety steps constitute a perfect industrial tread—non-slip and clean always. A heavy impact section is provided at the front of each step.

The carriers or supporting shelf on the safety steps are manufactured with a positive and a slotted hole at each end which preclude any reaming, drifting, or re-drilling of bolt holes in the field.

Type V—Step

Industrial step, carrier hole dimensions "A," 2 in. for $5\frac{1}{4}$ -in. wide step; $4\frac{1}{2}$ in. for $7\frac{3}{4}$ -in. wide step; $5\frac{1}{2}$ in. for 9-in. wide step; 7 in. for $10\frac{1}{4}$ -in. wide step

Co-operative Service

All that is necessary to secure prompt service and shipment is to submit size of the area to be covered together with the uniform safe load desired. Recommendations and guarantees will be given to suit the existing conditions.

Prices are made on a square foot or lump sum basis as may be desired.

All Kerlow floor units are furnished with standard fastening devices, standard finish, erection diagram, and unit list. Catalogues upon request.

A Refinery Installation

THE TRI-LOK COMPANY

Manufacturers of "Tri-Lok" Ventilated Steel Flooring and Tread

5531 Butler Street
PITTSBURGH, PA.

Product

TRI-LOK GRATING and TREAD, a ventilated steel flooring for purposes of transmitting light or air to areas above or beneath, or where extreme strength, durability, or fire-proof construction is required with a minimum of weight.

Adaptations

In addition to the use of *Tri-Lok* as hereafter mentioned, it is excellently adaptable to the *reinforcement or surface armoring of concrete floors* wherever additional strength is required or wear is excessive.

A specialty is made of *safety stair treads and landings*, either in open form or concrete filled. The nosings, or front edges of these steps, are positively visible when ascending or descending the stairway. Style BD *Tri-Lok* Nosing is positively non-slipping. (See illustration "C"). *Tri-Lok* Nosing is positively non-slip.

Accessories

Continuity bars for the purpose of joining sections of *Tri-Lok* Ventilated Flooring into a continuous span, thus making one integral floor with ample strength and no projections above the surface.

Tri-Lok Fasteners for making all attachments to supporting structures.

Construction

Consists of steel load bearing bars and load distributing bars, triple locked at right angles to each other. (Illustration A). The bearing bars are punched with curved slots exactly the same width and over-all depth as the cross or load distributing bars. In assembling, the bearers are set on edge with the slot uppermost, in a rigid steel frame which accurately spaces them and assures rectangularity of the finished unit. The bearers are arranged in such a way that the slots curve alternately right and left in adjacent bars. The cross bars are then started into the slots by hand to insure perfect alignment after which the entire unit is subjected to 1600 tons hydraulic pressure.

This drives the distributors to the bottom of the slots in the bearers and completes the triple or twist-and-turn lock, in other words, twists the lower edge of the distributing bars to the right and left at each side of the bearing bars.

Illustration A

Advantages

Strength and Deflection—*Tri-Lok* possesses maximum strength per unit of weight of material.

Since the bearing bars are not slotted or otherwise deformed below the neutral axis, and since all slots are solidly filled by the distributing bars forced into them, the carrying strength of the whole construction is the full equivalent of a solid of equal weight and depth. Deflection is a minimum.

Rigidity and Durability—The twisting of the distributors, alternately to the right and left as they cross the bearers, and the solid filling of the slots in the bearing bars by the cross bars, results in a joint which for rigidity, durability, and virtual indestructibility is unexcelled in this field.

Laboratory tests by Columbia University, the University of Pittsburgh, the Pittsburgh Testing Laboratory and Massachusetts Institute of Technology reveal that *Tri-Lok* joints remain absolutely unimpaired up to, and beyond, the failure point of the material.

Light Weight—Owing to the fact that every ounce of *Tri-Lok* construction represents the effective full strength of the steel, lighter materials may be used than when connections are made by means of rivets, bolts or welds. Comparison of safe load tables will disclose this fact.

Tri-Lok is approximately 90% open, thereby transmitting most effectively light and air to areas above or beneath, at the same time assuring absolute cleanliness.

Standard anchors, or fastening devices, which seem best suited to the conditions, are furnished with each installation of *Tri-Lok*.

Due to the triple lock construction a continuous flooring is assured and installation costs are reduced approximately 50% over other types.

Economy—In addition to the lower installation cost, the simplicity of *Tri-Lok* construction and its tremendous strength per unit of weight permits the accomplishment of a desired result with *Tri-Lok* at less cost than usual.

Our Service Department will gladly supply detailed literature and engineering data.

What a difference three locks make!

First, there is a right-twist lock in every other bar.

Second, there is a left-twist lock in alternate bars.

Third, there is the 1600-ton hydraulic pressure-lock, which is effected by pressing the cross bars into the two twist-locks.

Time nor wear can not open the three locks of TRI-LOK.

Tri-Lok Safety Tread
Illustration C

Some Uses for Tri-Lok

(1) "Tri-Lok" Ventilated Steel Flooring for—Area gratings, sidewalk doors, manhole covers, heating radiator guards, heating and ventilating grilles, automobile and truck radiator guards, conveyor walkways, boiler room walkways and platforms, window guards, cooling floors, fire escape landings, theatre overhead walkways, flooring and walkways for power plants, pumping stations, waterworks, filtration and sewage disposal plants, chemical plants, oil refineries, foundries, cold storage plants, gas plants, etc. and sidewalk gratings for subways.

(2) "Tri-Lok" Concrete Armoring and Reinforcing for—Loading platforms, industrial floors, armories, stairs, roads and sidewalks.

(3) "Tri-Lok" Safety Treads for—Grain elevators, fire escapes, stairways in boiler rooms, power plants, pumping stations, waterworks, filtration and sewage plants, gas plants, etc., subway exits, street cars, railroad locomotives, freight and tank cars.

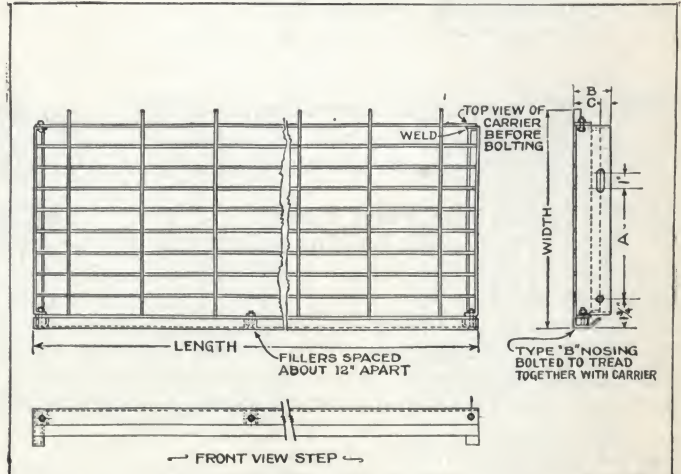

Some Users of Tri-Lok

United States Government for various departments
United States Steel Corp.
Delaware River Bridge Commission
N. Y. Board of Transportation for N. Y. Subway
Philadelphia & Reading R. R. Co.
West Virginia Pulp & Paper Co.
Consolidated Gas & Electric Co.
Union Light & Power Company
West Penn Power Co.
Dewey Portland Cement Company
Packard Motor Co.
Tidewater Oil Company
Aluminum Company of America
Essex Rubber Company
City of Cincinnati, Ohio
United States Gypsum Co.
Stone and Webster, Inc.
Dwight P. Robinson & Co.
Ford Motor Company
General Motors Corp.
The Toledo Furnace Co.
A. E. Staley Company
Pittsburgh Coal Company
Electric Bond and Share Co.
Phoenix Utility Co.

Standard Tri-Lok Safety Steps

The table of standard sizes as shown below, covers safety steps carried in stock for prompt shipment. Architects, engineers and designers are coming to realize the advantages in detailing their structures to conform with these standards as their building operations may be more effectively carried forward by the prompt service which can in this way, be given.

The cleanliness and simplicity of these safety steps may be seen from a study of illustration "C."

L—Safe load in lbs. per sq. ft. C—Deflection constant.

To obtain the deflection of any span, multiply the safe load figure by the deflection constant ($L \times C = \text{Deflection}$). We do not recommend spans greater than those shown on the left of the heavy line in the table.

Type "GS"—Bearing bars 1" apart; cross bars 2 1/8" c. to c.

Mark "GS" 2 1/4 approved by Board of Transportation City of New York for Subways. Safe loads same as Type "G"

Type "GO"—Bearing bars 1 1/8" apart; cross bars 1 1/8" c. to c. Safe loads same as Type "G"

For use where 1" square spacing is desired.

Other Types of Tri-Lok

Type "K"—Bearing bars 3/4" apart; cross bars 4" c. to c.

Type "KS"—Bearing bars 3/4" apart; cross bars 2 1/8" c. to c.

Type "KQ"—Bearing bars 3/4" apart; cross bars 7/8" c. to c. Gives 3/4" square spacing.

For safe loads multiply Type "G" loads by 1.28.

Type "H"—Bearing bars 1 1/4" apart; cross bars 4" c. to c.

Type "HS"—Bearing bars 1 1/4" apart; cross bars 2 1/8" c. to c.

Type "HQ"—Bearing bars 1 1/4" apart; cross bars 1 3/8" c. to c. Gives 1 1/4" square spacing.

For safe loads multiply Type "G" loads by .83.

Type "L"—Bearing bars 1 1/2" apart; cross bars 4" c. to c.

Type "LS"—Bearing bars 1 1/2" apart; cross bars 2 1/8" c. to c.

Type "LQ"—Bearing bars 1 1/2" apart; cross bars 1 1/8" c. to c. For safe loads multiply Type "G" loads by .71.

For Car Steps and Running Boards

Type "F"—Bearing bars 5/8" apart; cross bars 4" c. to c.

Type "FS"—Bearing bars 5/8" apart; cross bars 2 1/8" c. to c.

Type "FQ"—Bearing bars 5/8" apart; cross bars 3/4" c. to c.

For safe loads multiply Type "G" loads by 1.42.

Especially for Concrete Armoring

Type "G"—Bearing bars 2 3/8" apart; cross bars 4" c. to c.

Type "CS"—Bearing bars 2 3/8" apart; cross bars 2 1/8" c. to c.

Type "CO"—Bearing bars 2 3/8" apart; cross bars 2 1/8" c. to c.

For safe loads multiply Type "G" loads by .46.

1826—101 Years of Quality and Service—1927

"A.W." quality and service have, for over a century, been continuously known to the trade.

"A.W." Rolled Steel Floor Plates

Rolled from open hearth steel especially suited for this purpose, in our own plants, from raw material to finished product. They combine neatness, attractive appearance and strength with a patterned surface designed to prevent slipping. The beveled edges on the raised oval diamond and ribbed pattern assures *firm foothold without cutting*. They are self-draining and cleaning.

Manufactured in Two Patterns—"A.W." Diamond and "A.W." Ribbed pattern.

Either pattern can be matched at any time—they are always uniform.

A Permanent Flooring and a Secure Foothold—"A.W." floor plates, unlike cast iron, will withstand the roughest usage without breaking.

Note: Graphic chart of deflections and safe loads in comparison with cast iron on request.

A Few Principal Uses—Although "A.W." floor plates are used for all industrial and construction purposes generally, a few specific uses are:

Public buildings, schools, depots, theaters, hotels.
Sidewalk doors, manhole covers, trench and duct covers.
Traffic treads for bridge floors and railroad crossings.
Engine room floors, charging floors.
Power plants, gas works, ships, cars.
Trucks, stairways, fire escapes.
Locomotive running boards; aprons and bumper plates; steps.

SIZES AND WEIGHTS OF "A.W." DIAMOND PATTERN FLOOR PLATES

"A.W." Diamond Pattern Rolled Steel Traffic Treads Eliminate Replanking of Wooden Floor Bridges

Approved by engineers. Provide an easy driving surface, reduce vibration to a minimum and prevent nails and spikes from working up through the floors. They make an exceptionally neat appearance and are economical

BARNES WIRE FENCE CO.

Ornamental Iron and Wire Work and Wire Signs

10371 Northlawn Avenue

DETROIT, MICH.

Products

FENCES (Wire and Iron) for all purposes: FOLDING, SLIDING and SWING GATES; WIRE PARTITIONS:

IRON PORCH RAILINGS: WIRE and IRON WINDOW GUARDS.

Also Waste Paper Consumers.

No. 31 Wrought Iron Bar Gate

No. 40 Wire Factory Partition

Made of round steel wire crimped and interwoven (varies from 1 to 2 in.) diamond mesh with channel iron frame. Black finish

No. 50 Wrought Iron Folding Gate

Made of flat iron usually $\frac{5}{8}$ in. x $\frac{1}{2}$ in.

No. 10 Wire Guard with Round Frame

No. 10 guard is particularly suitable for school windows or for basement and bulkhead windows. It is usually secured to wood frame with staples and to steel sash with "J" bolts

No. 12 Wire Guard with Channel Frame

No. 12 guard is particularly suited for installation where heavy construction is desired, such as store and factory windows. It is secured to wood frame with wood screws, and to brick jamb with expansion bolts

No. 30 Wrought Iron Guard

No. 30 is particularly applicable where maximum protection is desired, such as in bank, store or factory windows. It is usually anchored in masonry when building is under construction. It is generally secured to brick jamb with expansion bolts. No. 30 is usually made of $\frac{5}{8}$ -in. round upright iron bars spaced $3\frac{1}{2}$ in. apart

No. 24 Iron Porch Rail

No. 2 Iron Porch Rail

No. 5 Iron Porch Rail

No. 19 Iron Porch Rail

No. 20 Iron Porch Rail

No. 21 Iron Porch Rail

Barnes Iron Porch Railings

These railings are usually made of $\frac{1}{2}$ -in. square bars spaced 4 in. apart with channel iron rails and half oval cover bar. Height, 26 in. Other designs offered upon application

BADGER WIRE & IRON WORKS

1210-1226 25th Avenue

MILWAUKEE, WIS.

Products

ORNAMENTAL IRON AND WIRE WORK:

Window Guards, Wire Partitions, Railings, Tool Room Enclosures, Fences, Grilles, Panels, Wire Signs, Skylight Guards, Iron Gratings, Folding Gates, Balcony Railings, Sidewalk Doors, Marquises, Fire Escapes, Iron Stairs, Elevator Enclosures, Fireproof Stairway Enclosures, Entrance Gates, Flagpoles and Lawn Furniture.

Wire Window Guards

A particular specialty is made of the manufacture of wire window guards and these can be furnished at minimum prices. Inquiries should specify quantities and sizes, as well as gauge of wire, size of mesh and style of frame

Wire Partition

Used extensively where it is desirable to enclose a space effectively without obstructing the light.

Generally made of No. 10 wire, 1½-in. diamond mesh, 1x½x½-in. channel frames; cover bar and cast pickets at top as shown

Service

Ornamental iron and wire work according to design to be submitted, or this Company will furnish details of their standard construction. Inquiries will be given prompt and careful attention.

BADGER WIRE & IRON WORKS own and operate a new plant, where, with ample space and facilities, they will be able to give prompt and satisfactory service.

Standard Sectional Wire Partitions

Principally for tool and stock room enclosures. Interchangeable, so that re-arrangement is possible without drilling or fitting. Standard partitions are made 4x7, 5x7, 4x8, and 5x8 ft. They are made of No. 10 wire, 1½-in. diamond mesh, 1x½x½-in. channel frames, horizontal bar through center, 1½-in. channel cover bar at top; swinging or sliding doors; also service windows, equipped with necessary hardware

BADGER WIRE & IRON WORKS

Wire Sign

A specialty is made of the manufacture of wire signs and BADGER WIRE & IRON WORKS have furnished some of the largest in use. In writing for price state length, height and lettering wanted, also the position of the sign so that the proper bracing may be figured. Complete specifications will be submitted in quoting

Folding Gates

Below are shown three styles of our folding gates.

No. 25 Single Folding Gate

No. 65 Wrought Iron Balcony Rail

No. 66 Wrought Iron Balcony Rail with Cast Ornaments

No. 27 Double Folding Gate

No. 67 Wrought Iron Balcony Rail

No. 68 Balcony and Railing

No. 28 Double Folding Gate with Overhead Track

Iron Gate and Fence

In this department exceptionally good service is given, and low prices consistent with the quality of the product are quoted.
Catalogue showing a number of styles will be sent on application.
Special designs furnished

Badger Steel Stairs

Design "M" is one of the recent installations by the BADGER WIRE & IRON WORKS. A great variety of

other types have been fabricated. Details of any will be furnished on request.

THE COLUMBUS WIRE & IRON WORKS CO.

Ornamental and Architectural Wire and Iron Work

MAIN OFFICE AND PLANT
Poplar and Michigan Avenues
COLUMBUS, OHIO

Products

ORNAMENTAL and MISCELLANEOUS IRON and WIRE WORK: including Stair, Balcony and Porch Railings; Grilles; Wire and Iron Window Guards; Entrance Doors and Gates; Steel Folding Gates; Bank Screens; Spiral Stairs; Fire Escapes; Pipe Railings; Area Gratings; Columbus Standard Wire Partitions; Wire Signs; Skylight Guards; Cold Air Screens; Flagpoles, Flag Stands; and many other Light Steel and Wire Products.

We are craftsmen in wrought iron.

Facilities

We will gladly submit designs and specifications for special work. We also furnish estimates on architects' plans and specifications, giving complete estimate on all work required for entire building as covered by ornamental iron specifications.

Our plant covers 22,000 sq. ft. of floor space and is equipped with best of modern metal working machinery. We employ mechanics of long experience.

Wrought Iron Railings from Stock

Send for circular showing railings, panels and posts which we can furnish from stock at prices more reasonable than many designs in wood.

Specify iron rails for porches on residences and apartments. They are neat and durable, and easy to erect.

Additional Plates of Stock Designs

For additional plates of our stock designs, refer to your files under "Ornamental Iron and Wire Work," A.I.A.-15d.

PLANT 318-322 DAVIS STREET
BALTIMORE, MD.

Products

ORNAMENTAL IRON and WIRE WORK: including Window Guards, Elevator Enclosures, Grilles, Folding Gates, Elevator Cars, Sieves, Sand and Coal Screens, Machine Guards, Wire Partitions, Railings, Iron Gratings, Sidewalk Doors, Fire Escapes, Railings and Entrance Gates.

Also Fine Mesh Wire Cloth, Diamond Mesh Fabric, Galvanized Wire Mesh Cloth and Steel Stack Netting.

Facilities and Service

Our plant is fully equipped with facilities to handle any type of ornamental iron work. Our service is prompt and satisfactory.

We are prepared to work up any special designs submitted to us or will be glad to offer our own suggestions when desired. Inquiries are given prompt and careful attention. We have a number of special catalogues covering the various types of work which will be sent on request.

**No. 25 Wire Window Guards**

These guards are made with channel iron frames. They are strong and substantial, and made to screw in the window jamb, but can also be made to fasten to the outside of frame if so desired.

No. 26 Wire Window Guards

This type of inexpensive guard is usually fastened with staples, but they can be furnished with lugs for screw attachment if required.

**Bank and Office Grilles**

Made of iron, steel, brass, bronze and oxidized copper and in any finish. Plain flat grilles, with or without frames for sundry purposes to the more elaborate ornamental types for office, banks, etc. Made to designs submitted to us or specially designed to harmonize with other fixtures.

**Elevator Enclosures**

We make a specialty of all types of elevator enclosures and have equipped some of the largest office buildings in this field. Your inquiries for this class of work are solicited. A special catalogue will be sent on request.

**Folding Gates**

All types and sizes of folding gates. Can be made to fit any opening. For store, factory, elevators, passageways and office entrances, as well as for other miscellaneous uses.

TAYLOR & DEAN

PITTSBURGH IRON AND WIRE WORKS
(ESTABLISHED 1842)

Ornamental Iron and Bronze Work, Builders Iron Work, Bridge Railing

2418-2428 Penn Avenue at 25th Street

POTTER MANUFACTURING CORPORATION

Manufacturers of the Potter Tubular Fire Escape

107 West Washington Street
CHICAGO, ILL.

Product

The POTTER TUBULAR SLIDING TYPE FIRE ESCAPE—inspected by the Underwriters Laboratories, Inc. and listed as standard.

Description

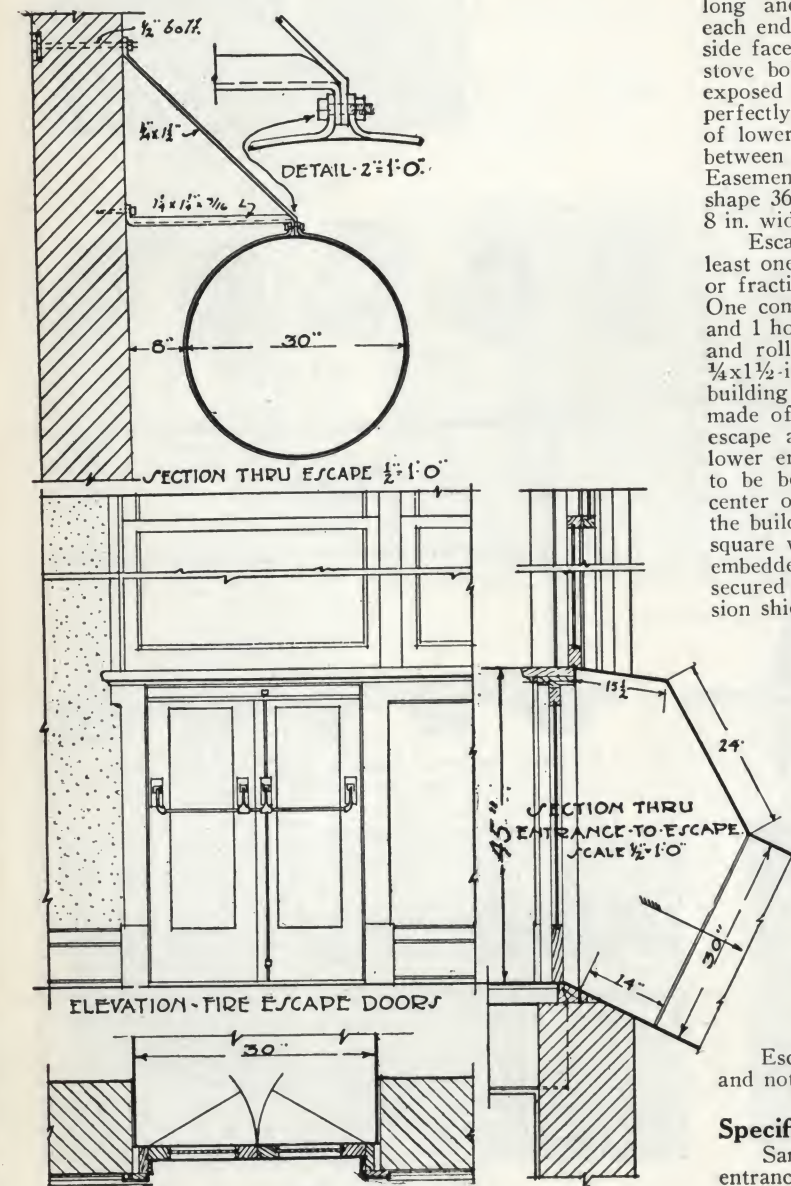

The Potter Tubular Fire Escape is designed especially for schools and hospitals. It consists of a copper-bearing galvanized sheet steel straight tube inclined about 30° to horizontal, with entrance from room through doors equipped with panic-bolt hardware and exit from horizontal section at ground level. Supporting brackets every three sections.

Advantages

It is safe, rapid, strong, durable and economical.

It can be entered direct from the schoolroom, thus permitting quicker exit.

There is no possibility of any one who uses it getting hurt. Slipping, falling, stumbling, pushing and confusion are all eliminated. Being enclosed, the occupants are fully protected from falling obstacles, flame, smoke, ice and snow.

Sizes

Made in two sizes—30 and 36 in. in diameter. The large size is recommended for hospitals as it will accommodate a patient on a mattress.

Specification School Type Size 30-inch Diameter

Construct all parts of fire escape out of 20-gauge copper-bearing G I metal. Entrance to escape to be 30 in. wide and 42 in. high, securely built into wall. Elbows to be 30-in. diameter with 8-in. sweep, except where elbow is placed more than 5 ft. from entrance in which case they shall have sweep of 18 in. All joints shall be double seamed. Sections shall be 30 in. in diameter, not more than 36 in. long and have an $1\frac{1}{4} \times \frac{1}{8}$ -in. angle iron band riveted to each end. Sections shall be joined together by bolting the outside faces of the angle iron bands together with fifteen $\frac{1}{4} \times 1$ -in. stove bolts. All rivets to have countersunk heads, and those exposed to the sliding surface to be soldered over and scraped perfectly smooth. Sheets of upper section to lap over sheet of lower section so that occupants slide with the lap. Joints between the sections to be filled with asbestos roofing cement. Easement or lower end to flare from 30-in. diameter to oval shape 36 high by 30 in. wide and rest on a concrete base 2 ft. 8 in. wide, 3 ft. 2 in. long and 16 in. high.

Escape shall be secured to the building with brackets. At least one set of brackets shall be used for every four sections or fraction thereof, exclusive of entrance, elbow and easement. One complete bracket shall consist of 1 band, 1 hanger brace, and 1 horizontal brace. Band to be made of $\frac{1}{4} \times 1\frac{1}{2}$ -in. flat bar, and rolled to 30-in. diameter. Hanger brace to be made of $\frac{1}{4} \times 1\frac{1}{2}$ -in. flat bar and extend from center of escape at top to building at an angle of about 45°. Horizontal brace to be made of $1\frac{1}{4} \times 1\frac{1}{4} \times \frac{1}{8}$ -in. angle iron and extend from center of escape at top to building horizontally. Both ends of band, lower end of hanger brace and outer end of horizontal brace to be bolted together with $\frac{1}{2} \times 3$ -in. machine bolt at top and center of escape. Upper end of hanger brace to be secured to the building with a $\frac{1}{2}$ -in. bolt through the wall held by a 3-in. square washer on the inside. Head of bolt and washer to be embedded in the plaster. Inner end of horizontal brace to be secured to the building with a $\frac{3}{8} \times 3\frac{1}{2}$ -in. lag screw and expansion shield.

Entrance on inside of building to be closed with double doors 15 ft. wide, 42 ft. high, equipped with panic bolt and lock operated with push bars on each door. Doors to swing into entrance of escape. All casing and woodwork to match other woodwork of room in which entrance is located as to kind of wood, design and finish.

Finish shall include stain and one coat of varnish. A horizontal swing bar shall be placed near top of entrance just outside the doors for occupants to grasp with hands when entering escape. Swing bar to be made of $\frac{3}{4}$ -in. pipe and be securely fastened to entrance.

Escapes shall be painted one coat in factory and when installation has been completed they shall be painted a second coat. Color to match that of building.

All materials used in the manufacture and installation of fire escape shall be of the best grade and all work shall be done in a thorough and workmanlike manner, by skilled mechanics.

Escape shall be hung with a slope of not less than 26° and not over 40°.

Specification Hospital Type Size 36-Inch Diameter

Same as above except for diameter of tube and width of entrance.

ENTERPRISE IRON & WIRE FENCE CO.

Manufacturers of Fencing and Ornamental Iron

Yandes and 24th Streets
INDIANAPOLIS, IND.

Products

ENTERPRISE "EVER STRAIGHT" WROUGHT IRON FENCES.

HAND WROUGHT ORNAMENTAL ENTRANCE GATES.

WROUGHT IRON ENTRANCE DOORS and GRILLES.

WROUGHT IRON BALCONIES.

WINDOW GUARDS.

WROUGHT IRON STAIR RAILS and AREA GRATINGS.

Factory

The factory of this company is equipped with their patented "caulking machines" which permit the quick fabrication of standard and special designed fences. The workmen are experienced craftsmen in wrought iron work, also in fancy and intricate design.

Experience

Enterprise fences and gates have been in satisfactory use for over 45 years.

Construction

Wrought iron is used exclusively in the manufacture of Enterprise fences and gates. All fittings are the best grade cast and malleable iron. The gates and balconies are hand wrought and all joints are mortised and tenoned. The fence pickets are permanently locked in place by a patented pneumatic caulking machine.

All work is given a coat of black preservative paint before shipping and a second coat after erection.

Quotations and Estimates

Will be sent without charge. Please send a simple diagram showing size of plot, lengths of fence, location and widths of gates, also a profile sketch, if there is a grade greater than 5 per cent.

Erection and Installation

Can be made by this company or by one of its agents, or the fence and gates can be shipped with full instructions for erecting, with sufficient paint for the finish coat.

Blue Prints and Specifications

This company maintains its own *layout* and *design* department for the assistance of architects, and will be glad to co-operate in making unusual plans and designs.

AMERICAN FENCE CONSTRUCTION CO.

Iron Picket Fences—Chain Link Fences

TELEPHONE

CIRCLE 9847-8-9

221-225 West 57th Street

NEW YORK, N. Y.

REPRESENTATIVES IN PRINCIPAL CITIES

Fences and Gates of Standard and Special Design

This company offers a wide and complete choice of designs in standardized fences and gates both of iron picket and chain link wire types. In addition, it is prepared to execute special-design fences and ornamental iron work from architect's designs. Some of our work of this kind is pictured here.

Iron picket fences, because of the infinite possibilities of ornamental design work, are standardized only in respect to the general use of certain "plain" picket fences of the designs detailed on the following page. Ornamental work, special gates, etc., are executed in infinite variety.

TRADE-MARK

Other Products

Tennis court enclosures, poultry and kennel runs, arbors and trellises, window guards, interior wire partitions and industrial property chain link fences.

Estimates and Service

Estimates on either fence materials or fences plus erection will be given, either by this office or local representatives throughout the Eastern, Central and Southern States. The fullest measure of co-operation is available. Information regarding standard practice in the size of members, dimensions of concrete footings and other such practical data is made available to any who will find it helpful.

Iron Picket Fences and Gates

The standard iron fences are built in varied sizes of pickets, proportionate to specified heights and the duty intended.

Standard designs can be given simple ornamentation to harmonize with the fence's architectural background, such as the row of rings in detail Fig. 10.

Special design work originates with the architect, often with the co-operation of our organization in so far as the specification is prepared to enable the utilization of members in sizes readily available.

Set with drive anchors, or in concrete post footings.

Style 913—Same as above but with 3 strands thickset barb-wire on post arms.

Bulwark Fence—A heavy weight standard for schools, institutions or extra high fences.

Specification—End, corner and gate posts 3 in.; line posts 2 1/2 in.; top rail 1 1/8 in.; all outside diameter standard weight galvanized pipe. Fabric 2-in. mesh chain link of No. 6 or 9 copper-bearing steel wire. Heights 5 to 10 ft. Set in concrete footings 36 in. deep.

Single and Double Gates

Are of rigid frame construction, being built of tubular members welded at all joints. Standard sizes for either fence, to meet all normal conditions.

Tennis Fence

Two specifications, for private and for club and professional courts. Either complete enclosure, backstop or backstop and wings, of standard 10-ft. height or to order.

Specifications—Private Courts—End, corner and gate posts 2 1/2 in.; line posts 2 in. spaced 8 ft. apart; top rail 1 1/8 in.; all outside diameter measurement standard weight galvanized pipe. Fabric 1 1/4-in. mesh chain link of No. 11 wire. Set in concrete footings 36 in. deep.

Professional Courts—Same as above, except end, corner and gate posts 3 in., line posts 2 1/2 in. outside diameter spaced 10 ft. apart, top rail 1 1/8 in.

Afco Chain Link Factory Fence

The heaviest chain link fence, used as a non-climbable barrier where absolute protection is essential. Built on steel angle posts, with integral overhanging arm carrying 3 strands of heavy barbed wire. Set in concrete. Described fully in SWEET'S ENGINEERING CATALOGUE, or printed specification sheets can be had on request.

Nation-wide Sales and Erecting Service

A chain of Anchor offices located in principal cities in all parts of the United States insures immediate attention to the requirements of architects. We maintain trained crews of erectors who erect fences under the supervision of our main office and branches, thus insuring good workmanship and an economical job. If

TRADE-MARK

desired, we will make surveys for grades and measurements and take entire charge of the work. When a customer prefers to do the erecting, tools and necessary instructions are furnished.

Estimates and Catalogues

Estimates given for products delivered and set complete in any part of the country. In requesting estimates, send, if possible, a diagram giving dimensions, location of gates, ends and corners.

For the convenience of architects and their specification writers we have prepared a special folder according to specifications for A.I.A. filing system. It contains a complete set of catalogues, specification sheets with scale drawings, details and dimensions on Anchor Fences, Railways and Gates.

The nearest Anchor office will gladly send you one of these handy folders. Just write for folder "A.I.A. File 14-K."

Surrounding residence of H. C. McCrady, Pittsburgh, Pa.

Iron Railings and Entrance Gates

Long experience enables this company to manufacture railings and ornamental gates properly proportioned and designed, and correctly made in all details. Special or stock designs furnished.

Anchor-Weld Railings and Gates

The ANCHOR POST FENCE COMPANY has secured the right to manufacture railings and gates by the *electric-weld process*. As shown in the illustrations, we use grooved square bars: $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ in. square. The rails consist of these bars in horizontal pairs the length of a panel. Welded between these pairs, and at right angles to them, are the pickets. All welding is done on the flange sides of rails and pickets.

The strength of this type of construction is enormous. Not only does it permit the making of panels as long as 10 ft., but the center support—so necessary with ordinary railings—is dispensed with entirely.

Even when supporting an additional weight of several hundred pounds at the center, the rails show little or no deflection. Neither can the pickets become loose and fall. Gates, made in the same manner as the railing, require no disfiguring diagonal braces to maintain rigidity.

Elaboration is possible: circles, scrolls, ellipses, and other special features may be introduced, double top or bottom rails may be used, and highly ornamental iron posts or brick, stone, concrete, or cast iron columns may be employed.

 End, corner and single gate posts.....No. 20-S or 25-S
 Double gate posts.....No. 25-S

Chain Link Steel Fences

Anchor Chain Link Fabric is of best quality copper-bearing steel wire *galvanized after weaving*. Made of No. 9 and No. 6 gauge wire. Heights up to 10 ft. The small mesh affords no foothold for climbers. This fence can be furnished with or without top rail of galvanized pipe and with or without barbed wire topping. All parts are heavily galvanized by the hot-dip spelter process.

Anchor Square Terminal Post

An exclusive Anchor feature recently introduced by this company.

Stronger—because of its square shape; Unclimbable—no bands or footholds for trespassers to use as a step-ladder; More protection—fabric can not be detached from post from outside; Better-looking—has no disfiguring fabric-holding bands

Anchor Chain Link Fence, Type DO-1

Part of an installation of 2980 ft. at the Soldiers' Home, Noront, Conn.

Anchor Chain Link Fence, Type DOA-1

Surrounding the estate of John D. Rockefeller, Sr., Lakewood, N. J.

Anchor Chain Link Fence, Type DTA-1

Surrounding transformer station of the Cleveland Electric Illuminating Co., Avon, Ohio

Anchor Chain Link Fence and Entrance Gate

Part of an installation at Willamette Iron & Steel Co., Portland, Ore.

Anchor Chain Link Lawn Fence, Type AT-1
On the property of Miss E. A. Bogue, Montclair, N. J.

Woven Picket Lawn Fence, Type AT-2
3 ft. 7 in. to 7 ft. 1 in. high. Can be furnished with arms and barbed wire 5 ft. and higher

Anchor Chain Link Lawn Fence, Type AT-1
Made in heights from 3 ft. 7 in. up to 4 ft. 1 in. Iron picket or chain link wire gates; electrically welded frames

Anchor Chain Link Tennis Enclosure, Type DT-1
Installed on grounds of high school, Pasadena, Cal. Built up to 12 ft. high, with adequate bracing of corners and firm anchorage. Narrow entrance gates comprised in enclosure proper

Square Mesh Farm and Pasture Fence, Type CO-5
Similar to the high fence used to enclose cattle pastures. Made in 3 ft. 6 in., 4 ft. 0 in., and 4 ft. 10 in. heights, without arms or barbed wire

Anchor Electric-Weld Farm Gates

Great strength is secured for Anchor welded farm gates by joining the top and bottom rails to double uprights of steel channel, by means of channel corner plates electrically welded to the uprights.

Double Farm Gate, Type "J"
Made in the following widths: 12 ft. 1 in., 13 ft. 10½ in., 15 ft. 10½ in. Other types to suit any width opening

Chain Link Kennel Enclosure, Type DT-1
This kennel enclosure offers a clean runway, ample room for exercise and absolutely guards the dogs against escape, injury or theft. Can be furnished with or without covered top

Chicken Run Enclosure, Type CT-4
These poultry fences are not only better looking, but will last two or three times as long as those built with wood framework. Ratproofing the outside of the enclosure is always advisable. A fine wire cloth is buried in the ground in such a way that rats can not burrow under it; a slight charge is made for this addition.
Specification for any size enclosure can be furnished on application

CINCINNATI IRON FENCE COMPANY

Manufacturers of Ornamental Iron and Wire Work

3330 Spring Grove Avenue
CINCINNATI, OHIO

Products

ORNAMENTAL and PLAIN IRON and WIRE WORK of every description and for every purpose.

Steel and Iron Fence suitable for residences, cemeteries, school grounds, parks, etc.; Entrance Gates, Folding Gates, Door and Window Guards, Sidewalk Doors, Grilles, Gratings, Iron Shutters, Wire Window Guards and Partitions, etc.

Estimates

Blue prints on request. Estimates cheerfully given.

Design and Construction

The dominant features of Cincinnati Iron Fencing are its rugged strength, coupled with attractive design.

Rails—Made of channel, angle or flat sections.

Pickets—Square, round, flat or angle, suitable thickness according to height required, pointed or tipped with malleable iron heads.

Posts—Made in large variety of sizes and styles to harmonize with the architectural surroundings.

J. W. FISKE IRON WORKS

Ornamental Iron, Brass, Bronze, Wire and Zinc Work

69-71 Park Place
NEW YORK, N. Y.

Products

ORNAMENTAL METAL WORK and FENCING as follows: Ornamental Entrance Doors, Window Guards, Lamps and Lamp Standards; Metal Stairs; Memorial Tablets; Fountains; Iron Railings and Entrance Gates; Woven Wire and Climbproof Chain Link Fencing; Sanitary Stable and Barn Equipment.

Also, Brass and Bronze Railings; Andirons and Fire Sets; Fire Escapes; Flagpole Bases; Balls and Trucks; Folding Gates; Leader Shoes; Marquises; Garden and Park Furniture; Sundials; Tree Guards; Wire Partitions.

Fiske Quality

The quality of Fiske products is best evidenced by installations for the United States Government, states, cities and leading commercial organizations, and upon many of America's largest private estates.

Co-operative Service

The J. W. FISKE IRON WORKS will submit estimates for products either delivered or erected complete. A well organized engineering staff is maintained, and contracts for designing and erection complete are made when desired. Co-operation with the architect, contractor or owner in executing unusual specifications is a specialty.

Where material is delivered only, instructions and drawings will be furnished to enable local mechanics to erect the work. Sketches and designs will be furnished on request, and full information as to sizes and weights will be given.

Entrance Gates, Fencing, etc.

This company will carry out any design in ornamental entrance gates, iron fencing, window guards, metal stairs and similar work, or will prepare and submit designs for such work.

"Set-in-concrete" Posts

All Fiske fence posts are set in concrete footings and this construction is strongly recommended by this company. This method keeps the posts from being thrown out of alignment by frost, and prevents them from rusting off at the ground line.

Chain Link Fencing

All Fiske chain link woven wire fencing is extra heavy galvanized by the hot dip spelter process. This is the heaviest and most durable type of wire fence made. Fiske woven steel wire fabric is made in widths from 60 to 96 in. and when erected in connection with Fiske standard "set-in-concrete" posts, provides a fence from

5 ft. 2 in. to 8 ft. 2 in. high. This height can be increased to 10 ft. with diagonal arms and 3 strands of barbed wire.

Foundry Work

This company is prepared to undertake any ornamental casting in iron, brass or bronze according to submitted designs or models, or from designs originated by its own organization.

Sanitary Stable and Barn Fittings

The J. W. FISKE IRON WORKS make a specialty of complete sanitary fittings for stables, cow barns, etc., and are pleased to co-operate with architects in writing specifications.

- Storehouses and warehouses
- Department stores
- Safe deposit companies
- Show windows and entrances

Folding Gates and Guards a Specialty

This company is the original manufacturer of the "Bostwick" gate, and the originator of most of the standard folding gates, developing their uses through specialization.

This department is therefore, by training, experience and facilities, prepared to meet the demands of architects, builders and the iron trade.

"Pitt" gates are internationally famous for their quality, and are found in every state and many foreign countries.

The initial cost is not high. They are strong, durable and easy working and take up very little space when not in use.

Quality of Work

Every "Pitt" product is of the highest grade workmanship and materials, economically produced under modern conditions.

Specifications

Copy the *number* and *description* of gate desired from the illustrations on this and the page following, or submit requirements for our advice and special blue prints or designs.

THE STEWART IRON WORKS COMPANY, INCORPORATED

Manufacturers of Iron and Chainlink Wire Fences and Gates
Architectural Wrought Iron, Bronze and Brass Products

780 Stewart Block, CINCINNATI, OHIO

Products

PLAIN and ORNAMENTAL IRON GATEWAYS and FENCES; CHAINLINK WIRE FENCE.

Also Iron Railings, Iron Grilles, Bronze and Iron Lanterns and Lamp Standards, Lawn Furniture, Folding Gates, Window Guards, General Ornamental Iron and Wire Work.

For Jail and Prison Construction, see page C3412.

Facilities

This company, "The World's Greatest Iron Fence Builders," with its unsurpassed facilities for the manufacture of iron fences and gates, has a factory containing 350,000 sq. ft. of floor space and covering an area of 8 acres; the equipment of the most modern machinery; an experience of more than 40 years; a complete organization of specialists in engineering and landscape architecture, and a large force of skilled mechanics and draughtsmen.

This equipment insures the highest standard of work and enables THE STEWART IRON WORKS COMPANY, INC., to give prompt service at proper prices.

Specialties

This company specializes in the building of highgrade ornamental iron fences and entrance gates, either from the designs of its own draughtsmen or from drawings and specifications submitted by customers or their architects.

They give particular study to the correct designing, proportioning and construction of enclosures and entrances of country houses and estates, as well as the simpler or more pretentious town house.

Special attention has also been given to designing simple and artistic enclosures for yards in the rear of city and suburban dwellings, providing security and eliminating the feeling of confinement produced by solid fences; with the added advantages of maximum sunlight, elimination of dark corners which conceal rubbish; and making the many small plots of green into a community garden for the enjoyment of all.

From its experience, this firm is qualified to advise as to the type of fence best adapted to particular conditions, and to aid in the most satisfactory and economical solution of fencing problems.

All types of plain and ornamental fences and gates, light or heavy, in iron or chainlink wire, for factories, public institutions, etc.

Decorative Iron Work

At innumerable points in the modern home the architect and builder find the use of interior stair railing, balconies, solarium grilles, terrace railing and other decorative iron work as developed by this Company necessary to give the final touch of beauty as well as utility to the interior and exterior.

Designs

The illustrations here are but a few of the many designs shown in this company's catalogues. Plain stock designs are featured in their Catalogue No. 50-A; special ornamental designs in "Book of Designs C."

These catalogues will be sent to architects and prospective purchasers on request.

Iron Fence and Entrance Gates

Stewart's Chainlink Wire Fence and Gates

Our product is the result of proven principles of construction which produce a quality unexcelled. Our organization of factory salesmen and erecting representatives, located at advantageous points, affords quick and efficient co-operation to those who place their orders with us.

Chainlink Fabric—Woven of No. 6, 9 or 11 gauge copper-bearing steel wire, possessing great rust-resisting qualities.

Galvanizing—All framework and fittings, barbed wire and fabric are extra heavily galvanized by the hot dip process and not wick-wiped. The fabric and barbed wire are galvanized after weaving, the fabric carrying a guaranteed coating which actually weighs 8 to 9 per cent of the finished product. Bolts and nuts are also hot-dipped galvanized.

Standard Type 3-T Fence—Very generally used for maximum property protection. Usually 7 or 8 ft. high over all, including either 3 or 5 strands of barbed wire

Integral Arm,
Angle Line
Post

Standard Type Wire Fence, 3T

above the fabric. Fabric is either No. 9 or No. 6 gauge wire, 2-in. mesh, with barbed selvages at top and bottom. Intermediate posts are angle section, $2\frac{1}{4} \times 2\frac{1}{4}$ in. (weight, 3.8 lb. per ft.), for setting in concrete 10 ft. apart; 2 ft. 6 in. below grade line. Top rail $1\frac{1}{8}$ -in. outside diameter, connected by expansion sleeve couplings. Fabric attached to top rail with zinc bands and to posts with staples. Bottom of fabric reinforced with No. 6 gauge coil spring wire. Tubular intermediate posts, $2\frac{1}{2}$ -in. outside diameter, with W-15 barbed wire extension arm, are furnished instead of the angle post, if desired.

This fence is also furnished without barbed wires (style OT), in which case we use No. W-8 ornamental post tops. For economy, the top rail is sometimes omitted and, in this case, we use a coiled spring wire of No. 6 gauge at both top and bottom of fabric for additional reinforcement.

Stewart's Chainlink Tennis Court Fence

Furnished in two specifications:

Heavy Construction—Chainlink Fabric of 2-in. mesh No. 9 gauge or $1\frac{1}{4}$ -in. mesh No. 11 gauge copper-bearing steel wire. Intermediate posts, $2\frac{1}{2}$ -in. outside diameter tubular steel (weight, 3.65 lb. per ft.) spaced 10 ft. apart, for setting 2 ft. 6 in. deep in concrete. Top rail, $1\frac{1}{8}$ in. outside diameter (weight, 2.27 lb. per ft.); reinforcement wire at bottom of fence and about 4 ft. above grade, No. 6 gauge galvanized coiled wire; end, corner and gate posts 3-in. outside diameter (weight, 5.73 lb. per ft.), for setting 3 ft. deep.

Light Construction—Chainlink Fabric $1\frac{1}{4}$ -in. mesh No. 11 gauge copper-bearing steel wire. Intermediate posts 2-in. outside diameter tubular steel (weight, 2.72 lb. per ft.), spaced 8 ft. apart. Top rail, $1\frac{1}{8}$ -in. outside diameter (weight, 1.66 lb. per ft.); end, corner and gate posts $2\frac{1}{2}$ -in. outside diameter. Specifications otherwise same as for heavy construction.

Stewart's Chainlink Lawn Fence

Far superior to ordinary types of lawn fence. Stocked in 36, 42 and 48-in. heights, in the 2-in. mesh, No. 9 gauge fabric. Intermediate posts, 2-in. outside diameter; spaced 10 ft. apart, for setting 2 ft. 6 in. deep in concrete. End, corner and gate posts are $2\frac{1}{2}$ -in. outside diameter, for setting 3 ft. deep.

Note: Often excellent, artistic and practical results are obtained around residences by using Chainlink Lawn Fence in combination with wrought iron entrance gates.

Chainlink Lawn Fence

"Heavy Duty" Gates

Furnished in any width. We also furnish sliding gates. These have 1.9-in. outside diameter steel tubular frames, joined with pressed steel corners; a horizontal cross member and $\frac{1}{2}$ -in. solid round steel brace rods. We guarantee them to be sagless. Hinges are forged steel, located below bottom rail and above top rail, thus rendering maximum efficiency.

"Heavy Duty" Gates

Double Gate Latch Device—Very simple and effective. Permits opening left-hand gate independently of the right. Locks by means of a padlock which can be operated from either side of gate.

Gate Equipment—Includes center stop for setting in concrete and automatic back stops to hold gates in open position.

Stewart's Road Guard Fence

For dangerous embankments, curves and bridge approaches. Woven of No. 6 gauge, copper-bearing steel wire into 2-in. mesh fabric, 24 in. high, with knuckled selvages at both top and bottom, and galvanized after weaving. Furnished painted white if desired.

Roadguard Fence

ACME WIRE & IRON WORKS

Manufacturers of Standard Wire Mesh Partition Panels and Window Guards

TELEPHONE
HOGARTH 4616

12340 Cloverdale Avenue
DETROIT, MICH.

Products

Manufacturers of STANDARD RED RIBBON WIRE MESH PARTITIONS, ENCLOSURE PANELS and SQUARE MESH WIRE WINDOW GUARDS.

WIRE MESH ENCLOSURES for Cashiers and Clerks.

Also Wire Mesh Guards for Skylights; Steel, Brass and Bronze Grilles and Wickets; other products in Wire Mesh and Light Ornamental Iron Work and manufacturers of Brass, bronze or Nickel Tubular Railing.

Red Ribbon Products

Red Ribbon partition and enclosure panels are carried in stock in sufficiently large quantities to permit a good sized order being shipped in twenty-four hours. They are designed to meet varying conditions and being in standard sections they are 100% salvageable. They can be added to, from time to time, with the assurance that the new parts may be mingled with the old, with no field work to make parts match.

Being manufactured in quantities, all economies in the way of labor and the machine method of construction can be used, keeping costs to a minimum.

It will be noticed that the multiplicity of parts has been avoided, enabling erection in the field by inexperienced help.

Construction Specifications

General Specification—Wire is No. 10 W&M gauge, crimped and interwoven to 1½-in. diamond opening mesh, measured parallel with the wire. Mesh is securely clinched into 1½x1½x1/8-in. steel channel frame. Crossbars are composed of two 1x3/8x1/8-in. channels, riveted together through the mesh; 3-in. sweeping space is provided at the floor.

Standard partition panels with mesh full height are designated as Type "M."

Type "S" panels have No. 16 gauge sheet metal base. Base is bolted to the channel framing surround-

Various Red Ribbon Panels Assembled in Enclosure

Various Red Ribbon Panels Assembled in Enclosure

ing it. All sheet metal base panels are flanged pan-shaped so that no rivets or bolt heads show from the face of the partition.

All standard panels measure 4 ft. wide and 8 ft. high, excepting at the ends of partition, where a special panel can be provided to fill in the balance of the space.

If height greater than 8 ft. is required, top panels designated as Type "T" are provided, which panels are to span two of the standard partition panels.

Doors—Sliding doors are equipped with special roller bearing hangers and flat bar track and will fit between any two panels. They have stops, guides, lock protecting plates and receiver for locks. Doors come in 4, 6 and 8-ft. widths. All doors are 7-ft. high opening, and have transom panel. 4-ft. wide doors are arranged to lock with a special bronze flat key claw lock. Because of the width, 8-ft. doors are arranged to lock with padlock (padlock not included).

Hinged doors lock with a Yale No. 042 R night latch with lock-protecting plate. Three steel tight pin butt hinges. Stock doors are 3 ft. wide by 7 ft. high and have a transom panel and side panel arranged to fit into a 4-ft. wide opening.

Windows—Type "SD-MD" is a drop shelf window panel 4 ft. wide, 8 ft. high and will also fit any other panels. The shelf which folds up, closes and locks the opening, is No. 10 gauge steel and has folding arms to stiffen same when used as a shelf.

Type "SW-MW" is a sliding window for use in passing requisitions or other papers through; can also be used for small tool passing, can be locked open at various heights or locked shut.

Top Panels—Type "T" panels are in various heights and designed to cross two base panels acting as a stiffener to the entire partitions. These panels are to permit higher partitions to the ceiling. They will receive the bulk of the cutouts for sprinkler, steam and water pipes for cross beams, etc., eliminating cutting into the more expensive base panels, and when partitions are rearranged are the only panels that it may be impossible to use in a new location because of cuts, etc.

Cap Bars—Cap bars are $1\frac{1}{4} \times \frac{1}{4}$ in. and can be fitted to the top of any partition; they act as an excellent stiffener to any partition. No drilling is required to make them fit—they are started in the center of a panel and always end in the center of a panel.

Stiffener Braces—Two types are shown, one for a wooden ceiling, another for concrete. The one for the concrete ceiling recommends itself particularly because it lowers the entire erection cost. A $\frac{1}{2}$ or $\frac{5}{8}$ -in. hole is punched into the concrete, the bar pounded into the hole and tightened to the vertical member of the partition; no lag screws, bolts, shells or lead packing is used.

In some cases, a type "D" flat bar is desirable to stiffen panels. Where this is done $\frac{5}{16}$ in. must be added to the length for each bar so used.

Floor Shoes—Of cast iron, can be used on any floor; designed to keep partition from shifting. Are placed after entire partition is lined up. On concrete floors partition can also be anchored or cemented into the floor.

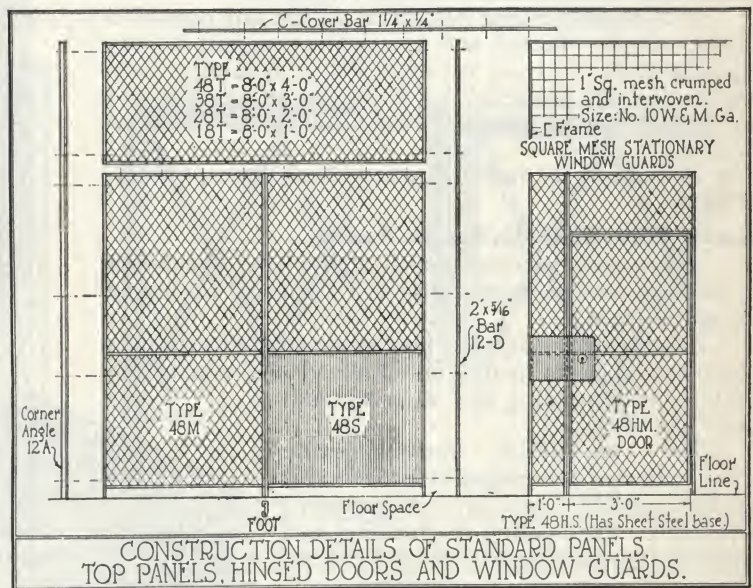

Paint—Standard paint is one dip coat of black asphaltum. Other finishes special.

Square Mesh Window Guards

Not carried in stock but due to the method of manufacture, orders can be shipped in 48 hours. This type cannot be made in diamond shape mesh. Diamond mesh guards require a greater length of time to make. Square mesh guards are not expensive, they are strong and desirable for window and burglar protection, bulk-head guards, etc.

Ornamental plates are provided for the corners of hinged guards to keep them from sagging. Padlocks or rim locks can be attached; no mortise locks can be used.

Specifications—1 in. square opening mesh No. 10 W&M gauge wire, $\frac{3}{4}$ -in. channel frames, painted 1 dip coat black asphaltum, or special color if desired.

ACORN WIRE AND IRON WORKS

Wire Mesh Enclosure Panels, Wire Cages and Wire Window Guards

TELEPHONE
NORMAL 1895

5906 Lowe Avenue
CHICAGO, ILL.

Products

Manufacturers of ACORN WIRE MESH ENCLOSURE PANELS; CAGES for Banks and Offices; DIAMOND MESH WINDOW GUARDS.

Also manufacturers of Skylight Guards, Machinery Guards; Elevator Enclosures, Wickets and Grilles; Railings for Stairs, Porches, Balconies and Windows; Area Gratings and Sidewalk Doors; Wire Signs and Collapsible Folding Gates.

Important Recommendation to Architects

It is suggested that architects secure our quotation direct. Copies thereof will be gladly furnished to contractors when this work is to be included in another contract. To be protected against inferior service and workmanship, the architect should include in his specifications:

"As made by the ACORN WIRE AND IRON WORKS, Chicago, or equal."

Acorn Wire Mesh Enclosure Panels

A fireproof partition which allows free circulation of air and unobstructed light is a requisite for every industrial plant.

Acorn enclosure panels give systematic effectiveness—the aim of every factory executive; they eliminate loss of tools and supplies, and do away with petty thievery.

They are 100% interchangeable. They can be rearranged, added to or moved quickly and by inexperienced workmen. They permit the forming of a corner at any intersection and the placing of doors between any two panels.

Material Specifications—Height—7, 8, 9 and 10 ft. carried in stock; other heights to order. Can also be increased to any height by adding special panels at top.

Width of Panels—Standard panels are 5 ft. wide. This extra width is used to eliminate the weakness caused by too many connections. It also saves from 15% to 20% installation cost. Special width panels furnished to fill in where necessary.

Cut-outs and Special Panels—Cut-outs, or special size or shape panels furnished to meet special conditions.

Door Sections—Standard door sections are 3 ft., 3 ft. 6 in., and 4 ft. wide, and of height to match partitions. Doors are 6 ft. 6 in. high with transom panel overhead. Door sections interchangeable with other sections. Either sliding or swinging types furnished. Sliding doors up to 4 ft. wide made self-closing without extra cost. Special sizes when necessary.

Locks—Made of brass, operated with pin tumbler cylinders from outside, and recessed knob from inside. Master-keyed locks furnished at slight additional cost. Doors equipped with hasp for padlock instead of regular lock with reduction in cost.

Service Windows—See illustrations of details.

Hangers—All sliding doors equipped with ball bearing hangers.

Wire, Web and Mesh—No. 10 ($\frac{1}{8}$ -in.) open hearth steel wire used. Entire web in one piece with wires passing through center stiffening bar, eliminating unnecessary joints. Mesh is $1\frac{1}{8}$ -in. diamond mesh.

Framing and Stiffening Bar—Framing, $1\frac{1}{2}$ -in. steel channel. Center stiffening bar, $1\frac{1}{8}$ -in. channel steel securely riveted to frame.

Capping Bar— $2\frac{1}{8}$ -in. steel channel extending from center of one panel to center of next, thereby breaking joints.

ACORN UNIT WIRE MESH ENCLOSURE PANELS

STANDARD INTERCHANGEABLE PANELS ADAPTABLE TO ANY USE
An excellent arrangement for tool or stock room

COMBINATION SERVICE WINDOW AND SHELF

Shelf swings up, closing opening, and is locked from inside with improved dead locking push bolt. After it is locked, a spring back of bolt lodges the hand into recess when it can not be opened until bolt is pressed against plate. Installed before shipment or after partition is in place. Special service windows furnished to suit requirements.

2 sizes; "A," 15 in. wide by 9 in. high, "B," 24 in. wide by 15 in. high. Each fitted with metal shelf extending about 2 in. on outside, and 9 in. and 15 in., respectively, on inside.

Bracing—While capping bars will carry a reasonably long partition, simple methods of bracing can be effected by use of wire strands from top of partition slantwise to ceiling.

Floor Sockets—2½ in. high to allow for adjustment where floors are uneven.

Corner Posts—1x1-in. steel angle with floor socket. This permits the making of corner at any intersection.

Connection Toggles—In addition to the regular bolts furnished for bolting panels together, 3 special toggles are furnished at each intersection to prevent channels from telescoping or overlapping, thereby overcoming the difficulty otherwise experienced in erection.

General Hardware—All hardware that is subject to strain is made of malleable iron or wrought steel to prevent breaking. The balance is made of soft grey iron.

Paint—Standard factory green unless otherwise specified. Special colors may be had at slight additional cost.

Erection—Many original and exclusive features make Acorn partitions extremely easy to erect. No experience or special skill is necessary. Diagram and complete setting instructions sent with each order.

Acorn Diamond Mesh Window Guards

They permit the opening of windows for ventilation without danger of burglary or damage to material or tools, and safeguard windows against accidental or intentional breaking.

Material Specifications—Made of three principal specifications: 1¼-in. mesh, No. 12 wire; 1½-in. mesh, No. 10 wire; 2-in. mesh, No. 8 wire. The 1½-in. mesh, No. 10 wire is most used, being the meeting point of burglary and glass protection. Guards can be furnished in any wire or mesh desired.

No. H-5 hinge and No. H-6 hasp, of malleable iron, are recommended. They afford an excellent means of fastening and are adaptable to any style window frame by reversing same where necessary. Hinges are fastened to window by lag screws making it difficult to remove from outside. Hasps are locked to a heavy screweye which can not be removed when padlock is in place.

Cages for Banks, Offices, etc.

The ACORN WIRE AND IRON WORKS have developed and are using the press crimp type of construction in bank and office cages (see detail). This type of crimp adds much to the character and distinctiveness of the work. The old type double crimp can still be furnished when it is necessary to match old work.

Press crimp can be furnished in either square or flat wire, but because of its greater utility and rigidity, square wire is recommended (see typical specification following).

Nos. 142 and 143 cages are commonly used in offices and small banks.

The upper part is made either of ⅛-in. square wire or ¼-in. flat wire, 1½-in. square mesh. The ⅛-in. square wire is preferable because of its greater strength. Wires are pressed at each intersection, making a neat and pleasing appearance. The lower part is made of round

DETAILS OF ACORN UNIT SECTIONAL DIAMOND MESH PARTITIONS

No. 121 WINDOW GUARD

No. 121

No. 122

DETAILS SHOWING CONSTRUCTION OF SCREENS

No. 121 guard has round steel frame of ⅜ or ¾-in. diameter according to size of guard. Furnished in either stationary or hinged type. Hinged type permits washing windows.

No. 122 guard has channel frame varying from ¾ to 1 in. wide. These are satisfactory when designed to fit opening, but are not recommended when outer grooved edge is exposed to view.

H-5 HINGE AND H-6 HASP

ACORN BANK OR OFFICE CAGE

No. 142, upper part square wire. No. 143, upper part flat wire

TYPICAL ARRANGEMENT OF BANK CAGE DESIGN No. 147

Same as Design No. 146 except that $\frac{3}{4}$ -in. square mesh panels 1 ft. high are fitted at top of solid panels

wire, $1\frac{1}{2}$ -in. diamond mesh.

Doors furnished either sliding or swinging type; sliding doors being made self-closing unless otherwise specified. Doors fitted with cylinder locks operating with key from outside and knob from inside.

DETAIL OF PRESS CRIMP CONSTRUCTION

Typical Specifications—Cages shall be of a height to conform to front fixture and shall be made of $\frac{1}{8}$ -in. square wire, $1\frac{1}{2}$ -in. square mesh of press crimped type. Framing to be of $1\frac{1}{2}$ -in. channel, tenoned and riveted at corners. Posts at doors and at each intersection shall be of $1\frac{1}{4}$ -in. square Shelby tubing No. 14 gage in thickness. The same tubing shall be used to finish top of cages. (See Design No. 146, Catalogue 200, ACORN WIRE AND IRON WORKS, Chicago.)

Note: If flat wire is specified, $\frac{1}{4} \times \frac{1}{8}$ -in. wire, $1\frac{1}{2}$ -in. square mesh is recommended.

Each section, including doors, to be fitted with metal panel 7 in. wide; bottom of panel to be flush with top of counter.

BANK CAGE DESIGN No. 146

Doors to be of sliding gravity, self-closing type hung on ball bearing hangers and fitted with Yale master-keyed cylinders; master keys to be of series different from balance of building. Pass baskets 8 in. wide, 10 in. long shall be included for each division. Pass baskets 8x8 in. shall be included for the rear of each cage. Basket to be fitted flush with outside of cage.

BANK CAGE DESIGN No. 144

Same as Design No. 146 except that solid metal panels are eliminated

BANK CAGE DESIGN No. 145

Same as Design No. 146 except that $\frac{3}{4}$ -in. square mesh panels 1 ft. 6 in. high are substituted for solid panels

Finish—Usually furnished in flat black, verde green, or natural bronze, but can be furnished in any finish desired.

Products

"GALV-AFTER" ALL COPPER-BEARING MATERIALS, CHAIN LINK FENCE for country estates, country clubs, golf grounds, suburban homes, city residences, public and private parks, schools, athletic fields, churches, cemeteries, city, county, state and national institutions.

WROUGHT IRON FENCE, ENTRANCE ARCHES and GATES, RAILINGS, etc.

FENCING for factories, industrial housing communities, power and pumping stations, transformer stations, reservoirs and filtration plants.

ENCLOSURES and BACK STOPS for tennis courts; also kennels, animal cages, and poultry yards.

ROAD-GUARD for the protection of motor traffic at dangerous curves, bridge approaches, grades, etc. Fabric is of heavy No. 6 gauge copper-bearing steel wire, 2-in. mesh, galvanized after weaving. Standard height, 24 in., for posts 36 in. high.

SWINGING, SLIDING and FOLDING GATES.

WIRE WORK of all kinds: Wire Partitions (built-in-sections) for factories, offices and stockrooms; Window and Sky-light Guards, Woven Wire Entrance and Display Signs.

Also manufacturers of Special Fencing and Entrance Gates in Wire and Iron for any purpose, and Snow Fence.

Complete Responsibility—Nation-Wide Fencing Service

The Mark of Dependable Property Protection

While building Property Protection Fence of outstanding superiority, the CYCLONE FENCE COMPANY has developed the most highly specialized service the fence industry has known. It is designed to relieve fence purchasers of every detail.

The CYCLONE FENCE COMPANY controls the quality of its products from the ore to the finished job.

Cyclone engineers design and specify fencing best suited to customers' requirements; then carry out the work of construction to the erection of the fence complete. No part of the work is subtle to others. In no other way could the CYCLONE FENCE COMPANY assume full responsibility and completely satisfy its customers.

Engineering Counsel—Cyclone engineers will make a complete study of your fence requirements and submit recommendations, layouts, and estimates of cost.

Cyclone Erection Crews—There are more than 100 erection crews constantly at work installing Cyclone Fence. One of these crews is available for your installation and will handle the work quickly, correctly and economically.

However, if you prefer to have your own workmen install the fence, a Cyclone erection superintendent will be furnished at nominal charge, to direct them.

Diagram, Prices, etc.—When writing for information, prices, etc., send simple diagram of proposed fencing. Give measurements of each stretch and total measurements. Indicate end, corner and gate posts thus, "O." State whether single or double swing, or sliding gates are wanted and give size of opening.

Copper-Bearing Steel

You do not need to test or investigate copper-bearing steel. That has been done for you by the American Society for Testing Materials, a body of eminent, impartial scientists and engineers who have been making scientific investigations and actual weather tests over a long period.

Their findings prove conclusively the superiority of copper-bearing steel and their test records are available for you.

The copper content of Cyclone Fabric and Cyclone Tubular Framework is 0.20%.

Cyclone Safeguard Chain Link Fence

Specifications—Standard height, 6 ft. Built in heights from 4 ft. up to and including 10 ft. Chain Link fabric is full height of fence.

Fabric—"Galv-After" Chain Link copper-bearing wire heavily zinc-coated (or hot-galvanized) by hot-dip process after weaving. No. 9 or No. 6 gauge wire woven in a 2-in. mesh. On heights 5 ft. and over, both edges of fabric have twisted and barbed finish. On heights 4 ft. and lower, one edge has twisted and barbed finish, the other has knuckled finish and it is recommended that the knuckled edge be placed at top of fence dressed below top rail with the barbed edge at the bottom.

Posts—Hot-dip galvanized. Of standard full weight tubular copper-bearing steel, made by the National scale-free process.

Line Posts—2½-in. outside diameter, weight 3.65 lb. per lin. ft. where fence is 6 ft. and over in height. Where fence is less than 6 ft. in height, 2-in. outside diameter, weight 2.72 lb. per lin. ft.

End, Corner, Angle and Pull Posts—3-in. outside diameter, weight 5.79 lb. per lin. ft. where fence is 6 ft. and over in height. Where fence is less than 6 ft. in height, these posts are 2½-in. outside diameter, weight 3.65 lb. per lin. ft.

Gate Posts—The size and strength of gate posts for swinging and sliding gates have been carefully determined by our Engineering Department. Details upon request.

Post Spacing—Posts are spaced in line of fence not farther apart than 10-ft. centers.

Depth of Posts—Line posts for fence 4 ft. or lower are set 24 in. in concrete base; terminal posts 30 in. In 5-ft. fence, line posts are set 30 in., terminal posts 36 in. In Cyclone Safeguard Fence 6 ft. in height and over, all posts are set 36 in.

Post Setting—Concrete post bases are of proper mixture, size and shape to furnish a foundation and support sufficient to withstand any ordinary strain or shock. A liberal factor of safety is provided.

Post Tops—Hot-dip galvanized. All posts fitted with heavy ornamental ball post tops of malleable iron. The base of these tops fits into the post and a flange carries over the outside to cap the post against moisture.

Top Rail—Made by the National scale-free process, hot-dip galvanized. Tubular copper-bearing steel 1½-in. outside diameter, weight 2.27 lb. per lin. ft. Expansion rail coupling. Top rail passes through post tops and forms a continuous brace from end to end of each stretch of fence. Top rail is securely fastened to end, gate and corner posts by malleable iron or pressed steel connections.

Braces—Made by the National scale-free process, hot-dip galvanized. End, gate and corner posts are braced by tubular copper-bearing steel braces 1½-in. outside diameter, weight 2.27 lb. per lin. ft. Braces are spaced midway between the top rail and ground and extend to the first line post, fastened by malleable iron or pressed steel connections, then trussed from line post back to end, gate or corner post.

Fittings—All copper-bearing materials, hot-dip galvanized. All fittings used in connection with Cyclone Safeguard fencing and gates are malleable, wrought iron, pressed steel or aluminum.

Fabric Bands—Aluminum. Fasten the fabric to line posts and top rail, spaced approximately 14 in. apart.

Finish—All materials entering into the fence construction, except aluminum bands, are heavily galvanized.

Top Finish of Safeguard Fence

Cyclone Safeguard Fence

Standard for schools, playgrounds, parks, etc.; strong, durable; will stand rough usage

Cyclone Invincible Fence Enclosing Athletic Field

Built in heights up to and including 11 ft. "Galv-After" Chain Link Fabric and tubular framework made of copper-bearing steel. Pressed steel extension arms carry 3 rows of barbed wires along entire top of fence

Cyclone Safeguard Fence

Extensively used for colleges, institutions, church property, public and private grounds of all kinds

Cyclone Tennis Court Enclosures and Back Stops

Framework, tubular copper-bearing steel, hot-dipped galvanized. Fabric "Galv-After" Chain Link No. 11 gauge copper-bearing steel wire woven in a 1 3/4-in. mesh. Standard height, 10 ft.

Cyclone Safeguard Fence

Beautiful and dignified property protection for country estates and homes—also golf grounds and clubs

Wrought Iron Fence, Pattern No. 508

One of the most popular patterns. Built in heights from 37 to 72 in. Square pickets. When desired, Cyclone Wrought Iron Fence will be built in special designs from architects' drawings

Cyclone Colonial "Complete Fence"

Standard heights: 36, 42, 48 and 54 in. Framework, tubular copper-bearing steel, hot-dipped galvanized. Fabric, style "F," copper bearing steel. Pickets spaced 3 in. apart at top, 1 3/4 in. apart at bottom

Wrought Iron Entrance Gate, Pattern No. 501

Cyclone Wrought Iron Fence and Entrance Gates are built in a variety of heights and handsome patterns from which fencing appropriate for any purpose may be selected

Cyclone Invincible Chain Link Fence

Standard height, 7 ft.. All copper-bearing materials. Built in heights up to and including 11 ft. Fabric, "Galv-After" Chain Link, heavily zinc-coated (or hot-galvanized) by hot-dipping process after weaving. No. 9 or No. 6 gauge wire woven in a 2-in. mesh. Extension arms carry 3 rows of 4-point barbed wires, 12 in. in or out from fence line. Posts and framework, full weight tubular steel, hot-dipped galvanized

Cyclone Non-climbable Chain Link Fence

Standard height, 7 ft. All copper-bearing materials. Built in heights up to, and including 11 ft. Fabric, "Galv-After" Chain Link, heavily zinc-coated (or hot-galvanized) by hot-dipping process after weaving. No. 9 or No. 6 gauge wire woven in a 2-in. mesh. Extension arms carry 5 rows of 4-point barbed wire 9½ in. in and out from fence line. Posts and framework, full weight tubular steel, hot-dip galvanized

Cyclone Swinging Gates

Either single or double, for Invincible, Non-climbable or Safe-guard Fence

Specifications, Cyclone Swinging Gates

Standard Sizes—Single swinging walk gates built standard for 4-ft. opening. Double swinging gates for driveways built standard for 14 and 18-ft. openings. The standard size for railroad entrance is 18 ft. Where conditions are such that standard sizes can not be used, gates are built to meet requirements.

Frames—Hot-dip galvanized, tubular copper-bearing steel; made by the National scale-free process. On fence having

barbed wire top, the end members extend 1 ft. above top horizontal rails, and carry 3 strands of barbed wire.

Stays—Hot-dip galvanized, tubular copper-bearing steel. Made by the National scale-free process. Stays, together with ¾-in. adjustable truss rods, keep gate absolutely rigid; prevent sagging, buckling and side weave.

Fabric—Cyclone "Galv-After" Chain Link to match fabric used in fence furnished.

Hinges—Hot-dip galvanized. Made of malleable iron. Exceptionally large bearing surface for clamping hinge on gate post. Cyclone swinging gate hinge equipment will carry 100% overload. Bottom hinge is ball and socket pivot type.

Latch and Lock—Hot-dip galvanized. On swinging gates of all types, latch is of the plunger bar type, arranged for pad-lock locking. Railroad and drive gates are equipped with catch posts to hold gates in open position.

Cyclone Sliding Gates

Either single or double, for Invincible, Non-climbable or Safe-guard Fence

Specifications, Cyclone Sliding Gates

Standard Widths—14 to 20-ft. opening for driveway. Standard overhead clearance 14 ft.

Frames—Hot-dip galvanized, tubular copper-bearing steel. 2-in. outside diameter. Made by the National scale-free process. When used with fence having barbed wire top, 3 strands of barbed wire are carried above the top horizontal rail.

Stays—Hot-dip galvanized, tubular copper-bearing steel. Made by the National scale-free process. Gate stays, together with ¾-in. adjustable truss rods, keep gate absolutely rigid, prevent sagging, buckling and side weave.

Fabric—"Galv-After" Chain Link copper-bearing steel wire to match fabric used in fence furnished.

Overhead Track Support—5-in. channel, weight 6½ lb. per lin. ft. Fastened to gate posts by means of combination special ornamental ball post top cap and channel support.

Trolley—Double truck roller bearing type. Very easy to operate. Track completely enclosed.

Wire Work of All Kinds

Partitions (Built-in-Sections)—Standard size sections 4 ft. wide by 8 ft. high. Frames are 1-in. channel iron. Fabric is No. 10 gauge wire woven in 1½-in. diamond mesh. Furnished with either swinging or sliding gates. Handholes or wickets provided where needed. Floor flanges furnished for either wood or concrete floors. Sections are interchangeable, movable; can be taken out and used elsewhere—no refitting—no loss. Quick changes in departments can be made at any time.

Send blue print or layout of partition work wanted.

Window and Skylight Guards—Frames are 1-in., ¾-in.

channel, or ¾-in. round iron. Fabric is usually No. 10 gauge wire woven in 1½-in. diamond mesh. Channel iron frames fit into openings. Round iron frames usually allow ¾ in. on all sides for lap. Special guards built with either channel or round iron frames, using size of wire and mesh desired.

Partition Section

Window Guard

Products

CHAIN-LINK FENCING for protection and ornamental purposes of every description.

INDUSTRIAL FENCING for factories, mills, refineries, railroads, power stations, mines, yards, etc.

FENCING for city, state, and national institutions, including schools, parks, playgrounds, prisons, hospitals, etc.

ENCLOSURES for athletic fields, tennis courts, baseball grounds, race tracks, fair grounds, amusement parks, aviation fields, automobile parking enclosures, etc.

Also manufacturers of Page Hi-Way Guard; Page Panel Partitions, made of Page Chain-Link fabric, for factories, offices, warehouses, stock rooms, etc.; Fencing and Entrance Gates of copper bearing steel for residences, estates, country clubs, etc.; Page Chain-Link Specialties: Window and Skylight Guards, Display Signs, etc.

TRADE-MARK

The first wire fence ever made was designed by J. Wallace Page in 1883. For 43 years Page fences have been standards of good fence design.

Half Size Illustration of Page Protection Fabric
 No. 6 Wire, 2-in. Mesh

This fabric is made in copper bearing steel.

The standard weave for fence purposes is a 2-in. mesh made from No. 6 or No. 9 wire or a 1 3/4-in. mesh No. 11 wire for tennis courts

"The Watchman That's Everywhere at Once"

Page Protection Fence

"The watchman that's everywhere at once" standing guard around the plant of a large manufacturing concern. Page is the most permanent and economical protection that is available

Only Page Drawn Wire Meets with Page Specifications

To assure the high standards for uniformity and strength set by Page engineers, every bit of wire used in Page products is rolled and drawn and galvanized in the Page mills.

The most rigid of inspection guarantees only perfect material being used.

Fabric Heavily Galvanized After Weaving

To guard against corrosion and rust, all Page fabric is heavily galvanized after weaving with a uniform coat of zinc—approximately five times heavier than ordinary galvanizing. This is applied by a hot dip process perfected by Page and assures uniformity. Page fabric galvanized in this manner has proven its claim for superiority by giving many years of satisfactory service under the most adverse conditions in all parts of the country.

Tests carried on both in the laboratory and in actual service prove that the heavier coat of zinc results in a more durable fence, especially when the base metal is uniform and of high quality.

There Is a Page Distributor Near You

In each district of the United States and Canada there is a responsible firm of fence engineers that carries complete stocks of Page products and specializes in fence construction. This assures expert performance of the work all the way through, and gives the advantage of consultation with men of long experience in the erection of fences.

Estimates gladly furnished on receipt of rough sketches of proposed work, or complete detailed designs will be drawn up, if desired, and estimates supplied.

Get in touch with the distributor nearest you, as listed on the preceding page, or write direct to association headquarters for interesting literature.

Page Protection Fence for Industrial Buildings

Page factory fences are supplied in styles and sizes to cover every protection purpose.

Used to enclose yards and buildings, it keeps out malicious intrusion and reduces fire hazard. It helps maintain an accurate record of material entering and leaving the plant, and makes the yard a safe storage place for tools and fuel. In times of strike or other disturbances it protects buildings.

For detailed specifications see following page.

Eight Styles of Page Protection Fence from Which to Choose

- | | |
|-------------------|--|
| No. 1. Style 0-TR | No barbed wire—using top rail. |
| No. 2. Style 0-W | No barbed wire—using tension wire. |
| No. 3. Style 3-TR | Three strands of barbed wire—using top rail. |
| No. 4. Style 3-W | Three strands of barbed wire—using tension wire. |
| No. 5. Style 5-TR | Five strands of barbed wire—using top rail. |
| No. 6. Style 5-W | Five strands of barbed wire—using tension wire. |
| No. 7. Style 6-TR | Six strands of barbed wire—using top rail. |
| No. 8. Style 6-W | Six strands of barbed wire—using tension wire. |

Page Chain Link Fence Offers Permanent Protection for School and Institutional Property

Page Panel Partitions

For inside protection in warehouses, stores, garages and factories, Page panel partitions have no equal. They provide light, airy compartments for the storing of material, facilitating an accurate check on stock at all times.

Where an enclosure is desired for superintendent's office in shops, Page panels occupy little space and afford view of the entire floor or department.

Page panels are constructed of the same strong square mesh as Page fence. Fabric is 1½-in. mesh, No. 10 gauge. Frames are of channel iron (½x1x1/8) braced crosswise with 3/8-in. diameter rods. Panels come to you complete with fittings, and painted black. Ready to install.

Units 4x8 ft., finishing 8 ft. 3 in. high. We also stock 3, 2 and 1 ft. wide.

Interchangeable standard panels permit removal and relocation of Page partitions with 100% salvage value.

Doors for Page panels are also interchangeable with regular panels. Both swinging and sliding types of doors can be hung on either side of partition to operate in either direction.

Sliding doors are built in two sizes, 4 ft. and 8 ft. wide.

This Stockroom Facilitates an Accurate Check on Supplies

Specifications for Page Chain Link Fence

Line of Fence

Chain Link Fence Fabric—Chain Link Fabric can be of copper bearing steel containing not less than .20% copper and galvanized after weaving. Usual specifications for factory fence are 2-in. mesh No. 6 or No. 9 gauge (W&M). Residential, 2-in. mesh No. 9 and 2-in. mesh No. 11 W&M gauge. Tennis courts construction, 1½-in. mesh No. 11 W&M gauge.

Line Posts—Are hot galvanized copper bearing steel pipe and furnished in the following sizes: 2-in. outside diameter, weight 2.717 lb. per ft. for fences under 6 ft. high, and 2½-in. outside diameter, weight 3.652 lb. per ft. for fences 7 ft. high and over. These posts are spaced approximately 10 ft. on centers and are set 3 ft. deep in bell shaped concrete footings crowned at the top to shed water and to prevent posts from rusting at the ground line.

Top Rail—Shall be 1½-in. outside diameter copper bearing steel pipe hot galvanized, weighing 2.272 lb. per ft. in random lengths, the average of which shall not be less than 15 ft.

Expansion Sleeve—(No. 1027 P. O. 1½.) This fitting is used in connecting the lengths of top rail and shall be made of pressed steel heavily galvanized and shall be extra long, providing a rigid connection and allowing for expansion and contraction in the top rail.

Intermediate Post Tops—(No. 15-24-25-30-45.) For all styles of Page protection fence shall be made of malleable iron heavily galvanized and so designed as to fit over the posts, thus excluding moisture from the inside. All tops are also constructed so as to be used with top rail or tension wire, as desired. Post tops for styles of fence calling for barbed wire shall be provided with stamped iron extensions.

Fabric Bands—(No. 1020.) For attaching fabric to line posts are made of rustless zinc alloy—the advantage of this band being that it can not be removed without a tool and that the post is free of drilling.

Tension Wire—All Page protection fence is provided at the bottom with a No. 6 gauge high carbon steel coiled wire. The purpose of this is to prevent the fabric from being forced in by external force between line posts.

All "W" styles of fences are provided with this same type of wire at the top to support the fabric instead of the top wire.

Terminal Posts

3-in. outside diameter—weight 5.79 lb. per ft.—end, gate and corner posts

4-in. outside diameter—weight 9.10 lb. per ft.—gate posts

6-in. outside diameter—weight 14.61 lb. per ft.—gate posts

All the above shall be hot galvanized copper bearing steel pipe and of sufficient length to set 3½ ft. in bell shaped concrete footings which are crowned at the top to shed water and to prevent posts from rusting at the ground line. End and gate posts for styles of fence provided with barbed wire shall also be long enough to extend 1 ft. above fabric—to provide a support for the barbed wire.

Gate, End and Corner Post Tops—(No. 11-26-31-46.) Shall be of malleable iron heavily galvanized so constructed as to fit over the posts, thus excluding moisture. Corner posts for styles of fence with barbed wire shall be supplied with an improved post top with stamped iron extension for barbed wire. This arm is also provided with a setscrew whereby the arm is held stationary on the post.

Brace and Tension Bands—(No. 1001-1002-1006-1007.) Shall be of unclimbable beveled edge steel type provided with

¾-in. diameter square shouldered carriage bolts which are easily installed and can not be removed from the outside. All bands and bolts are hot galvanized and are used in attaching fabric brace assembly and top rail to posts.

Brace Assembly—(Rail end No. 43 P 1¼ A, brace end 44 P 1¼, and brace rod No. 1030.) All end and gate posts shall be furnished with one complete brace assembly as follows: 1 piece 1½-in. outside diameter copper bearing steel pipe for brace, weighing 2.272 lb. per ft., which shall be used as a compression member, 1½-in. diameter steel brace rod with drop forged turnbuckle, to be used as a tension member, 1 malleable iron rail and brace with necessary brace bands, and bolts for attaching to post. Corner posts shall be furnished with 2 complete brace assemblies.

Tension Bars—(No. 1046.) This 1½x¾-in. flat bar is run through the first spiral picket in a roll of fabric and is secured to the post by means of tension bands. This method of terminating the fabric distributes the strain evenly over its entire length, thus avoiding the distortion of the fabric at the bolts.

Gates

Frames—Shall be of 2-in. outside diameter copper bearing steel pipe construction weighing 2.717 lb. per ft. with intermediate braces of 1½-in. outside diameter copper bearing steel pipe weighing 2.272 lb. per ft. All joints shall be welded making a rigid and watertight frame.

12-ft. single or 24-ft. double gates and over shall be provided with a ¾-in. diameter steel brace rod with drop forged turnbuckle for adjustment, which shall run diagonally across the frame from the top of the frame on the hinge side to the bottom of the frame on the latch side.

Gate Filler—Frames shall be filled with fabric to match that in the line of fence and shall be furnished with or without barbed wire—as specified. When barbed wire is specified, ratchets shall be furnished on the gate extension to provide a means of keeping the wire taut at all times.

Hinges—(No. 115.) Shall be of the double clamping offset type allowing the gates to swing back parallel with the line of fence and shall be made of malleable iron and forgings heavily galvanized.

Latches—(No. 130 and No. 180.) The latches shall be of the eccentric double locking type which engages stops securely bolted to gate frame at both top and bottom. The lever handle is drop forged steel insuring the greatest strength possible without additional weight on the gate frames. The lock bars are of steel, the lower one being sufficiently long to extend down when locked, engaging an extra heavy malleable iron non-freezing gate stop for drive gates and a disappearing type of stop for railroad gates. Either one of these stops shall be securely fastened to a large concrete footing in the center of the opening.

Keeper—(No. 140.) With each gate frame there shall be furnished a keeper, the purpose of which is to automatically catch the gate when it is swung open and to hold it in this position.

Auxiliary Brace—(No. 1047.) With all gate posts for single gates 12 ft. wide or double 24 ft. wide and over, there shall be furnished a diagonal or strut brace of 2-in. outside diameter copper bearing steel pipe with necessary brace end and band for attaching to post. This brace shall be set inside and at right angles to the fence line to relieve the strain on the gate post when the gates are in an open position.

All gate fittings are heavily galvanized with the best grade of zinc.

**New Stadium at Haskell Institute,
Lawrence, Kan.**

Page Chain Link Fence encloses and permanently protects grounds. It assures more paid admissions and better control of crowds.

TUCKER & FICKEISEN, INC.

Manufacturers of Wire Mesh Cage Enclosures, Railings, Grilles and Wickets

34 Cliff Street
NEW YORK, N. Y.

Products, Facilities, Service

CAGES and GRILLE WORK for banks and offices.

WIRE ENCLOSURES for stockrooms, toolrooms.

WIRE GUARDS for windows, doors, skylights.

BAR GRILLES, WICKETS, and RAILS—in bronze, brass, steel and silver.

Facilities—Our plant is completely equipped with modern machinery for the manufacture of the highest type product in our field.

Service—Accurate working drawings or design sketches prepared for any project. Samples of material or various finishes furnished. Architects' details accurately followed.

H. V. BRIGHT

Manufacturer of Turnstile Equipment for Entrances and Exits

1104 Prospect Avenue
CLEVELAND, OHIO

Products

TURNSTILES, including Registering, Coin Controlled, Automatic and Non-registering Turnstiles; HARDWARE for Exit Turnstiles or Baffle Gates, consisting of top and bottom Castings, Ratchet, Dogs, etc.

TICKET CANCELING MACHINES.

Application and Service

Can furnish turnstiles for any purpose desired, such as swimming pools, museums, libraries, pay-toilet rooms, self-serve groceries, stadia, baseball parks, university or high school athletic fields, amusement parks, expositions, fair grounds, railroads, ferry and boat landings.

This concern has been manufacturing and furnishing turnstiles for more than twenty-five years, and has furnished them for use at many different places including the baseball clubs of both the American and National Leagues, the Sesqui-Centennial and Municipal Stadium at Philadelphia, the Woodland Hills Park Swimming Pool at Cleveland, Grandstand at Illinois State Fair and others.

Suggestions and advice given for arrangement and building of entrances and exits. Write us what you have in mind.

The "Bright" Printing Register

The "Bright" Printing Register for turnstiles furnishes a printed record of the opening and closing numbers of the turnstile register on a record slip, in a convenient form for filing or reference. It eliminates the chance for error in reading and writing down the figures from the register.

Automatic Registering Turnstile "C"

Can be used for either cash or ticket admissions. It embodies especially desirable features particularly in its automatic release—the patrons practically operating the Turnstile themselves as they go through—the attendant or gatekeeper's duty being to collect the tickets or money.

Can always be under control of gatekeeper as by releasing the foot lever the Turnstile cannot be operated. It is equipped with a shock absorber. This Turnstile can be used as a non-attendant type if desired.

The top broad arms are aluminum, black japanned—making for both lightness and strength. The base and center are of grey iron. Both center and arms are black japan finish.

Ticket Chopper "K"

The above is suitable for many places where it is desired to cancel the tickets.

This Chopper punches clean holes in the tickets and leaves their surface smooth so that they can readily be counted if desired. Plate glass with heavy brass trimmings is used for the top.

The cabinet can be furnished in any finish desired such as oak, mahogany, white enamel, etc.

Registering Turnstile "A"

This machine is more generally used in connection with tickets and is suitable for many places where a lower-priced Turnstile is desired.

The base is of grey iron, levers of malleable iron, arms of steel tubing and iron castings.

Turnstile "A" is successfully used at many places. It is under control of the gate-keeper or attendant by use of the foot lever. Furnished with either the printing or plain register.

Coin-Controlled Registering Turnstile

With this Machine, the coin must be dropped into the slot of the Coin Machine cabinet before the arms of the Turnstile will revolve passing the person through. Can be furnished to operate with 50¢, 25¢, 10¢ or 5¢ piece. It is positive in its operation—does not require electric power.

Used by many of the Fair Associations where the admission is a single coin. Being automatic, can be used at entrance to Toilet Rooms—eliminating locks on doors.

Registering Turnstile "B"

The above Turnstile is equipped with the Drop Arms, an added protection in that it makes it just that much harder for anyone to crawl under the arms of the Turnstile.

Is suitable for Libraries, Museums, Baseball Parks, Amusement Parks, Swimming Pools, Stadiums, etc.

Can be used for an inside Exit Turnstile if desired.

Turnstile "A" with Broad Arms

The above cut shows the Turnstile "A" equipped with the Broad Arms, the idea being to lessen the possibility of two people passing through the Turnstile on one registration.

Wood Exit Turnstile or Baffle Gate

The above operates one way only and no attendant is necessary. The Hardware only is furnished for the above Exit, this consisting of the top and bottom castings, ratchet plate, dogs, etc. A blue-print is also furnished giving the dimensions, etc.

of the principal wood parts used in the construction so that if desired the complete Exit Turnstile can be built in your own locality.

All Metal Exit Turnstile or Baffle Gate

Center post of Turnstile of 4½ in. O. D. iron pipe or tubing with arms of 1¼ in. O. D. iron pipe.

The outside posts carry the baffle and guard rails—Turnstile arms are strengthened by special iron fittings for inside of center post.

Will furnish complete shipped knock-down or will furnish Hardware only consisting of ratchet, dogs, top and bottom castings, etc.

PEREY MANUFACTURING COMPANY, INC.

Manufacturers of Turnstiles

101 Park Avenue
NEW YORK, N. Y.

Products

TURNSTILES, BAFFLE GATES, PASSIMETERS, and DEVICES for REGISTERING HUMAN BEINGS.

A Perey Turnstile for Every Purpose

For the past 15 years we have been solely engaged in manufacturing turnstiles and our organization is composed of specialists of wide experience.

We do not install our turnstiles, but furnish blue prints from which they can be readily installed.

We show below only a few standard models. Our line is complete and we can furnish turnstiles for every conceivable purpose.

Where Perey Turnstiles Can Be Used

Railroad, trolley and bus terminals, subway stations, amusement parks, bathing establishments, stadiums, athletic fields, ferries, or wherever a fare or an admission is charged and an accurate record of the number

of admissions is required (see standard and automatic models shown below). Also made in coin controlled type.

Libraries, museums, botanical gardens, zoos, recreation centers and the like where an accurate record of attendance is required without an attendant (see non-attendant model shown below).

Cafeterias, self-service stores, Y. M. C. A.'s, libraries and the like, where patrons are required to enter at a given place and to leave at another (see No. 11 wooden arm turnstile shown below).

Advantages of Installing Perey Turnstiles

- (1) Control crowds.
- (2) Save wages of ticket takers and attendants, and the cost of tickets.
- (3) Register accurately the number of persons admitted.
- (4) Assure many years of dependable operation at insignificant cost.
- (5) Save labor.
- (6) Prevent collusion.
- (7) Assure immunity from breakdown.

Standard Model

Suitable for railroads, ferries, amusement parks, baths or wherever a congested crowd is liable to collect and the collection of fares or admissions in a minimum space of time is desired.

Equipped with compression spring throw, shock absorber, unbeatable recording meter, hand and foot control, solid brass arms of the spread type and automatic locking device.

Suitable for right or left-hand operation

Automatic Model

Suitable for railroads, ferries, amusement parks, baths or wherever the collection of fares or admissions in minimum time is desired. Automatically operated by patron, but cashier can, if necessary, prevent patron from passing. Speed is limited only by ability of cashier in making change.

Equipped with compression spring throw, shock absorber, unbeatable recording meter, solid brass arms of the spread type and automatic locking device

Non-attendant Model

Especially suited for museums, libraries, social centers, parks and public institutions or wherever accurate automatic registration of attendance is required. Automatically released by the patron and registers on each quarter revolution. Locks itself.

Requires no attendant.

Equipped with automatic locking and unlocking device, compression spring throw, shock absorber, unbeatable recording meter and brass arms of the spread type

Perey No. 10 Turnstile

A durable and reliable turnstile of the non-registering type suitable for outdoor or indoor installations at parks or wherever an exit is desired to be barred against entrance or entrance against exit.

Sturdily built of best materials. Workmanship is same as in our other turnstiles. Attractive design. Arms of metal. Finished in aluminum bronze.

Equipped with double ratchet and pawl, making it easy to change direction of rotation.

Net weight, 100 lb. Spread of arms, 40 in. Height to top of arms, 36 in. Height to bottom of arms, 23 in.

Perey No. 11 Wooden Arm Turnstile

A non-registering type suited for libraries, self-service stores, cafeterias, Y. M. C. A.'s, museums, etc., where patrons enter at a given point and exit at another.

Will turn in one direction only, but can be made to rotate in the opposite direction, if necessary, without the purchase of additional parts.

Base finished in aluminum. Arms are of solid oak highly polished in golden oak finish.

Can readily be screwed to counter with lag screws, or, if desired, our No. 12 stand (see opposite illustration) can be furnished for this turnstile.

Net weight, 27 lb. Spread of arms, 40 in. Height to top of arms, 4 in.

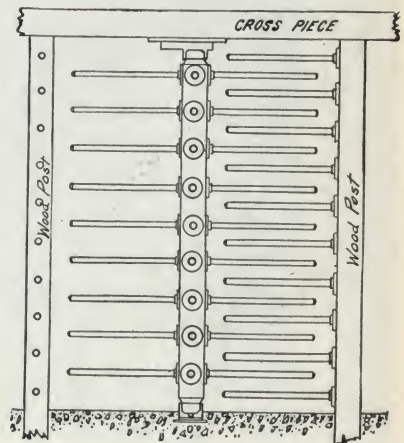

No. 12 Turnstile Stand

Net weight, 43 lb.
Height, 31 in.

Perey Baffle Gate

Suitable for bath houses, amusement parks, railroad stations or wherever it is desired to provide an exit and to bar entrance. We furnish top and bottom bearings and ratchet only (suitable for any size gate or opening), also blue prints from which any mechanic can construct the gate.

Perey Baffle Gate

ROBERT C. REEVES CO.

Manufacturers and Distributors of Wooden Fences

187 Water Street
NEW YORK, N. Y.

Products

DUBOIS WOVEN WOOD FENCE imported from France.

REEVESHIRE FENCE—an English type of fence.

HABITANT FENCING—a Michigan cedar fence.

Dubois Woven Wood Fence

The charm of Dubois Woven Wood Fence is entirely *natural*, for it is made of split, live, chestnut saplings, firmly bound together with strong, rustproof copperweld wire, looped over several cross braces. The natural color of the saplings quickly mellows to a beautiful gray-brown tone, forming a charming background for shrubbery and flowering plants. All of these features combine to give it great strength with a quaint, rustic appearance.

Uses of Dubois Fencing—Privacy to the home with the added touch of rustic beauty is found in Dubois Woven Wood Fence. It has been used in France, where it is made, for generations and is unique, distinctive, and artistic. It harmonizes with any style of architecture and may be used with city or suburban homes with equally good results.

Although the beauty that Dubois Woven Wood Fence adds to the landscape is a principal feature, many

others have been discovered from long usage. Service yards and driveways are effectively concealed, suburban gardens gain a new privacy and a new beauty, and even city back yards are transformed into secluded, restful spots by this simple means.

Dubois has been used for decades in England as well as in France. It blends equally well with the English style cottage, the stone or brick manor house, the picturesque chateau of the Loire district or the low, quaint Norman type. With homes of strictly American origin, it is equally suitable—simple New England, Colonial, Dutch Colonial, the trim brick and stone houses of old Germantown and the stately, pillared homes of the South.

This imported fencing has been given the enthusiastic endorsement of landscape architects because it solves their most difficult problem.

Sizes and Erection—Dubois Woven Wood Fence is furnished in 5-ft. sections and in two heights—4 ft. 11 in. and 6 ft. 6 in. It is shipped ready to erect against 3 to 4-in. posts placed about 8 ft. apart. The posts should be set 3 ft. deep and extend 5 ft. above the ground, and should be connected at the top and about 1 ft. from the ground with rough 2x4-in. spruce timbers. The sections of fence are simply nailed to this rough framework. Owing to its flexible construction, the fence follows perfectly the contour of the ground, making it equally suitable for use on level or rolling land.

Dubois is also made up into charming gates which are stocked with curved and straight tops. Special designs are made upon order.

Perfectly at Home in This California Setting

Cost and Maintenance—The cost of Dubois Woven Wood Fence is small and no expense is required for maintenance. No paint is ever necessary. It may be truly said that without any attention after erection Dubois mellows as it weathers and becomes more beautiful with the lapse of time. Price list sent upon request.

Reeveshire Hurdle Fence

An adaptation of the cleft chestnut hurdle fence which has been used in England for centuries. It is made of split chestnut timber, constructed in sections or hurdles, each hurdle being 8 ft. 3 in. long. At each end is a 6-ft. post which extends 18 in. into the ground, making the fence 4 ft. high. The posts of one hurdle lock easily with those of adjoining hurdles by means of wooden pins which are supplied. This makes for exceeding strength as no one post is required to support alone a strain on its particular hurdle.

A Section of Reeveshire Hurdle Fence

The hurdles are made in three styles, 4, 5 and 6-bar, all of which are the same length and height, the difference being in the spacing between the bars.

Uses—Reeveshire Hurdle Fence is something more than an enclosure—it is decidedly an artistic fence, possessed of unusual rustic charm, and blends well with many types of architecture. Recently there has been an increasing demand for it as a boundary fence for large estates, a division fence in the suburbs, or to accentuate the setting for a residence of the English farmhouse or similar type.

The 4-bar hurdles are suitable for enclosing pastures for cattle where a close fence is unnecessary.

The 5-bar hurdles make an ideal fence for paddocks or pasture for spirited horses and are used for this purpose on the estates of many of the leading

A Strong Pasture Fence

horsemen of this country. Hurdle fencing is easily seen by colts and they will not injure themselves by running against it.

The 6-bar hurdles make a very close fence and are particularly suited for enclosing pastures or pens for sheep or pigs.

Erection and Removal—Reeveshire Hurdle Fence is easily set, requiring no digging of post holes. Two men can place from one to two hundred sections in a day. A hole is made in the ground with a crowbar and the end posts are driven in. The hurdles are then locked together with the wooden pins. It is easily taken down and transferred from one plot to another,

and during the winter months may be compactly stored.

Reeveshire Hurdle Fence Gates—Made with 4, 5 or 6 bars to conform with the three styles of fencing. Stocked in 10-ft. lengths with extra braces. Furnished to order in any desired length.

Reeveshire Portable Post and Rail Fence—Much heavier than Reeveshire Hurdle Fence though of the same length and height when set. Posts extend 2½ ft. in ground. Generally used as permanent fences in hunting districts.

Old-fashioned Post and Rail Fence

Old-Fashioned Post and Rail Fence

An authentic Early American post and rail fence for farm use. Made of split chestnut. Ideally suited for erection in hunting country.

Habitant Fencing

Made in many designs of selected, seasoned Michigan cedar, known as "the wood of durability." Shipped in sections 7 ft. 6 in. long, complete with posts, in heights ranging from 2 to 12 ft. Pickets are fastened to the rails with rustproof nails and posts are properly mortised to accommodate tenoned ends of the rails. Fencing gives extremely long service and is unaffected by varying climates.

All cedar poles used in Habitant Fencing have the bark removed, which makes a particularly refreshing effect. As time goes on they take on a beautiful dark sil-

Design No. 300, Habitant Fencing

ver-gray tone. The sections are designed to conform to sloping ground, hillside, or bank. They may be readily removed if desired as each section is a complete unit.

Habitant Fencing includes entrances and gates, and many unusually attractive effects are to be had. We will gladly make up special designs.

Service to Architects

Our Service and Advisory Department will gladly assist in the solution of any fencing problem. Our 67 years of experience places us in a position to make specific suggestions as to the adaptability of fencing to special requirements.

ALUMINUM COMPANY OF AMERICA

Manufacturers of Aluminum and Aluminum Alloys

PITTSBURGH, PA.

Product

ALUMINUM for ORNAMENTAL METAL WORK.

For Aluminum Roofing, see page A424; for Aluminum Paint, see page B1609.

Aluminum for Ornamental Metal Work

Aluminum is applicable to ornamental metal work ranging from the finest grades to the commercial grades and forms. Because of its light toned permanent color, high resistance to corrosion, non-staining properties, light weight, uniformity, and easy working properties, it is finding increasing use in the architectural field for general sheet metal and ornamental metal purposes.

Physical Characteristics of Aluminum

Color—The permanent silvery gray color makes aluminum very desirable as a decorative material and the various alloys furnish a considerable range in strength and workability.

Resistance to Corrosion—The resistance of aluminum to atmospheric corrosion is very good, as is witnessed by installations of varied forms ranging in location from tropical to high latitude conditions.

Light Weight—Aluminum has a specific gravity of approximately 2.8 and weighs $\frac{1}{16}$ lb. per cu. in. As this is one-third the weight of other commonly used metals, ease of erection is a natural consequence.

Will Not Discolor Adjoining Materials—Aluminum forms no colored salts and does not discolor surrounding or supporting structures from drip or splash of watershed.

Strength—Specifications of aluminum range from fully annealed 2S0 pure metal (12000 lb. per sq. in. tensile strength, 25% elongation in 2 in., Brinnell hardness, 22) to special 17S alloy (65000 lb. per sq. in., 20% elongation in 2 in., Brinnell hardness, 92).

Easily Worked—Aluminum machines easily and is capable of taking and holding a high polish.

Cost

The cost of installing aluminum is of course dependent on the design and quality of work, and compares with the cost of installing high grade materials.

Actual cost of aluminum per unit of weight is divisible by three for comparison by bulk with cost of other similarly used metals.

Marketable Forms

Aluminum and aluminum alloys are obtainable in the form of ingots, sheets, rods, bars, tubing, rivets, bolts, extruded moulding, and structural shapes for fabrication.

Architectural Bronze Work Uniquely Executed

The ANTIOCH ART FOUNDRY offers to the architect a foundry service that it believes to be unique among American foundries—the use for architectural bronze work of casting methods heretofore confined through their cost to the production of only the most expensive and artistic sculptural statuary bronze castings.

Our bronze foundry work is of a distinctive, exacting and quality nature rather than the usual "production" castings. Frequently architects search for a foundry that can do an unusually detailed piece of casting in a creditable manner, and we feel that with both our lost wax process and french sand process we are equipped to handle just such inquiries. It is an unusual feature to offer lost wax casting to architects as generally this work is offered solely to sculptors. One outstanding advantage of this process is the easy duplication when more than one casting is desired from a single model.

Signor Giovanni Polizzotti, formerly instructor in

the lost wax process and director of the Art Foundry at the Royal Institute of Industrial and Fine Arts at Palermo, Italy, is now supervisor of all lost wax casting.

Mr. Roger Williams, for thirteen years associated with the Gorham foundry, is in charge of all french sand casting. With these two men in charge of all casting work, we place at the architect's disposal bronze casting work that is essentially craftsmanship and not production work.

Whether the casting is to be made from a plaster model supplied by the architect or from one executed by our designer, the finished bronze will be outstanding as to quality.

Due to favorable factors of location and resulting low overhead costs, the estimates of the ANTIOCH ART FOUNDRY are attractively moderate. The combination of the highest foundry craftsmanship with reasonable cost we believe will be of interest. We shall be glad to furnish full particulars on request.

Feature of Lost Wax Process

The advantage of this casting process, besides being more faithful in reproduction as sculptors have long recognized, is that the completed casting is a duplicate of the original model with very little retouching work necessary. Also, numerous duplicates can readily be made from one mould.

For Metal Covered Doors, see pages A848-849

Marquise for All Classes of Buildings

Many years of experience in the manufacturing of marquise for all types of buildings have given us a great fund of practical knowledge on the subject. We design and construct marquise for theaters, hotels, banks, apartment houses, etc. We furnish and erect, any place in the country, all standard steel framing and use galvanized Armco ingot iron or sheet copper on all marquise furnished by us. We also build marquise according to architects' plans.

In our well illustrated marquise catalogue which we will gladly send on request, are shown many of our representative installations. Marquise suitable for buildings of all kinds are included. From these, suggestions of design and practice can be obtained.

Our engineering and architectural departments are composed of men who have specialized on marquise and are espe-

cially capable to solve any problem relating to their design or installation. They are at all times ready to submit sketches and estimates.

When making inquiries, give the following information: width of marquise across front of building and projection over sidewalk; select design from our catalogue or submit sketches; whether wiring is required on underside; specify reading of fixed letter signs; type of construction of building.

Signs, when furnished, are made as an integral part of the marquise with cornices, brackets and all mouldings applied. Wiring is complete with leads ready to connect to wiring in building. Letters furnished as follows:

No. 1 No. 2 No. 3
Interchangeable Letters for Marquise Signs

No. 1, a raised glass letter contained in a special frame, sizes from 4 to 12 in. No. 2 has a raised channel of metal outlining the letter, the metal being the only part removed for changing the reading. No. 3, similar to No. 2, either copper or zinc with bright facing on outline of letter. Nos. 2 and 3 in 8 and 12-in. sizes only.

Letters for interchangeable letter signs are furnished in sets of the proper assortment. "In," "and," "the," periods, quotation marks and sufficient blank spaces in assorted sizes are included.

Letters similar in construction to Nos. 1 and 2 and the exposed bulb channel type are furnished for signs having fixed letters

Designs and Catalogue

We have a very complete and comprehensive marquise catalogue which will be sent on request or, should it be preferred, our architectural department will supply a design which will fit the architecture of the building if a front elevation drawing is sent to us.

ART BRASS & WIRE WORKS, INC.

General Metal Work for Banks and Public Buildings

407 East Fort Street
DETROIT, MICH.

Products

ORNAMENTAL METAL and WIRE WORK, including:

Bank Screens, Cages and Entrances
Ornamental Iron Stair Railings
Elevator Cabs
Marquees
Brass Railings
Iron, Wire, Brass and Bronze
Grilles
Bronze Doors
Bronze Tablets
Iron, Brass and Bronze Wickets
Ornamental Iron and Bronze Entrances
Altar, Balcony and Communion
Railings for churches
Wire Partitions
Machinery Guards
Bulletproof Bank Installations
Iron, Brass and Bronze Work for all types of public buildings
Window Guards
Fire Escapes
Ornamental Iron Porch Railings

Service

We solicit inquiries and correspondence with architects, decorators, and engineers on their special problems, as we are equipped to produce designs in any style of architecture or for special purposes.

On request, special drawings will be prepared, carrying out every detail with accuracy. In all cases, complete data requested as follows: style, size, construction, finish and approximate cost. Contracts should be placed early enough to permit first class workmanship.

Metal Construction

All work can be made in genuine bronze, copper, brass, steel, wire and wrought iron; either in solid cast or built-up construction.

Ornamental Cast Iron Bank Entrance

Banking Screen and Cages

Ornamental Iron Stair Railing

Banditproof Bank and Paymaster Fixtures

Installations of bulletproof glass, steel backing, for frame; bulletproof wickets and deal plates which are banditproof, yet unobtrusive, the bullet-stopping features being concealed, leaving the deal plate flush with the counter. Wickets which are simple, effective and inexpensive, yet without the aggressive appearance of the average banditproof wicket.

The entire installation being such as to give perfect security, yet in no way marring the architectural beauty.

Finish

All work can be finished in the following manner:

Oxidized copper	Nickelplate
Plain copper	Oxidized silver
Old copper	Bright silver
Polished brass	Frosted silver
Oxidized brass	Steel blue
Brushed brass	Japanese bronze
Old brass	Statuary bronze
Dull brass	Plain bronze
Egyptian dead black	Genuine bronze
	Electro-bronze

Genuine bower-barff

Imitation bower-barff

Any special colors in oil paints and lacquer paint

Prices

Quotations are furnished upon receipt of information giving design, size, construction and finish. All goods are carefully crated or boxed, free of charge. All prices f.o.b. Detroit.

Guarantee

All work executed by this concern is guaranteed to be of the best metal and workmanship in the market, and is assembled complete in our shops, to insure accuracy, before being shipped.

Products

ANACONDA ARCHITECTURAL BRONZE, BRASS AND COPPER for ornamental and structural purposes as used for over twenty-five years by leading manufacturers of ornamental and structural metal work, including Cornices, Pilasters, Grilles, Wickets, Counters, Door and Window Trim, Screens, Hand Rails, etc.

For Anaconda Sheet, Roll and Strip Copper, see page A426; for Anaconda Brass and Copper Pipe and Benedict Nickel Pipe, see page C2301.

Extruded Shapes

In the extrusion process, a bar of bronze is forced under hydraulic pressure through a hardened steel die of the proper cross section. The resulting product obtained is of a remarkably homogeneous texture, very strong and durable, and in every way superior to a bronze casting. There are no sandy surface, porosities or any of the defects frequently found in castings. The tensile strength of Anaconda Extruded Architectural Bronze is never less than 45,000 lb. to the square inch.

The edges are sharp and clean, so that the effect desired is invariably obtained.

Standard Patterns and Special Designs of Extruded Shapes

A large selection of standard designs, covering all general uses, offers a wide variety to choose from. A few sections are illustrated on the following page. Where required, dies for new designs will be furnished at cost and held for the exclusive use of the customer.

Since Anaconda Extruded Shapes are produced from bars weighing 100 lbs. or more, it is not practical to execute orders for a smaller quantity than that obtained from a single bar.

Cold Drawn Shapes

When light mouldings and shapes are required with walls $\frac{1}{8}$ in. and thinner, the drawn process is used to produce Anaconda Architectural Bronze Shapes.

These cold drawn shapes are used for a great variety of architectural purposes, such as interior trim, window frames, showcases, store fronts, etc.

Colors

Anaconda Architectural Bronze Shapes, whether made by the extrusion process or cold drawn, have a natural golden color. After exposure the metal darkens and assumes the characteristic color of bronze. For interior use, the metal can be artificially colored to obtain any effect desired.

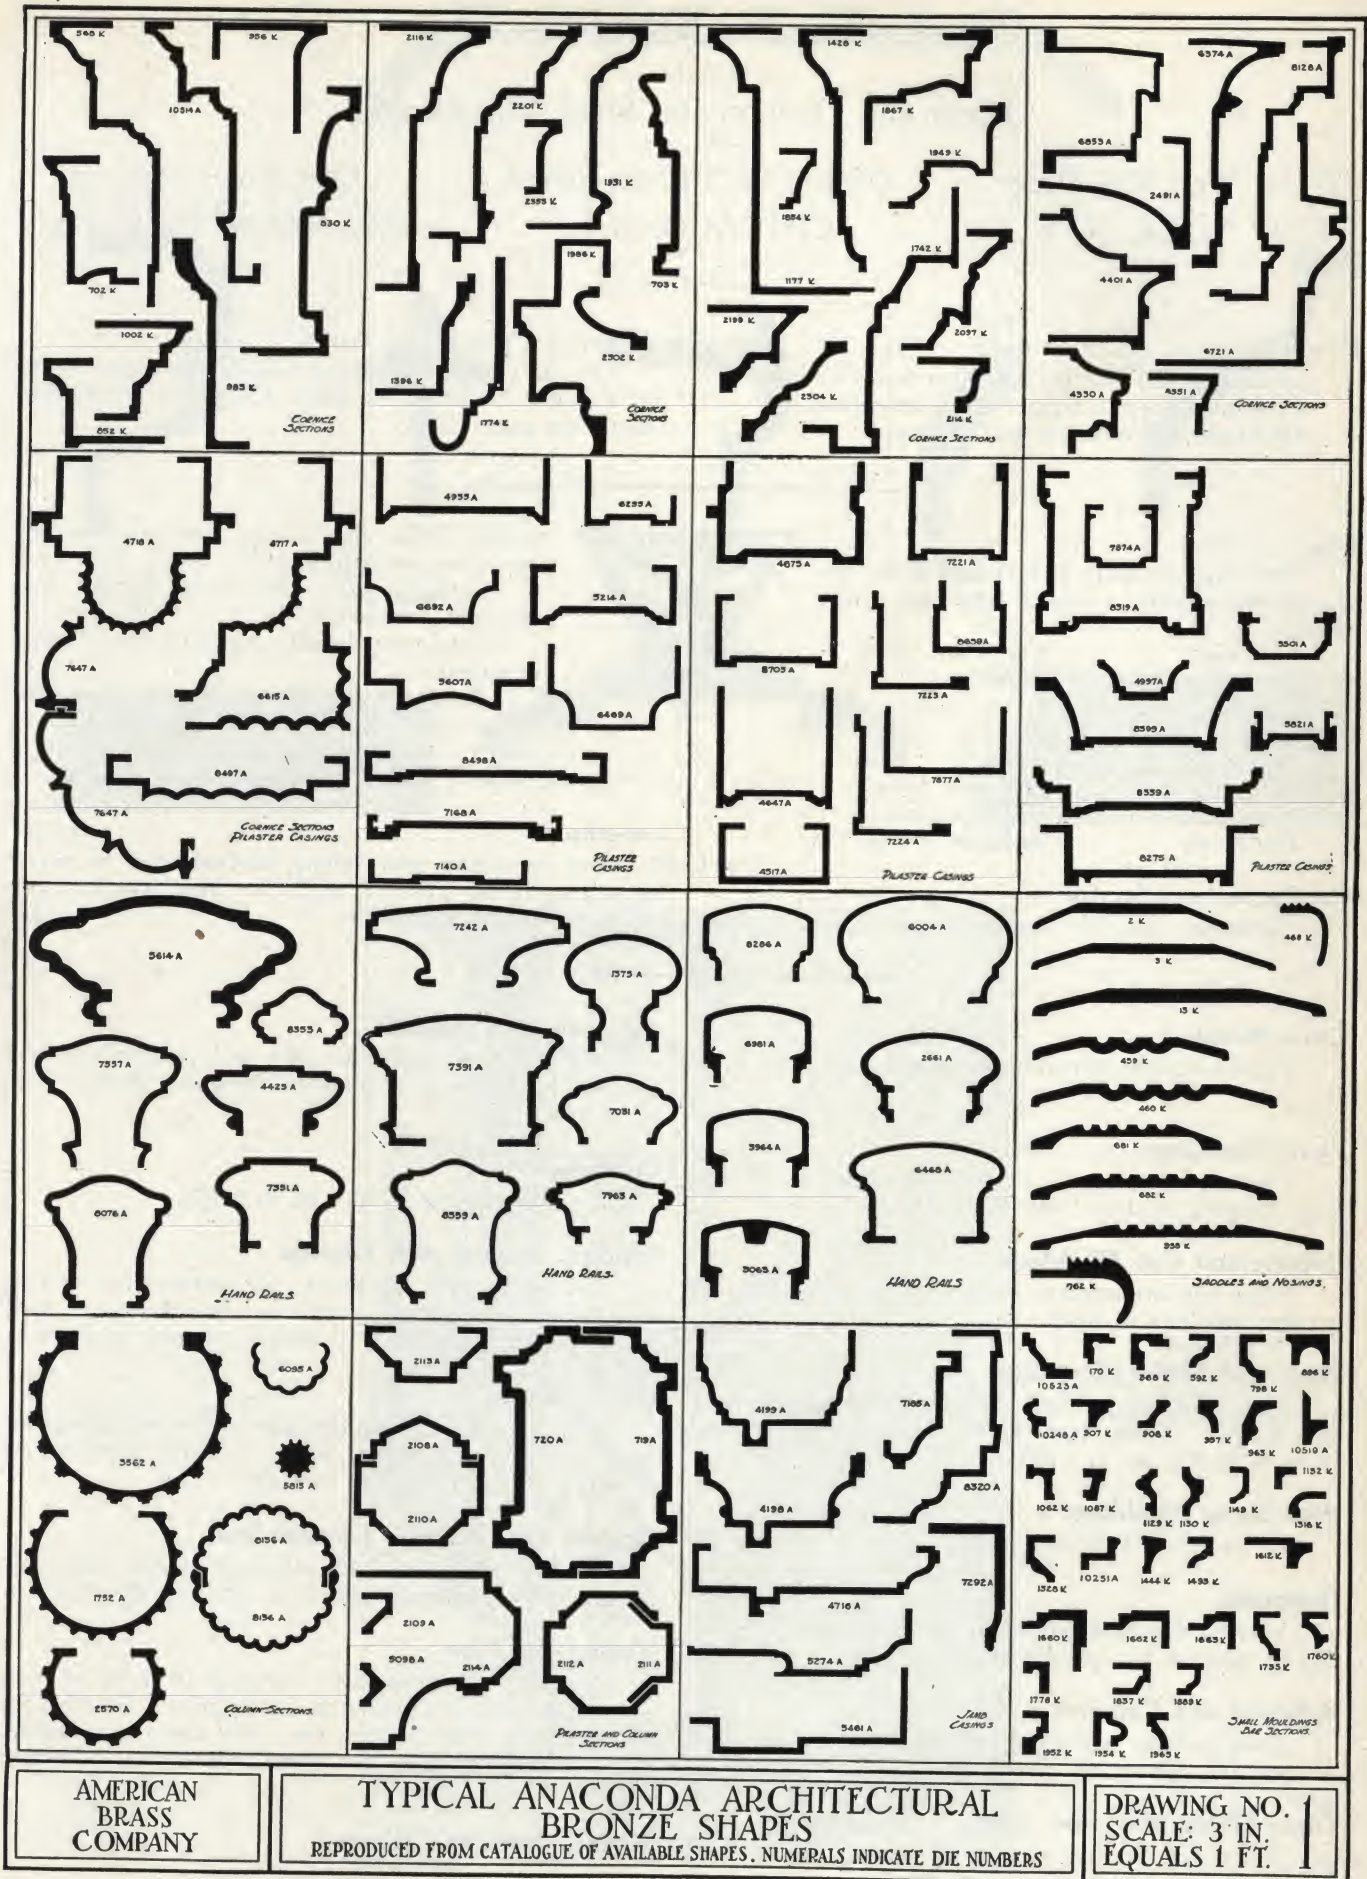

Estimates and Co-operative Service

THE AMERICAN BRASS COMPANY offers full co-operation in furnishing estimates and determining the suitability of Anaconda Metal Shapes for various uses. While estimates can usually be prepared from detailed blue prints and specifications, a representative of THE AMERICAN BRASS COMPANY will be sent at any time to consult with architects or fabricators whenever such consultation is requested.

Facilities

THE AMERICAN BRASS COMPANY is equipped for extensive production of Anaconda Architectural Shapes. The Company has complete facilities for serving the East from its mill at Ansonia, Conn., and the West from its mill at Kenosha, Wis. Inquiries or orders should be sent to the nearest mill.

Uses

Our various products find application in a great many ways; a few of which are mentioned:

Balconies	Stairs and rails
Bank screens	Store fronts
Canopies	Ticket booths
Casement windows	Elevator cabs and fronts
Directory boards	Entrance doors
Fascias	Register grilles
Marquises	Radiator covers, etc.
Partitions	

pickets, balls, etc. It also contains interesting ornamental iron detail.

Catalogue No. 18, drop forged and wrought ornaments.

Catalogue No. 20, stamped iron and brass ornaments.

Catalogue No. 26, perforated sheets for grilles, etc.

Our Service Department is prepared to assist in arising problems.

Lengths

Our moulding and tubing is furnished in warehouse lengths of from 12 to 20 ft. We have facilities to cut to specified lengths.

Catalogues and Service

Catalogue No. 25 illustrates mouldings, tubings,

Cove Mouldings

Fifteen designs in various types and sizes from $\frac{3}{8}$ to $1\frac{3}{8}$ in.

Panel Mouldings

Plain and ornamental. Practically all solid. 40 patterns ranging in sizes from $\frac{3}{8}$ to $2\frac{1}{4}$ in.

Cornice and Cap Mouldings

Plain and ornamental. $1\frac{1}{8}$ to 6 in. in height. 40 varying numbers in stock.

Panel and Scribe Mouldings

Plain and ornamental. 60 patterns carried in various designs. Sizes from $\frac{3}{4}$ to $3\frac{3}{4}$ in. in height and from $\frac{1}{2}$ to $1\frac{3}{4}$ in. in width.

Wall String Mouldings

Seven designs from 1 to $2\frac{1}{4}$ in.

Handrails

Sixteen numbers carried in steel and brass. $1\frac{3}{4}$ to $2\frac{3}{4}$ in. wide to fit top rails of $\frac{3}{4}$ to $2\frac{1}{4}$ in.

Balusters and Columns

Twenty-four varying types and sizes, plain and ornamental. $\frac{1}{2}$ to 2 in. in thickness.

Glass Fillets, Bars and Caps

Thirty-five types and sizes for sashes, doors, windows and casements.

Astragals and Facings

Plain and ornamental, solid and perforated. An array of 125 patterns of beautiful designs. Widths from $\frac{1}{4}$ to 4 in.

Crestings

Twelve patterns $\frac{3}{4}$ to 4 in. in height.

Saddles, Nosings and Edgings

Carried in steel and brass. 20 patterns for varying stair tread and door sill problems. See also page A680 for stair nosings.

Corner Beads

Six numbers excellently suited for protecting corners of plaster and similar walls. Can be furnished cut to length with anchors for concrete.

Angles, Tee, Zee and Channel Iron

A great variety of the aforementioned shapes in square root of special interest in building construction.

Tubing and Pipe

Square and rectangular; ranging from $\frac{3}{8}$ to 4 in. square and 1×2 to $1\frac{1}{2} \times 3\frac{1}{2}$ in. rectangular. Suitable for newels, rails, door frames, etc. We also carry various types of caps and drops for newels, also locks and hinges for doors.

Pickets, Balls and Rivets

A large range of sizes and designs.

Wrought Iron Ornaments

We carry in stock a line of 5000 ornaments of every style and period.

Their hand forged character adapts them to the finest of work

Stair Rail

This stair rail was designed and executed by PAUL FIEBIGER, New York, N. Y.

Stock ornaments were used throughout

PECORA PAINT COMPANY

Mortar Stains and Sash Putty

Fourth Street and Erie Avenue
PHILADELPHIA, PA.

Products

PECORA MORTAR STAINS.

PECORA METAL SASH PUTTY.

For Calking and Glazing Compounds,
see page B1749.

Pecora Mortar Stains

Uses—A paste, or pulp, *not a powder*, made in 12 standard colors for mixing with lime or cement mortar, or the two combined, in laying brickwork for facing exterior or interior walls in any type of structure. Equally applicable for coloring mortar for mantel facings, fireplaces, hearths, floors—whether of brick, tile, marble, slate or other material. Also used for pointing and jointing mortar of stonework where any color effect is desired; also for producing color tones in exterior "white-wash."

Advantages—Pecora Mortar Stains are offered as heavy paste or pulp, for in that form only, after much experiment, this company has found it is possible to produce *chemical* (not acid) mortar stains which, made from finely ground ores dissolved in chemicals, have the advantage of being absolutely fadeproof, exceptionally strong and thoroughly economical, and which give that deep, rich tone so often sought and so seldom found.

They have the added advantage of being most easily and thoroughly assimilated by the mortar with which they are mixed. The quality of permeability is obtained by mechanical precision in making the paste, instead of uncertain results of hoeing a dry powder into a wet mass of mortar.

This company's many years of successful research and constantly growing business have *proved this superiority of pulp stain*. While a small detail in the construction of a building, it is, nevertheless, an important one. Its correct use helps to build a lasting quality reputation for architect and contractor.

Properties—Being a pulp or paste, constituting a fast *stain or dye*, and differing in that respect from ordinary coloring mediums, they form a chemical union with the mortar and strengthen, rather than weaken, the mortar joint.

Economically they are unapproached as, *being 50% to 100% stronger than any mere mineral coloring material*, they are much less costly in the long run. Manufactured from carefully selected, finely ground, and richest ores in combination with extenders and fixatives, the colors become permanent after mortar is set, making rich, clean, clear shades, free from streaks or spots. Pecora Mortar Stains do not cause or increase unsightly efflorescence on face of brick walls.

Colors—Shades below are always in stock. Special shades made to order.

Black	Red	Amber
Brown	Buff	Terra cotta
Dark brown	Fern green	French gray
Windsor	Colonial drab	

Specifications—Many architects have found that specification by description only has resulted in the substitution of inferior goods, the spotting or fading of which necessitates expensive tuck pointing. Therefore the following outline form is suggested:

All mortar to be colored or stained with Pecora Mortar Stain, manufactured by PECORA PAINT COMPANY, Philadelphia, Pa., using by measure 1 bucket of paste or pulp to 7 buckets of face wall mortar.

Mortar must be cold before mixing in stain. To secure a uniform and smooth shade, "hoe in" stain thoroughly. Keep soft in package by covering with water. Pour this off before using. Do not allow stain to freeze before being mixed with mortar.

Note: Depending upon depth of shade desired, the following proportions per 1000 brick, ordinary stretches, will be found to approximate quantity desired:

Red, Buff, Terra Cotta and Amber—For $\frac{1}{8}$ -in. joint use 45 to 55 lb.

Brown, Windsor, Colonial Drab, Fern Green, French Gray and Dark Brown—For $\frac{1}{8}$ -in. joint use 35 to 45 lb.

Black—For $\frac{1}{8}$ -in. joint use 20 to 30 lb.

Mortar varies and takes more or less stain according to richness of lime and quality of sand. Before laying brick it is suggested that a small portion of the stained mortar should be taken from the mortar bed and dried out thoroughly to determine whether the proper quantity of stain is being used to produce the shade desired.

Literature—Booklet showing actual colors and giving full details and photographs of important buildings, with testimonials from architects and owners, sent on request.

Pecora Metal Sash Putty

Uses—A specially prepared putty for use in metal sash only.

Advantages—Pecora Metal Sash Putty is the modern plastic product developed by this company to replace white lead, litharge and ordinary putties used in connection with metal.

It is a "special duty" putty, embodying the essential features of retaining its elasticity and staying in place, regardless of the difference in coefficient of expansion between glass and steel.

Properties—It remains soft in the package; and on removal is immediately ready for use. It is "long," therefore readily applied by the workman; and not requiring any manipulation enables the contractor to reduce his cost of installation.

Colors and Samples—The standard shade is dark red. Other shades are made to order. Sample on request.

Specifications—Be sure to specify Pecora Metal Sash Putty. It will be a trouble-saver as evidenced by the fact that thousands of pounds have been used with the greatest success.

LOUISVILLE CEMENT COMPANY

INCORPORATED

Speed Building

LOUISVILLE, KY.

Brixment Mills at Brixment, N. Y., and Speed, Ind.; Portland Cement Mills and Natural Cement Mills at Speed, Ind.; Lime Quarries and Plants at Milltown, Ind.

Products

BRIXMENT, a mason's cement for brick, tile and stone masonry and for stuccoing buildings.

Also Speed Portland Cement, Louisville Natural Cement, Speed Chemical Lime, Speed Chemical Hydrated Lime and Speed Mason's Hydrated Lime.

TRADE-MARK

Brixment

Brixment is a mason's cement that combines the characteristics of portland cement and lime, having both strength and plasticity. When mixed with sand and water, it makes perfect mortar for any type of brick, tile or stone masonry.

How Used—The proper mix is 1 part Brixment and 3 parts sand, measured by volume, with water added for proper consistency. Neither portland cement nor lime is necessary. The simple Brixment mix makes strong, smooth-working mortar.

Brixment can be mixed in any quantity either by hand or machine. It is ready to mix and use at once.

How to Estimate—Brixment is packed in cloth or paper sacks. Each sack contains 1 cu. ft. There are 4 sacks to a barrel.

When mixed with 3 parts of sand, a barrel of Brixment will lay between 800 and 1000 bricks, depending on the width of the joint. Therefore, 1000 bricks require 4 to 5 bags.

Uniformity—The use of Brixment is the architect's assurance that all mortar will be uniform in strength and color and that his specifications will be accurately followed. When oversanded, Brixment mortar works short and, since there is no lime in the mix, the necessary plasticity can be secured only by using the proper amount of Brixment.

Strength—The strength of Brixment mortar is greater than that required by the building code of any city for the heaviest load-bearing walls. Its strength increases with age. Its final strength is greater than that of the brick itself.

TEST BY ROBERT W. HUNT & COMPANY

Three specimens of Brixment mortar, mixed 1:3 with sand, were used in 1/2-in. joint between two common bricks. All were tested at the age of 28 days.

Specimen	No. 1	No. 2	No. 3
Mortar started to crush at about	20,000 lbs.	19,000 lbs.	23,000 lbs.
Brick started to crush at about	25,000 lbs.	24,000 lbs.	25,000 lbs.

TEST BY PITTSBURGH TESTING LABORATORY

Sample from warehouse of H. B. Rosenberger, Doylestown, Pa.

Fineness through 100-mesh sieve, 97.8%
Fineness through 200-mesh sieve, 90.2%
Soundness in water, O.K.
Soundness in air, O.K.
Initial setting time, 3 hours
Final setting time, 6 hours
7-day tensile strength, 1:3 sand, 107 lbs. per sq. in.
28-day tensile strength, 1:3 sand, 232 lbs. per sq. in.

Bond—Brixment makes a stronger, tighter bond between the brick and the mortar. It is ground finer and hardens more slowly than portland, thus permitting

deeper penetration and a more thorough keying into the pores of the brick.

Resists Moisture—During the process of manufacture a small amount of mineral oil is intimately mixed with Brixment. For this reason Brixment resists the passage of moisture through the mortar joint.

For Walls Below Grade—Brixment is a true hydraulic cement. This, with its water-resistance and freedom from lime, make it ideally suited for walls below grade.

Convenient Setting Time—The manufacture of Brixment is controlled to give Brixment mortar a slower, more convenient setting time than portland cement mortar. This keeps the mortar from setting up on the board and enables the mason to strike the joints conveniently before the mortar has hardened.

Clean, Permanent Joints—Because of the slower set and unusually smooth-working quality of Brixment mortar, cleaner, neater joints can be struck. The absence of free lime keeps them from scaling, crumbling or popping.

No Efflorescence—Efflorescence is due to the presence of soluble salts in masonry materials. Brixment itself never causes efflorescence because it contains less than 1/2 of 1% of such salts. Even when soluble salts are present in the other materials, the water-repellent quality of Brixment resists the passage of the salts in solution and usually prevents them from coming to the surface of the mortar.

Does Not Fade Colors—Colors mixed with Brixment mortar develop and hold their full strength permanently. Brixment contains none of the acids and strong alkalis which are so frequently the cause of fading in portland cement and lime mortars.

Economy—Brixment costs less than the portland cement and lime necessary to make an equal amount of mortar. It saves labor because it requires no soaking or slaking and its plasticity enables the mason to do faster work. There is no waste of time and material because Brixment mortar sticks to the brick.

Specifications

(1) All mortar shall be composed of Brixment, manufactured by the LOUISVILLE CEMENT COMPANY, and sand. (2) The mortar shall be mixed by measure in the proportions of 1 part Brixment to 3 parts clean, sharp, dry sand. (3) The Brixment and sand shall be mixed dry until the color of the mass is uniform. Clean water shall then be added to make mortar of the proper consistency for the work to be done. All mortar shall be mixed by machine (or by hand for small operations where machine mixing would not be practicable). (4) If mortar colors are used, they shall be mixed with the mortar in the proportion and manner specified by the manufacturer of the particular color used. (5) In freezing weather the sand and water shall be heated.

ProductsANCHOR BRAND STUCCO COLORS.
ANCHOR BRAND MORTAR COLORS.
ANCHOR BRAND CEMENT COLORS.**Anchor Brand Cement Colors**

Anchor Brand Cement Colors are very finely ground and produce clear, bright tones with a minimum of coloring material. They are used in floors, sidewalks, cast stone work, roofing and floor tile, stucco, etc., and should not be confused with mortar colors.

For Cement Floors—Although colored cement floors are comparatively inexpensive, they should never receive the treatment of a cheap floor. Colored cement, if carefully laid, finished and protected, will be found to possess all the decorative qualities of more expensive materials, along with the strength and economy of concrete.

For Stucco—The popularity of colored or tinted stucco surfaces is increasing rapidly. Directions for the use of our stucco colors will be furnished on request.

Available Colors—Our list of colors suitable for cement and stucco work is too long to publish here, but the more important numbers are given below. For special shades or tints, we will be glad to supply samples as requested.

No. 500	Red Oxide	No. 17	Dark Buff
No. 1195-B	Red Oxide	No. 1169	Brown

No. 1149-M	Yellow Oxide	No. 328	Blue
No. 5	French Yellow	No. 246	Black

Specifications for Coloring Cement Floors

Subfloors under colored cement topping should be specified as usual, although it is better to use a fairly dry mix and tamp thoroughly. Allow 1 in. for top dressing, which should be laid immediately. The following paragraphs should be incorporated in the specifications:

Cement Floor—Cement color, wherever specified, shall be Anchor Brand Cement Color, manufactured by C. K. Williams & Co., Easton, Pa., and delivered to site in original packages.

Top Finish—A top finish not less than 1 in. thick shall be applied to floors in (state part of work), topping to be composed of 1 part cement and 2 parts of sharp clean sand, free from loam, and from 3 to 10% of color, according to results desired.

Mixing—Cement, sand and color shall be thoroughly mixed before water is added. Only enough water shall be added to make a heavy paste. Mixing shall continue till the mass is absolutely free from spots or streaks of color.

Application—While base is still moist, top dressing shall be applied as follows: Trowel down about ½ in. of colored cement at a time, so as to work the air out of the mass. Build to the surface in this manner. Use the stroke board to chop the surface, as the mass will be too tough to stroke in the usual way.

Take off any surplus with the trowel. Level the surface and let it lie till it becomes dull. Do not trowel until all water on the surface disappears.

Tile Effect (Optional)—48 hours after application of top finish, floors shall be cut ⅛ in. deep with a three-cornered file sharpened to a diamond point, so as to produce a tile effect in the pattern directed by the architect.

Note: Cutting floors while green will produce a ragged edge.

Protection—As soon as topping is sufficiently set, floors shall be covered with a 2-in. thickness of sawdust, which shall be kept wet for at least 2 weeks.

Cleaning and Waxing (Optional)—When protective coating is removed, the surface shall be washed with linseed oil soap, using a wire brush if necessary, to remove dirt and stains. When clean and dry, the surface shall again be covered with a 2-in. thickness of sawdust.

Just before the floor is to be put into use, it shall be polished with a floor wax approved by the architect and applied in accordance with the manufacturer's directions.

Anchor Brand Mortar Colors

The growing popularity of Mortar Colors during the past decade is largely due to the following reasons:

(1) **Mortar to Match Brick**—Where particular color effects are desired, such as in brick panels of contrasting or harmonizing color or for interior work, especially hearths, mantels, etc., the effects are greatly increased by coloring the mortar to match the brick. The American Face Brick Association standard specifications provide:

"The hearth shall be of (name) brick laid as per drawings in a 1:3 cement mortar to match the brick."

(2) **For Mortar Contrasting with Brick**—By laying the brick in mortar of a color and shade which will bring out the full value of brick texture and tone gradation, a beautiful effect is secured. Some combinations which have become very popular are as follows: rough texture variegated red brick with buff or chocolate mortar; red brick with black mortar; and smooth-surface light buff or yellow brick with red mortar.

(3) **For "Mellowing" the Mortar**—One of the principal charms of old brick buildings is the warm and mellow tone of the mortar. To reproduce the charm of half-century-old mortar, a judicious use of mortar colors will prove most satisfactory.

(4) **For Color Control**—The color value of sand and cement varies greatly with the source of material. Our standard specifications provide architects with an exact method of color control.

(5) **One-fifth of the Brick Wall Surface Is Mortar**—Proportions vary, but in the ordinary wall with ½-in. mortar joints, approximately one-fifth of the wall surface is mortar. For this reason architects realize the necessity of selecting the mortar color with the same discriminating care that is used in the choice of the brick.

Cement Floor Tile Colored with Anchor Brand Cement Colors

Left
Five Range Rough Texture Brick
 Laid with Anchor Brand
 No. 19 Buff
 188 lbs. Sand (2 cu. ft.)
 94 lbs. Cement (1 bag)
 9½ lbs. Hydrated Lime
 15 lbs. No. 19 Buff

Right
Full Range Rough Texture Brick
 Laid with Anchor Brand
 No. 1151 Red
 188 lbs. Sand (2 cu. ft.)
 94 lbs. Cement (1 bag)
 9½ lbs. Hydrated Lime
 20½ lbs. No. 1151 Red

Anchor Brand Colors are manufactured in our own mills to meet the three essential requirements: *permanence of color*, so the mortar will not change its shade with age; *uniformity of color*, so that all batches of mortar in which a given color is used will be exactly alike; and *fineness of grinding*, so that the maximum coloring power is developed.

Colors—The following ten colors are standard:

No. 1151 Red	No. 19 Light Buff
No. 115 Red	No. 220 Single Strength Black
No. 1184 Brown	No. 222 Double Strength Black
No. 17 Dark Buff	No. 1174 Double Strength Chocolate
No. 18 Dark Buff	No. 257 Lime Proof Green

For special work we can supply special colors of any shade desired. Also some very good tints can be obtained by mixing the regular colors. Grays are obtained by using black sparingly, etc.

Sold in Dry Form—It is our experience that colors in the dry form are least expensive to the user and show the greatest coloring power per unit of weight.

Specifications for Anchor Brand Mortar Colors

The following paragraphs are to be inserted in the Brick Masonry specifications:

Mortar Color—Mortar color shall be Anchor Brand Mortar Color, manufactured by C. K. WILLIAMS & Co., Easton, Pa., and delivered to the site in the original packages.

Cement Mortar—All mortar for face brick work in (state part of work) shall be accurately mixed to the formula: 188 lbs. (2 cu. ft.) sand, 94 lbs. (1 bag) cement, 9½ lbs. hydrated lime, with the proper amount of Anchor Brand Mortar Color.

The exact quantity of color to be used will be decided by the architect after the construction of test panels.

Mixing—Dry color, sand, hydrated lime and cement shall be thoroughly mixed before water is added. After the water is added, mixing shall continue until the mass is absolutely free from spots or streaks of color. Mortar shall be mixed as stiff as is practicable, and batches shall be kept as nearly as possible at the same consistency throughout the job. The same proportions of ingredients shall be accurately maintained in all the batches. The kinds of lime, sand, cement and color shall not be changed after the work has begun. *See Notes (1) and (2).*

Test Panel—Test or sample panels as required by the architect shall be constructed in the same manner and of the same thickness as the finished wall. Face brick for test panel shall be laid in mortar mixed according to the formula and directions given above. After test panels are thoroughly dry, the architect will decide whether the color of the mortar is satisfactory, or whether the amount of mortar color in the formula should be increased or reduced. *See Notes (3) and (4).*

Cleaning and Pointing—When plasterer has left building, all surface brick and mortar shall be thoroughly cleaned down by applying a solution containing not more than 1 part of muriatic acid to 20 parts of water, using a stiff wire brush. Surface shall then be rinsed with clean water. All defective joints shall be pointed up at this time. *See Notes (5) and (6).*

Notes to Specifications

(1) **Lump Lime**—If lump lime is used in place of hydrated lime, it must be thoroughly slaked and allowed to cool at least 24 hours before being brought in contact with mortar colors. *Hot lime bleaches color.*

(2) **Accurate Mixing Necessary**—Lime is a strong pigment; sand and cement also have an important effect on color. It is important to measure accurately and maintain same proportions throughout the work.

(3) **Omission of Test Panel**—For smaller jobs where cost is an important consideration, the test panel may be omitted. In this case, a little of the mixed mortar may be taken from the first batch and pressed into a small cake. When this cake is dry, it can be determined whether the color of the mortar will be satisfactory.

(4) **Pigments Differ in Strength**—For this reason, a specific formula is given for the use of every mortar color.

(5) **Raking Joints**—Defer raking till mortar has begun to set.

(6) **Prevention of Efflorescence**—If mortar is mixed stiff and raking of joints deferred till mortar has begun to set, efflorescence will rarely be found. Efflorescence is in no way caused by Anchor Brand Mortar Color. It is due to the occurrence of soluble salts in cement, sand, lime, water or the brick, and is just as common in plain mortar as in colored mortar, though not so easily visible.

Special Facilities of C. K. Williams & Co.

C. K. WILLIAMS & Co. has a highly specialized organization, and a plant equipment which consists of a group of mines and a color plant located in Spain, where it produces its own Spanish Oxides. Other plants are located in different parts of the United States, as near as possible to the sources of supply of raw materials. Production of colors of maximum quality and uniformity has been the Company policy for nearly fifty years.

HENRY MAURER & SON

Manufacturers of Refractory Clay Products

TELEPHONE
ASHLAND 1510

420 East 23rd Street
NEW YORK, N. Y.

PLANT, MAURER, N. J.

Products

FIRE BRICK for high pressure boiler settings to meet the modern engineering demand for intensive power plant operation, and for the various general types of industrial furnaces, including both a complete line of 9-in. standard shapes and sizes and special shapes and intricate designs to order. A special department is maintained for the production of all items of an intricate nature.

Also Fire Clay for laying up brick and for foundry use.

For Terra Cotta Hollow Tile Block, see page A366.

Facilities and Experience

Plant—Our plant is located at Maurer, New Jersey, on tidewater in New York Harbor and on two railroads (Central R. R. of New Jersey and Lehigh Valley R. R.) with all facilities for shipment by boat and rail. Motor truck deliveries direct from factory to destination can be made when expedient.

A Clay Mine of Henry Maurer & Son

Clay Resources—All Henry Maurer Fire Brick are manufactured from the highest refractory New Jersey fire clay obtained from our own extensive clay mines.

Mines located in the famed Woodbridge district, nearby the plant.

Seventy Years' Experience—HENRY MAURER & SON have been manufacturing refractory and other clay products for more than seventy years.

Substantial and superior workmanship is typical of all Henry Maurer products.

Maurer Fire Brick

All brands of Henry Maurer Fire Brick are made with the same exacting care, to insure uniform brick, true to size and shape, with sharp edges, so that they can be laid with minimum thickness of joints. The following principal brands have been developed:

Henry Maurer

No. 1 AA—For furnaces fired by fuel oil. Contains our most suitable clays prepared and combined to meet the conditions incidental to the use of liquid fuels.

Henry Maurer

No. 1 A—For high pressure boiler settings operated by stokers or powdered coal systems. Has great strength to resist compression and load stress in carrying the weight of the higher furnace walls. The rugged texture retards the abrasive action of fuel and slag.

Henry Maurer

No. 1—The original brand of Maurer fire brick. Recommended for use in hand-fired boilers and for various types of industrial furnaces. This brand has been used in mechanically stoked furnaces with complete satisfaction.

Henry Maurer

Royal No. 1—A fire brick for moderate heat duty. Of first class workmanship; uniform in size and shape.

THE ALABAMA MARBLE COMPANY

Producers of All Grades of Alabama Marble and Manufacturers and Contractors for Interior Marble Work in Any Kind of Marble

MAIN OFFICE AND PLANT
GANTT'S QUARRY, ALA.

SALES DEPARTMENT: 1701 Avenue A, BIRMINGHAM, ALA., and 303 Railway Exchange Building, CHICAGO, ILL.
Inquiries should be addressed to Sales Departments

Alabama Marble

The white marble deposit which runs northeast and southwest through Talladega County, Alabama, is, like all such deposits, variable in thickness and quality.

At Gantt's Quarry, where the quarries of THE ALABAMA MARBLE COMPANY are located, the merchantable marble in the deposit attains an uninterrupted thickness of 120 ft., measured at right angles to the beds, and is of high average grade. It is a remarkable and probably a unique feature of these particular quarries, that fully 75% of the entire output from top to bottom of the deposit falls into one well defined grade. For a fine grained saccharoidal white marble, such as these quarries produce, this is very unusual. The grade referred to is Alabama Cream A (A.C.A.)

Alabama Cream A (A.C.A.)

We believe we may fairly claim this grade to be a *standard* among interior white marbles available at this time. It is fine grained, has a warm, creamy background with light to moderate clouding; carves and polishes perfectly; is impervious and non-staining, strong, elastic and hard, and extremely durable under all ordinary exposures, either interior or exterior. It is available in slabs and pieces of any size likely to be required, and in quantities sufficient for any job, however large. The great amount of marble on THE ALABAMA MARBLE COMPANY's properties, and the extensive development of their quarries insure both the *adequacy and permanence* of the supply. Moreover, THE ALABAMA MARBLE COMPANY has a record extending back many years and cover-

ing the delivery of millions of feet of marble for hundreds of buildings *without having been the cause of delay on any one of them.*

Alabama Cream Blanc P (A.C.B.P.)—Creamy white, free of any but the merest suggestion of clouding and veining. Practically a statuary marble. It is separated from other grades by sawing. It is difficult to secure in large slabs, and in thicknesses greater than twelve inches. The supply is not unlimited but is available in sufficient quantity for pilasters, bases, caps and stiles. Also for rails in large decorative schemes where a framework of white marble of the very highest grade is desired for luxurious bathrooms, lavatory slabs, memorial tablets, etc.

Alabama Clouded Cream (A.C.C.)—This grade differs from Alabama Cream A (A.C.A.) in the greater amount and intensity of the clouding. In A.C.A. the dominant feature is the creamy white background; in A.C.C. the clouding is co-ordinate in importance with the background. A.C.C. is available for large jobs, though the supply is less abundant than in the case of A.C.A.

Alabama Cream Veined A (A.C.V.A.)—Fine grained creamy white background, with many pencil-like veins of grayish color. It matches perfectly, is highly decorative, yet restrained and dignified in its general effect. It is available in any reasonable amount—there need be no fear of not getting it.

Alabama Pocahontas (A.P.)—Somewhat similar in veining to A.C.V.A. but the veins may be heavier; they are greenish or blackish and bordered by orange or

One of the Quarries of The Alabama Marble Company

pink clouding. A very decorative marble—quite different from any other. Available in moderate quantities. An excellent material for unique decorative effect in jobs of moderate size. Highly effective when used in panels framed in white—such as A.C.B.P.

Alabama Ivory Pavonazza (A.I.P.)—The most richly colored and marked of any Alabama Marble so far produced. The ground tone is of a creamy ivory white, with veins varying from black to greenish black and clouding of yellow, orange and pink. It matches perfectly and is an extremely rich decorative material, especially when framed in with A.C.B.P. It is available only in moderate quantities, and its occurrence in the deposit is rather erratic. When available it is a beautiful and unique material. It is one material that can not be overdone by too general use.

Alabama Terrazzo

THE ALABAMA MARBLE COMPANY is also the largest producer in the country of pure white marble terrazzo. Alabama Terrazzo is unexcelled in all the qualities which make such material desirable. The capacity of THE ALABAMA MARBLE COMPANY's terrazzo plant is 200 tons per day and there is always a large reserve of material, both crushed and ready to crush, so that prompt shipments are always possible.

General Characteristics of Alabama Marble

All of the grades of Alabama Marble are alike in their perfect crystallization, fine grained texture, warmth of tone in the background and in their working qualities. The three last named grades, like similar marbles from other places, require a little waxing and occasional liners.

If you specify any of these marbles by the name of the grade, as established by THE ALABAMA MARBLE COMPANY, you can be sure that the material you have in mind is available and can be obtained—each grade at a fair price; but in specifying a grade, use a *completed*

job as a standard, not a small sample. No small sample can ever correctly represent a grade of marble to the extent of giving an accurate idea of what it will be like in a completed job. A completed job, in any of our marbles, can always be duplicated to your satisfaction.

CARTHAGE MARBLE CORPORATION

Producers of Ozark Gray Marble, Veined and Veinless

QUARRIES AND MILLS

CARTHAGE, MO.

Product

OZARK GRAY MARBLE:

Sawed, Planed, Turned and Cut for polished interior and exterior work.

Facilities

The CARTHAGE MARBLE CORPORATION owns eight plants and quarries which include 55 gang saws, 25 polishing machines, 15 rubbing beds, 8 diamond saws, 12 planers, 11 traveling cranes, 30 channelers and 20 derricks.

Ozark Gray Marble can be furnished by marble or stone dealers anywhere in the United States or Canada.

Color and Texture

Veined Interior—A true gray with veins varying in color sufficiently to give life and beauty to the marble.

Veinless Interior—A soft gray, fine grained, monotone marble with a tinge of buff. Uniform in color, but with enough variation to be interesting.

Ozark Marbles, either veined or veinless, can be used economically wherever it is practical to use marble, and their neutral tones blend readily with any color scheme.

Exterior—White with a tinge of gray. Because of its wearing and non-stain qualities, its use is especially recommended for steps, base course, trim or entire building. Fabricated price for the exterior is, we believe, lower than for any other marble, and only slightly higher than for ordinary limestones.

Finish—On exterior work, sand rubbed finish shows up to best advantage on ordinary work, but where a special finish is wanted, rock face, bush-hammer or tooled may be used. It is susceptible to all finishes of any natural stone or marble, but polished finish is recommended for interior finish only.

Veining—Attention is called to the fact that this Company cannot agree to furnish Carthage Marble free from veins, which are characteristic of all marbles.

Analysis

Chemical analysis shows that Ozark Gray Marble contains nothing which can in any way discolor it. It is 99% calcium carbonate and is free from iron.

Non-absorbent

The ratio of absorption of this marble is 45/100 of 1%. Such a quality is of great importance in both exterior and interior work, for stains that cannot penetrate the marble can be easily removed from the face, a feature of great value in sanitary work.

Strength

The strength of Ozark Gray Marble is such that it stands all tests subjected through various kinds of work. Its crushing strength is about 18,000 lb. per sq. in., which is considerably more than is required in any building work.

Short Specifications

Exterior Work—All cut stone to be of properly selected Carthage building stock, as furnished by the CARTHAGE MARBLE CORPORATION, Carthage, Mo. Veining averaging $\frac{1}{4}$ in. or less, if tight and sound, is permissible anywhere in the face of the marble.

All steps, door and window sills, coping and projecting courses shall be cut to lay on the natural bed. Base, belt courses, ashlar, lintels, etc., shall be set on edge. On marble set on edge, veining shall not intercept the face but clouded faces are permissible.

Interior Work—Marble to be Ozark Gray as furnished by the CARTHAGE MARBLE CORPORATION, Carthage, Mo., sawed with the grain to show clear faces, or sawed across the grain to show veining.

Samples

We will be pleased to furnish either interior or exterior samples on request.

References

We will gladly furnish, on application, a list of buildings in your locality in which Ozark Gray Marble has been used, as reference.

APPALACHIAN MARBLE CO., INC.

Quarriers and Manufacturers of Appalachian Tennessee Marble
Manufacturers of Foreign and Domestic Marble

KNOXVILLE, TENN.

APPALACHIAN TENNESSEE MARBLE, especially for interior use, including Appalachian Golden Vein, Appalachian Champion Pink, Appalachian Roseal, Appalachian Special Silver Gray, Appalachian Dark Choco-

late, Bond Pink, Bond Tavernelle and other Appalachian colors.

Foreign and Domestic Marble.

Floor Tile, Ashlar, Rubble Marble, Tennessee Granito.

Bond Pink

A sturdy marble, that may be used in any type of building and for any part of the design. It is remarkably uniform in color and veining, more so, in fact, than any domestic marble, and is rapidly gaining favor as the most popular pink marble on the market. The supply is unlimited, and on account of the tremendous quarry volume, can be priced very low.

Quarry

The quarry holdings of the APPALACHIAN MARBLE Co., INC., are so great that its marble actually in sight will not be exhausted within a century. The quarry equipment is adequate and of the most modern type.

Reserve Supply

The APPALACHIAN MARBLE Co., INC., stores its own production to create a reserve supply. Every bit of marble waste is utilized and sold.

Interior Marble Treatments,
Chicago Union Station, Chicago, Ill.
(Left)

Interior Marble Treatments,
Morton Building, Chicago, Ill.
(Right)

Appalachian Golden Vein

The aristocrat of the field, a marble expressing a cool quiet monumental dignity not found in any other material. Has been selected for special interior treatments by the most fastidious architects and owners in the country. This marble is an exclusive Appalachian product available in reasonable quantities, but lower price than marble of like quality.

Mill

The mill has a yearly handling capacity of 200,000 cubic feet, or a daily capacity of three carloads of finished marble. Use of hydro-electric power further lessens production cost.

Shipping Facilities

The fifteen-acre mill property of the APPALACHIAN MARBLE CO., INC., has one-half mile of railroad tracks with continuous loading points to facilitate rapid loading of all shipments.

Quality

Appalachian Marbles are non-absorbing, long wearing, strong and easily workable.

	Average
Co-efficient of absorption.....	.047
Tensile strength (transverse to bed).....	1,554 lbs. per sq. in.
Tensile strength (with bed).....	1,551 lbs. per sq. in.
Transverse strength (modulus of rupture).....	2,686 lbs. per sq. in.
Compressive strength.....	18,274 lbs. per sq. in.

These tests made by U. S. Bureau of Standards and reported by T. Nelson Dale, Retired Geologist, U. S. Geological Survey.

Standard Thickness

Appalachian Marble is cut in standard thicknesses. They are (after honing and polishing): $\frac{7}{8}$, $1\frac{1}{4}$, $1\frac{1}{2}$ and 2 inches. Other thicknesses on order.

Floor Tile

Appalachian Tennessee Floor Tile comes in 8x16, 10x20 inches, and 12 inches square standard sizes. It can also be obtained in any special sizes the architect may desire for exactly carrying out his own ideas. It can be had in a wide variety of beautiful colorings.

Appalachian floors are low in initial cost, low in maintenance cost and last the life of the building. They are easy and economical to keep clean, materially reduce the dust nuisance and make for better health. They subdue traffic noise and afford a safe, comfortable walking surface.

8x16 and 10x20-inch tile is always on hand, and shipment can be made on receipt of order.

(Above)

Appalachian Roseal

An exclusive Appalachian marble, of rich mottled coloring, suitable for out-of-the-ordinary treatment for interior, superior to imported marble on account of higher quality, and equal beauty, at a considerable lower price, available in unlimited quantities

Ashlar

Appalachian Marble tile for ashlar, either hone or polish finish, can be furnished in our standard tile sizes at prices which make marble ashlar available for the comparatively moderately priced home as well as for more pretentious structures. This is because it is one of our by-products.

Crushed Tennessee Marble

Beautiful, bright Pink Tennessee Marble suitable for stucco work. For color see (cut No. 1) Bond Pink Marble.

Tennessee Granito

Sizes No. 1, 2 and 3 for terrazzo floors. Crushed from Bond Pink Marble, making a dark, bright Pink Tennessee Granito.

Tennessee Rubble Marble

This company is in a position to ship large quantities of one man's size stone for prompt delivery.

Price

Because of quantity production Appalachian Marbles, although as beautiful as most fine foreign marble and superior in quality to the best of them, are a great deal cheaper in price than imported marbles, as well as like quality domestic marbles.

Installation

Appalachian Marble has been manufactured exclusively by us for sixteen years. More than \$1,000,000.00 of it is sold annually in England, Canada, Latin America and every state of the Union.

Many of the most noted public and office buildings, churches, schools, theaters, hospitals, stores, banks, etc., have interiors, including floors and ashlar work of Appalachian Marble.

Foreign Marble

Our established connections with the leading foreign quarries enable us to manufacture practically any desired foreign marble at a substantial cost saving.

Appalachian Marble Company Mill

Prompt Shipments, Low Rates

Huge production facilities and entire absence of labor troubles insure quick deliveries. Freight rates on marble from the Appalachian mill are estimated at commodity rates to all points in U. S. and Canada.

Samples

Polished samples, showing the beauty of the Appalachian Marbles, will be sent to any interested architect or contractor, upon request.

Cost Estimates and Co-operative Service

The Service Department of the Appalachian Marble Co., Inc., welcomes the opportunity to co-operate with the architect. This co-operation reaches its highest state of efficiency when architects furnish the Appalachian Service Department with blue prints of the projects upon which they are working. The Service Department is then in a position to carefully estimate on work and offer all possible co-operation.

All Marble from One Source

Though a project may contemplate the use of foreign marble in addition to Appalachian Tennessee and other domestic marble, the complete cost estimate may be obtained from the Appalachian Service Department. Obtaining all marble from one source is not only a convenience but has definite shipping and price advantages.

Marble Working Drawings

Complete marble working drawings are made up by our drafting department to be used in submitting to the architects for approval as to jointing and for the securing of accurate Building Measurements.

Catalogue

A copy of the elaborate Appalachian loose leaf catalogue, illustrated in full colors, will be gladly furnished to architects and others interested in interior marble.

CLARENDON MARBLE COMPANY

Producers of Vermont Marble

WEST RUTLAND, VT.

Product

Producers and manufacturers of EXTERIOR and INTERIOR MARBLE in blocks, sawed and finished.

Facilities

A fully equipped quarry, sawmill and finishing plant are maintained at West Rutland, Vermont, which furnish exterior and interior marble for banks, schools, churches, public buildings and residences.

A large supply of quarry blocks is on hand at all times so as to insure prompt deliveries of work of any nature.

Service to Architects

We are prepared to furnish samples of any type of Clarendon marble upon request. We are always pleased to advise the architect as to grades, colors, finishing, or any other items which may assist him in the execution of his design.

Physical Properties of Marble

Vermont marble has an ultimate crushing strength of about 14,000 lb. per sq. in. and absorbs about one-tenth of one per cent by weight when immersed in water.

These figures were obtained from tests made by the United States Bureau of Standards.

Varieties

Exterior—Clarendon Light—A very hard and durable marble which cuts and carves freely. It is non-absorbing and does not disintegrate. The color is very light with a moderate clouding.

Clarendon Dark Vein—This grade in-so-far as durability is concerned has the same qualities as Clarendon Light. It is a veined marble running somewhat darker in color, but it cuts and carves very freely.

Interior—A number of varieties, including light variegated, light clouded, dark clouded with white background, dark veined with white background, green veined with white background, green veined cream, cream with golden vein, and blue.

THE GEORGIA MARBLE COMPANY

TATE, GA.

BRANCH OFFICES

ATLANTA, GA., 511 Bona Allen Building

NEW YORK, N. Y., 1328 Broadway—Telephone, Wisconsin 6574

CHICAGO, ILL., 456 Monadnock Block

Products

GEORGIA MARBLE for exterior and interior building and monumental work.

Rough quarry blocks, sawed stock or finished work in the following marbles produced by us: "WHITE," "LIGHT CHEROKEE," "SILVER GRAY," "MEZZOTINT," "CREOLE," and "PINK."

Durability

Georgia marble, owing to its dense, flawless, crystalline formation and non-absorbing qualities, does not disintegrate. It will stand the test of time, as proved by use in many fine buildings and memorials.

Colors

"White"—This company operates four quarries of white marble ranging from almost pure white to white with more or less dark marking, known as "White Georgia" and "Kennesaw."

"Light Cherokee"—A very light gray with clouding and veins running in waves well distributed.

"Silver Gray"—A uniform pearl gray, practically free from marking.

"Mezzotint"—Gray background with rather heavy dark marking occurring in waves, between "Silver Gray" and "Creole."

"Creole"—Heavily veined and having white background with black and bluish black veining and figures.

"Pink"—Ranges from a very light salmon to a deep old rose with very warm tints.

Physical Properties of Georgia Marble

Crushing Strength—Tests by the Ordnance Department, United States Army, show crushing strength to be from 11,000 to 16,000 lbs. per sq. in.

Analysis—Made at Worcester Polytechnic Institute:

Carbonate of Calcium.....98.96%

Carbonate of Magnesium.....0.13%

Alumina0.22%

Silica0.61%

Loss0.08%

Weight—The specific gravity at 60° Fahr. is 2.7178, equaling a weight of 169.5 lbs. per cu. ft.

Absorption—A 2-in. cube was dried at 220° Fahr. till its weight was constant; it was then placed in water at 60° Fahr. for 24 hours, and reweighed. It was found to have absorbed only 0.028% of moisture.

Statuary

The "White" and "Silver Gray" Georgia marble are unexcelled for sculpture work exposed to the weather. The marble is unaffected by the most severe weather. Large sizes can readily be obtained.

Columns and Monoliths

Special attention is given to the production of long columns in one piece. The company has furnished monoliths 30 ft. long by 4 ft. diameter.

Facilities

Facilities for production and finishing are unexcelled. Eight quarries are operated, which will easily produce 1,000,000 cu. ft. per annum. The equipment of the four plants consists of upwards of 100 gang saws, 22 rubbing beds, planers, lathes, diamond saws, carborundum machines, etc.; and with an unlimited supply of marble any size order can be accurately and promptly filled.

THE STANDARD MARBLE WORKS CO.

Manufacturers of Foreign and Domestic Marble

TELEPHONE
WEST 2705

CINCINNATI, OHIO

Products

Any MARBLE manufactured for interior and exterior of buildings; MARBLE ALTARS; FURNITURE MARBLE, etc.

Also Soapstone and Slate for all purposes.

Facilities

We have a complete sawing and finishing mill and are prepared to execute work promptly from our large stocks of sawn and block marble, which are always on hand.

Orders for blocks, full sized slabs and custom sawing solicited.

Service

We contract for marble installed anywhere, or finished f.o.b. Cincinnati.

Installations

We can refer to many large jobs, located in practically every state.

Estimates

Estimates will be submitted upon definite plans and specifications, or complete lists.

Marble Classifications

To convey a knowledge of the characteristics of the various marbles, we have allotted each kind to one of four groups, viz:

Group A—A marble obtained in fair size regular blocks and sold as sound marble.

Group B—A marble obtained in medium size or irregular blocks and sold as sound marble.

Group C—A marble which has a minimum amount of natural faults that are treated in an approved manner and sold as semisound marble.

Group D—A marble generally obtained in irregular shaped blocks, including most all highly colored decorative marbles, having natural faults which are treated by approved methods and are sold with this understanding.

Standard Thickness for Wainscot

Marble is sawn in thickness to finish approximately $\frac{7}{8}$, $1\frac{1}{4}$, $1\frac{1}{2}$ and 2 in.

Other thicknesses to order.

Standard Size Floor Tile

8x16-in. and 10x20-in. tile carried in stock in $\frac{7}{8}$ -in. thickness only.

Other size tile and pattern floor to order.

List of Marbles

The following, while only a partial list of the marbles and kindred products we carry in stock, gives suitable variations to complete any marble installation:

Facilities

The company has large sawing mills and finishing plants in Vermont; also finishing plants in Philadelphia, Cleveland, Chicago, Dallas, San Francisco and Tacoma. At the last-named plant is the storage yard for the Alaska marble, which can be shipped from there in rough or finished state. Alaska marble can also be supplied from any of the other plants.

Varieties

Exterior—Mountain White Danby, Imperial Danby, Highland Danby, Corona, Eureka and Pearl Gray Vermont.

Interior—*Vermont Marble*—Over 40 varieties, including white, lightly clouded and veined; gray, light green and dark green; red and black.

Alaska Marble—Several different kinds, the predominating color being pearl white veined with gray or black.

Physical Properties of Marble

Tests made by the United States Bureau of Standards show Vermont marble to have an ultimate crushing strength varying from 11,000 to 16,000 lb. per sq. in.

Tests made by the United States Bureau of Standards show that Danby Vermont marble, a variety much used for exterior purposes, absorbs about one-tenth of one per cent by weight when immersed in water.

Suggested Specifications for Exterior Marble

Material—All cut stone work shall be (insert name of variety of marble wanted).

Quality—All marble entering into the construction of the work shall be selected for uniform color. It must be free from cracks, chips, stains, or other defects upon exposed surfaces.

Samples—Before proceeding with the work the contractor shall submit a sample 4x8x2 in. of the marble he proposes to use. One face of this sample shall have (specify what finish is desired).

Joints—All marble shall be cut for $\frac{3}{16}$ -in. joints.

Finish—All exposed surfaces of marble work shall have (specify desired finish).

Drawings—Detailed drawings will be furnished by the architect for all work requiring them. The contractor shall make and submit for the architect's approval, shop drawings showing in plan and elevation the dimensions of all stones, position of joints, and the spacing of dentils or other repeated ornament.

Cutting—All cutting must be done in a workmanlike manner and in accordance with the shop drawings referred to. All faces shall be free from winds, so as to present a true and even surface. Joints shall be at right angles to the face. Intersecting profiles shall be accurately cut. Re-entering angles of mouldings shall be cut from the solid, unless otherwise shown by the drawings. The contractor shall, where called for by the architect's drawings, cut the marble work to accommodate steel, flashings, leaders or other structural materials.

Delivery—All marble shall be crated or otherwise protected so as to be delivered at site in good condition.

Storage—All marble stored at the site shall be on cleats, off the ground, and protected where necessary from any stains from above.

Setting—Marble shall be set with a derrick and in full bed of mortar. The mortar-bed shall be kept back at least 1 in. from the face of the stones.

Mortar—Mortar for setting marble shall be composed of 1 part white non-staining portland cement, 3 parts clean, sharp sand and a quantity of hydrated lime equal to 10% of the volume of cement.

Public Library, Detroit, Mich., Built of Vermont Imperial Danby Marble
CASS GILBERT, Architect

Protection—During construction, all sills, moulding, or other work liable to injury shall be suitably protected by boards which shall not be removed until the cleaning and pointing is done.

Anchors—Anchors to be of wrought iron, heavily galvanized or painted 2 coats with an approved brand of dampproofing paint and allowed to dry before using. For each stone 2 ft. long one anchor shall be used, and for each stone over 2 ft. long, at least two anchors. Provide suitable clamps at corners and such special anchors as the architect may direct. Balusters shall be doweled top and bottom with brass, copper, zinc or some other non-staining metal.

Pointing and Cleaning—All exposed surfaces of the building shall, on completion, and when directed by the architect, be cleaned with clean water only and fiber brushes. All joints shall be raked out, 1 in. back from the face, and carefully pointed with a mixture of 1 part white non-staining portland cement and 2 parts clean white sand. Joints shall be ruled with a tool of approved shape.

Vermont Interior Marble Service

We contract either for interior marble work installed or to finish and furnish it to local interior marble dealers, following whichever method will give best service to architects, contractors and owners.

Suggested Specifications for Interior Marble

Material—All interior marble shall be as follows: All toilet marble, Vermont Venoso; all corridor marble, Vermont Brocadillo. (Always insert the name of the desired grade, avoiding the too general term "Vermont Marble.")

Quality—All interior marble shall be of good quality, free from stains. Patching will be permitted only where the natural imperfections of a particular stone are subject to correction by the established usage of the industry.

Samples—Before proceeding with the work the contractor shall submit to the architect samples of all the marble specified above, 1 ft. square and $\frac{7}{8}$ in. thick.

Finish—All floors and stair treads shall have a fine sand finish. All standing marble shall be highly polished.

Drawings—Detailed drawings will be furnished by the architect for all work requiring them. The contractor shall make and submit for the architect's ap-

proval, shop drawings showing proposed jointing.

Measurements—Before proceeding to finish the interior work the contractor shall verify all measurements at the building.

Cutting—The marble contractor shall do such necessary cutting and fitting to accommodate his work to other trades as is sanctioned by common usage in the trade.

Setting—All floor marble shall be set in a cement mortar of 1 part cement and 3 parts sand, adding a quantity of hydrated lime, not exceeding 10% of the volume of cement. The concrete fill must be swept and thoroughly sprinkled before setting is started. All stair treads and all standing marble shall be set in plaster of paris. All wall marble shall be securely anchored with brass, copper or aluminum wire.

When work is completed all marble shall be cleaned and left in good condition.

Classes of Work Supplied

Wainscot and interior decorative treatment generally: floor tile, stair treads, bank screens, counter tops, soda counters, electric switchboards, scale tops, lamp bases, and many other purposes.

Adaptability

Innumerable are the ways in which Vermont marble may be applied to building construction. Nor is it merely a beautiful product. It is thoroughly sanitary as well as fireproof, though it may be readily cleaned. It needs no refinishing. Although initial cost of marble may be slightly in excess of certain other materials, in the end it is no more expensive.

Marble Exhibit in New York City

There is an exhibit of large-sized samples of our marbles at our New York office in the Architects' Building, 101 Park Avenue, to which architects, engineers, contractors and owners are cordially invited.

"The Book of Vermont Marble"

A brief compendium of our products and the best ways to use them; our facilities; a number of drawings and details showing most approved methods of construction in exterior and interior marble work, etc. Contains 65 pages, of standard architect's size. Furnished without charge to any architect upon request.

MILL: BLOOMINGTON, IND.

Products

Selected, Standard and Rustic Grades of Buff, Gray and Variegated INDIANA LIMESTONE in the Rough Block, Sawed, Planed, Turned or Cut ready to set in the wall, supplied from any of the well-known quarries in the district.

Facilities

Our mill, located in the heart of the Indiana Limestone district, modernly equipped with electrically operated machinery of the latest approved type, offers

**INDIANA
LIMESTONE**
The NATION'S BUILDING STONE
TRADE-MARK

excellent facilities for the prompt and efficient execution of contracts of any size.

Description

For complete description of the colors and grades of Indiana Limestone, refer to pages of the Indiana Limestone Quarrymen's Association.

Quality

The policy of this company is to see that no work leaves its mill not thoroughly executed in a workmanlike manner, and that the grade of stone is in accordance with the specifications and equal to approved sample submitted.

Samples

To interested parties and prospective buyers will be sent, express prepaid, on request, samples of ordinary size to any part of the United States or Canada.

Estimates

Requests for quotations on stone work are solicited and will be given prompt attention.

Co-operative Service

This company has an organization composed of men thoroughly experienced in their respective lines, and will gladly give information or render service to the architect, owner, and general contractor when called on. Prompt and satisfactory attention will be given to all inquiries and attractive quotations made at all times.

References

This company has executed the stone work for some of the prominent buildings of the country, and points with satisfaction and pride to its references. Some recently completed contracts follow:

100 YEARS OF SERVICE

ST. PAUL STONE QUARRIES CO.

Pioneer Quarriers and Manufacturers

OFFICES, QUARRIES AND MILLS

ST. PAUL, IND.

Product

ST. PAUL STONE, a non-absorbent, non-staining limestone which affords the architect a splendid stone for Base Courses, Steps, Platforms, Door Sills, etc., equal to granite in appearance and durability and at *considerable less cost*.

St. Paul Stone

The merit of St. Paul Stone for these purposes has been established. Light bluish gray in color, it harmonizes admirably with the Indiana limestones, sandstones, terra cotta, etc., that may be used in the superstructure.

Facilities

An increasing demand for St. Paul Stone has warranted this company installing modern machinery, so that today we are in position to promptly supply this stone cut, ready to set. It may be specified with the assurance that the cut stone contractor (who is neither equipped nor accustomed to working such a hard stone) can obtain promptly from this company the St. Paul Stone cut and ready to set in the building.

Uses

St. Paul Stone is available for any stone need in the architectural or landscape fields. Where a permanent, clean exterior and absolutely dry interior are required for a structure, we ask your consideration of our product.

Quality

Close grain, with resulting non-absorbent qualities, prove St. Paul Stone practically voidless. Its toughness and resistance to wear are

Christ Church, Indianapolis, Ind.

Hand hewn St. Paul Stone set on edge. Rough quarry bed exposed to weather. 70 years in the heart of city shows this stone mellow and clean. As a contrasting stone result note the "Van Camp" Residence on Meriden Street where the stone is laid on its natural bed

A Modern Example

Dressed St. Paul Stone trim, with field of rock face set on its actual bed

OUR HOBBY—BASE COURSES, STEPS, ETC.

remarkable; it therefor should not be confused with other so called "hard limestones" that are but slightly different from standard oolitic limestones.

Facts

Specific gravity 2.67; net weight 170 lb. per cu. ft.; strength about 22,000 lb. per sq. in.

Specification Data

Portland cement (a real non-staining test) does not stain St. Paul Stone. Moisture does not penetrate face of stone. The use of non-staining cement and waterproofing when setting is not required. You need only to protect stone from rough handling during construction.

For ashlar, base courses, etc., stone should be set on edge. For steps, door and window sills, coping and projecting courses, stone should be set on its natural bed.

Carborundum and sand rubbed or planer and smooth sawn finishes recommended. Pleasing results can be obtained under any specification finish, all of which are applicable to St. Paul Stone. Where desired bush hammered treads with smooth risers add charm. On interior stone floors, etc., polishing with terrazzo polisher produces a unique and beautiful floor.

Cleaning should be done by the use of water and silica sand, rubbing with a stiff fiber brush. A piece of 40KG4 carborundum stone or wire brush will remove any accidental spotting. St. Paul Stone may be cleaned by these methods regardless of the years in place.

Service

No requirement is too small to receive careful attention; no demand is too large for our facilities.

Product

INDIANA LIMESTONE
(which is often called "Bedford Stone").

Gray (or Blue), Buff and Variegated (or mixed); also certain other varieties, including "Old Gothic"—a grade showing interesting texture and color-tone variations; also the rough Sawed-four-side Indiana Limestone of Short-length stock for Random Ashlar, range work and other informal types of Ashlar Facing for moderate cost buildings.

See complete listing of classifications under the present system of grading the product on following pages.

Indiana Limestone

Indiana Limestone is a *natural stone*, not a manufactured product. It is a fine even-textured non-crystalline limestone of beautiful soft color-tone, ranging in the various grades from a somewhat grayish buff, on through silver gray to a medium-toned gray of slightly

bluish cast. The massive deposit forming the ledges in the hills of Southern Indiana, from which this fine,

easily worked, yet durable and permanent stone is quarried, constitutes one of the most wonderful and probably the most useful, of building stone deposits in the world. An interesting booklet, Volume 1 of the Indiana Limestone Library, which describes the stone and its structural qualities, will be sent free upon postal request.

Cost

The cost of this stone compared with substitute products is always such as to make it economically available for use in all classes of buildings—especially store fronts and small commercial buildings, schools and institutional work—as well as for larger and more monumental work for which a natural stone is always used.

The rough sawed strip stone makes it in every way suitable for use in decidedly moderate cost houses.

Ledge at the Indiana Limestone Company's Dark Hollow Quarry

The largest single ledge in operation in the Limestone district, measuring 1400 ft. long, 140 ft. wide and 60 ft. deep. This will cube 11,760,000 ft., approximately 20,000 large car loads of Indiana Limestone.

The New Company's Facilities

Indiana Limestone is found only in two counties of the state of Indiana (Lawrence and Monroe).

The INDIANA LIMESTONE COMPANY owns, approximately, 6,600 acres of land, of which over 1,600 acres are proven stone land available for immediate quarry development.

Engineers estimate that at the present rate of production and shipment, there is sufficient stone in these proven areas for seventy years' operation.

INDIANA LIMESTONE COMPANY has a quarrying capacity of 16,000,000 cu. ft. per year, a sawed stone capacity of 6,000,000 cu. ft., and a cut stone capacity of 3,000,000 cu. ft. per year.

Millions of dollars are invested in machinery, equipment, buildings, and a network of railway tracks.

The entire production operation is handled with precision and efficiency, more like large-scale manufacturing than quarrying, as quarrying is ordinarily carried on. This enables the industry to give rapid delivery and most satisfactory service, regardless of the quantity of material required, or the size or number of contract operations.

The merging of these vast limestone interests into one well-financed and properly managed organization is in line with the whole trend of modern large-scale business, the object of which is to secure the benefits of quantity production and the efficiency that goes with this method. More effective co-operation with the architectural and building professions, and the production of Indiana Limestone at a price that would make it more attractive to the public, were the principal ideas behind the consolidation.

Practically all of the long established and proved quarries from which this dependable stone has been produced for generations are owned by this company.

Transportation Facilities

Owing to the fortunate central location of quarries and unsurpassed railroad facilities, Indiana Limestone can be transported to all points in the United States and Canada with exceptional promptness and at minimum cost.

Distribution of Stocks

Good sized stocks of Indiana Limestone are carried by cut stone contractors in nearly all the principal cities of United States and Canada.

It is a standard product available in quantity for prompt deliveries at all times.

Architects Service Bureau

Architects and builders are cordially requested to make free use of the Architects Service Bureau of the company as a source of reliable information regarding its product, its most effective and economical use and for assistance on any problems pertaining to structural design and use of Indiana Limestone in building construction.

The activities of this Technical Department are chiefly educational, comprising investigation and research work, publicity, technical service and assistance to the architectural profession, to the trade, and to others directly interested in the use of the product.

Selection of Most Suitable Material

The selection of the kind or grade of stone to be used for a particular building often does not receive the careful consideration which it deserves. When a building is intended to become the art or cultural center of a community, its administrative headquarters, or the realization of the life-dream of some influential citizen, it is natural to think that only the very best is good enough. In such cases, there is a temptation to specify the fine-textured "Select" or what is really selected stone, the highest in cost, for all parts of the work. This is rarely necessary or desirable.

All grades of Indiana Limestone are equal—in-so-far as soundness is concerned. The production processes employed in a cut stone mill, further, are such as will automatically eliminate any blocks or pieces that contain planes of weakness, as in the average run of work the stresses set up in machining the stone and in handling it by the travelers from one machine to another, are greater than would be permitted in building, and serve to test effectively all of the stone as it passes through the various milling operations that are employed to shape and prepare it for its position in the building.

For many types of structures, especially for sawed-finish wall facing, the Old Gothic grade, which is decidedly low in cost is the most fitting to use. The moderate cost Variegated grade is suitable for all purposes, either for trim or for all-stone faced buildings.

During the past few years the proportionate use of the gray stone on account of its fine, close, even texture has been rapidly increasing. Many architects now prefer and specify it regularly, on account of its density, uniformity and fine weathering qualities, together with dignity and pleasing color-tone which becomes progressively lighter in shade with the passing years. It most effectively resists the accumulation of grime and in appearance is the nearest approach to a costly light-colored fine grain granite that it is possible to obtain in the field of an easy-working, moderate cost building stone.

Architects will never regret specifying this material for their best work, as exemplified by some of the finest buildings in America that have been constructed of it.

The well-known Oolitic Limestone of Indiana, formerly called Bedford Stone, is commercially available only in Lawrence and Monroe Counties, and the architect should protect both his client and himself against substitutes. All of the long established and proven quarries from which this dependable stone has been produced for generations are located within these two counties, a majority of them owned and operated by the INDIANA LIMESTONE COMPANY.

Colors and Textures

The INDIANA LIMESTONE COMPANY classifies its product by color-tone and texture and recommends the use of these terms to indicate the character of stone required.

Regular classifications are as follows:

Select Gray	Select Buff
Standard Gray	Standard Buff
Coarse Gray	Coarse Buff
	Variegated

Special classifications are as follows:

Rustic Buff	Special Hard Gray
Old Gothic	Special Hard Buff
	Buff Statuary Stock

Other specialties, ranging in color-tone from very light, almost a cream white, to distinctly dark, are also usually available, samples of which will be furnished by the Company upon request. A general description of the various grades and recommendations as to their selection and employment is given below.

Architects should remember that the classification established by the former Indiana Limestone Quarrymen's Association which, with minor changes in the system of grading, was adopted by this company, is for their direct benefit and the protection of their clients in the specifying of Indiana Limestone.

"Select" Stock (Either Gray or Buff)—"Select" stock is the average finer grained stone. It is more uniform in color-tone and texture than standard and is finer in texture than is required for the average run of exterior work. "Select" stock is suitable for the finer class of exterior work in monumental buildings and especially for entrances and those portions of a building that are within ready range of vision, also for carving, interior work and other particular uses. The use of this grade is also recommended for carving, important entrance and other prominent features of commercial and various other types of buildings in which standard or the coarser textured grades are otherwise employed. "Select" stock as produced by the quarries

may contain some fine streaks of crystalline calcite and minor variations in texture that do not impair the strength or appearance of the finished stone or that can be eliminated readily from appearing on the face of stonework in the finished building.

"Standard" Stock (Either Gray or Buff)—"Standard" stock is the average product of the quarries and constitutes the bulk of the total output. It is thoroughly sound stone, having some variation in color-tone and texture. It may contain some streaks of calcite or slightly coarse grained formation, but such variations in this grade are confined with reasonable limits in the grading of the quarry blocks that will usually make it impossible to determine in the finished work at a short distance any difference between the general appearance of this and "Select" stock. Stone of the "Standard" classification is suitable for all purposes in the regular run of building work.

"Coarse Stock" (Either Gray or Buff)—This stock is the average coarse grained stone having a greater variation in color-tone and texture than "Standard," somewhat shelly in formation and may contain some pit holes, but is not as variable, coarse or open in texture as "Rustic."

"Coarse" stock is suitable for large cornices and other boldly detailed work in the upper part of any building, the lower part of which is built of "Standard" or "Select." It is also recommended for the cut work, trim, etc., in combination with sawed ashlar of "Rustic" or "Old Gothic" stock.

"Variegated" Stock—The "Variegated" stone is an irregular mixture of the gray and buff produced from the blocks that are quarried where the buff and gray color-tones adjoin in the quarry, showing some variation in color-tone as well as in texture. Such material, when cut up for building purposes, will, in the finished work, produce pieces of each color-tone and a small percentage of stone with both color-tones in one piece. It is unusually effective in giving variety to plain surfaces and is a desirable class of material for trim as well as for wall facing.

"Variegated" stock will embrace stone that will range in texture from a fair grade "Standard" to "Select," and consequently will include some stone containing streaks of crystalline calcite and shelly formation that do not make the quarry blocks too coarse or variable to be used for the average run of cut stone work, trim, etc. The coarser grained and more variable of the "Variegated" stone is included in the "Old Gothic" Classification.

Where only a uniform fine grained selected grade of "Variegated" stock is desired, "Variegated Statuary Stock" may be specified. This is not a regular classification and is not included in price list or segregated in the stock piles. Stone of this character is usually available in moderate quantities, and will be furnished on special order only at a differential in price covering the cost of selecting the quantity required from the stacks.

"Rustic" Stock (Buff Only)—"Rustic" stock is the coarser grained stone, having an interesting, more or less open shelly texture, with a varying amount of crystalline calcite intermixed, some of which will have a decidedly coarse somewhat honeycomb formation; some of it is likely to be darker in color-tone, and some of it is quite hard, due to the size of grain and amount of calcite that it contains. It is therefore coarser and more distinctive in texture, showing a wider range of granular formation and more variation in color-tone than any other grade, except "Old Gothic."

This grade is particularly suitable for the sawed ashlar facing of walls, for which purpose it may be to advantage combined with trim of either "Variegated," "Standard," "Coarse" or "Select" stock. "Rustic" stock is not generally recommended in place of "Standard" or other grades for any portions of a building on which there is much molded work and cutting, on account of its texture and hardness and the consequent greater cost of cutting this kind of stock.

"Old Gothic" Stock—This class of stone is unselected as to color and texture, and embraces the gray, buff and variegated stone, which, although varying in texture from medium fine to distinctly coarse, will generally be of fairly coarse texture, containing shelly formation with both white or dark crystalline streaks, and streaks of calcite, shelly matter, crowfeet, etc., that do not affect the structural soundness of the stone. It has the widest range of variation in color-tone and texture and is recommended especially for all forms of rough-sawed masonry field work; range work, random ashlar, etc.

Buff Statuary Stock—This grade covers only the very fine uniform grain buff stock as produced by certain quarries in comparatively limited quantities. It is not a regular grade and is sold principally for sculpture and carved doorways, tracery, sculptured panels, memorials and elaborate interior work, for which purposes the higher cost of this stock is fully warranted. For all exterior work with the possible exception

of occasional pieces of statuary, fine tracery or intricate carving, "Select" stock available at lower cost will be found eminently satisfactory.

"Special Hard" Stock (Either Gray or Buff)—"Special Hard Gray" and Special Hard Buff" are especially adapted for base or grade courses, steps and platforms, buttresses, floor tiling, terrace paving, and other work that is subject to abrasion, or constant wear under foot traffic; for which purposes these special grades of stone are principally recommended. This class of stone is not recommended in place of the regular classes for the average run of work, such as ashlar, trim, etc.

Ease of Working

No other commercial stone is so easily worked as Indiana Limestone. In spite of its great strength it can be freely sawed, planed, turned and carved, and be otherwise worked by machinery, as well as by hand.

Physical Characteristics

Indiana Limestone is *non-crystalline*; the aggregate filler and matrix are all pure carbonate of lime.

CHEMICAL ANALYSIS (AVERAGE)

Carbonate of lime.....	97.23%
Carbonate of magnesia.....	1.20%
Silica74%
Alumina56%
Oxide of iron.....	.15%
Water and loss.....	.12%
	100.00%

PHYSICAL DATA ON INDIANA OÖLITIC LIMESTONE

Average weight (dry).....	144 lb. per cu. ft.
Average absorption by weight.....	4.6%
Average crushing strength seasoned stone from 6000 to 8000 lb. per sq. in.	

It is not a hard or brittle stone, and can be cut with equal ease in any direction. For all practical purposes it is considered a free stone, having no evidence of cleavage plane. It possesses far greater strength than required for any ordinary building purpose, the seasoned stone having an average crushing strength as given above and a remarkably uniform modulus of rupture value, whether tested parallel to or at an angle with the grain, making it safe for long lintels, etc. It is unnecessary to set this stone on its natural quarry bed.

Indiana Limestone is to all intents and purposes fire-proof. It calcines above 1500° F. and will not spall, crumble, split nor check at temperatures up to 1000° F. when drenched with cold water.

Possessing a wonderful internal elasticity, adapting itself without damage to extreme temperature changes and other conditions of permanence that exist in modern building structures, it is for this reason alone particularly well adapted to use both in building masonry and as a facing material in the colder northern sections of the United States and in Canada.

Permanence

Durability and resistance to atmospheric action is proved by the exposed quarry ledges that are centuries old and by many fine existing structures of considerable age. The soft light color-tones are permanent, and no other building material remains clean so long or better resists the accumulation of grime from the smoke-laden atmosphere of manufacturing cities.

Many fine monumental and commercial buildings in the South and in Canada may be referred to as attesting the beauty, adaptability, permanence and genuine value of this fine natural building stone under varied climatic conditions.

Finishes

Any hand-tooled, machine, or sawed finish, including rubbing and honing, may be applied, except bush

hammering and other so called "hardstone" finishes which are used only infrequently for special purposes.

Additional information on finishes will be found in the service publications of the Company.

Uses

Indiana Limestone, to the extent of many millions of cubic feet, is used each year for all classes of buildings. A large proportion of the United States Government buildings have been built of this stone.

Many of the finest office buildings, banks, stores, and other commercial structures, churches, school and college buildings, residences, apartments, as well as monumental buildings of all sorts have been built of Indiana Limestone.

It is unsurpassed as a material for residence trim, and for the trim of schools, factories and industrial buildings of all types where it is used in walls of brick or other native stone.

The finer grades of Indiana Limestone are much used for interior work in churches, public buildings, fine residences, etc. The fine grained buff stone, when in place, can scarcely be distinguished from the caen stone of France; and having much greater strength and durability is conceded to be its superior.

The finest and most elaborate carved work, both interior and exterior, is easily, beautifully and permanently expressed in this material.

It is widely used for the larger kinds of architectural sculpture and statuary groups, gateways, pergolas and memorials with most gratifying effects. For such uses, the practically unlimited size of the perfect units which may be had is a great advantage. Monolithic columns, up to any size which can be transported, are always obtainable.

In addition to its regular use as cut stone for the various purposes already enumerated, it is also used in the rough-sawed form, for masonry facings, forming the field work of walls trimmed with cut stone, as described on the next page.

An example of this class of usage in church building is illustrated on the fourth following page.

In engineering, Indiana Limestone is extensively used where an architectural effect is desired for walls, piers, bridge abutments, etc., and especially for the balustrades and trim of bridges built of other masonry, or of reinforced concrete.

Literature and Samples

Literature useful to architects in the form of service publications, including technical information, construction details, service plates, etc., is constantly being prepared, and as published will be furnished gratis to those requesting it.

Samples of the stone will also be furnished to architects and others interested.

Data on anchorage, setting mortars, stain-prevention and cleaning, and other related subjects will be furnished on request.

Every architect should have on file a copy of the latest edition of the Indiana Limestone Specification Manual.

All architects should also obtain a copy of the new specifications for random ashlar masonry.

Rough-sawed Indiana Limestone

Rough-sawed Indiana Limestone in "Old Gothic" and Short-length "Variegated" or other classifications is one of the Company's more recent developments

for the facing and building of moderate cost masonry walls.

The wall construction and facing schemes that are embraced within the class of random ashlar, range work, etc., as covered by this specification, are many and varied in detail and effect, and cover a wide field of usage in buildings of various types. These forms of stone-faced wall construction are especially adaptable for church, scholastic and institutional buildings of all kinds, as well as for residences, and, in fact, for all other classes of buildings for which a somewhat informal architectural style is considered most suitable.

The architect will find these forms of construction are decidedly economical and possess advantages that are worthy of careful study.

On account of the saving in labor that is afforded by the use of material already squared to the exact height and thickness of the different units required by the particular jointing scheme adopted, ashlar of this rough-sawed limestone will frequently be found less costly and more effective in the finished building than walls built of or faced with cheap local stone; especially so, as the facing units may be dimensioned to fit and bond with the brick or tile backing units; also by reason of the easy working qualities of Indiana Limestone, which make possible the breaking and trimming of the sawed stone strips to the proper lengths at a minimum of labor cost.

The Rough-sawed, "Old Gothic," "Variegated" and "Rustic" Indiana Limestone in strip form gives the architect a wider range of choice in the employment of stone for the facing of buildings, by filling the gap that has heretofore existed between the regular cut stone ashlar, on the one hand, and the rougher types of wall such as field stone or rubble work and other forms of rock-faced masonry, on the other. It also affords a means of using stone in an economical manner for buildings of moderate cost, for which any form of cut stone facing, however desirable, might be considered as involving an unwarranted increase in the cost.

For further information and data address the Architects' Service Bureau at Bedford, P. O. Box 308.

Preface to Standard Form of Cut Stone Specifications for Indiana Oolitic Limestone

For the convenience of architects and others using this specification, it has been prepared and published both in loose leaf typewritten form and in folder form, and *will be mailed free to architects on receipt of postal request.*

It is particularly important that the Company's bulletins in reference to setting mortar, sand for setting and pointing mortar, flashing and calking of projecting members, detailing of stone in connection with reinforced concrete and the protection of cut stone at time of delivery, during and after erection, also be carefully studied.

Note: It being more or less usual for cut stone to be furnished to the contractor either f.o.b. cars at destination or delivered alongside curb at the building site by trucks or teams, the specification is so arranged that either the setting only, or the delivery and setting, may be readily separated under an entirely separate "Setting Contract."

Specification for Cut Indiana Limestone

(1) **Work Included**—The work under this contract shall include all labor and material for the furnishing of cut stone work in accordance with the drawings and as hereinafter specified.

(2) **Description of Stone**—All Limestone specified or shown on drawings shall be Indiana Oolitic Limestone building stock, free from all defects that would materially impair its strength, durability or appearance, and within the range of variation of color and texture represented by two samples approved by the architect.

Specially graded stone, acceptable as to hardness and color, as per samples to be submitted, shall be employed where indicated on drawings, for and all other positions in contact with the soil or exposed to direct wear.

Wherever the terms "Indiana Limestone" or "Limestone" occur in this specification, they specifically refer to and shall imply "Indiana Oolitic Limestone" quarried in Lawrence or Monroe Counties, Indiana, all such stone to be from a quarry the product of which has been tested at the U. S. Bureau of Standards for physical properties and weathering with satisfactory results.

(3) **Finish**—The finish on exposed surfaces generally, except where tooling or carving is indicated, shall be smooth, machine-dressed, showing no tool marks.

(4) **Samples**—The contractor shall submit to the architect two samples which shall be typical of the extremes which the contrac-

Tribune Tower, Chicago, Ill.

JOHN M. HOWELLS and RAYMOND M. HOOD, Associated Architects
HEGEMAN-HARRIS, INC., General Contractors

War Memorial, Southampton, L. I., N. Y.

GOODWILLIE & MURAN, Architects

One of the many recent fine monuments constructed of Indiana Limestone

tor proposes to furnish. Samples to be about $3\frac{1}{2}$ in. wide by 7 in. long by about 1 in. thick, produced with the large faces cut across the grain of the stone, the finish specified to be indicated on the large faces and at least two of the edges to be rock-face. Similar samples shall be provided when "Special Hard" stone or any other grade of stock is specified for certain positions in the building.

All samples shall be labeled or otherwise clearly marked with the grade of the Limestone, the name of the contractor submitting them, and with the statement: "Samples of Indiana Limestone to be furnished for the Building."

(5) **Standard Practice**—The standard practice established by the former Indiana Limestone Quarrymen's Association of Bedford, Indiana, shall govern, except where this is in direct conflict with the specific intent of the architect's detail drawings. Bidders not familiar with these standards relating to grading, cutting, setting and anchorage practice, etc., are cautioned to inform themselves regarding them.

The architect reserves the right to approve the sub-contractors for both the cutting and setting of the stone, before this portion of the work is awarded.

(6) **Cutting and Setting Drawings**—The cut stone contractor shall prepare and submit to the architect for approval, complete cutting and setting drawings, in triplicate, for all of the Limestone work under this contract and no stone shall be cut until these drawings are approved by the architect. Such drawings shall show in detail the sizes, sections and dimensions of stone, the arrangement of joints and bonding, anchoring and other necessary details.

These drawings shall be based upon and follow the drawings and full size details prepared by the architect, except where it is agreed in writing that changes be made. Each stone indicated on these drawings shall bear the corresponding number marked on the back or bed with a non-staining paint.

(7) **Bonding and Anchorage**—All projecting stones, except where otherwise shown as anchored to the structure, and so provided for by details on setting drawings, shall have beds in the wall at least 1 in. greater in depth than their maximum projection.

Moulded projecting courses, unless shown as secured by suitable anchorage or steel supports, shall have not less than four-sevenths ($\frac{4}{7}$) of their cubic contents inside the face of wall. There shall be "through" or bond stones wherever indicated on approved cut stone drawings.

Provision for the proper anchoring, doweling and cramping of work in keeping with standard practices, also for the support of stone by shelf angles and loose steel, etc., when required, shall be clearly indicated on the setting drawings.

(8) **Details for Lintels, etc.**—Lintels, architraves and other members spanning openings, whether supporting a superimposed load or only their own weight, shall be of the proportions and sectional area that will provide an ample factor safety based on the average ultimate breaking strength of the stone specified.

(9) **Carving and Models**—All carving shall be done un-

der this contract by skilled carvers in a correct and artistic manner, in strict accordance with the spirit and intent of the architect's sketches, or from plaster models provided or approved by the architect.

All carving to be executed.....

Contractor shall include in his estimate the sum of..... to be expended by the architect for the models that are required.

(10) **Cutting**—All stone shall be cut accurately to shape and dimensions and full to the square, with jointing as shown on approved "cutting and setting" drawings. All exposed faces shall be cut true. Beds and all joints shall be dressed straight and at right angles to the face, unless otherwise shown, and except where otherwise shown or noted on drawings the joints shall have a uniform thickness of $\frac{1}{4}$ in.

The patching or hiding of defects will not be permitted.

Washes shall be as deep as practicable and drips of sufficient width and depth to shed water shall be provided on all projecting stones and courses.

Raglets for flashing, etc., shall be cut in the stone where so indicated on the drawings.

Moulded work shall be carefully executed from full size details, supplied by the architect, and must match perfectly at joints. All arrises shall be sharp and true.

Quoins, pier and pilaster stone shall be checked at back as indicated.

All columns shall be accurately cut with the entasis shown on drawings. All pilasters to be cut straight without entasis or taper.

(11) **Back Checking and Fitting to Structural Frame**—Stone coming in contact with structural work shall be back-checked as indicated on the general drawings, and where shown resting on structural work shall have beds shaped to fit the supports.

(12) **Lewis Holes and Cutting for Dowels, Anchors, Cramps, etc.**—Holes and sinkages shall be cut in stones for all anchors, cramps, dowels, etc., called for under this specification or indicated on the "cutting and setting drawings."

Lewis holes shall be cut in all stones weighing more than 100 lb. No lewis or other holes shall be cut in exposed washes or come closer than 2 in. to the exposed face of the stone.

(13) **Cutting and Drilling for Other Trades**—This contractor shall do all cutting and drilling of stone for electric conduits, piping, leaders, etc., required for the installation of the work of other trades, as shown on the details for cut stone work.

(14) **Field Cutting**—Specify in detail any field cutting that will be required.

(15) **Loading and Shipment**—The Cut Indiana Limestone shall be carefully packed for rail or wagon transportation, with exercise of all reasonable and customary precautions against damage in transit.

All cut stone under this contract shall be delivered promptly as ordered and in the sequence in which it is to be set.

Setting Cut Stone

(16) **Work Included**—Contractor shall refer to the preceding specification for Cut Indiana Limestone for more detailed information regarding the cut stone that is to be set under this contract; also refer to "General Masonry," "Sheet Metal Work," "Roofing" and "Carpentry" specifications for references to other work that must be executed in conjunction with this work.

(17) **Delivery and Storage**—All Indiana Limestone delivered f.o.b. cars at destination under contract shall be carefully unloaded and delivered to the building site.

The cut stone shall be handled throughout by competent workmen and by such methods as will guard against soiling, mutilation or snipping in transit to and upon delivery at the building site.

The stone shall be stored at the building site on planking set so that the stone will rest entirely clear of the ground, and be protected by proper means from damage to arrises and from contact with anything which would result in the accumulation of dirt, dust, soot, mud, grease and other staining or disfiguring elements. The stone shall be covered with tarpaulin, stout non-staining paper or boards during extended periods of storage at destination or building site.

(18) **Setting Mortar**—All Indiana Limestone shall be set in carefully prepared lime mortar tempered with non-staining cement of an approved brand. The mixture shall consist of 1 part dry hydrated lime or lump lime paste, to not over 3 parts sharp, *clean washed* sand, with the addition of non-staining cement in an amount equal to at least 15% by volume of the lime used.

Lump lime paste shall be made from the best quality of freshly burned lump lime, slaked with cold water and screened through a $\frac{3}{8}$ -in. mesh screen into a settling box, following the practice employed in preparing lime for plastering. The lime putty thus prepared shall stand in the settling box not less than one week and then mixed with sand and be properly stacked to age; the cement to be added and thoroughly worked into the mixture in small batches just prior to its use for the setting of cut stone.

The sand must be *washed* entirely free from loam, silt, vegetable matter, salts and all other injurious substances, and shall be screened if containing pebbles or coarse grains that would interfere with the proper bedding and jointing of the work. The water shall not be alkaline and must be clear and devoid of salts and injurious elements.

(19) **Scaffolding**—The scaffolding required for the use of all trades, including scaffold for the proper execution of the cut stone work, will be furnished and erected by the masonry contractor.

(20) **Centering**—The wood centering required for the proper setting of cut stone work will be furnished and erected by the carpentry contractor.

(21) **Anchors and Dowels**—All anchors, cramps, Lewis anchors, etc., required by setting drawings or necessary for the proper erection of the work shall be included under stone setting contract. Except where otherwise specified, all anchors shall be of iron, thoroughly galvanized after they have been bent to shape.

Anchors for ashlar and face work generally shall be the standard $\frac{3}{8}$ x 1-in. ashlar anchor or be of equivalent cross section, one anchor to each stone over $\frac{1}{2}$ sq. ft. in area and at least two anchors to all stone over 2 ft. long or more than 3 sq. ft. in superficial area.

All dowels required for light stone work shall be made of standard heavy brass pipe of the size required.

(22) **Grade Course**—Where the Limestone extends down to the grade line, the stonework above grade shall be protected by a properly installed layer of approved non-staining impervious material.

(23) **Setting Cut Stone**—The Indiana Limestone shall be set accurately in accordance with the requirements of the

drawings. Before setting, all stone shall be *washed clean on all sides* and, if required, shall be scrubbed with fibre brushes using only soap powder and water and then be thoroughly rinsed with clean water. Just prior to setting, all stone shall again be sponged or drenched on all sides with clean water.

All stone shall be properly set, by competent stonemasons, true to line and level, with full flushed joints, filling all anchor holes.

All beds and vertical joints shall be $\frac{3}{4}$ in. in width, except where otherwise indicated. Wood wedges may be used only where necessary to prevent the crushing of mortar under heavy blocks, and shall be thoroughly soaked before use.

Mortar shall be raked out $\frac{3}{4}$ in. from the face of the stone to allow for pointing; excepting for such parts of the work as may best have the joints pointed or grouted full as set. The stone as set shall be sponged off along all joints.

Steps shall be set with a slight pitch to the front.

The ends only of lugged sills shall be bedded with mortar, balance of joint to be left open until pointed.

Heavy stone or projecting courses shall not be set until the mortar in courses underneath has hardened, all projecting stone to be securely propped until the wall above them is built.

All cornices, copings and projecting belt courses and all stones forming gutters, etc., shall be set with the vertical joints unfilled. The exterior profile of these joints shall then be calked with rope yarn or picked oakum and be filled solid from above with a mortar grout composed of 1 part non-staining cement and 1 part fine white sand, mixed in small quantities, and of as thick a consistency as can be poured into the joints. Grout shall be stirred vigorously until used.

Splashing exposed faces of stone with mortar shall be avoided, and any splashings be immediately removed with a clean sponge and water.

(24) **Parging and Backing Up**—The entire backs of all stone, as set, shall be plastered with not less than $\frac{1}{2}$ -in. coat of stone setting mortar before backing is built, and the first course of brick in back of stone shall be laid in this same kind of mortar. Where the stone occurs as a facing applied direct to previously erected structural members, both back of stone and face of structural work shall be plastered with setting mortar and any space left be grouted where required, to insure a thoroughly filled back-joint.

(25) **Protection of Finished Work**—Contractor setting cut stone shall co-operate with the carpentry contractor, who will furnish and erect the necessary protection for sills and all projecting stonework. All steps and platforms shall be protected with boards during the entire period of construction.

(26) **Replacement Damaged Stone**—No defective stone, and no broken, spalled, patched or otherwise damaged stone shall be set without first obtaining the architect's approval. All damaged stone shall be recut or repaired, if approved, or be replaced by the contractor free of cost to the owner.

(27) **Pointing**—All face joints shall be raked and brushed out clean to a depth of at least $\frac{1}{2}$ in., carefully removing any wedges and loose mortar so that pointing will be continuous, and after a thorough wetting of the stone the joints shall be pointed flush with mortar consisting of 1 part non-staining cement, 2 parts clean white sand and sufficient cold lime putty to make as stiff a mixture as can be worked.

(28) **Cleaning**—The face of all stonework under this contract shall be properly cleaned down upon completion; if necessary, this cleaning shall be done by scrubbing with soap powder boiled in clean water, applied vigorously with stiff fibre brushes, adding clean, sharp, fine, white sand to the soap and water mixture, drenching all exposed surfaces of stone with clear water after cleaning.

The use of wire brushes or acids of any kind will not be permitted under any circumstances for cleaning the stonework.

Twin Cities Plant, Ford Motor Company, St. Paul, Minn.

ALBERT KAHN, Architect

Interesting example of usage for Industrial Building

Redeemer Presbyterian Church, Detroit, Mich.

GEO. D. MASON & COMPANY, Architects

Interesting example of "Variegated" random ashlar, showing a mixture of rough-sawn and split face finish

Specification for Random Ashlar Wall Facing of either Sawed-finish "Old Gothic" or Short-length Indiana Limestone (Note A)

All exterior wall facing, except cut stone trim which is elsewhere provided for under the heading of "Cut Stone Work," shall be of ["Old Gothic"] ["Variegated"] Indiana Limestone, laid up in random ashlar, using the stone of varying textures, sawed on four sides in the several heights required to lay up the work as indicated on the (detail) drawings, with the finish as it comes from the saw. (Notes B and C.)

This facing shall be bonded to the backing as shown, having at least one bonding stone 4 in. thicker than facing to each (Note D) sq. ft. of wall, and the units shall be arranged to bond properly with the cut stone quoining at corners, window jambs, etc., and to fit in generally with the bonding scheme of cut stone trim throughout.

All stone for this purpose shall have faces square and be furnished in lengths of not less than 3 ft. 6 in., and shall be broken up and jointed on the job to the sizes required (Note E). All stone shall be set with level beds, shoving each block on to a full bed of mortar. End joints shall be (vertical) and be properly staggered, and shall be worked off square with the face of the stone (Note F). All joints shall be thick (Notes G and H), weathered joints well filled with setting mortar struck full to the face of stone as the blocks are set, and each block shall be carefully backplastered with a thick coat of the same mortar as that used for setting.

All mortar droppings adhering to stone shall be immediately removed and the face of stone along all joints be sponged off clean as the work is set.

The specification for setting mortar and for backing up of stone should follow (Note I).

Explanatory Notes—

Note A—This specification should preferably be included under a separate heading of its own, as given above, or be made a part of the general masonry specification, under such a subheading, so as not to form a part of or be confused with the specification for cut stone work.

Note B—This Sawed-four-side, "Old Gothic" or "Variegated" may also be used where a rock face random ashlar is required. In such cases, for a 4-in. thick ashlar facing, the stone would be sawed to a thickness of 10, 11, 12 in., or more, according to the amount of rock required on the face, and then be split apart on the job giving two rock-faced slabs with sawed beds and backs. After the strips have been jointed off to the required lengths, the rock-face is pitched off to a line parallel with the back.

Or, as an alternate, sawed slabs may be used for rock-face work, involving a little more labor at the building but costing less than Sawed-four-side material f.o.b. the quarry.

Note C—Where the desired design has not been fairly well indicated on the drawings, it is advisable to add the following clause to the first paragraph:

"The length of Random Ashlar units generally shall not be less than one and one-half times their height" (except for closures and except where a long effect is desired) "nor more than three and one-half times their height."

Note D—The requirement for bond stones will vary somewhat with the ashlar design and unit height of units employed, and a small section of the wall should be carefully detailed to determine this. These units should generally be worked out in multiples of the brick or hollow tile backing units. Under usual conditions, one bond stone in from 8 to 12 sq. ft. of wall is considered sufficient.

Note E—The stone stock of any grade furnished under the Short-length classification will vary from 3 ft. 6 in. to 5 ft. 11 in. in length. Where greater length of stock is required the ashlar must be cut from full dimension quarry blocks, and the regular grade must be specified, as the Short-length classification will not apply.

Note F—This provides for the more regular and usual form of random ashlar. Where the irregular form with the angular end joints is desired, omit the word (vertical) and substitute either the words (irregular) or (hammer broken).

Note G—It is not practicable nor desirable to require joints less than $\frac{3}{8}$ in. thick for wall facing of this rough-sawn material, and this thickness is recommended as the minimum, $\frac{1}{2}$ -in. joints to be specified for the ordinary run of work. For rock-face work or where a rougher effect is desired, a wider joint than $\frac{1}{2}$ -in. is often preferable. For rough, irregular work, where the end joints are not vertical but are pitched off at an angle with the bed, fairly wide joints should be specified. It is not intended that the joints be raked out and pointed later but that the work be laid by masons with a full joint struck off flush, or weathered, at the time of setting.

Note H—A struck weathered joint, finished as the stone is set and requiring no pointing up later on, is specified, as it is considered the most appropriate type of mortar joint for this character of stone work.

As an alternate to this, especially when the joints are not very wide and it is considered advisable to accent them, a slightly raked out joint may be specified. For a raked joint, especially if wide, an unusually stiff mortar is sometimes necessary.

Note I—Where the use of a lime mortar is impracticable for any reason, a lime-cement or cement-lime mortar, made with a non-staining cement, should always be used.

Ordinary gray portland cement should not be used, because of its detrimental effect on any natural stone and on account of the frequently resultant staining of the limestone. A lime or lime-cement mortar, similar to that employed for cut stone work, is recommended for this work and for parging or immediate backing up of it.

Particular mention of careful backplastering in connection with the setting of all cut stone trim, should be made in the specification for that portion of the work.

The Association and Its Functions

The chief aim of this Association is to further the use and sale of granite for building purposes by extending the knowledge of its many qualities and merits and by establishing means of closer co-operation between the producers of granite and the architects and general building public.

Service to Architects and Users—The Association offers a convenient and unbiased service to all interested in the use of granite for permanent construction.

This service is freely offered wherever it may assist in the logical and proper use of granite, or help to solve the economic and aesthetic problems which may arise when the use of granite is under consideration.

Through the gathering of available information concerning granite from within and without the industry, and through continual research and study of the product itself, its chemical and physical properties, production methods and experience in actual use, the Association has become a clearing house for the best information available.

Requests for information pertaining to granite and its use for building purposes will receive the willing and careful attention of the Association office, backed up by the combined knowledge and experience of its membership.

Estimates and Samples—The Association does not quote prices, but requests for preliminary or final estimates will be transmitted to its members and estimates promptly obtained.

Requests for samples will be transmitted to members producing the kind and quality of granite desired and information will be furnished as to where specific colors and qualities of granite may be obtained.

Sample Exhibits—Permanent exhibits of samples of the various granites produced by Association members are maintained at the following addresses:

Architects Samples Corp., 101 Park Avenue, New York, N. Y.
Master Stone Cutters Association, 220 South 16th Street, Philadelphia, Pa.

National Building Granite Quarries Association, 31 State Street, Boston, Mass.

Here will be found the standard building granites of various colors and textures, also complete sets of samples illustrating the standard building granite finishes. In the New York exhibit will be found a model "Study in Granite," illustrating the possibilities of combining different colors and textures, using standard granites.

Architects and the general building public are invited to visit these exhibits when considering the selection of material or finish.

Proposal and Contract Forms—Uniform Proposal and Contract Forms have been prepared and adopted by the Association in which the terms and conditions are fairly standardized, and the equity of both parties carefully studied and protected.

Competition—The Association, by its impersonal publicity and through its reports to members concerning prospective work and bids desired, insures a wider and more intelligent range of competitive bids, backed up by the best organized and equipped plants in the granite industry.

Architects and contractors, who refer their requests for granite bids through the Association, may secure a larger number of responsible competitive bids with a minimum of effort and expense. Requests for bids, with information as to closing dates, will be transmitted to

the members. Architects and contractors are invited to avail themselves of this service, which has proved its value and frequently produces bids which might not otherwise have been secured.

The Association stands for fair practice in bidding and advocates that bids, tendered in good faith in accordance with plans and specifications, should be fairly considered and used, both as a matter of principle and in order that the best interests of all parties concerned may be assured.

Granite and Its Architectural Qualifications

Granite has many and varied qualifications suiting it for architectural uses. Its natural qualifications are unsurpassed by any other material for exterior building purposes.

In its form of origin and in its physical characteristics, granite is distinct and different from other building stones such as marble, limestone or sandstone. It is of igneous origin and is composed of the crystals of minerals which include the most durable and beautiful substances known to man. Its constituent minerals are of the kind and substance which form many of our precious and semi-precious gems. The humblest piece of granite is a veritable natural mosaic of gem minerals, everlastingly welded together and retaining all the priceless virtues of its gems in blended beauty, color, texture, and durability, unequalled by any other building stone and unattainable in man-made imitations.

The various combinations of intergrown gem crystals, differing in kind, size and arrangement in the different granites available for architectural uses, provide the great range in colors and textures which sets granite apart from all other stone not so wonderfully made and constituted. These features, peculiar to granite and so obviously apparent and compelling under the microscope, are responsible for the inherent character and beauty which is always manifest in granite but not so easily accounted for under casual observation.

Aside from its natural beauty, and also due to its form of origin and mineral constituents, granite is the most durable of building stones, and is also harder, stronger and more resistant to the effects of climate, weather and ravages of time than other stones.

Granite may be cut into any form desired for architectural use. Exposed faces may be dressed in a great variety of finishes, including the highly polished finish which in other stones is either impossible or not sufficiently durable to withstand long exposure to the weather and the elements.

Granite is often and erroneously considered as suited only to plain or massive work. It is, however, a well established fact that granite may be carved with as much refinement and delicacy of detail as, for instance, marble, and with the added certainty that such detail, in granite, will retain its original sharpness and delicacy indefinitely, unaffected by action of weather or time.

Granite has a well recognized value as a commercial building material, due to its great strength and durability. It is also pre-eminently suited for perpetuating architectural masterpieces, where ultimate and lasting results far outweigh mere cost considerations. Modern tools and processes have made it possible to execute fine architectural details and ornament in granite within reasonable time and cost, having always in mind the worthwhile results.

Description of Granite

Granite is technically described as a holocrystalline, granular rock of igneous origin. The essential constituents are quartz and a potash feldspar. The principal accessory mineral is usually either mica or hornblende. Other minerals occur in small quantities, but are generally secondary to those mentioned.

The accessory mineral, mica, occurs in two forms—black mica or biotite, and white mica or muscovite. The hornblende in building granite is usually black or a very dark green.

Granites are technically classified by the predominating accessory mineral. The most common varieties of building granites are known as biotite, muscovite, biotite-muscovite, muscovite-biotite, hornblende, biotite-hornblende, and quartz-monzonite granites.

As a general rule the color of granite is determined by that of its feldspars, and the hardness by the quartz and feldspars, varying according to the proportion and hardness of the feldspars.

Colors and Textures—The granites produced by Association members include many shades of gray, lavender, pink, red, green, brown, buff and white.

Natural texture varies according to the distribution and size of crystals of the constituent minerals. Granite is graded, as to grain, by the size of its feldspar crystals, from very fine to very coarse. The size of crystals or coarseness of grain has practically no bearing on the structural qualities, but gives to granite the variety of texture which adds greatly to its architectural possibilities.

Physical and Chemical Tests

The standard building granites so far exceed all ordinary architectural requirements as to chemical and physical properties, that specific data on tests has little or no bearing upon the relative architectural merits of the different granites.

In confirmation of this, the following statement, prepared by Mr. G. F. Loughlin of the U. S. Geological Survey is quoted in full:

"Physical tests have supplemented actual experience in the use of granite by showing that it exceeds the requirements for the tallest and most exposed buildings to a great degree. With this fact demonstrated, the actual results of strength and porosity tests are of little significance; far less than an accurate knowledge of the component minerals and their state of preservation as revealed by the microscope.

"Recorded crushing strengths of granite may serve as relative measures of soundness provided the tests were all made on machines that are calibrated alike and provided enough samples of each granite are tested to show its range in strength, also provided all samples are prepared with equal care; but as even the lowest recorded results obtained under unfavorable circumstances are far above the maximum required for the tallest buildings, the fact that the crushing strength of one granite is somewhat more than that of another should be of no concern to the architect or builder. Only when monuments of solid masonry and of unusual height are to be erected or when paving stone for extremely heavy traffic is to be laid, do crushing tests of granite need any consideration.

"Transverse breaking strengths of granites are also quite adequate to support any load that they are expected to support in buildings. There is much more danger of cracking from uneven settling of foundations than from overloading, and examples can be shown where granites with the highest recorded transverse strength have cracked when the load upon them was relatively low.

"Issues have been raised at times regarding the porosity of granite. Unweathered granites such as are supplied to the high class building trade are for all practical purposes absolutely impervious except close to the surfaces of blocks where minute cracks have been developed during splitting or tooling. 'Porosity' varies with the number and depth of these cracks. Differences in 'porosity' may indicate which granites are most likely to 'blister' from frost action if tooled too severely. If 'blistering' takes place it extends only to the depth of the minute surface cracks and thereafter weathering effects are imperceptible. That granite weathers in nature is undisputed, but conditions of

weathering in the walls of a building are much less severe and not strictly comparable, and the time necessary for unweathered and properly fabricated granite to show appreciable effects of weathering in buildings is too long to cause concern except for monumental structures intended to last for thousands of years.

"Chemical analyses of granite, as usually recorded, are of little or no value from the builder's standpoint. For proper interpretation they require microscopic study. Such study supplemented by examination of the granite in the quarry and in the building, will disclose the essential facts regarding weathering qualities and other important questions. Such study may result in a call for special chemical tests, for example, to determine permanency of color, and then specific directions should be given to render the test thorough. For most granites, however, competent examination in the quarry and in structures supplemented by microscopic study will give all the information needed without resort to any physical or chemical tests."

Production Facilities

Certain definite requirements are essential for any granite producer to successfully meet the demands of modern building construction. These requirements apply to organization, quarry and finishing plant. Association members have been and are the leaders in developing their organizations and production facilities to keep pace with these exacting requirements. They can furnish unquestionable references as to past performance, financial responsibility and ability to supply the material and render the services which they may undertake. They have earned and are entitled to preferential consideration wherever building granite is under consideration.

In granite, as in other materials, there are concerns which will submit bids and undertake contracts on work for which they lack the ability and experience to execute satisfactorily, and their quarries and finishing plants may be totally inadequate to meet the requirements for quality of material and delivery schedules.

These facts should be very carefully weighed and considered whenever a granite is to be selected and a contract awarded. Bids tendered by Association members should receive especial consideration on the ground that contracts based upon them will be conscientiously and satisfactorily executed.

Quarries—In selecting granite for building purposes, the ability of the quarry to produce the quantity, sizes and quality of granite desired is the first essential, and the quarry must be so equipped that its output may be handled and shipped at a rate to meet the cutting requirements, not only for the work under consideration, but all the work which may be simultaneously under contract.

The Association quarries, without exception, meet the above requirements. They are all quarries of established reputation and have been developed to meet the requirements of quantity production.

Cutting and Finishing Plants—Modern time requirements demand that building granite plants be well equipped with up-to-date machinery and appliances for manufacturing and handling granite in considerable quantity without sacrificing quality of workmanship. Association plants include the largest and best equipped plants of their kind in the country.

Granite is delivered to the finishing plant from the quarry in rough blocks—some already split to approximate dimension sizes and others in random sizes to be drilled and split to dimension or sawed into slabs for ashlar or polished work.

Among the essential equipment of a modern granite finishing plant are pneumatic drills and hand tools, pneumatic surfacing machines, saws, polishing machines, lathes and carborundum machines. The handling, machining, sawing, and polishing of granite consumes power in large quantities and adequate power is a most

important essential. Adequate blacksmith shops, carpenter and repair shops are also necessary accessories.

Handwork is required in finishing practically every piece of architectural granite, and a good journeyman granite cutter is one of the most skillful craftsmen in industry today. Modern tools and machinery have relieved this craftsman of a great deal of laborious and time consuming work, but his skill of hand and eye is as indispensable today as when the Egyptians cut their granite temples.

The plants of Association members have been established for considerable periods and a "home guard" of skilled workmen has been built up and established to supply the demands of their home plant. This is a very important factor in the ability of Association plants to fulfill both the quality and quantity demands of their contracts and further entitles them to preferential consideration.

Organization—Organization is by no means the least important factor to be considered. In fact without a properly manned and experienced organization, even an adequate quarry and finishing plant will not ensure satisfactory execution of contracts.

Association members have built up organizations having the necessary experience and ability to put through whatever they may undertake. Their estimators have the benefit of actual cost figures covering a wide variety of executed work, thereby removing much of the guess-work and chance taking for which many a job has been skimmed and botched. Their draftsmen are the best trained men to be had and their knowledge of practical stereotomy, skill in layout and accuracy in figures may be counted upon to discover in advance errors in vital dimensions or impractical points in construction and jointing which frequently cause delay and expense to all concerned.

The planning and routing of work through the mill and the thorough inspection while in process and at completion, due to well trained and experienced supervision is all reflected in expedited erection at the building and a minimum of interference with the progress of the work of other trades.

Experienced and practical salesmen constitute a service as well as a sales force, and the co-operation they are able to offer is frequently of no small importance in the securing of preliminary estimates and in consultation as to the practical economies possible.

The Association itself, is maintained by these members as a vital and necessary extension of their individual organizations, to carry on collectively those important services which make for efficiency and economy and are alike beneficial to the users and producers of granite generally.

Carving and Models

Granite can be carved with the same delicacy of treatment and detail as much softer and less durable stones. The pneumatic carving tool in the hands of a skilled granite carver has made it possible and practical to carve granite to almost any extent desired.

In the preparation of details and models for granite carving, three points should be considered; the color and texture of the granite; location in the building as to distance from the eye; and location as to sunlight.

Color and texture regulate to a material extent the decorative value of the detail produced. Delicate detail

would generally be wasted on a coarse grained granite with strongly contrasting mineral constituents.

In a fine grained light colored granite, or a granite of light, nearly uniform tone regardless of grain, delicate details would appear more nearly in their true relative values.

Distance from the eye should obviously regulate the character of detail and treatment, both from the aesthetic and economic viewpoints.

Location as to sunlight is generally the least considered point of all.

The relative light and shade values of different exposures should regulate to some extent the character of detail and mass.

With the assurance that granite may be carved to almost any extent desired, it lies chiefly with the architect and modeler to get the best results with the greatest economy.

Standards of Quality

It will be noted under "Physical and Chemical Tests" that these standard building granites come well within all possible requirements of architectural use, so that standards of material are unnecessary. The cutting properties of the granites from different quarries vary quite materially and it would be very difficult to define standards of workmanship.

Quality of workmanship has been graded by usage into three classifications, which, while somewhat elastic and difficult to define exactly, are pretty well established and recognized by the manufacturers.

Monumental Building Grade—For permanent buildings designed to perpetuate public pride or civic spirit, where utility and economy are subordinate to architectural merit, such as state house, courthouse, library or public memorial.

Good Commercial Grade—For high class buildings designed both for utility and to express something of the character, dignity and stability of the occupancy, such as banks or insurance buildings, high class office buildings, churches, schools, etc.

Ordinary Commercial Grade—For buildings where architectural appearance is subordinate to utility and governed by economic considerations. Workmanship will meet requirements of structural safety, but not carried beyond the point of a good appearance to the casual observer.

Booklet of Color Plates

The Association has published a 24-page booklet, titled "Architectural Granite," which contains twenty-one color plates of some of the principal building granites produced by Association members.

These color plates serve a two-fold purpose—they give at a glance some idea of the great range in colors and textures available in standard American granites, and they also serve as preliminary samples for making preliminary selections for specific jobs, thereby avoiding the necessity of securing actual samples until final selection is to be made.

When color in granite is under consideration it should be borne in mind that, as a rule, polishing produces a darker tone and brings out the color of each component mineral crystal, while a hammered finish gives a much lighter tone to the granite and softens the colors of the contrasting minerals.

This booklet, "Architectural Granite," is a reprint of our catalogue in the twenty-first edition of SWEET'S ARCHITECTURAL CATALOGUE and will be sent on request to any one desiring a copy for their files.

Modern granite methods permit a delicacy and richness of detail once thought adaptable only to softer stones.

There is such a wide range of colors and textures available that a granite may always be selected which best fulfills both the esthetic and economic requirements.

STUDIES IN GRANITE PLATE XXV

Designing in Granite

The use of granite is frequently restricted because of excessive cost as compared to other stones. The cost of most jobs in granite need not be prohibitive if certain fundamental facts are taken into consideration by the specification writer and designer.

The customary insistence upon uniform color and texture often adds unnecessary expense. Substantial savings may be effected if the natural range of tone and texture, characteristic of most quarries, is permitted, eliminating only too obvious and sharply defined deviations such as unsightly knots and clearly defined stripes.

The simplification of mouldings, eliminating unnecessary members and unimportant minor details will reduce cost materially. A study of the section on "Granite Mouldings" on the next page and the Member Chart on second page following will be pertinent in this connection.

The finer surface finishes are often specified where the coarser finishes would be as good or better and considerably less expensive. For certain types of buildings, especially in combination with other materials, rock face and the pointed finishes may be successfully used at reduced expense. The treads of steps and platforms, as a safety measure, should never be finer than four-cut and machine pointed is even more practical.

Beds and joints constitute a surprising percentage of the total cutting cost. Elimination of superfluous labor here will also materially reduce cost. Specifications requiring bush-hammered edges and unnecessary fullness add unnecessary expense. $\frac{1}{4}$ in. joints should be the minimum allowance for even the highest grade of monumental building work. On work of coarser texture and finish, allowances of $\frac{3}{8}$ in. and even $\frac{1}{2}$ in. are reasonable and on more massive masonry, such as bridge or rock faced work, even larger joint allowances are both good practice and more economical.

Before a superior material, such as granite, is ruled out because of supposed prohibitive cost, even greater latitude in stock, finish and jointing should be permitted, with their consequent and material savings, than might be expected and necessarily accepted in a lesser material which would otherwise be substituted.

Innumerable minor details, studied from the viewpoint of economical production in granite, will increase the gross savings possible. A few are mentioned here as typical examples, and a study of Drawings No. 2 and 3 will suggest others.

Internal angles cut on the solid are more expensive than a straight run-by bond.

Allow at least 2 in. between top of concrete and bottom of steps to obviate bedding off steps.

Area copings may well be finished with four-cut or machine pointed top and rock face. Omit rabbet for grills and substitute iron brackets. Eliminate lock joints and substitute dowels.

Avoid projections on courses which might otherwise be sawed or machine surfaced.

Detail rustications, checks, rabbets and sinkages to take fullest advantage of carborundum saw cutting.

Joint cornices to save stock and cutting labor.

Avoid raised seats on balustrade base and substitute round for square plinths on the balusters.

Eliminate the need for guess work and chance taking in the plans, details and specifications and ensure close estimates on the actual work required thereby.

Detailing for stone, regardless of whether it is to be granite, marble or limestone is responsible for much of the extra cost in granite. Best results will be secured if details are specifically made for granite. The Association can render real service here.

Sand Blast Carving

The attention of architects and designers is directed to a recently developed method for producing ornament on granite by use of the sand blast process. The use of this process has been developed to a considerable degree in the granite memorial industry but has not as yet been applied in the architectural building field.

It is the purpose here to briefly present its possibilities, believing that progressive architects and designers will recognize at once its aesthetic and economic significance. It seems quite possible that herein lies a means for developing a distinct type of ornamentation for modern American structures.

This process may appropriately be termed the intaglio process, as it engraves or etches into the flat surface of the granite, in clean cut intaglio, ornament having a quality and distinction out of all proportion to its cost to produce.

The architectural building field offers far greater latitude for its application and further development than the memorial field. To adapt this process to the building field and to create appropriate designs it is essential that the process itself, its scope and limitations be fully understood.

The Process—This process has been well termed a "harnessing of the sand storm," controlling it at will to the creation of unique and beautiful ornament. The cutting medium is a white silica sand driven by compressed air at very high velocity under absolute control of a skillful operator.

The face of the stone to be "blown" is protected by a special composition, termed "glue" or "dope" by the trade, and this blanket of "dope" is cut away to form, in effect, a stencil of the ornament to be carved. This ornament is etched into the exposed granite to the depth desired in a remarkably short time, and removal of the "dope" reveals a remarkably clean cut intaglio, with its unique texture and beauty impossible to duplicate by any other means.

This, in brief, is the process, but there are many variations in technique, and combinations of blowing, re-doping and re-blowing by means of which a skilled operator may produce effects in shading, variable depth and texture which have unrealized possibilities of development.

Application to Architectural Ornament—Space here is too limited to reproduce some of the many beautiful applications developed in the memorial field, or to illustrate suggestive architectural applications. The process and type of ornament produced is especially adaptable to the embellishment of otherwise plain, flat surfaces, and herein lies its especial adaptability to modern American architecture.

Classic forms may readily be conventionalized and adapted to execution by this process in intaglio, or new forms created utilizing the deeply etched line alone or in combination with various forms of surface sinkages. It is especially adapted for running ornament, panels, embellishment around door and window openings or reveals, vertical or horizontal delineations without projection, inscriptions and countless other applications.

While the sinkage is relatively slight as compared to regulation carving, the sharpness of its cuts and the unique tone and texture of its surfaces in contrast with hammered or polished surfaces produce remarkable effects, which can not be duplicated by any other method.

The Association will be glad to co-operate with any architect or designer who may desire to utilize this form of ornament, and who will necessarily require more detailed information. It certainly offers very interesting possibilities.

Granite Mouldings

The cutting and finishing of mouldings on granite work is almost exclusively a hand process. No practical machine has yet been devised which will do this work and eliminate the more expensive hand work.

In limestone and marble, machine processes are almost universally utilized on moulded work, and here lies one of the most essential differences between the cutting of granite and of the softer stones.

The pneumatic tool, during recent years, has materially facilitated the hand cutting process, making it possible to produce the most delicate and intricate detail of moulding or carving at costs materially less than would otherwise maintain. The fact remains, however, that until the right machinery is devised, the cutting of granite mouldings will continue to be a hand process and their cost one of the principal factors in the total cost of granite work.

As the hand process is relatively more expensive than an equivalent machine process, it can be readily seen that a knowledge of the essential facts and relative cost factors is very valuable in the preparation and study of economic granite details.

The simple illustration shown below will visualize the purpose and use of the chart of granite mouldings, illustrated on Drawing No. 1 in determining the relative "cost importance" of adding or eliminating moulded members when detailing granite work.

In estimating the cost of cutting granite mouldings the so-called "Member System" is generally used. In this system each moulded section is divided into "members." A moulded "member" is a more or less arbitrary unit in which the edges, contour and changes in direc-

tion of the surface between edges, and the width between edges is taken into consideration. The determination of the number of "members" in a moulded section is a combination of rule and judgment.

The Association "Member Chart" (Drawing No. 1) represents the combined judgment of several experienced granite estimators, and is in effect an average, based upon experience with a number of granites of variable cutting qualities. The Chart is designed for approximate comparisons of relative cost in the study of moulded granite details, and is not intended as an exact basis for estimating cost in any particular granite.

"Studies in Granite"

A series of plates entitled "Studies in Granite" is being prepared and published by the Association for the information and use of architectural designers, draftsmen and students of architecture.

These plates cover a wide range of subjects and the details illustrate both the interesting architectural features and something of the granite construction in each case. The projects illustrated have been in most cases designed by contemporary architects of standing and actually executed in granite. The original architectural drawings and the actual granite shop drawings have been used in the preparation of these plates, making them accurate delineations of the work as executed.

A typical plate is illustrated in this catalogue. The series now numbers twenty-five plates, which will be sent, upon request, in a file size portfolio, to architects and others interested in the use or design of granite work.

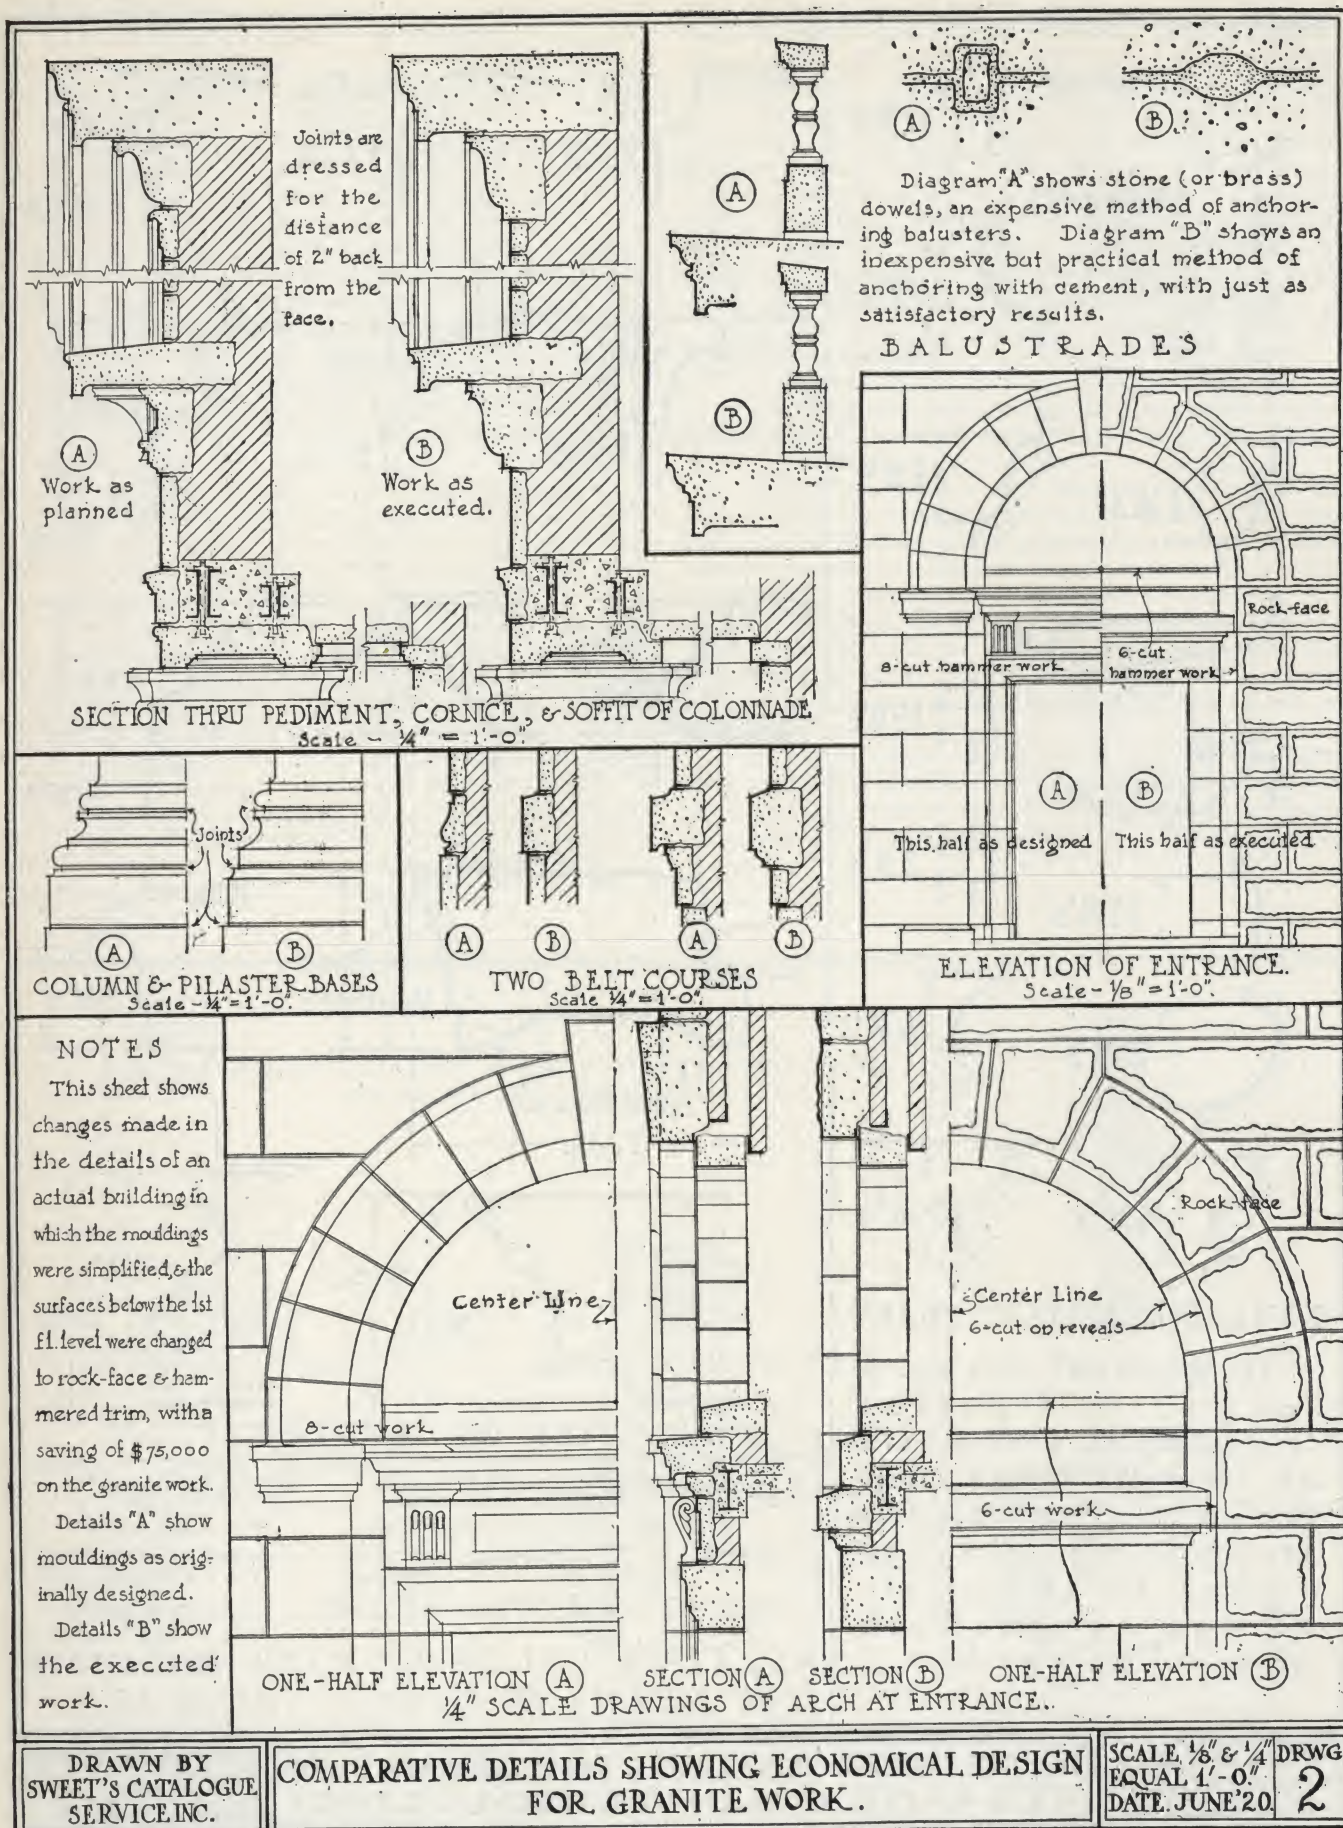

BASIS OF COST UNIT—One lineal foot of moulded member equals one square foot of plain work.

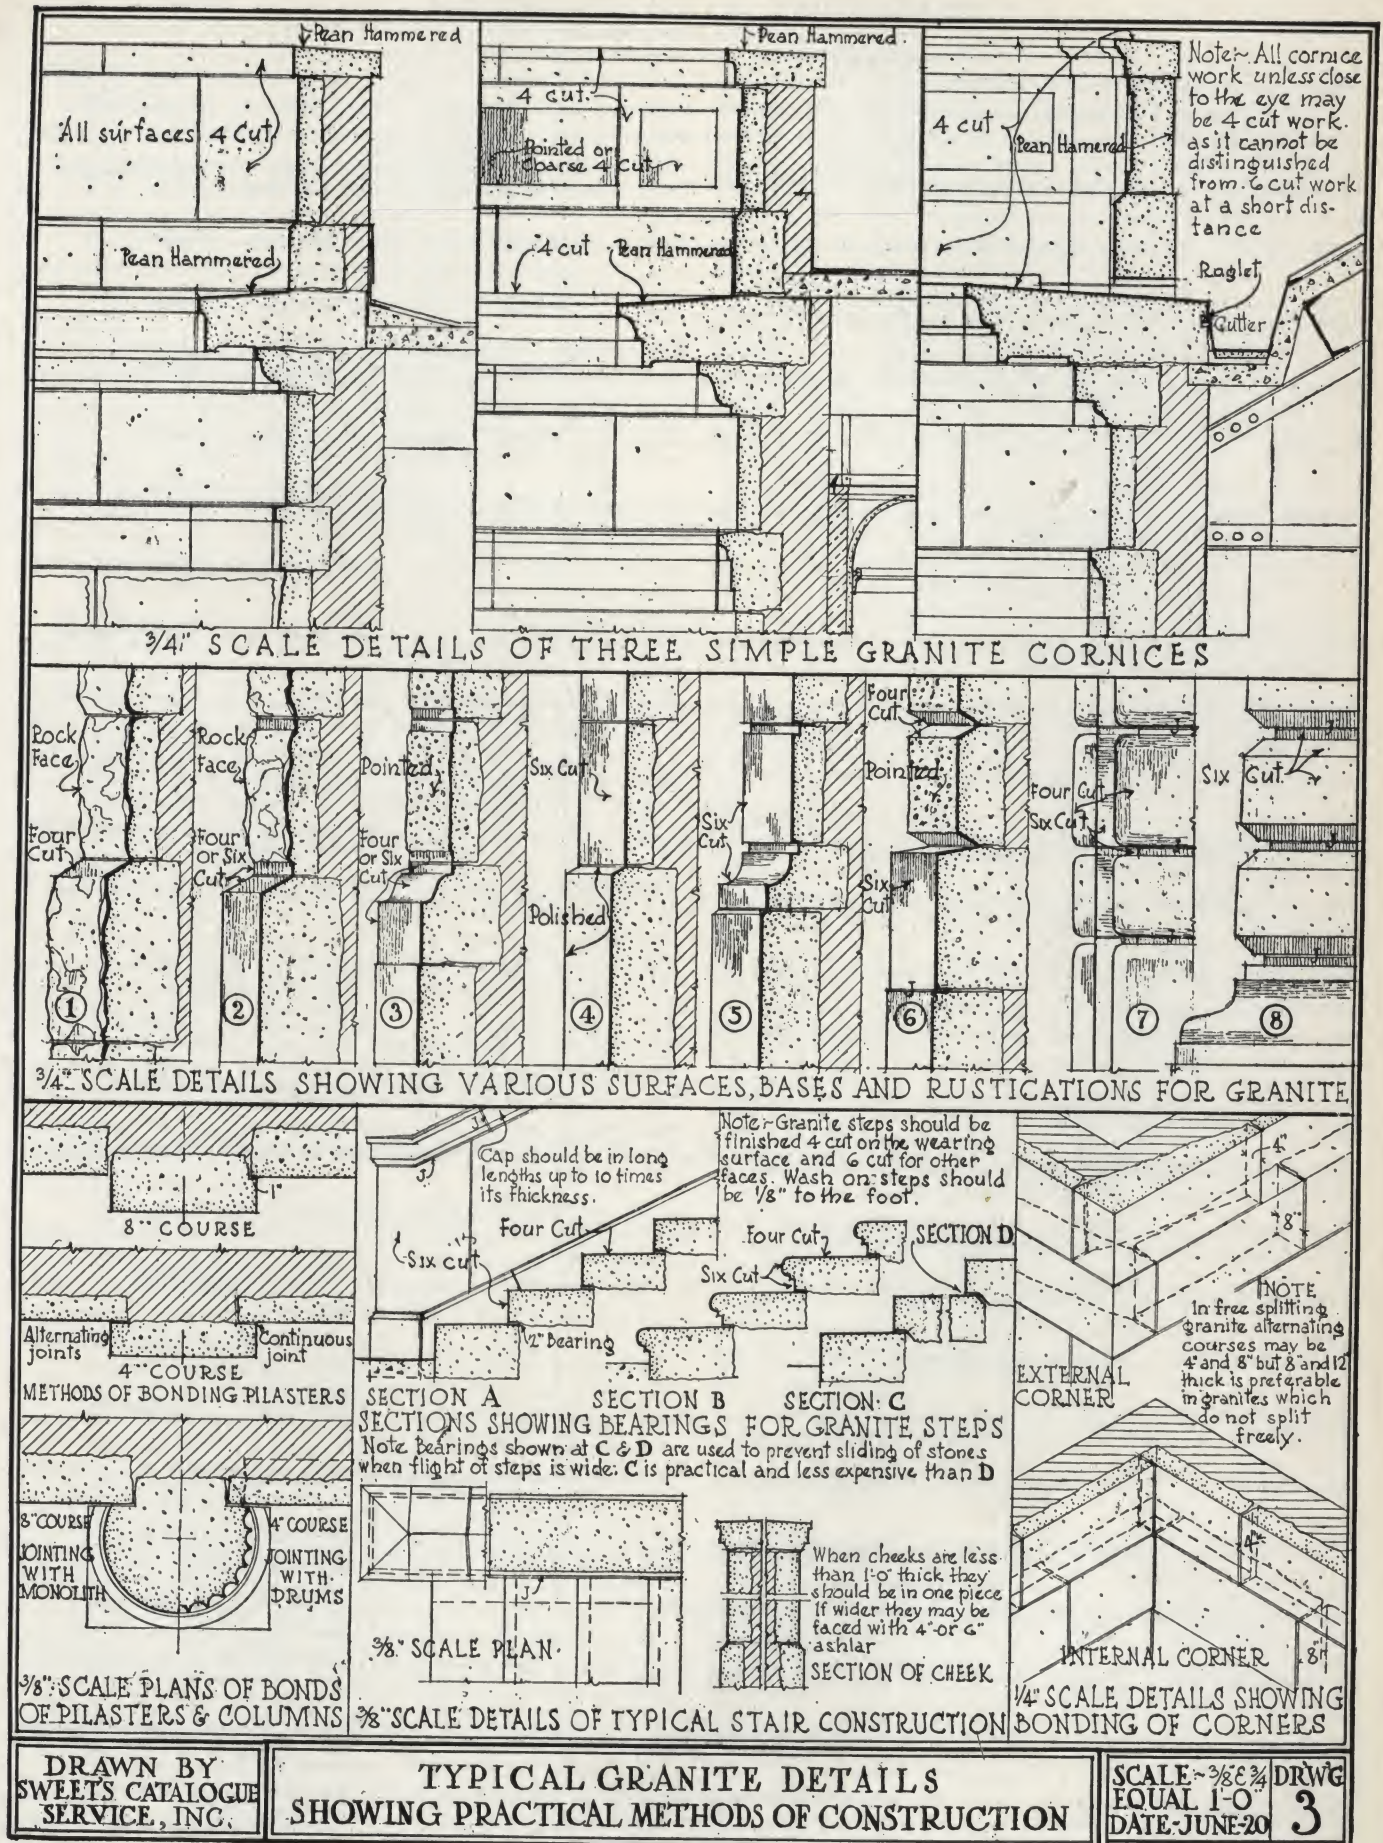

EXAMPLES ILLUSTRATING THE RELATIVE COST IMPORTANCE OF MOULDED MEMBERS IN TERMS OF PLAIN WORK

CLASSIFICATION OF BUILDING GRANITES

Quarried and cut by Association Members
White, Gray, Lavender, Pink, Red, Green, Buff, Brown

Name of granite	Producer and manufacturer	Location of quarry	Grain	Color	Technical classification
Bethel White	Woodbury Granite Co., Hardwick, Vt.	Bethel, Vt.	Coarse inclined to medium	White faintly mottled with gray...	Quartz-monzonite
Mount Airy	North Carolina Granite Corp., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray....	Biotite
Mount Airy	North State Granite Co., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray....	Biotite
Mount Airy	Mt. Airy Granite Cutting Co., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray....	Biotite
Mount Airy	J. D. Sargent Granite Co., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray....	Biotite
Chelmsford White.....	H. E. Fletcher Co., West Chelmsford, Mass.	West Chelmsford, Mass.	Medium	Very light gray....	Muscovite-biotite
North Jay	Maine & New Hampshire Granite Corp., North Jay, Me.	North Jay, Me.	Fine	Very light gray....	Biotite-muscovite
Chelmsford Gray	H. E. Fletcher Co., West Chelmsford, Mass.	West Chelmsford, Mass..	Fine	Light gray	Muscovite-biotite
Milford, N. H.	Lovejoy Granite Co., Milford, N. H.	Milford, N. H.	Fine inclined to medium	Light gray	Quartz-monzonite
Concord	John Swenson Granite Co., Concord, N. H.	Concord, N. H.	Fine to medium..	Light to medium gray	Muscovite-biotite
Connecticut White....	Booth Bros. & Hurricane Isle Granite Co., 208 Broadway, New York, N. Y.	Waterford, Conn.	Fine	Medium buff gray, hammers light....	Quartz-monzonite
Westerly Blue-White..	New England Granite Works, Inc., Westerly, R. I.	Westerly, R. I.	Fine	Bluish gray	Quartz-monzonite
Barre (Light, Medium and Dark).....	Marr & Gordon, Inc., Barre, Vt.	Barre, Vt.	Fine to medium..	Light bluish gray, medium bluish gray and dark bluish gray	Biotite
Woodbury Gray	Woodbury Granite Co., Hardwick, Vt.	Woodbury, Vt.	Medium	Medium gray	Biotite
Rockport Gray	Rockport Granite Co., Rockport, Mass.	Rockport, Mass.	Medium to coarse.	Medium gray, slight bluish green tinge	Hornblende
Chelmsford "Bulfinch".	H. E. Fletcher Co., West Chelmsford, Mass.	West Chelmsford, Mass.	Fine to medium..	Light grayish buff..	Muscovite-biotite
Somes Sound	Booth Bros. & Hurricane Isle Granite Co., 208 Broadway, New York, N. Y.	Mt. Desert, Me.	Coarse inclined to medium	Light grayish buff..	Biotite
Goss Pink Deer Isle...	John L. Goss Corp., Stonington, Me.	Crotch Island, Stonington, Me.	Coarse	Pinkish, lavender tinted, medium gray	Biotite
Conway Pink	Maine & New Hampshire Granite Corp., North Jay, Me.	Redstone, N. H.	Coarse	Light pink mottled with large gray and small black spots	Biotite
Jonesboro	Booth Bros. & Hurricane Isle Granite Co., 208 Broadway, New York, N. Y.	Jonesboro, Me.	Coarse inclined to medium	Pinkish gray	Biotite
Red Westerly	New England Granite Works, Inc., Westerly, R. I.	Westerly, R. I.	Medium inclined to coarse.....	Reddish gray, speckled with black...	Biotite
Moose-a-pec Red	Rockport Granite Co., Rockport, Mass.	Jonesport, Me.	Coarse	Dark reddish gray with white and pinkish feldspar..	Biotite
Ausable Mottled-Green.	Marr & Gordon of New York, Barre, Vt.	Ausable Forks, N. Y.	Coarse	Light grayish green, coarsely mottled with black and bluish spottings..	Anorthosite
Rockport Sea-Green...	Rockport Granite Co., Rockport, Mass.	Rockport, Mass.	Medium to coarse.	Dark olive-green-gray with black spottings	Hornblende
Conway-Green	Maine & New Hampshire Granite Corp., North Jay, Me.	Redstone, N. H.	Coarse	Dark yellowish-greenish-gray with black spottings...	Biotite-hornblende
Rockport Seam-Face...	Rockport Granite Co., Rockport, Mass.	Rockport, Mass.	Medium	Dark yellow-brown, bright rust-brown, light yellow-brown	Hornblende

Surface Finishes

The surface finishes most frequently used for granite on building work, arranged in the approximate order of their relative cost, are:

Rock-faced, pointed, pean-hammered, four-cut, six-cut, eight-cut, rubbed, honed and polished. These terms are frequently misunderstood and sometimes misapplied.

The following brief description of finishes most generally used is therefore given:

Rock Face—Generally the least expensive finish, but with decorative as well as utilitarian value.

The relative cost varies with the grade of work required.

The grades vary from ordinary split or quarry face ashlar with split or roughly squared beds and joints, to carefully quarried faces having practically uniform projection, and with joints and arrises as carefully and accurately cut as for hammered work, and sometimes with rusticated or tooled margins.

Pointed Work—Coarse, medium, fine and machine pointed are the four general distinctions for pointed work, with many special types for certain texture effects.

Hand pointing and machine pointing differ slightly in general appearance, machine pointing being generally more uniform. Special pointing is generally more expensive than the standard grades. In general the point depressions in fine pointing will be approximately $\frac{3}{8}$ in. apart, medium and machine pointing $\frac{5}{8}$ in. to $\frac{3}{4}$ in., and coarse pointing 1 in. to $1\frac{1}{4}$ in.

Where special pointing is required, a sample should first be prepared under the architect's supervision. Beds, joints, and arrises will conform to the character of use and grade of pointing.

Pean-hammered—Adapted to rougher work such as steps, curbings, house or mill sills and thresholds, or to portions of high class work not exposed to the eye. Pean-hammering is coarser and less regular than four-cut and the point marks are not entirely eradicated by the axing.

Four-cut, Six-cut, and Eight-cut—These finishes are produced by bushing with the patent "bush-hammer." This is a hand-hammer with patent head having two opposite jawlike openings about $\frac{7}{8}$ in. wide, into which are firmly bolted sets of 4, 6 or 8 cutting blades as the case may be.

Four-cut work is frequently and erroneously specified as 4 cuts to the inch. Actually the four-cut hammer leaves nearer five cut marks to the inch, as 4 cutting blades are clamped into a $\frac{7}{8}$ -in. jaw; six-cut and eight-cut are likewise incorrectly specified as 6 cuts to the inch or 8 cuts to the inch.

In bush-hammered finish the resultant surface has the appearance of being uniformly corrugated to the fineness determined by the number of cuts used, but while the bushing is kept parallel and in the required direction the bush marks are not necessarily continuous or mechanically precise.

Six-cut and eight-cut finishes are simply continuations of the four-cut process, each finer hammer being used consecutively until the required finish is reached.

Pneumatic surfacing machines are also used for bushing, especially on all larger surfaces, following practically the same routine as required for hand bushing. Sawed surfaces are also bushed under the surfacing machines, in which case much of the preliminary preparation is avoided.

Ten-cut and Twelve-cut—These finishes are also produced, but less frequently used on regular building work, being more applicable to small memorials or special work.

Texture and character are emphasized by the coarser finishes.

Rubbed and Honed—Produced by grinding a pointed or sawed surface under the polishing wheel. The grade of rubbing is determined by the extent to which this grinding is carried and the abrasive used; from coarse-rubbed, with small surface scratches, adapted to work requiring fine smooth finish but not close to the eye, to honed finish, which is the last stage just before glossing, with velvet smooth surface, practically free from scratches.

Polished Finish—Produced by glossing, under a heavy, felt coated wheel, a surface previously rubbed and honed. A durable and mirrorlike polish requires that the grinding and glossing processes be carried to their extreme stages, leaving a surface free from scratches, dull spots, or indications of "stun marks" from the tooling.

Under modern methods practically every standard granite may be polished to a satisfactory gloss, suitable and durable for most ordinary requirements. Generally the harder granites and those containing the least mica content take the best and most durable polish.

Hand Polishing—Small surfaces and mouldings generally have to be rubbed, honed or polished by hand at considerable extra expense over machine work or cut work of similar character. On work where cost is the dominant factor portions necessitating hand rubbing or polishing should be avoided wherever possible.

Selecting the Finish

The following general suggestions will indicate methods of selection, which depend on the type and design of building, color and texture of the granite, location and atmospheric conditions.

Large scale work: rock-face, pointed and the coarser cuts. Small scale work: the finer cuts.

Rock-face, pointed, pean-hammered, and four-cut for economy, and rock-face and pointed for decorative effect in conjunction with hammered work and other materials.

Six-cut for average work, combining economy with good architectural effect.

Polished for base courses, portions subject to traffic stain, lower stories where exposed to smoky atmosphere, and for decorative effect.

Rubbed or honed where fine finish is required and for softened tone and texture effects.

Polished finish is practically impervious to stain or weather. Fine finishes will keep clean longer than coarser finishes, particularly where subject to atmospheric dirt and dust.

The possibilities of combining different grades of finish are almost unlimited, and combinations of different granites are used extensively with splendid architectural results.

Standard Grades of Surface Finishes

The half-tone reproductions on the next two pages illustrate the standard grades of surface finishes most commonly used on exterior building granite work. The reproductions are full size and have been prepared from a standard light gray granite but are much darker than the actual granite to bring out more clearly the different finishes.

The relative cost of the different finishes runs approximately in the same order as the reproductions are numbered, with rock-face as the less expensive and polished as the most expensive.

Full-sized reproductions prepared from a standard light to medium granite of fine to medium grain

Granite Specifications (Complete Form)

Section 1. General Conditions—All work included under the specifications for granite is to be subject to the general conditions hereinbefore written for the entire work.

Section 2. Material—All granite shall be of compact structure, hard and practically non-absorbent, and equal in durability and strength to the best granite of the kind required. Granite shall be (mention color, tone and grain) and of the kind designated as (mention name) granite from quarries at (mention location). Granites designated as (mention names and quarries), will also be considered. In submitting estimates, the contractor shall state the name of granite, and quarry, upon which his proposal is based.

Section 3. Quarry and Plant—Granite must be obtained from approved, well-known quarries having capacity and facilities for furnishing the quantity, sizes, and quality of granite required, and the cutting and finishing must be done by firms properly equipped to produce the finished material without causing delay in the progress of the work.

Evidence to this effect must be submitted if required by the architect.

Section 4. Quality—All the granite shall be selected to meet the requirements of these specifications and shall be absolutely sound and free from seams or other defects which would impair its strength.

Exposed surfaces shall be free from spots, stain, discoloration, knot formations, spalls, chips or other defects, which would impair the appearance of the work, except that in inconspicuous places a reasonable number of knot spots or texture variations inherent to the particular granite proposed may be permissible if samples showing the maximum of such characteristics be submitted to, and approved by, the architect.

In quarrying the granite the blocks shall be so selected that any variations in color permitted by the architect will be uniformly distributed throughout the exposed surfaces of the walls and other portions of the work.

If granites from different quarries are used such granites shall be similar in texture and shall satisfactorily match in color and tone throughout the work.

Section 5. Work Included—The work to be done by the contractor under the heading of Granite shall include the furnishing, delivery and setting in place and completion of all granite work as required by the drawings and herein specified.

The work generally shall include (state portions of work to be of granite).

Note: State any portions or special features which are not to be of granite or not to be included in this contract.

Section 6. Shop Drawings—The granite contractor shall prepare all necessary shop drawings, showing the bedding, bonding, and jointing of all the granite work and typical and special anchoring of same. The dimensions and setting number of each granite stone shall be indicated upon the drawing which shall be submitted and approved by the architect as required under general conditions. No cutting shall be done or work completed except from shop drawings which have been approved by the architect.

Section 7. Corner Stone*—The granite contractor shall furnish and set where indicated on the drawing (or as directed) a corner stone of the required dimensions, having an inscription cut thereon in accordance with the drawings and recessed to receive the copper box to be furnished by the (general contractor).

Section 8. Samples—After the award of the contract 2 samples of each kind of granite required 8 by 8 by 2 in., showing the extreme variation in quality, color and texture that will occur in any granite which will be used, shall be submitted to the architect. Upon approval of these samples, one of each shall be returned to the granite contractor for use at the quarry or plant and the other retained by the architect for comparison with work at the building. Samples shall be dressed on the face and one edge to show finish required by the specification; opposite face may be split or dressed to the approximate size called for or may be dressed to another of the specified finishes called for.

Section 9. Finishes—The exposed surfaces of the granite shall be dressed as indicated on the drawings or specified herein.

In general, surface finishes shall be as follows: From 2 in. below grade to level (state level or course) shall be dressed

*If required.

with best (state finish—as polished, six-cut, eight-cut) work; from level (state level) to level (state level) shall be dressed with best (state finish) work; and from level (state level) to top of parapet shall be dressed with best (state finish) work.

Note: State here any exceptions to the above such as "treads of steps or platforms shall be finish"; "back of parapet and coping courses shall be finish," etc.

The cut marks of all bush hammer work shall be vertical except as noted.

Soffits shall be bushed at right angles to the face.

Faces of key blocks and voussoirs shall be bushed (state whether vertical or radial).

Top surfaces of window and door sills, steps, copings, washes and projecting courses shall be bushed at right angles to the nosing.

Moulded surfaces shall be bushed parallel to the direction of the mouldings.

Note: Mention other specific instructions on direction of bushing.

Section 10. Cutting—All exposed surfaces must be out-of-wind, free from waves, projections or depressions and faces of granite in the same plane must be absolutely flush at joints. Arrises must be cut sharp and true to square or pattern and continuous with adjoining arrises.

Slight inequalities which may occur in setting shall be trimmed to the proper surfaces and refinished equal to the original finish.

Section 11. Beds and Joints—Beds shall be horizontal and shall be cut full and square for a distance of at least 2 in. back from the face, from which point they may fall off not to exceed 1 in. in 12 in.; and shall be reasonably free from large depression and cuppings, which might impair the stability of the work.

Joints shall be dressed at right angles to the face for at least 1½ in. back from which point they may fall away, not to exceed 1½ in. in 12 in.

Backs of granite stones shall be scabbled or split to approximate vertical surfaces which shall not vary more than 1 in. in 12 in. from the true vertical, nor vary more than 1 in. either way from the thickness called for on the drawing.

Section 12. Jointing—The jointing of the granite work shall be as shown on the drawings and no additional joints will be permitted except upon written consent of the architect. The joints shall be uniformly ¼ in. in thickness.

Section 13. Bonding—The bonding of various portions of the work shall be as shown on drawings. Alternate courses of granite shall bond at least 4 in. with the backing except where otherwise shown. No granite stone shall have less than 4-in. bed; projecting courses shall have beds equal to the projections unless otherwise shown. Where brick backing is required the granite shall not go closer than 4½ in. to the inside of the brick wall. Where granite facing occurs at grades it shall extend nowhere less than 4 in. below grade unless otherwise shown.

Section 14. Reveals and Returns—Reveals of all openings, unless otherwise shown shall be cut solid without vertical joints. Returns shall be not less than indicated on the drawings.

Mitering of granite stones at corners will not be permitted.

Section 15. Mouldings—Granite stones forming continuous moulded courses shall be of uniform profile on the face with continuous unbroken lines absolutely flush at the joints and with the surfaces free from projections or depressions and out-of-wind.

Section 16. Washes and Drips—All exterior projecting granite stones and all exterior sills, steps, platforms, coping and other stones with exposed top surfaces, shall be cut with a wash on top. Where other work is built upon such granite stones, they shall be cut with raised seats and lugs to form level beds for work built upon them.

All projecting granite stone, such as sills, cornices, copings, etc., shall have a groove drip cut on the underside unless otherwise detailed.

All exterior door sills shall be cut with raised thresholds unless otherwise shown.

Section 17. Miscellaneous—Mouldings and projections must not be subjected to pressure; and granite stones having projecting members which have weight of any kind bearing upon the upper surface shall have seats cut to bear such weights; and in all cases the edges of mouldings or projections must be kept free from pressure.

Specifications (Continued)

Reglets shall be cut for flashing and counterflashings as required.

Section 18. Models—Full size plaster models of all ornamental and carved work, shall be furnished to the granite contractor as hereinbefore specified.

Where necessary for the proper execution of the work, models will be delivered at the plant of the granite contractor free of expense to him, to be used by him for the purpose of roughing and such carving as may be done at the plant, the granite contractor to carefully preserve these models for re-shipment to the building if required. The expense of handling and re-crating for shipment at the plant to be borne by the granite contractor.

Section 19. Roughing for Carving—No roughing for carved work is to be done from drawings but from approved models only. Sufficient stock in all cases shall be left for the carving and the granite shall be roughed to suitable form and condition for the carver. The cutter and carver shall co-operate in the method of securing the proper roughing for ornamental work.

Section 20. Carving*—Carving may be done at the site either before or after the granite is set or the work may be delivered at the site already carved.

In case the carving is done at the plant or at the site before being set in place, this contractor shall do all necessary refinishing or retouching to make the carving conform to the models and to the satisfaction of the architect. All carved ornament shall be executed by hand by skilled carvers in a spirited and artistic manner and in strict accordance with the approved models.

Where carving is done after the work is set all necessary staging and protection shall be furnished by the general contractor, and if required the models shall be hoisted into position and properly secured to the scaffolding for the convenient use of the carvers by the general contractor.

Inscriptions, lettering or numerals if required shall be clean cut and in accordance with the models, if provided, or otherwise with the full sized details of same. The incised surfaces of lettering shall be cut smooth and accurately to the full depth and section shown on the models or drawings.

Section 21. Crating and Shipping—This contractor shall properly crate the finished granite, for shipment, the crating being so constructed as to properly protect the edges and surfaces of the exposed portions of the work during shipment and handling prior to setting same. Due precaution shall be taken to use crating material which will not stain or discolor the exposed surfaces of granite; and especial care shall be used to protect and suitably note any delicate portion where extra care should be observed in handling.

The finished granite properly crated shall be carefully loaded for shipment by this contractor who shall exercise all necessary precautions in loading to withstand the usual hazards in transit.

Section 22. Precaution Against Stain—Special precautions shall be taken in the setting to guard against possible seepage through the joints of moisture from the mortar or material used in backing up the granite work, which will cause discoloration around the face joints or surface of the granite.

At least 12 hours before the granite is set, all surfaces not exposed shall be thoroughly coated with an approved damp-proof compound to within 1 in. of the exposed face. After the granite is set, and before backing up, another coat of the same dampproofing compound shall be applied to the back for the special purpose of covering the backs of the mortar joints.

The painting of the granite may be omitted with the approval of the architect when it is definitely known that the setting mortar will not stain the granite, but the backs of the mortar joints should be dampproofed in any event to guard against seepage.

If the first coat of dampproofing is applied at the mill, the setting numbers must be painted conspicuously over the damp-proofing.

The granite shall at all times be protected from stain and upon delivery at the site shall be kept stacked on timber or platforms at least 4 in. above the ground, until set in place in the wall.

Under no circumstances shall salt be used for thawing out lewis-holes or otherwise in connection with the granite work.

*Note: If carving is to be done by others than the granite contractor same should be noted here—and this specification modified to suit conditions.

Section 23. Setting—Each granite stone shall be brushed clean and drenched immediately before being set. Each piece shall be carefully bedded in a full bed of non-staining mortar and tapped home with a wooden mallet to a full and solid bearing.

The face of the granite work shall be kept free from mortar at all times.

Granite facing shall not in any case be built up more than two courses ahead of the backing and no stone having a greater width of bed than the one below it shall be set until the lower course is backed up.

All surplus mortar shall be immediately raked out to a depth of at least 1 in. and every precaution taken to prevent stones bearing upon the edges.

Sills, etc., subject to pressure, shall be bedded only at the ends.

The cement in the mortar used for setting all granite work where the joint is exposed to the weather shall be made waterproof with a satisfactory waterproofing compound, mixed with the mortar.

The sand used in all setting mortar shall be such as to cause no stain or chemical action with the cement.

Section 24. Anchors, Dowels, etc.—All bolts, expansion bolts, anchors, ties, etc., required in the setting of the granite work, will be furnished to the granite contractor.

All ashlar shall be anchored to the backing with heavily galvanized wrought iron anchors $\frac{3}{4}$ by $1\frac{1}{4}$ in. turned down into the granite $1\frac{1}{4}$ in. and extending into the backing 8 in. if the thickness of wall permits; the end to be turned up $1\frac{1}{2}$ in. into the backing. There shall be at least two anchors to every stone whose length exceeds its height and in general there shall be not less than two anchors to each superficial square yard of ashlar.

Note: Special anchoring for heavy cornices and overhanging courses, cramps, dowels, etc., for parapets, balustrades, pilasters, and columns, etc., should be suitably described or shown according to the requirements of the work.

Section 25. Boxing and Protection—All granite work must be protected from damage during the progress of the work and until the completion of the building.

The general contractor shall provide the necessary protection, covering all projections, top surfaces, angles, etc., protective boxing to be securely fastened in position and securely nailed throughout with galvanized iron nails. No lumber or material to be used which would in any way stain or deface the granite work.

All necessary forms, centers, scaffolding, etc., required by the setter or carver to be furnished by the general contractor.

Section 26. Pointing and Cleaning—After the completion of the granite work or at such time thereafter as all liability from stain of other operations on the building is passed, and when there is no danger therefrom, the whole of the granite work shall be carefully cleaned down, removing all dirt, mortar, stains, and other defacements.

The use of wire brushes, acids or solutions which might cause discoloration will not be permitted.

All face joints shall be raked out to a depth of not less than 1 in., brushed clean, thoroughly wetted, and filled with pointing mortar and then carefully jointed. The pointing mortar must be packed solidly into all joints, completely filling the same; and the form of joint shall be as directed by the architect.

Vertical joints in the top courses of uncovered cornices having a projection of 8 in. or more shall be filled with mortar by grouting to within 3 in. of the top of the granite, then calked with picked oakum and filled with molten lead, calked against the edges and slightly convex at the top—taking care that the oakum is kept at least 2 in. away from the face and top of granite.

Joints in the upper surfaces of projecting stones which are not so protected and in all platforms, steps and coping, shall be raked out at least 2 in. deep and thoroughly grouted flush with the surface of the granite.

Pointing and cleaning shall start at the top and be continued until such work is completed.

Section 27. Defective Work—No patching or hiding of defects will be permitted. Defective granite stones shall be replaced with perfect ones, except in extreme cases where a stone has been damaged through no fault of the granite contractor, and where it is possible and practicable to remedy the defect without in any way impairing the appearance, strength or durability of the work—and then only with the approval and under the supervision of the architect—and where a satisfactory allowance has been agreed upon which shall be deducted from the contract price.

Specifications—Short Form

The following short form of Granite Specifications has been prepared by the Association for use where a comparatively small amount of granite is required, but where the standards of workmanship and other essentials should conform to the same requirements set forth in detail in the complete form printed on the two preceding pages.

(1) **Work Included**—The work to be done shall include the furnishing, delivery, and setting of all granite work required by the drawings and specified herein. (State portions of work to be of granite and note any exceptions about which there might be any question.)

(2) **Material**—The granite shall be sound and of good quality, free from defects which would impair the strength, durability, or appearance of the work, and equal to the approved sample. In estimating, the contractor shall state the name of granite and quarry, upon which his proposal is based. The following granites will be considered: (mention color, tone and grain) granite from (mention locality).

(3) **Samples**—Submit in duplicate, for the architect's approval, samples of the granite showing the extreme variation in quality, color and texture to be used under the contract, and showing the specified finishes. (State size of sample required.)

(4) **Shop Drawings**—The granite contractor shall prepare all necessary shop drawings, showing in detail the jointing, bonding, and construction of the granite work, and special anchoring. These shall be submitted to and approved by the architect before any cutting is done.

(5) **Finishes**—The exposed surfaces of the granite shall be finished as indicated on the drawings or specified herein.

Note: State finishes desired.

(6) **Cutting**—All exposed surfaces shall be out-of-wind, free from waves, projections, or depressions, and flush at the joints. Arrises shall be cut sharp and true to square or pattern, and continuous with adjoining arrises.

(7) **Bed and Joints**—Beds shall be cut full and square for at least 2 in. from face, and may fall off not to exceed 1 in. in 12 in., reasonably free from large depressions. Joints to be full and square at least 1½ in. from face, falling off not to exceed 1½ in. in 12.

(8) Backs of granite shall be scabbled or split to approximately vertical surfaces.

(9) Jointing shall be as shown on approved drawings, and ¼ in. in thickness.

(10) **Bonding**—Shall be as shown on approved drawings, with no bed less than 4 in. Projecting course shall have beds at least equal to projection, unless otherwise shown.

(11) **Mouldings**—Shall be cut with uniform profile throughout their lengths, in conformity with full size details, with lines true and straight, and flush at joints.

(12) **Washes and Drips**—Washes shall be cut on stones whose top surfaces are exposed, unless otherwise shown. Projecting stone shall have groove drip cut on underside.

(13) Raised seats or lugs shall be cut where stone work rests on projections or washers, and raised thresholds shall be cut on exterior door sills.

(14) Reglets shall be cut for flashing where shown or required.

(15) **Models**—Full size plaster models of all ornamental and carved work shall be furnished to the granite contractor, who shall preserve these models for re-shipment to the building, if required.

(16) **Roughing**—For carving shall be done from approved models only, leaving the stone in suitable form and condition for the carving.

(17) **Carving**—All carved ornament shall be executed by skilled carvers, in a spirited and artistic manner, and in strict conformity with the approved models.

(18) **Crating and Shipping**—The finished granite shall be properly crated for shipment, to protect the surfaces and edges of all exposed work.

(19) **Precaution Against Stain**—Precaution shall be taken at all times to protect the granite from stain.

(20) Under no circumstances shall salt be used for thawing out lewis-holes, or otherwise in connection with the granite work.

(21) (If dampproof painting is required, specify requirements here.) After setting, the backs of all mortar joints shall be suitably dampproofed to prevent moisture from the backing seeping through the joints.

(22) **Setting**—The setting of the granite work shall be done by competent, experienced stone setters, and in strict accordance with the approved drawings and specifications.

(23) Each granite stone shall be brushed clean and thoroughly drenched immediately before setting and carefully bedded in a full bed of non-staining mortar. The granite facing shall not be built up more than two courses ahead of the backing, and the faces shall be kept free of mortar at all times.

(24) All surplus mortar shall be immediately raked out to a depth of at least 1 in. Sills, etc., subject to pressure shall be bedded only at the ends.

(25) Where a joint is exposed to the weather, it shall be made waterproof by mixing a satisfactory waterproofing compound with the mortar.

(26) The sand used in all setting mortar shall be such as will cause no stain, or chemical action with the cement.

(27) **Anchoring**—The granite shall be anchored to the backing with galvanized iron anchors, ¼ in. by 1¼ in., turned down into the granite 1¼ in., extending 8 in. into the backing if possible, and turned up into the backing 1½ in. There shall be two anchors to each stone whose length exceeds its height and, in general, not less than two anchors to every superficial yard of ashlar. All anchors, bolts, ties, etc., shall be furnished to the granite contractor.

Note: Special anchoring for heavy cornices, and overhanging courses, cramps, dowels, etc., for parapets, balustrades, pilasters, columns, etc., should be suitably described or shown according to the requirements of the work.

(28) **Boxing and Protection**—All the granite work shall be protected by the general contractor during the progress of the work and until the completion of the building. No lumber or material shall be used which will in any way stain or deface the granite work.

(29) **Centers and Scaffolding**—All necessary forms, centers, scaffolding, etc., required by the setter or carver, will be furnished by the general contractor.

(30) **Pointing and Cleaning**—After all liability from stain or damage from other operations on the building is passed, the granite work shall be carefully cleaned, removing all dirt, mortar stains and other defacements. The use of wire brushes, acids, and solutions which might cause discoloration, will not be permitted.

(31) All face joints shall be brushed out, thoroughly wet with clean water, and carefully pointed as directed by the architect.

Note: See Long Form for special treatment of vertical joints in uncovered cornices, and joints in upper surfaces of projecting stones.

(32) **Defective Work**—No patching or hiding of defects will be permitted. Defective stones shall be replaced with perfect ones, unless otherwise directed by the architect.

NEW ENGLAND GRANITE WORKS, INC.

WESTERLY, R. I.

BRANCH OFFICE: 12 East 41st Street, NEW YORK, N. Y.

REPRESENTATIVES

PHILADELPHIA, PA., EDWARD A. JEFFERY, 34 South 16th Street
PITTSBURGH, PA., JAY R. WELLS, 302 Commonwealth-Annex Bldg.

CLEVELAND, OHIO, H. L. WALTERS Co., 406 The 2341 Carnegie Bldg.
MIAMI, FLA., J. E. STAMM, Box 632

Westerly Granite

Westerly Granite is offered as the finest material for higher class buildings and monumental effects. Adapted to any finish and resisting the ravages of time and weather, it is especially recommended where excellence of workmanship and permanence are desired. Westerly Granite is available in several colors, red, blue, gray and pink. All are capable of hammered or polished finish and are especially desirable where carved ornament or letters are used.

Westerly Granite is wrongly considered high priced. Our facilities allow us to offer this exceptional material at prices comparable with many softer stones. Considering the quality of material and workmanship which Westerly offers, prices are very moderate.

Other Granites

Concord Granite, a light gray, medium fine grained granite, is available where heavy construction or large quantities make the use of Westerly granite inadvisable.

It is low in cost and available in practically unlimited quantities.

Deer Isle Granite is a light pinkish-gray coarse grained granite likewise available in large quantities and at reasonable cost.

Quincy Granite, dark gray, medium grained, is available for polished work where a near-black effect is wanted.

Quarries and Plant

We have ample quarry facilities for procuring all of the above granites, and complete manufacturing plant and equipment for the finishing of building granite of

every description. We are unusually equipped to handle polished work and turned work in large sizes and large volume. Our employees are skilled at their craft and the reputation of Westerly for the highest grade of workmanship is jealously maintained.

The location of our plant, at Westerly, R. I., on the main line of N. Y. N. H. & H. R. R., permits quick freight deliveries to all points and our loading facilities enable cars to be loaded without delay.

Organization

We maintain a complete organization for the planning and supervision of building work. We are always willing to confer with architects on preliminary costs, economical construction and practical specifications and we will gladly furnish samples showing colors and finishes.

We are a member of the National Building Granite Quarries Association and we refer to their display of granite reproductions and typical construction and specification to be found in this catalogue.

MOUNT AIRY GRANITE CUTTING COMPANY

Mount Airy, N. C.

Products

DIMENSION GRANITE for Buildings, Mausoleums, Monuments, Bridges, Dry Docks, etc.

POLISHED and TURNED GRANITE.

GRANITE PAVING BLOCKS, STREET CURBING, CROSS-WALK, RUBBLE, CRUSHED GRANITE and RIP RAP.

The Association and Its Object

The aim of this Association is to jointly promote the use of Mount Airy granite for all purposes where granite is adapted.

The individual members will co-operate with architects, engineers, contractors or owners in matters relating to the use of granite, samples, specifications, estimates, etc.

Quarry Production

The quarries were first opened in 1889, the first shipment being made in July, 1890; the output for that year being 135 carloads and has increased rapidly to a maximum output of 3500 carloads in one year.

Owing to the natural advantages peculiar to the Mount Airy quarries, Dimension Stone of unusual size is easily obtained, the only limit being that of railway transportation.

Facilities

The Mount Airy quarries are located one mile east of the Town of Mount Airy, N. C., and have 70 acres in exposed granite area.

Cutting plants and offices are located at the base of

the Mount Airy quarries and are equipped with the latest improved machinery for the manufacture of granite, including electric traveling cranes, polishing machinery and turning lathes with individual motors, sand blast and carborundum machines, also compressed air for the pneumatic surfacing machines and hand cutting tools.

These plants, taken together with the unlimited supply of rough granite available, enable large contracts to be executed in quick time.

World War Memorial Erected at Tenafly, N. J.

Geographical Location

The Mount Airy quarries are well situated in reference to shipping, being about an equal distance from New York City, New Orleans and Chicago; which fact guarantees a reasonable transportation cost on their material to points throughout the East, South and Middle West. These quarries are served by the Southern Railway and have a nearby connection with the Norfolk & Western Railway.

Moulding and Carving

Owing to the composition of Mount Airy granite, it is especially adapted for fine moulding, carving and sculpture work, as is attested by reference to the following:

Pennsylvania State Monument, Gettysburg, Pa.

Column Capitals of the North Western Life Insurance Building, Milwaukee, Wis.

Column Capitals and Panels of the Municipal Building, New York, N. Y.

Colors and Texture

Mount Airy granite, "*The Granite of Individuality*," is a very light gray, almost white, biotite granite of medium texture. Feldspar, quartz and mica characterize the granite megascopically.

The feldspar is nearly white, while the quartz is a blue gray and the mica black and very evenly distributed, giving an appearance of decided strong character when hammer dressed.

The composition of Mount Airy granite is indicated by the following Chemical Analysis:

SiO ₂	70.70
Al ₂ O ₃	16.50
Fe ₂ O ₃	2.34
MgO	0.29
CaO	2.96
Na ₂ O	4.56
K ₂ O	2.45
FeS ₂	0.09

Total 99.89

Weight per cu. ft.	165 lbs.
Water absorbed per cu. ft.	0.33 lb.
Crushing strength.....	23,068 lbs. per sq. in.

From Bulletin No. 2, page 155; North Carolina Geological Survey, "The building and ornamental stones of North Carolina."

JOSEPH HYDE PRATT, State Geologist.

Estimates and Samples

A complete organization is maintained by each member of this Association for furnishing estimates, setting plans, details, etc., on short time.

Preliminary estimates cheerfully furnished on request of architect or contractor. Samples of Mount Airy granite will be furnished on request, and advice as to grade or style of finish desired.

Complete Information on Granite

For detailed information, including complete granite specifications, see the pages of the National Building Granite Quarries Association in this volume.

Product

GOSS PINK DEER ISLE GRANITE, for polished, tooled, hammered, pointed or rock-faced work, in buildings, memorials, mausoleums and monuments.

Trade-name

Deer Isle granite has been used for many years under that name and various others, such as Greens Landing, Stonington Pink, Maine Pink, Crotch Island, Deer Island, and many more, and has been produced by a number of quarries operating in the Deer Isle district from time to time.

A Blast in the Quarry

This moved the 2000-ton block shown about 6 in. from its natural bed. It is now ready to be cut into convenient sizes for shipment.

The Crotch Island quarry of JOHN L. GOSS CORPORATION was opened in 1870, and has been operated continuously to this day. Thorough development insures the same high quality of stock for years to come. To distinguish the product of this one quarry from that of all others, the name "Goss Pink Deer Isle" was adopted.

Service Available

The rough granite is shipped to finishing plants in all parts of the country, which are equipped to furnish all classes of work. Any responsible dealer or cutting yard can give quotations on work to be executed in this material. A large number of plants carry stocks on hand, and the quarry always stands ready to supplement these with prompt shipments of any sizes, shapes or quantities. We will be pleased to assist architects and builders to get in touch with the finishing plants best situated to handle any particular project.

Facilities for Production

The natural advantages of the quarry site—a free working formation, so located that the product travels the short distance to our tidewater dock by gravity—are supplemented by the best of modern equipment, derricks, compressors, air tools, etc., which are being constantly improved, replaced and kept up-to-date.

This makes it possible to give prompt deliveries on large or small orders, and to furnish monoliths of any size that may be desired. We ship by water directly

from our own dock to seaport cities, or deliver to the railroads at Rockland or Portland, Me.; Boston, Mass.; Philadelphia, Pa., or Wilmington, Del.

Color and Texture

Natural scale color plates are shown on following page. Polished surfaces when used in a building appear somewhat darker than as reproduced, while hammered work appears lighter. Polishing brings out all the colors of the various mineral constituents, and produces a surface not readily stained or soiled. Hence it is especially adapted to use in base courses adjacent to the sidewalk. The polish is permanent. Hammering blends and softens the coloring, and tones down the striking character of the natural markings.

Compressive Strength

Tests by the United States Ordnance Department give a compressive strength of 23,620 pounds per square inch. This is well above all structural or code requirements.

Advantages

Goss Pink Deer Isle granite can be specified "flat" without losing the advantages of competition. The rough granite represents only a small part of the cost of the finished work. It is not difficult to obtain as many figures as may be desired from manufacturers who compete with each other.

Goss Pink Deer Isle Granite is especially desirable for use in combination with other materials. The warm delicate shade harmonizes with almost all other building materials, such as brick and limestone. It lends itself equally well to bold rock-face work or tooled and carved details.

It is a peculiar characteristic of this granite that it retains its freshness for a long while, and does not readily become soiled or discolored. This is a very useful factor in and around cities where there is an excess of soot and smoke.

Producers of Granite
WEST CHELMSFORD, MASS.

Products

CHELMSFORD WHITE GRANITE.
CHELMSFORD GRAY GRANITE.
CHELMSFORD "BULFINCH" GRANITE.
MILFORD (N. H.) GRANITE.

DIMENSION, CUT, RUBBLE and CRUSHED GRANITE for buildings, bridges, roadways, sea-walls, docks and dams.

DIMENSION GRANITE, in carloads for mausoleum and monumental work.

PAVING BLOCKS, CURBING, SEWER INLETS and CRUSHED GRANITE for municipal work and for "FLETCHERMIGHT" pavement.

Chelmsford White Granite

A grayish-white granite which weathers well and is widely used for building and bridge work.

Chelmsford Gray Granite

A well-known standard light gray granite for building and memorial work.

Weathers equally as well and is finer grained than Chelmsford White.

Both granites, when bush-hammered, are almost unequalled in retaining their light, almost white color even after years of exposure.

Chelmsford "Bulfinch" Granite

A varied light grayish-buff colored granite used for many years in Colonial structures. A notable example is University Hall, of the Harvard University group at Cambridge, Mass., designed by Bulfinch and built in 1813. This famous building stands today, an example of the splendid weathering qualities of Chelmsford Granite. Chelmsford "Bulfinch" Granite has been used in recent additions to this group.

Paving Blocks and Curbing

We are one of the principal producers of paving blocks and curbing, and make a specialty of delivering curbing on the street in correct position for setting and in the shortest possible time.

"Fletchermight" Pavement

We are presenting to the attention of the public a new pavement, called "Fletchermight" after a vote by the road builders of America. This is designed for heavy motor traffic on main trunk highways, and is protected by patent No. 1,573,923, Feb. 23, 1926. The sketch at right shows the general construction and use of granite curbing with this pavement.

Facilities

Nearly fifty years of expert quarry development has produced free quarry faces containing millions of feet of clear granite, all available for immediate quarrying under numerous derricks. With unexcelled railway facilities, and adequate cutting plant, this means that the largest contracts can be easily and promptly handled. We do no polishing work at this plant, but are in a position to furnish saw blocks to polishing plants for quick delivery.

Organization and Service

Our organization has been built up of men having long experience in granite production and includes business, traffic and technical experts who have made intensive study of the requirements for giving satisfaction and service to purchasers of our products.

The H. E. Fletcher Quarry at West Chelmsford

THE SMITH GRANITE COMPANY

WESTERLY, R. I.

NEW YORK OFFICE, 12 East 41st Street

Product

WESTERLY GRANITE in all shades, rough and finished for public and private memorials, mausoleums and monumental work of every kind.

Westerly Granite

For eighty years Westerly Granite has been quarried and worked by this organization. Throughout this period it has been recognized as one of the best granites in the world where monumental effects are desired. Its hardness, strength and imperviousness to weather give it a permanence of construction and appearance greater than obtainable with any other building material. Westerly granite is obtained in several shades, all of which are well adapted to regular or special hammered finish or to rubbed, honed or polished finish.

Blue-White Westerly Granite

—Is fine grained bluish white granite enlivened by very fine grains of black mica. It is especially adapted to fine hammered work and well executed lettering and ornament.

Pink Westerly and Cream-White Westerly Granites—Differ only in shade of coloring, a medium pink and a delicate creamy white not obtained in any other granite. Both are especially fine grained and very hard, and are used mainly where fine detail and finish are desired in lasting effect. They can be worked practically to the perfection obtainable in marble, and yet they give to

the memorial that fundamental requirement, permanence.

Red Westerly Granite—Is a medium grained granite reddish-gray when hammered and medium red when polished. It is adapted to the larger types of monumental work and bolder ornament. There is no better material for special finishes and antique tooling such as may be used in Celtic work.

Facilities

THE SMITH GRANITE COMPANY owns and operates at Westerly, R. I., quarries producing all colors of Westerly granite, and a modern cutting plant equipped with all types of machines and manned by craftsmen skilled in the production of the finest in granite work. Quarries and plant on the same property permit operation at highest efficiency.

Extensive setting equipment and expert setters are available for the erection of work in cemeteries or public grounds.

Fenwick L. Peck Mausoleum, Dunmore Cemetery, Scranton, Pa.

Service

THE SMITH GRANITE COMPANY offers a complete organization to handle the memorial, monumental and mausoleum work of the highest quality—unexcelled material, adequate quarries, careful execution, expert erection, unified control and supervision.

Estimates and samples are gladly furnished and correspondence or consultation on preliminary work is invited.

QUARRIES: ROCKPORT, BAY VIEW AND PIGEON COVE, MASS.; JONESPORT, ME.

Products

ROCKPORT GRAY (Light, Medium and Dark), ROCKPORT SEA GREEN and MOOSE-A-BEC RED GRANITES for the better class of buildings and memorials.

SEAM FACE GRANITE for residences and churches. Also Granite for bridges and sea-walls; Granite Paving Blocks and Crushed Stone.

Rockport Granite

Rockport Granite—"The Granite of Character"—is a true hornblende granite, resembling in composition the Egyptian granite of which the ancient obelisks and sarcophagi were built. It is strong beyond all possible requirements, and is decidedly hard and tough. It is remarkably free from impurities, is practically impervious to moisture or stain, and will withstand indefinitely the action of frost and weather.

One of the outstanding qualities of Rockport Gray and Rockport Sea Green Granites is the exceptionally high and durable polish which they take, due largely to the hornblende in their mineral composition.

Rockport Gray Granite—Is available in light, medium and dark gray shades, with a medium to coarse and even grained texture.

Rockport Sea Green Granite—Has practically the same physical properties as the gray. In color it is dark olive green, spotted with black. It is especially beautiful in polished finish, although used extensively for hammered work as well.

Moose-A-Bec Red Granite—Is a beautiful dark reddish gray, biotite granite, with a mixture of white and pinkish feldspars. It has a coarse, even grained texture, and takes a beautiful polish. While slightly more expensive than the gray or green, its coloring makes it very desirable where a richly colored granite is wanted.

Rockport Seam Face Granite—Is available in a mixture of light to very dark reddish, rusty browns, and makes wonderfully attractive ashlar work for residences, churches, etc. Unlike most seam face granites, the color runs deep into the stone and it can therefore be used for headers, sills, steps, etc., as well as for ashlar surfaces.

Facilities

The plants and quarries, comprising more than 800 acres, are located at Rockport, Bay View and Pigeon Cove, Mass., and Jonesport, Me. The company also owns its own docks, and a fleet of vessels, including sloops, schooners, barges, towboats, and lighters. With facilities for both rail and water shipment, the company is in an exceptional position to render first class service, both to seacoast and inland points.

In the several quarries are located forty large power derricks, many of which are of 75-ton capacity and over. Drilling is done with modern appliances using compressed air or steam. The quarries and plants at Rockport, Bay View, and Pigeon Cove are interconnected by rail and heavy capacity motor trucks.

The cutting plants are well equipped with modern tools and appliances, pneumatic tools and drills, pneumatic surfacing machines, lathes, etc. The large modern polishing plant is completely equipped with polishing wheels, polishing lathes and pendulum polishers.

In normal operation, from 600 to 800 men are employed by the Company.

Color Reproductions, Samples and Estimates

The color reproductions of our granites, on the following page, are submitted for preliminary selections. They are full size as to texture, and approximate as to color. Samples will be furnished to architects on request. Opportunity is solicited to submit prompt and reliable estimates from plans and specifications.

THE JOHN SWENSON GRANITE CO.

Concord Granite

CONCORD, N. H.

BRANCH OFFICES

NEW YORK, N. Y., 101 Park Avenue

CHICAGO, ILL., Marquette Building

Products

SWENSON'S CONCORD GRANITE.

SWENSON'S ANTIQUE GRANITE.

ROUGH OR FINISHED GRANITE for buildings and memorials.

Swenson's Concord Granite

Our Concord Granite is a warm toned, light gray granite of fine to medium grain. It is technically known as "muscovite-biotite" granite, and the soft, brownish color of the small muscovite particles adds warmth to the general tone of the finished granite.

According to Geo. P. Merrill, Curator of Geology, U. S. National Museum, one of the remarkable features of Concord Granite "aside from its color, texture, and freedom from flaws, pyrite and other injurious constituents, is the remarkable ease with which it can be worked."

Swenson's Antique Granite

This variety of our Concord Granite is a blending of buff and gray, giving that warm antique appearance one associates with old ivory. It is available in reasonable quantities and architects who have used it are enthusiastic about it.

Strength and Durability

Watertown Arsenal tests give Concord Granite a crushing strength of 30,830 lb. square to the rift and 23,860 lb. parallel to the rift.

Geo. P. Merrill, referring to the Concord State House and Old State's Prison, erected of Concord Granite in 1816-1819 and 1812, respectively, states that "both buildings are in admirable state of preservation, and evidently, so far as the stone is concerned, good for centuries to come."

Facilities

Our quarries have been in active operation for over 60 years and have been developed and equipped for large scale production.

Our cutting plant is one of the most up-to-date in the country; modern machinery, the pick of skilled workmen, due to exceptionally healthy working conditions, and a fast working granite ensure prompt and economical production.

Prices and Service

Reasonable prices, good workmanship and service to our customers have been the policy on which our business was founded and built up. Our offices at Concord, New York and Chicago are always prepared to render every possible service. Samples, showing finishes desired, will be furnished on request. Estimates and consultations upon economical use of granite furnished without obligation.

New Hampshire Savings Bank Building,
Concord, N. H.

J. D. LELAND Co., Architects
Exterior of Concord Gray Granite

Recommended Finishes

For general building work we recommend our Concord Granite in six-cut finish for lower portions and four-cut for upper work. For base courses, subject to traffic stain, polished finish is most practical. All the standard finishes, including rock-face, are adapted to this granite.

Sand Blast Carving

We are experienced and equipped for sand blast work. For a general description of this recently developed process and its architectural possibilities, see the catalogue of the National Building Granite Quarries Association in this section of Sweet's.

Producers of "Shastone" Special Granites

97-115 Harrison Place and 96-114 Ingraham Street

BROOKLYN, N. Y.

Products and Services

"SHASTONE" GRANITES for building exterior work, memorials, mausoleums and monuments.

FOREIGN GRANITES from Norway, Sweden, Finland and Labrador.

GRANITE CUTTING and SHAPING.

POLISHING, a specialty.

"Shastone"

The world's selected granites, foreign or domestic, noted for their beautiful colors, flawlessness, durability and all other fine qualities which make their use adaptable for highest grades of monumental and architectural purposes.

The illustration is a reproduction of the famous American Radiator Building, situated in the heart of New York. The use of "Shastone Black" at the base and first three stories, added so much to the external beauty of this modern cathedral of commerce.

"Shastone" polished granites have demonstrated their ability to resist the action of the elements in any climatical condition, are non-absorptive and non-staining. They are therefore specially commendable for all exterior decorative work and memorials, which are subject to dust and dirt.

The trade-mark shown above is a guarantee for quality and genuineness. Every stone that leaves the firm's yards bears the "Shastone" trade-mark.

Polishing

"Polish Expresses the Beauty of Granite."

It is the genuine polished surface of granite that is the effective means of preservation and preventive of surface deterioration against the action

of the elements and staining from dust and dirt.

Shastone Polishing Plant—Our polishing plant is one of the largest in the world. It is equipped with every imaginable device for the production of a high class polish. Our polishing machines, singularly devised by our engineering department, cannot be surpassed by any other polishing machines in the world and have made it possible for us to bring down the cost of polishing equal to that of ordinary hammering.

The cost of polished granites for exterior decorative purposes which hitherto has been almost preventive has now been decidedly moderated and has therefore popularized their use.

The cost of polished granites for exterior decorative purposes which hitherto has been almost preventive has now been decidedly moderated and has therefore popularized their use.

Colored Granites

We carry in stock both foreign and domestic granites of a large variety of colors (white, black, gray, red, green, etc.).

We are prepared to furnish all details, descriptions, prices and recommendations on the special requirements of any architect or contractor.

Location and Shipments

Conveniently located in Brooklyn, we are able to make prompt deliveries in any quantities, as required. We are also prepared to make shipments to any part of the country. We furnished the granite for numerous buildings all over the United States and Canada.

Architect's Service

We are at all times prepared to co-operate with the architect in his problems and will cheerfully furnish estimates on work contemplated or in construction.

American Radiator Building

RAYMOND M. HOOD, Architect

The exterior work at the base and first three stories of this modern cathedral of commerce is "Shastone" Black Swedish Granite as specified by the architect. It harmonizes and is an integral part of this example of modern structural design

THE DOLBEN QUARRIES

Weymouth Seam Face Granite

DOLBEN & COMPANY

7 Water Street, BOSTON, MASS.

QUARRIES AT WEYMOUTH, MASS.

Products

SEAM FACE GRANITE ASHLAR.

SPLIT FACE GRANITE ASHLAR.

Also, Seam Face Flagging and Stepping Stones; Special Stones for Arches, Lintels and Sills, cut according to drawings; Jambs, Quoins, Steps, Copings, etc., of special sizes for trimming walls faced with ashlar.

Facilities

The facilities of this company are adequate to handle operations of any kind.

Nature of Stone

A true granite of great strength, found in nearly upright sheets of various thicknesses. Seams between these sheets provide faces for the blocks into which the stone is cut. Permanent in texture and color.

Split face granite is produced by splitting blocks after quarrying. Surface is generally a little rougher than seam face. Splits evenly and requires no dressing or pointing.

Colors of Stone

The range of colors is large, with a wonderfully beautiful golden gray predominating.

Colors range from light gray to dark brown and purples. Color of split face granite is warm gray.

Sizes

The blocks are produced in varying sizes.

The faces range from 5½ to 14½ inches in height, from 8 to 36 inches in length, and from 4 to 8 inches in thickness.

Uses and Cost

The natural stone for churches, country residences and public buildings, it can be obtained in whatever texture and color desired at moderate prices.

Wise Centre Building, Cincinnati, Ohio
FECHHEIMER & IHORST, Architects

Method of Laying

Reference to the illustrations on the following page shows that our seam face granite is especially adapted to three and four-head ashlar work, and equally well to coursed ashlar.

The quarry cost per square foot is the same for either method of laying, but laying cost is lowest for coursed ashlar and highest for three-head.

Estimates and Samples

Estimates and samples are gladly given to architects, owners and contractors, as well as advice regarding style of finish.

Sample walls in seam face and split face ashlar are shown and described on the following page.

COLD SPRING GRANITE COMPANY, INC.

FORMERLY ROCKVILLE GRANITE COMPANY

Quarriers and Producers of Granite

COLD SPRING, MINN.

QUARRIES: ST. CLOUD GRANITE DISTRICT and MORTON, MINN.

Products

MINNESOTA PEARL PINK GRANITE.
COLD SPRING RAINBOW GRANITE.

Uses

Building facings, doorways, window trim, stairways, sills, flagging, columns, abutments, mantels, fountains and other structural and memorial purposes.

Minnesota Pearl Pink Granite

Pleasing color tones run from black through gray to light shell pink and work well into most color schemes. Hammered finishes produce a warm gray tone.

Physical Properties—Weight, 175 lb. per cu. ft. Crushing strength, 20,000 lb. Modulus of rupture, 2000 lb.

ABSORPTION TEST MINNESOTA PEARL PINK GRANITE
4-23-24 to 4-30-24

Weight air dry, grains	Weight after immersion of one hour, grains	Weight after immersion of one day, grains	Weight after immersion of one week, grains	Total gain in weight, grains	Per cent gain
1944	1945.5	1945.5	1945.5	1.5	.07

The weight is the same after a week as it is after an hour. Gain in weight appears to be due to surface moisture only; no moisture being absorbed.

CHEMICAL ANALYSIS OF MINNESOTA PEARL PINK GRANITE

Silica	62.15%	Lime	2.27%
Alumina	19.41%	Phosphorus13%
Iron oxide	2.99%	Magnesia	trace

Cold Spring Rainbow Granite

A warm general tone running from dark gray through deep green to flesh pink—an unusually beautiful color combination. No striking contrasts but a perfect blend of varying tones. Exceptional for columns.

Physical Properties—Weight, 185 lb. per cu. ft. Crushing strength, 23,000 lb. Modulus of rupture, 3042 lb.

Qualities

Both granites are extremely hard and take beautiful high polish or rough finishes. Readily decorated and beautiful effects are secured by carving, sand blasting and other methods of ornamentation.

Because of the peculiar natural properties, modern facilities can produce unusually thin slabs for facings. Slabs 1 to 2 in. thick are as durable and as effective as thicker slabs, and reduce freight and handling costs. The 2-in. polished granite show window bases for store fronts originated with this concern.

Both granites endure for ages without losing luster, beauty or finish, and grow more beautiful as time passes. There is no disintegration, scaling or splitting.

Production

Quarries using efficient modern equipment operate the year around. The drilling and broaching system is used instead of blasting, to prevent shattering of stock.

Sizes possible are only limited by the restrictions of railroad transportation.

The plant, largest in the Mississippi Valley, is one of the best equipped in the industry.

Granite is sawed, instead of chiseled or hammered, to prevent disturbance of the crystalline formation.

Step, flagging and base course material can be produced at lower prices with a sawed finish. The result is similar to that of a 4-cut hammer and is more suitable for steps than the slippery finer finishes.

Delivery

Located in the central part of the United States on the Great Northern Railway, shipments can be readily made to any part of the country.

A supply of polished slabs from 1 in. thick up is kept on hand at all times for immediate shipment.

Service

The organization combines men of lifelong experience in the granite and cut stone field with men trained in engineering and architecture. This assures rapid assimilation of the architect's ideas and prompt preparation of setting plans and details.

Sales offices are maintained at Chicago, Cleveland, St. Louis and Minneapolis by direct representatives trained in granite construction work.

Inquiries and requests for estimates, quotations, references and samples are welcomed. A new 26-page folder containing architectural sketches, installations and product information will be sent on request.

MEMORIALS of all kinds in GRANITE, MARBLE and BRONZE, ranging from monumental pieces of public interest to the simplest of private tributes.

Mortuary Art

Individual tastes are as diversified as the art itself but, whether the desired effect is dignified elegance or impressive simplicity, we are truly prepared to serve the best interests of our clients in an efficient and able manner.

Design and Architectural Departments

Wide experience in our field has fitted us to offer design suggestions, sketch studies, etc., and we are glad to co-operate with the architect by placing the facilities of these departments at his disposal.

Construction and Erection Facilities

Eighty years of "knowing how," careful personal supervision, and our complete and extensive cutting facilities enable us to set and maintain a high standard of workmanship and design.

The Harrison plant is electrically equipped and contains all the modern tools and appliances necessary to the production of well-finished, artistic monuments.

Our erection facilities are of the best and this work is entrusted only to those who have demonstrated their ability to grasp and execute the lofty concept of the architect who designed the monument they are to build.

ASHLAR, in Seam Face and Split Face Granite.

FLAGGING and STEPPING STONES, in Seam Face Granite.

Seam Face Ashlar

The geological formation of our material is unique in that the rock mass has been sheared and tipped, so that it now stands in vertical sheets. The seepage of vegetable and mineral solutions through the seams between sheets has produced a wide range of coloring on the faces of the seams ranging from the natural gray through buffs, tans, yellows, greens and browns to a very dark brown and dusty purple.

By using the face of the seams as the exposed face of the stone in the building, a very interesting texture and coloring is obtained, and since these are the result of natural causes, a permanent and natural effect of age is immediately obtained on new construction together with the feeling of strength characteristic of granite.

The seams in the quarry have in no way affected the strength of the granite, which together with the fact that our granite is practically non-absorptive, make it an ideal building material.

Split Face Ashlar

Our Split Face Ashlar is obtained by splitting the blocks and using the split face as the exposed surface. The texture is somewhat rougher than Seam Face, but is not a rock face in any sense.

Although the variation in color is not as wide as

in Seam Face, the Split Face colorings, ranging from the grays through the light tans and buffs to the light browns, give life and warmth to this material.

Where Seam Face and Split Face Granite Can Be Used

Plymouth Quarries product, both Seam Face and Split Face, can be used for all purposes for which ashlar is suitable: walls, both exterior and interior; jambs; lintels (if not too large); slip sills; steps, etc. See detail drawings on third page following.

Flagging for Indoors and Out and Stepping Stones

Flagging and stepping stones can be obtained only in Seam Face. The surface is sufficiently smooth to be very suitable for both interior flooring and for garden walks, etc., and has all the variety of color of the ashlar.

Allow at least 5 in. for bed and flagging.

Thickness and Height of Ashlar

The beds of the Seam Face and Split Face ashlar are from 4 to 8 in. thick. In height it is generally used from 4 in. to 1 ft. 1 in. rises, though higher rises can be obtained, if desired, in limited quantities.

Cost of Ashlar

The natural seams in this formation together with our organization and equipment enable us to produce a granite ashlar at a minimum cost, so that we can compete with local stone over a very extended area.

Quarriers, Producers and Setters of Granite

WEST TOWNSEND, MASS.

Products

SPLIT FACE GRANITE ASHLAR.

WEST TOWNSEND PINK GRANITE for all building work of any size.

Also Seam Face Granite Ashlar.

Split Face Granite Ashlar

This material, specially suited for exteriors of churches and residential work, is produced in a variety of colors from gray to pink and brown, and when set in the building bears a warm tone. This material taken as the run of the quarry makes a very fine color combination.

West Townsend Pink Granite for Building Work

Takes a fine hammer and finish with a slight pink cast. It is specially suitable for all work where a warm toned granite is desired.

The quarries have been under continuous operation since 1900 and an unlimited supply is in sight, with a complete and efficient plant for the production of any size job.

Special Service for Architects

We are equipped to serve architects who desire special designs and color combinations in their work.

An efficient corps of stone masons is continually in our employ for setting our products complete in the job. These men are trained in the setting of West Townsend granite. In furnishing and setting our own materials direct in the job we can produce more nearly the architect's ideas and, at the same time, save on outside costs. We will be ready to furnish prices and consult with architects at any time.

Properties

An analysis of West Townsend granite as made by the United States Department of Agriculture is:

Silicate of alumina and potash	45.6%
Silica	24.0%
Silicate of alumina, lime and soda	16.0%
Hydrous silicate of alumina, iron, magnesia and potash	7.4%
Hydrous silicate of alumina	7.0%

Crushing strength, 25,500 lb. per sq. in.

100.0%

Concord Granite

Composition—A holocrystalline, granular rock composed of quartz, a potash feldspar, and muscovite-biotite (potassium and magnesium iron mica). The feldspar crystals being very small, the granite is of very fine grain.

Color—The color of the granite is blue gray, the shade being determined by feldspars in the quarry.

Quality and Usage—Being of a very fine grain and of especially high quality, Concord granite is primarily used for buildings of artistic merit and imposing design, such as memorials, public buildings, mausoleums and other structures of a permanent character.

Production—The cutting plant—one of the largest and best equipped in the United States—is located near our quarries at Concord, N. H., enabling us to turn out large quantities of polished, dressed and rough granite in a comparatively short length of time.

Shipping Facilities—We are located on the Boston & Maine R. R., with connections with the Boston & Albany R. R., the Central Vermont Ry., and the New York, New Haven and Hartford R. R., thus making possible the shipping of our granite to any part of the United States and Canada.

Advice on Proposed Work

Our designers will be glad to consult with you regarding the cutting of designs and the reduction of cost.

Unnecessary expense may be avoided by considering the finish of the stone for different parts of a building and the adaptability of design to cutting methods generally employed, depending on the location and the exposure of the granite to smoke and dirt, and its position as regards visibility to the public eye.

Estimates and samples gladly submitted on request.

AMERICAN BLUE STONE COMPANY

Producers of Genesee Valley Blue Stone

101 Park Avenue
NEW YORK, N. Y.

QUARRIES AND MILLS: AMBLUCO, WYOMING CO., N. Y.

Products

GENESEE VALLEY BLUE STONE, a New York State blue stone for architectural exterior and interior building construction.

For AMBLUCO Non-slip Treads, Landings, Flooring, Thresholds and Wall Base for interior and semi-interior uses, see pages A677-679.

Facilities

This company was organized and opened its first quarry in 1899, now having well developed quarries on its own property of about 200 acres located at Ambluco, Wyoming County, N. Y. The blue stone is taken out to a depth of 100 ft. from the top of the ground.

Mills and yards are equipped with the most modern machinery so that large volumes of business can be shipped without delay. This blue stone is handled by dealers in principal cities east of the Mississippi River. Samples are displayed with the Architects Samples Corporation, 101 Park Ave., New York.

Genesee Valley Blue Stone

Color and Texture—A distinctive uniform shade of light blue, blending well with adjacent light colored surfaces, or giving a sharp clean contrast with dark materials. It is of a fine grain and even texture, being made up mostly of pure hard quartz as shown below.

MINERALOGICALLY CONSIDERED

Fine hard sand, mostly quartz.....	70%
Clay, as binding material.....	28%
Water	2%

In this blue stone, quartz, the essential constituent, being harder than the accessory minerals, is pre-eminent on the wearing surface, which makes the stone slip-proof and very durable. Besides the rust-proof, non-porous, dustless and sanitary qualifications, it is quiet to walk on.

Strength, Weight and Fire Resistance—Few, if any, stones have a greater crushing and transverse strength than this blue stone. Likewise, the stone has high tensile and shearing strengths.

The following table gives its crushing strength, as compiled from tests made by the United States Ordnance Department:

CRUSHING STRENGTH

Rockport granite (Kidder's Hand Book) ..	17,750 lb. per sq. in.
Vermont marble	Average 13,500 lb. per sq. in.
Genesee Valley blue stone	19,970 lb. per sq. in.

Although of great density it weighs only approximately 150 lb. per cu. ft. when cut ready to set.

It offers great resistance to extreme heat, and the dielectric strength test is among the highest of all natural stones.

Durability—Specimens of this blue stone have been critically and carefully analyzed by eminent mineralogists and pronounced one of the most durable of all stones. In abrasive tests it excels most other stones. Like all stones, it should be cut to set on its natural bed.

It is said by one who has been in the business all of his life and who has made careful study of the stone

edifices in Europe, that this Genesee Valley Blue Stone is very much the same as the stone in the architecturally famous stairway of the court in the Bargello Palace, Florence, Italy.

CHEMICAL ANALYSIS

Silica	76.50%
Alumina	14.75%
Oxide of iron	6.35%
Water	2.00%
	99.60%

Adaptability—This blue stone has substantially all the good qualifications of the old genuine North River blue stone which has practically been out of the market since 1912, and has several advantages over such blue stones of the reedy rock character. Genesee Valley Blue Stone is a liver rock and does not produce natural split flagging and curbing. The sheets of stone in these AMBLUCO quarries, being of unusually low levels, represent early deposits and are, therefore, much harder and more compact than stone quarried from higher levels. The quarry blocks are from 2 to 4 ft. thick, permitting ashlar and base courses to be set on the natural bed with face against the grain, which condition rarely or never exists with other blue stones.

Cutter and Sawed Face Ashlar

Even more artistically effective than seam face granite, cutter face (vertical seam face) blue stone ashlar has been worked into buildings of the early American farm house and English Tudor styles. The cutter faces are permanently and beautifully stained many colors and soft shades, producing an old tapestry design when laid random. Also the combination of sand sawed and shot sawed faces furnishes a pleasing relief from the smooth planed and rubbed finishes.

Foundation Beds, etc.

Genesee Valley Blue Stone is unexcelled for engine, motor, pump, etc., foundation caps.

It is also especially good for shelves and uprights of underground vaults. Garden seats and sundials are frequently made of it.

Specification Suggestions for Exterior Use

It is essential that Genesee Valley Blue Stone be specified, and better to guard against the substitution of inferior blue stones, mention this company's name and address as producers.

Specifications should require all blue stone (as well as most other stones) to be thoroughly seasoned and to be cut so as to set on its natural bed, especially when used for grade courses.

The practical finishes, in order of their costs are: Sand sawed; shot sawed; rock face; wet sand rubbed; fine axed (6-cut); horizontally (machined) tooled; and vertically (hand) tooled. This blue stone also takes most any finish applied to a natural stone. The sand sawed finish, showing no saw marks, is very uniform and brings out the character of the stone. This is produced by a slow process and does not burn or bruise the surface of a stone as does planing and axing.

Co-operative Service

Our organization, through its members' lifelong experience with blue stone, offers its knowledge in an impartial manner, unbiased by thought of personal profit.

THE BRIAR HILL STONE CO.

Producers of Golden Buff and Variegated Sandstone
GLENMONT, OHIO

Briar Hill Golden Tone Sandstone

Briar Hill Golden Tone Sandstone—rough blocks, semi-finished, or cut and carved ready to set in accordance with plans and specifications.

Readily available in practically every locality.

Varieties—Golden Buff, Light Variegated and Dark Variegated, or in any desired combination.

A wonderful range of colors, all tinged with a beautiful subdued golden tone.

Adaptability—Suitable for all classes of buildings, both for interiors and exteriors; effective as trim for seam face granite, field stone, brick or stucco, and especially adapted to gothic architecture, because of its easy working qualities.

Durability—Briar Hill Sandstone is permanent in texture and color. Positive proof of this is offered by an old church at Glenmont, illustrated below. Built of stone from this quarry in 1857, the original tool marks remain clean cut and sound. Age merely mellows the beauty of this colorful stone.

Physical and Chemical Properties—Results of physical and chemical analyses, compression, freezing and absorption tests gladly furnished on request.

Quarry—Our vast quarry holdings insure a practically unlimited supply of this stone. Production is 50% golden buff, 30% light variegated, 20% dark variegated. It can be furnished in any height for column drums, etc.

Facilities—Our quarry and mill are thoroughly equipped with modern machinery, capable of handling

any size project. Prompt, efficient execution of contracts assured at all times.

Price—Although distinctive and yielding infinite color resources to the architect's skill, Briar Hill is reasonable in cost. It is, therefore, economically available for all classes of buildings.

SUCCESSORS TO THE BRAINERD, SHALER & HALL QUARRY COMPANY

Quarriers of Portland Brown Stone

OFFICE

MIDDLETOWN, CONN.

QUARRIES: PORTLAND, CONN.

Time Has Tested Portland Brown Stone

Contrary to the generally accepted belief, Connecticut Brown Stone is a very enduring stone. When laid on its natural bed its life is equal to that of any building stone. It is infinitely more durable than most of the so-called monumental stone.

The old Connecticut State House at Hartford, Conn., now used as the city hall, was designed by the illustrious Bulfinch and erected in 1794. Portland Brown Stone was used for the first story and as trim for the rest of the building. The stone in this building after withstanding the elements for 130 years, is in excellent condition, even the tool marks are clearly apparent.

Fire Resisting Qualities of Portland Brown Stone

Portland Brown Stone, in common with sandstone generally, is very little affected by extreme heat. Heat that would spall and check the surface of other stones does not affect Brown Stone.

The Flood residence on Nob Hill, San Francisco, Cal., one of the most imposing of the older San Francisco mansions was erected in 1884 of Portland Brown Stone. During the fire following the great earthquake this building was completely gutted, only the walls remained standing. How well the Portland Brown Stone walls withstood the extreme heat of this conflagration is demonstrated by the fact that in rebuilding it was only necessary to clean down the walls—the stone itself was not in any way damaged by the extreme heat of the fire. The building is now occupied by the Pacific Union Club.

With the Proper Use of Portland Brown Stone Fine Architectural Effects Can Be Obtained

Brown Stone can be used very effectively with the better grades of common brick and any face brick of the proper color, to obtain exteriors of character, beauty and refinement.

By mixing a small percentage of white stone with Portland Brown Stone rubble walls of striking beauty have been obtained. Fine examples of walls of this character can be seen in several attractive residences recently erected in Hartford, Conn.

For college buildings, schools, institutions and other permanent buildings erected in the country or suburbs where there can be effective floral treatment, buildings faced entirely of Brown Stone can be used with excellent effect. The light reddish brown tone of Portland Stone blends well with colors found in nature.

Physical Properties of Portland Brown Stone

Portland Brown Stone is a sandstone of uniform reddish brown color. The texture is medium to fine.

Its crushing strength as determined by U. S. Government Tests is from 13,980 to 15,020 lb. per sq. in. Its specific gravity is 2.35 and its ratio of absorption 1 to 40.

CHEMICAL ANALYSIS

Silica	70.11
Aluminum	13.49
Iron Oxide.....	4.85
Manganese35
Lime	2.39
Magnesia	1.44
Soda, Potash, etc.....	7.37

Facilities

Ample stocks of thoroughly seasoned Brown Stone are always kept on hand. Stone is not quarried after October—winter orders being cared for by stone quarried in the summer.

There is a large mill located at the quarry, where stone may be sawed, planed, rubbed, etc., or it may be cut ready to set in the building.

Shipments can be made by rail or water.

Baeco Products

Silen-Stone—A Decorative Tile for Acoustical Treatment

Silen-Stone is a decorative artificial stone with a high coefficient of sound absorption. It is a handsome material that can be used not as an imitation of some natural stone but because of its own inherent beauty.

Composition—Silen-Stone is a lightweight, fireproof masonry material composed of sand and portland cement, and because of its very porous nature, possesses high sound absorbing value. Due to an unique process, Silen-Stone contains globular cells of various sizes. These cells make up 60% of the volume of the material.

Texture—In appearance Silen-Stone is absolutely new and different. The accompanying illustration shows the texture of Silen-Stone much better than it can be described by words. The texture may be varied somewhat by increasing or decreasing the size and number of cells, also by the method of dressing the surface. One of the most desirable features of Silen-Stone is the ease with which it can be cleaned, without destroying or altering its acoustic efficiency in the slightest degree.

Color—Silen-Stone is furnished in any color or degree of color obtained by the use of mineral coloring matter. Colors are varied to meet architect's individual requirements.

Sizes—Silen-Stone is furnished in tiles or slabs $1\frac{1}{8}$ in. in thickness and in various sizes up to 22x30 in. to meet the architectural requirements of any particular installation. The tiles are easily cut to any required shape or size.

Reinforcement—Silen-Stone is reinforced by heavy wire mesh, preventing damage by handling, and eliminating danger of cracking of the tile after it is in place.

Application—Silen-Stone is set in the same manner as any other tile. Special care is used in its manufacture to assure a satisfactory bonding surface.

For application to masonry it should be bedded in portland cement mortar.

Acoustics

The following excerpt from "Acoustics of Buildings," by F. R. Watson, Professor of Experimental Physics, University of Illinois, adequately describes "Silen-Stone" an "acoustic tile," now at the disposal of architects, after several years of research and experimentation:

"Masonry material with acoustic absorption is very desirable because of its fireproof and verminproof qualities."

"To be effective, any such material must have pores open to the sound, in which the energy is damped out, by friction into heat."

"There appears to be a need for a presentable, fireproof material that has considerable sound absorption, is no more expensive than other building materials, can be installed easily, and can be cleaned without greatly impairing its acoustic efficiency."

An Unretouched Photograph of Silen-Stone

THE DECORATIVE STONE CO.

Producers of Highest Quality Cut Cast Stone

PLANT

Chapel Street and Blatchley Avenue
NEW HAVEN, CONN.

Product

DEXTONE—a manufactured Building Stone of great strength and durability. It possesses many individual characteristics which make it a preferred stone either for trim in conjunction with brick or rough stone, or for entire buildings. It has been extensively used in this manner for bank buildings.

Experience and Capacity

This company has been a pioneer in the development of cast stone, employing original methods and specially devised machinery to insure high quality.

Entrance of Roosevelt High School, Yonkers, N. Y.

G. HOWARD CHAMBERLIN, Architect
Executed in Dextone Hudson gray buff

The personnel of the management is rich in practical experience and commands the facilities and an organization ample to handle orders of any size or importance. A private railroad siding expedites carload shipments.

Scientific Methods

There are two most vital elements in the making of cast stone:

- (1) The selection of the ingredients and the exact proportioning of them.
- (2) The finish or cutting of the stone.

This company has invested no small amount of time and money in devising equipment designed to control the quality and the proportioning of the ingredients used.

Marble aggregate, portland and white cement and a high grade integral waterproofing are the principal ingredients. The marble is carefully selected for its

DEXTONE

TRADE-MARK

hardness and transparent whiteness. It is crushed in the company's own crushing plant and screened to various sizes by means of electric vibrator screens.

In this costly, but vitally important step, all dust particles are removed. This of course is not accomplished when marble direct from the crusher is used. A stone in which dust has been used loses the cleancut rocklike appearance which is an outstanding characteristic of Dextone.

Careful screening of aggregate and accurate proportioning of sizes is the only effective guarantee against crazing or surface checking.

In line with the most advanced practice, the water content is controlled automatically.

The mass is mixed for not less than five minutes and then kept constantly agitated until poured in the moulds. This is essential in the wet-poured process.

A minimum of two weeks time is allowed for curing under conditions which prevent too rapid evaporation of water.

All pieces are cast oversized and then cut to exact profile and dimension by carborundum cutting planers and rubbing machines. This method, although more costly than other methods, is absolutely necessary in the production of high gradecast stone. Otherwise the sharp arrises, true profile, exposure of aggregate, and other characteristics of cut stone work are lost.

These same cutting operations are necessary regardless of the ultimate surface treatment.

Drawings and Models

Upon receiving an order, setting drawings at large scale, correctly interpreting the architect's plans and showing the jointing and relative position of the units, are submitted for approval. Suggestions are often made for the better use of the material but no liberties are taken without securing special permission.

Models for ornamental work are made in the company's own studio and can be approved at the plant in conjunction with the modeler or by photograph.

Showing use of Dextone Indiana buff for intricate Gothic details

Finishes

Dextone is finished in the same way as any quarried product, such as planer rubbed, honed, machine groove tooled, bush hammered or axed, crandalled, pointed, etc.

Rubbed and honed finishes and machine groove tooling are machine operations and are less expensive than the hand finishes, such as bush hammered, crandalled, etc. The selection and suitability of each is largely a matter of taste and cost.

Dextone—Ohio Variegated

Color

Color effects are produced in Dextone by the use of non-fading mineral color pigments. Brilliant colors are impracticable, but in all the softer colors, especially buffs and reds, the range is practically unlimited. Two samples of Dextone are here shown: Ohio variegated and Connecticut pink.

Other varieties of Dextone now in demand are Vermont white, Kentucky light gray, Hudson gray buff, Indiana buff, and Pennsylvania black.

Specifications for Dextone

The essential points to cover in a specification for cut cast stone are as follows:

- (1) Aggregates must be sized by screening and proportioned to produce maximum density. Crusher run aggregate not allowed.
- (2) Must be made by the wet-poured process and in sand moulds.
- (3) Stone must be of the same composition throughout and not faced.
- (4) Mixed materials must be constantly agitated until placed.
- (5) All stone must be made at least $\frac{1}{4}$ in. oversize on exposed surfaces, and then cut to correct size.

Dextone—Connecticut Pink

(6) Cover setting thoroughly as poor setting will ruin any stone job.

(7) Quotation to be based on Dextone Vermont White with hand bush hammered finish, manufactured by THE DECORATIVE STONE CO. (Substitute here other color or finish if desired.)

State amount added or deducted and name of manufacturer in case other make is estimated.

Note: In this specification no mention has been made of sand finish, acid treated, brushed or any other finish which cannot be properly classified as cut cast stone. Buyers should be aware that these finishes are often sold in competition with cut cast stone.

A member of this company's technical staff will be glad to assist architects and builders with any problems relative to cost or construction.

Dextone Is Good Cast Stone Because

It is made by the method recommended in the essential points of the cut cast stone specifications:

- (1) Screened and graded aggregate.
- (2) Wet poured process in sand moulds.
- (3) Made oversized and machine cut.
- (4) Cured for not less than two weeks.

PLASTIC PRODUCTS CO.

Manufacturers of Cast Stone and Ornamental Plaster Work
1991 Port Washington Road
MILWAUKEE, WIS.

Products

CAST STONE, PLASTER STAFF, RELIEF WORK, CAST STONE MANTELS, FIREPLACES, FOUNTAINS, BIRD BATHS, BENCHES, VASES, GARDEN DECORATIONS, RAILINGS and BALUSTRADES for Bridges, Terraces, etc., COMPO CARVINGS for Woodwork.

Also Contractors for Interior Ornamental Plaster Work, Sculpture and Modeling; Dealers in Imitation Caen Stone, Travertine, Portland Cements, Keene's Cements, Plasters, Fibres, etc.

Uses of Cast Stone

Cast stone is a scientifically prepared concrete which is especially adaptable for exterior trim and decoration. It replaces terra cotta and cut stone for durability and is often preferred because of the ease with which it can be set and the architectural effects obtained.

Cast stone is not limited to exterior use alone; it can be very effectively used for interior decorations for window trim, arches, wainscots, stairways, mantels and columns. It can be produced in shades to harmonize with certain color schemes thus obtaining beautiful results by using the natural colored aggregates of various sizes in order to obtain the right degree of shade and effect.

Advantages of Cast Stone for Building Purposes

Cast stone offers many advantages which other materials lack. The possibilities of reinforcing are such that many intricate designs can be carried out in cast stone which prove impractical with other materials. This is especially true where delicate artistic designs must be combined with strength.

Different Finishes Available in Cast Stone

Some architects prefer a finer grained surface in cast stone for interior decoration than for exterior use. Others have secured beautiful results by using the same texture for both interior and exterior ornamentation. Either tooled or smooth finishes can be produced, but the most satisfactory finish for resisting wear and the action of the elements has been found to be one composed of materials which present a slightly rough finish resembling bedford stone in color and texture.

Co-operation with Architects

The Plastic Products Co. has always taken pride in maintaining close co-operation with the architect. To carry out with exactness the ideas of the designer of the building is their constant endeavor and so it is always preferable that the architect give complete information on all points involved.

Consultations with architects on cast stone are always welcomed, no matter whether the question refers to an estimate, to the qualities of the material as tested by experience or to its adaptability to certain designs the architect has in mind.

Specifications

For cast stone specifications write us direct and complete data for filing will be sent to you.

Garden Decorations in Cast Stone

A garden, like a room, demands characteristic furnishings. That garden lovers and designers may find the ornaments and furniture which each individual garden needs, we gladly offer furnishing suggestions if landscape plans are sent to us for that purpose.

Catalog

We issue catalogs on all of our products which will be supplied free to the trade upon request.

CLEVELAND, OHIO

Products

ASHLAR, SILLS, LINTELS, CORNICE, BALUSTRADES, and all kinds of BUILDING TRIM for exterior and interior work; GOTHIC WINDOWS. FLAT SLAB CONCRETE ROOFING TILE.

TRADE-MARK

shipping facilities are such as to make for promptness in the fulfillment of contracts.

Artstone

Being the first in its particular field, Rackle Artstone has the advantages which experience in manufacturing brings. Thus, while made of concrete, the Rackle product has points which distinguish it from other materials of a similar nature. Further than this is the constant effort, throughout the different processes of manufacture, to turn out as perfect a product as possible.

Setting of Rackle Artstone is accomplished by means of diagrams furnished, wherein each piece is lettered and numbered to correspond with similar markings on the Artstone.

The Company and Its Facilities

This firm originated Artstone over fifty years ago, and has produced it in steadily increasing quantities ever since. A strong organization has been developed which is qualified to handle the best class of work, including that which is ornamental in character.

The plant being located on the Pennsylvania Railroad and in a section where the greater share of the materials used are close at hand, manufacturing and

Mt. Olive Lutheran Church, Milwaukee, Wis.
KIRCHHOFF & ROSE, Architects

Advantages of Artstone

In these days of high building costs the low price of Rackle Artstone, as compared with other materials of equal value, is a strong point in its favor, as is also its attractive appearance.

The possibilities of reinforcing are such that certain designs can be carried out in Artstone which are not practicable otherwise. Especially is this true where delicacy of detail must be combined with strength.

Rackle Artstone is a permanent material. There are still standing buildings in which it was used over fifty years ago, a fact which expresses more than words.

Uses of Artstone

Rackle Artstone is suitable for all exterior work, such as ashlar, water table, sills, lintels, cornice, belts, quoins, and for any place where a medium is required for the proper expression of architectural design. Balustrades are successful in Artstone, as are relief ornamentation and statuary.

For interiors, Rackle Artstone is used for door and window trim, arches, wainscots, stairways, mantels and columns.

It is often desirable to have Artstone made of a shade to harmonize with a certain color scheme. This idea is carried out very successfully, so that beautiful results are obtained.

Gothic Windows in Artstone

For Gothic window tracery, Rackle Artstone has certain superior and individual qualities. It is thoroughly reinforced; it is strong, straight and true, and it is ideal for holding glass. Furthermore, it has no grain or strata to cause splits at curves and angles.

Rackle Artstone Gothic windows have been a special line with this firm for many years, and it is worth noting that architects often prefer these windows even when using other materials for their regular building trim.

Artstone Colors

Regular colors include white, buff, red, brown, limestone and granite, besides many combinations of these.

The buff, red and brown may be made either lighter or darker, and the limestone and granite may be varied in shade or combined with the buff, red or brown.

Special colors, to meet unusual conditions or to match other work, are made as required by the architect's specifications.

Artstone Finishes

Smooth and tooled finishes are both produced. The most satisfactory surface for resisting wear and the action of the elements has been found to be one which is composed of such material as to present a slightly rough surface. This gives a rich, artistic effect when appearing in masses, as in exterior work. Many architects like the same texture for interior work as for exterior, while others prefer a finer grained surface, such as Caen stone or smooth white, either of which has been found satisfactory for inside use.

Co-operation and Service

The manufacturers of Rackle Artstone have always taken pride in maintaining close co-operation with the architect. To carry out with exactness the ideas of the designer of the building is the constant endeavor, and so it is always preferable when the architect can give complete information on all points involved. However, there are occasions when the architect desires consultation with those who make a special product, and it is at such times that the services of the Rackle organization may be called on freely, no matter whether the question raised refers to an estimate, to the qualities of the material as tested, by experience, or to its adaptability to a certain design the architect has in mind.

Flat Slab Roofing Tile

Rackle reinforced concrete flat roofing tile form a light, strong and economical roof which is fireproof, and meets every requirement of first class building construction.

For foundries, shops, warehouses, garages, schools and theaters they are well adapted. They are laid rapidly in place on steel purlins, no forms or centering being required, and are suitable for either flat or pitched roofs.

A booklet, which is sent free on application, gives information regarding these tile, sizes of purlins for different spans, methods for meeting special conditions, etc.

Zenitherm, the Material and Its Uses

Zenitherm has all the dignity and massiveness, without the coldness, of stone, and all of the convenience of wood since it can be nailed, sawed, drilled and screwed.

Zenitherm is made of a combination of selected wood fibre and highest quality calcined magnesium oxide. This is treated with a weatherproofing binder and subjected to hydraulic pressure in steel moulds. The pressure is maintained until the mass sets into a dense slab, which is not only highly fire resistant but is exceptionally low in absorption. It does not distort or shrink. The process is covered by patents and its production is under factory control. There is no substitute having the specific advantages of Zenitherm.

Qualities and Properties

Zenitherm is impervious to frost or any climatic conditions. Constant physical characteristics together with low thermal conductivity make Zenitherm preferable as a permanent material insuring comfort, beauty, durability, weather resistance and safety in its fireproof qualities.

Zenitherm becomes tougher with age. It wears better than many grades of marble. It is kept clean by washing with soap and water. Zenitherm is odorless and verminproof. It contains nothing to decay or rot. It costs less than stone. Zenitherm is usually installed by carpenters.

Uses

Zenitherm is used for interior or exterior walls, floors, fireplace facings, wainscot, arches, panels, sills, stair treads, risers, string, base, walks, etc.

Standard Colors

Zenitherm is made in 14 standard colors: red, black, blue, light brown, dark brown, green, pink, olive, buff, gold, drab, light gray, stone gray and natural.

The fact that Zenitherm is available in different shades gives the architect ample opportunity to secure beautiful and permanent effects.

Standard Sizes

Zenitherm is made in sixteen standard sizes. Other sizes can be furnished according to specifications. Prices on application. All

wall material is $\frac{5}{8}$ in. in thickness. Floor material $\frac{3}{4}$ in. Cove base measures $4\frac{3}{4}$ in. from top of base to finish floor. Straight plain base, any height desired. Stair treads $1\frac{1}{4}$ in. in thickness. Risers $\frac{3}{4}$ in. in thickness.

STANDARD SIZES

Width, in.	Length, in.	Width, in.	Length, in.	Width, in.	Length, in.	Width, in.	Length, in.
$5\frac{1}{2}$	$5\frac{1}{2}$	$5\frac{1}{2}$	$47\frac{1}{2}$	$8\frac{1}{2}$	$23\frac{1}{2}$	$15\frac{1}{2}$	$15\frac{1}{2}$
$5\frac{1}{2}$	$11\frac{1}{2}$	$8\frac{1}{2}$	$8\frac{1}{2}$	$8\frac{1}{2}$	$47\frac{1}{2}$	$15\frac{1}{2}$	$17\frac{1}{2}$
$5\frac{1}{2}$	$17\frac{1}{2}$	$8\frac{1}{2}$	$11\frac{1}{2}$	$11\frac{1}{2}$	$11\frac{1}{2}$	$17\frac{1}{2}$	$23\frac{1}{2}$
$5\frac{1}{2}$	$23\frac{1}{2}$	$8\frac{1}{2}$	$15\frac{1}{2}$	$11\frac{1}{2}$	$17\frac{1}{2}$	$17\frac{1}{2}$	$47\frac{1}{2}$

Standard Mouldings and Trim

Zenitherm standard mouldings are made for use in conjunction with Zenitherm walls. There are twelve different designs available. Zenitherm mouldings and trim to match ashlar surfaces afford a wide range in style, and assure a finish correct in design and effective in treatment.

Corner Pieces

Zenitherm solid corners are manufactured to eliminate the appearance of joining and edge mitering. They carry out completely the effect of solid stone for columns, pilasters, beams, returns, reveals, quoins, et cetera. Where Zenitherm corner pieces are used, all edge mitering or joining is eliminated and installation costs reduced to a minimum.

Installation

Zenitherm presents no difficulties of installation. The slabs, cut into stock sizes at the factory, are simply nailed with galvanized finishing nails, countersunk and pointed, to furring for ashlar surfaces. Zenitherm floors follow the standard methods of installing floor materials. Any carpenter can lay Zenitherm floors and erect Zenitherm walls if a reasonable amount of care in working with it is used.

Our "Contractors Handbook" gives full information, and helpful suggestions to make the erecting of Zenitherm a simple task. A copy furnished on application.

Literature for Architects, Their Clients and Contractors

We have several folders available which we will be glad to mail on request. Included among these are "Zenitherm Walls"; "Zenitherm Floors"; "Contractors' Handbook"; "Architects' Manual"; "Color Chart"; "Folio of Floor Patterns"; "Folder of Mouldings."

Zenitherm Walls, McFarlin Memorial Auditorium
Southern Methodist University, Dallas, Texas
R. H. HUNT COMPANY, Architects

Specifications for the Proper Installation of Zenitherm

The following specifications are suggested for architects' use. They are designed to cover all possible uses of Zenitherm.

Specification for Zenitherm Interior Walls

To be written under Carpenter's Specifications.

Backing—The backing to which Zenitherm is to be applied shall be true to line, level and plumb.

Joints—Zenitherm slabs shall have $\frac{1}{8}$ -in. chamfer on surface edge, all around, to form "V" joint when laid up close.

Note: Alternate: Zenitherm slabs shall have straight edges to form $\frac{1}{8}$ in. [$\frac{1}{4}$ in.] open joint when laid up.

Nails—Zenitherm shall be nailed to furring strips or wood sheathing with 6d galvanized finishing nails. Nails are to be driven in at an angle, countersunk $\frac{1}{8}$ in. and nailholes pointed with Zenitherm Pointing Compound.

Note: We strongly recommend that the edges of the set slab coming in contact with the next slab to be set, be buttered with Zenitherm Pointing Compound. Nail next slab into place, wiping off the pointing compound which oozes up between the joints.

On Wood Sheathing—Zenitherm shall be nailed to wood sheathing as specified above.

On Wood Studding—Provide wood sheathing 1x6 in. laid diagonally or provide $\frac{7}{8}$ x3-in. furring strips laid horizontally at each coursing joint of the Zenitherm ashlar.

On Brick, Masonry, Hollow Tile or Gypsum Block Grounds—Allow $2\frac{3}{4}$ in. from face of rough wall for double furring strips and the Zenitherm $\frac{3}{4}$ -in. thick slab.

Note: If Zenitherm is specified $\frac{3}{4}$ in. thick, allow $2\frac{1}{2}$ in. Double-furr rough wall with $\frac{7}{8}$ x3-in. spruce furring and cross furring to provide plumb and true surface for Zenitherm slabs. Nail Zenitherm to furring through face of slab with galvanized finishing nails, to be countersunk and nailholes pointed with Zenitherm Pointing Compound.

Specification for Zenitherm Exterior Walls

To be written under Carpenter's Specifications.

Frame Construction—Cover sheathing with waterproof building paper, nail Zenitherm slabs to sheathing with 6d galvanized finishing nails, countersunk $\frac{1}{8}$ in., nailholes to be pointed with Zenitherm Pointing Compound.

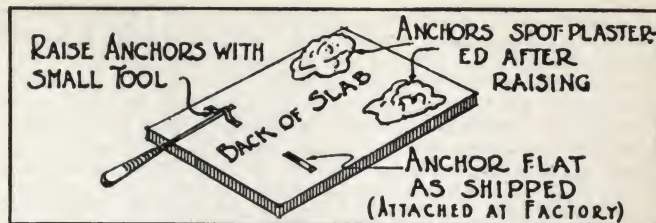

Note: If close joint is specified, butter edge of slab with Zenitherm Pointing Compound and squeeze into place before nailing, wiping off excess compound. If open joint, use Zenitherm Pointing Compound.

Masonry Construction—Nail $\frac{7}{8}$ x3-in. furring strips to wood plugs, or metal wall plugs, set in masonry wall. Nail Zenitherm slabs to furring strips with 6d galvanized finishing nails, countersunk $\frac{1}{8}$ in., nailholes to be pointed with Zenitherm Pointing Compound. Center all vertical joints of Zenitherm ashlar on furring strips where single furring only is used; center horizontal joints on horizontal furring strips where double furring is used.

Note: (a) If close joint is specified, butter edges of slab with Zenitherm Pointing Compound. Point open joints as specified under frame construction.

(b) Alternate: Secure furring for Zenitherm with expansion bolts.

(c) Alternate: On hollow tile walls, secure furring with toggle bolts about 18 in. on centers vertically.

Specifications for Erecting Zenitherm Walls Where Building Codes Enforce Stringent Fireproof Regulations

For erecting without furring strips, brass spot anchors are secured to block at factory. Raise loop on anchor and spot over anchor with Acme or any other slow setting plaster. Set block same as marble block but omit brass dowels. For either gypsum block or hollow tile partitions on walls, it is essential to wet the areas thoroughly before applying Zenitherm with spot anchors, in order that the plaster shall receive its proper set.

Specifications for Zenitherm Floors

The following group of specifications are for Zenitherm floors over subfloors of wood and masonry.

Zenitherm Floor on Wood Underfloor—

To be written under Carpenter's Specifications. Face nail Zenitherm directly to wood floor. Butter edges of slabs with Zenitherm Compound and squeeze up tight, wiping surplus compound that oozes out off the face immediately. Use 6d galvanized finishing nails, countersinking heads and pointing with Zenitherm Compound.

Note: If wood underfloor is not true and level, use thin bed of Zenitherm Bed Compound to bring to desired level. Allow this to set for 24 hours and nail blocks as above.

Zenitherm Border—Lay border same as specified for floor work.

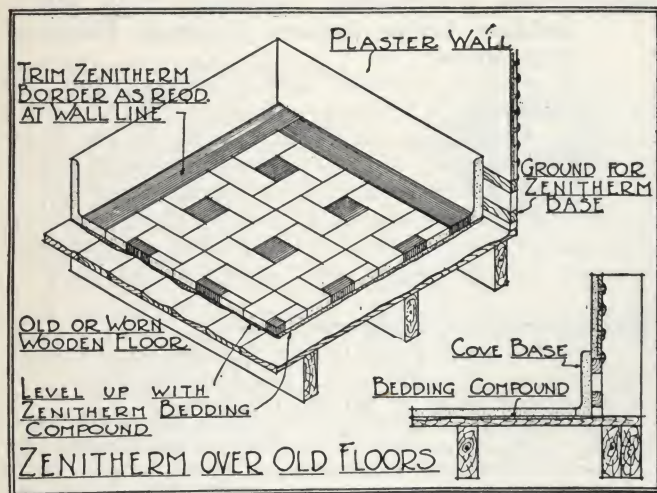

Zenitherm Base—Install Zenitherm cove (straight) base in $47\frac{1}{2}$ -in. lengths, $\frac{3}{4}$ in. thick. Secure to wall same as specified for wall material.

Zenitherm Floor Over Level Wood Subfloor—Before starting to lay the floor, take out the field pieces and lay them down in proper position without nailing, to determine correct measurements and pattern. Cut border to fit, if necessary. In starting to lay the Zenitherm floor, first lay any two sides of the border which meet to form an angle. This will insure a perfectly squared and symmetrical pattern. To lay a Zenitherm slab on a level wood floor, butter two edges of the slab and lay in proper position. Then nail the slab in place using 6d finish galvanized nails. From 4 to 6 nails are usually sufficient to keep the slab in place properly, depending upon the size of the slab. Countersink the nails $\frac{1}{8}$ in. and fill the nailholes with pointing compound. Wipe off any excess pointing compound with a putty knife. Be sure to keep the surface of the slab as clean as possible. Proceed with other slabs in like manner.

Note: Where Zenitherm cove base is specified, nail to furring before laying floor.

Zenitherm Floor Over Subfloor Out of Level—Determine the highest point of the wood subfloor and mark points lower than this by driving nails at intervals into the lower points of the wood floor. Bring heads of these nails even with the highest point. Fill low parts of floor with bedding compound up to nailheads. Level can be maintained by pulling a straightedge across the compound over the level points, the same as in laying portland cement. If slope is small, proceed to lay floor according to instructions for laying Zenitherm over level wood floor. If slope is very pronounced, lay Zenitherm according to instructions given for laying over concrete.

Zenitherm Floor Over Rough or Finished Concrete and Similar Subfloor—

Note: General Contractor must see that the concrete floor is brought to level one inch below finished floor surface by Concrete Contractor.

To be written under *Tile Setter's Specifications*. Before starting to lay floor, lay down the field pieces to determine the correct measurements and pattern. Start actual laying of floor by laying two sides of the border which meet to form an angle. This will insure a perfectly squared and symmetrical pattern. Lay corner slab of border by spreading bedding compound to about ¼-in. thickness on a small portion of the subfloor. Butter Zenitherm slab on two edges with pointing compound. Care should be taken to keep compound off of the finished face of the Zenitherm slab. It is customary to gently tap the surface of the slab to bring it to the proper level. This allows the compound to ooze into the crevices in back of the slab and give a firm setting. Make sure that each slab is set at proper level as the job goes along. Proceed with other slabs in like manner. Zenitherm floors laid in bedding compound should be allowed to lay 24 hours without usage.

Zenitherm Base—Install Zenitherm cove (straight) base in 47½-in. lengths, ¾ in. thick. Secure to wall same as specified for wall material.

Specification for Zenitherm Stair Treads, Risers and Bases

Note: Before proceeding to lay Zenitherm, take off nosing of old step so that step is flush with riser.

Wood Stairs—Lay Zenitherm Stair Tread and Riser on wood stairs in same manner as in laying Zenitherm over wood floor, by nailing to wood undertread and under riser.

Concrete or Cement Stairs—Lay Zenitherm Stair Tread and Riser on concrete or similar stairs in same manner as in laying Zenitherm over concrete underfloor by cementing to concrete undertread and in back of riser. It is a good point to provide nailing blocks in the concrete for extra security in nailing tread and riser.

Iron Stairs—Insert toggle bolt through hole in iron step; countersink it and fill hole to surface of tread or riser with pointing compound. If it is possible to get under the stairs, drill holes through the iron, and insert screws. Screw Zenitherm on tightly from under stairs. Where impossible to get under iron stairs, drill ½-in. hole big enough for tumbler of toggle bolt to drop through. Also drill hole through Zenitherm step diameter of bolt. Countersink head, screw toggle and fill hole with pointing compound.

Product

ARCHITECTURAL TERRA COTTA of highest quality.

Services

As one of the largest terra cotta concerns in the country, the Conkling-Armstrong organization is in an exceptional position to execute, from sketch drawings if necessary, work of any description, however artistic, complex or technically difficult, and of any magnitude whatever. Information, specific or general, covering any matter relative to terra cotta and its use gladly supplied on request and without obligation.

Quality

Conkling-Armstrong material has long represented the best in terra cotta both as to satisfactory appearance and permanence. This has been the result of studied investigation, not only of the material, but allied facts such as support, mortar, setting, pointing, etc.

Use of This Material

Schools, colleges, churches, theaters, office buildings, banks, store buildings, garages and factory buildings, trimmed with Architectural Terra Cotta, become neighborhood beautifiers. This material which has stood the test of time and the elements with all its color and surface treatment possibilities, is the logical building material where durability, decorative qualities and color are required to make a complete and permanent design.

Delivery

Large centrally located plant assures convenient delivery to any part of the United States.

Our Record

Thirty-nine years' experience, more than 10,000 contracts, a maintained standard of excellence during this period, are our credentials for soliciting your business.

Products and Services

ATLANTIC TERRA COTTA made in accordance with architects' drawings and specifications (always the major part of our business).

EXTERIOR CLEANING SERVICE in New York and vicinity.

Printed Information

Monthly Magazine "Atlantic Terra Cotta"—Illustrating ancient and modern Terra Cotta.

"Stock Designs"—A catalog of stock sizes.

Garden Pottery Catalog—Reproductions of Florentine originals.

Chimney Pot Catalog—Thirty designs in usual and unusual colors; many flue sizes.

Uses of Terra Cotta

For entire facades; for entrances, window trim, mouldings, cornices and panels.

For interior sidewalls and ceilings.

For important rooms in hotels and banks, and for rotundas of public buildings.

For exterior or interior construction and decoration with masonry, steel or reinforced concrete frame.

Colors

Many shades of gray, buff, brown and red in unglazed, vitreous surface.

White, creams and ivories in matt or lustrous glaze.

Conglomerate colors; combinations and textures that occur in natural geological formations.

A practically unrestricted range of blues, greens, sienna, purple, yellow, lavender, etc., in matt glaze, and special fire scarlet vermilion and burnished gold.

Cost of Atlantic Terra Cotta

Atlantic Terra Cotta, in its widest application, is made especially for the building in which it is to be used, and is intended to occupy a certain place in that building.

Every piece is stamped

and backed by our reputation.

To determine the cost of Atlantic Terra Cotta the architect should submit the following drawings:

Floor plan, and elevations drawn to scale.

Sections showing projections, and sketch details.

When specifications have been prepared, they should be sent with the drawings.

Details such as the amount and character of the modeling, and the color or colors should be indicated.

Stock Designs

Our Stock Design Catalog shows name panels, jambs, mullions, lintels, belt courses, coping, modeled inserts, cornices, pilaster and column capitals, architraves, arches, piers, cartouches, consoles, brackets, balustrades, sidewall fountains, etc.

Stock Design Catalog obtainable from either the Atlantic or the Atlanta Company. (Mention "Stock Designs" when writing.)

Atlantic Terra Cotta in stock designs permits a convenient, economical and effective use of Terra Cotta. The sizes and forms are varied, the choice of colors wide and the quality of the best.

The architect has little trouble in adapting stock designs to his design, for either the entire elevation or trim—particularly stores, small banks, apartment houses, garages, filling stations, theaters, and in general buildings of moderate size.

Exterior Cleaning Service

In New York and vicinity the ATLANTIC TERRA COTTA COMPANY will contract to clean the exterior of any masonry building—Terra Cotta, stone or brick. If desired, this service includes repointing and minor repairs.

The cleaning is done rapidly and effectively with minimum inconvenience to tenants, and all operations are covered by Property and Liability Insurance. Sand blast is used sparingly on stone and brick, and Terra Cotta is carefully washed. Exteriors are returned to their original freshness.

Euclid Avenue Baptist Church, Cleveland, Ohio

WALKER & WEEKS, Architects DEVAULT & DEITRICK, Builders

A beautiful example of Lombard Romanesque entirely of Atlantic Terra Cotta. The arrangement of ashlar in varying buff and the beautifully modeled brilliant polychrome screen over the main entrance are particularly interesting

MAIN OFFICE AND FACTORY

CORNING, N. Y.

AGENCIES IN ALL PRINCIPAL CITIES

Corning Architectural Terra Cotta

The CORNING TERRA COTTA CO., INC., has been in business since 1887, and during this time great progress has been made in the manufacture of their product.

Endless variety of colors are produced in the laboratories, the chemistry of fire being their only limit. Glazed work is produced in many colors, with bright gloss or dull matt surface. Various beautiful mottled effects are produced by the pulschrome system of glazing (at practically the same cost as plain glazed work). Polychrome work is produced in many colors and effects, to the satisfaction of the most critical artist.

The location of the Corning plant, on three main line railroads, affords excellent shipping facilities in all directions.

Specifications

The CORNING TERRA COTTA CO., INC., recommends the use of the standard specifications as adopted by the National Terra Cotta Society for furnishing and setting Terra Cotta, reprinted on pages A340-343 of this volume.

Ornamentation

Clay, being plastic, enables the production of rich ornamentation at moderate cost, especially if there is repetition of ornament.

As all terra cotta is produced from plaster moulds, the designer will aid materially in keeping the cost of the building down by minimizing the number of moulds required.

With the expert modelers employed, architects' designs and ideas are fully interpreted and reproduced.

Photographs of clay models and ornamental features are furnished to the architect for criticism and approval.

Stock designs of principal features of buildings illustrated in our catalogue are kept in stock.

Catalogue, etc.

The CORNING TERRA COTTA CO., INC., will gladly forward its catalogue or samples of representative colors to architects who are interested when request is made on their business letterhead.

IN PRINCIPAL CITIES

Product

ARCHITECTURAL TERRA COTTA for exterior and interior use.

Service

Development of preliminary drawings to show adaptability and construction of terra cotta.

Colors and Finishes

Complete lines of unglazed standard colors, such as gray, buff, red, etc., with hard burned vitreous surface; matt and full glazed white, cream, and polychrome finish.

All surface finishes are hard burned, impervious to weather conditions, and permanently durable.

Terra Cotta Granite and Terra Cotta Marble

Reproducing exactly the color, texture and general appearance of the natural material. Samples furnished on request.

Specialties

Gold glaze and polychrome.

Detail of Terra Cotta Work, Roxy Theater, New York, N. Y.
Unglazed Terra Cotta in limestone color, with black glazed window infill and cream glazed lattice work

Unusually Large Pieces

With careful study of jointing to conform to architect's scale and design.

Guarantee

Federal Terra Cotta is *guaranteed* and a periodic inspection is made regularly of all buildings in which it is used.

Publications

Monthly brochures of the FEDERAL TERRA COTTA Co. give descriptions of special developments in certain buildings and progressive expansion in areas of color.

Services of the Society

The NATIONAL TERRA COTTA SOCIETY is a bureau operated by the manufacturers of terra cotta in the United States for the technical and artistic improvement of product, the dissemination of authentic information relating to it and the assistance of the architectural and engineering professions in the proper and effective employment of this material. In addition to the Standard Specifications printed below the Society issues other

helpful literature relating to the proper construction of terra cotta and the use of color in architectural design; also illustrated brochures pertaining to various classes of buildings.

Its individual member companies are also prepared to assist architects with counsel and recommendation upon the use of terra cotta in specific instances of application, and to furnish samples of their product when desired.

Standard Specifications for the Manufacture, Furnishing and Setting of Terra Cotta

These Specifications were prepared with the assistance of representatives of the Structural Service Committee of the American Institute of Architects and of the National Bureau of Standards, U. S. Department of Commerce, Washington, D. C.

Note: The Architect or Specification Writer will find it convenient to follow the Short Form Specifications beginning with Section 63.

The Short Form incorporates all the provisions of the Standard Terra Cotta Specification, but eliminates the necessity of mentioning them in detail.

Reference to the Glossary, Sections 50-62, will supply the surface finish, ceramic finish, and color data necessary to specify surface and color correctly.

The Corollary Clauses, Sections 85, 86, explain the setting option between mason and manufacturer.

Sections 87-91 under Corollary Clauses explain the specifications for flashing, sheet metal, structural steel, structural concrete and rough carpentry. These specifications form a part of the Terra Cotta Specification, although the materials are supplied and set in place by different contracting parties.

A—General Information

Drawings and Schedules

1. The Terra Cotta manufacturer shall be furnished with all drawings, details and other information necessary for the manufacture of Terra Cotta, including drawings for all classes of work with which the Terra Cotta engages.

2. Wherever Terra Cotta is required to match in contour, color, finish and surface treatment, existing Terra Cotta, as for example in connection with alterations or additions to existing work, the Terra Cotta manufacturer shall be furnished with the required profiles and samples of the original work, and other needed information.

3. The Terra Cotta manufacturer shall, before proceeding with manufacture, submit to the architect for his correction and approval, shop drawings showing jointing and construction of the Terra Cotta and provision made for all flashing and counter flashing. These drawings must conform as nearly as practicable to the architect's drawings, but shall be in accordance with good Terra Cotta structural practice.

4. All pieces of Terra Cotta shall be numbered. The Terra Cotta manufacturer shall provide two copies of the completed scale shop drawings to be used for setting and showing the piece numbering of the Terra Cotta, and the size of the joints to be used for setting the various portions of the work clearly indicated. These drawings shall be designated as the setting drawings.

5. The Terra Cotta manufacturer shall furnish, as promptly as possible, a schedule of all special anchors, hangers, etc., necessary to secure and support the Terra Cotta in a manner approved by the architect.

B—Material

Quality, Tests

6. *Note:* In view of the researches now being conducted by the National Bureau of Standards at the instance of the NATIONAL TERRA COTTA SOCIETY, it seems inadvisable to attempt, at this time, to write either quality clauses in terms of crushing strengths, densities and elasticity, or specifications for tests. Clauses descriptive of the desirable physical characteristics and of tests to prove compliance of the material with such physical requirements will be prepared as soon as the necessary data are available and inserted in a later edition of this standard specification.

Modeling

7. All ornament shall be artistically modeled by the Terra Cotta manufacturer's staff artists. (Or, models made to Terra Cotta shrinkage scale will be furnished to Terra Cotta manufacturer, without cost to him, securely crated for shipment f.o.b. modellers' studio at .)

8. Photographs in duplicate of all ornament shall be submitted to the architect for his approval or correction, or, if he so desires, he may inspect all modeling at the factory. Such approval or inspection by the architect shall be made promptly. No ornamental work shall be burned until modeling has been approved.

Surface Finish, Ceramic Finish and Color

9. The surface finish, ceramic finish and color of all exposed surfaces of Terra Cotta shall be as indicated by the architect's drawings or as specified. For surface and ceramic treatments, see Glossary of Terms relating to Terra Cotta, which is hereby made a part of this specification.

10. The ceramic finish shall be applied to the Terra Cotta in such a manner as thoroughly to coat the exposed surfaces.

Samples

11. The Terra Cotta manufacturer shall submit samples of the color or colors of the ceramic finish to the architect for his approval, and all Terra Cotta shall conform without marked variation to the sample or samples so approved.

C—Design and Structure

Ends, Walls and Partitions

12. Walls shall not be less than one inch thick and partitions shall be of such thickness and so spaced as to perform their proper functions with regard to form and structure. Each piece of Terra Cotta shall be provided with the necessary anchor holes and hand holes and shall be so formed as properly to engage the structure. Beds generally shall be not less than 4 in. deep.

Washes, Weep Holes and Drips

13. Projecting courses, cornices and heavy ornamental detail may have washes, drips and weep holes, where shown on the approved shop drawings.

Preparation for Flashing

14. Where so shown the washes of all projecting cornices and other exposed horizontal surfaces shall have provision made for flashing. All surfaces where the wash pitches inward toward the structure and stops against superimposed work; all balcony floors, and all gutter grades shall have provision made for flashing.

15. Raggles shall be provided to receive gutter linings and flashings when the joints can not be used for the purpose. Raggles shall be not less than $\frac{3}{4}$ in. deep.

16. All capping courses, copings and sills except of the "slip" type, shall have stools and lugs at intersections with vertical surfaces.

Joints

17. All joints shall be straight and true and of an approximate uniform width of $\frac{1}{4}$ in. All Terra Cotta shall be laid out at the factory to test it for uniformity of joint widths and over-all dimensions. Where necessary to secure accurate dimensions and uniform joint widths, the material shall be sized straight and true.

D—Transportation, Storage and Protection

Shipment, Delivery and Care

18. Unless otherwise specifically agreed, all Terra Cotta shall be furnished by the manufacturer f.o.b. cars factory, with freight allowed to destination. All Terra Cotta shall be carefully packed in hay, straw, excelsior or other suitable material.

Replacements

19. If any pieces of Terra Cotta are damaged in transit, the manufacturer shall be immediately notified in writing by the setting contractor and proceed with the remaking of the pieces. The responsibility for the cost of such replacements shall be determined by the point of delivery fixed by the contract under which the Terra Cotta is delivered. If the point of delivery is beyond the immediate control of the manufacturer, the setting contractor shall assume responsibility for the necessary proof of damage.

E—Erection

Handling

20. The setting contractor shall receive the Terra Cotta on arrival at the freight yards and shall transfer it without damage from the cars to the building. When the Terra Cotta manufacturer delivers on trucks at the building the setting contractor shall unload and store the Terra Cotta. Terra Cotta shall be stored under cover not in contact with the ground, stacked without inflammable packing on wood laths or strips, so as to protect it from injury.

Mechanics

21. All Terra Cotta shall be set by mechanics experienced in the handling and setting of the material.

Cutting and Fitting at the Building

22. Notice of errors in the manufacture of the Terra Cotta shall be given to the manufacturer immediately upon discovery. Cutting or fitting due to such errors shall be done by the Terra Cotta manufacturer or shall be paid for by him if he fails to do the necessary cutting or fitting promptly upon receipt of notice.

23. Other necessary cutting and fitting of the Terra Cotta that may be required at the building, including all fitting around anchors, steel and iron work and reinforced concrete, shall be done by the contractor for setting Terra Cotta.

Supporting Metal Work and Anchors

24. *In Connection with Structural Steel*—Beams, channels, angles, T's, plates and fabricated members for supporting Terra Cotta and which are not secured to the structural steel by rivets or short bolts, as shown on the architect's drawings, together with all anchors, hangers, bolts, clips, straps, rods and pins for securing Terra Cotta, shall be furnished and set by the contractor for setting Terra Cotta.

25. *In Connection with Structural Concrete*—The contractor for structural concrete shall furnish and set all supporting metal work imbedded in the concrete and all shelf angles and continuous rods. All such metal work shall conform to the requirements of the setting drawings prepared by the Terra Cotta manufacturer.

26. All other loose iron such as clamps, hangers, clips, straps, and pins shall be furnished and set by the Contractor for setting Terra Cotta.

27. All anchors, hangers, bolts, clips, straps, rods and pins for securing Terra Cotta shall be of wrought iron or non-corroding soft steel.

28. Anchors, hangers, bolts, clips, straps, rods and pins for securing the Terra Cotta, except where otherwise shown or specified, shall be of the following minimum sizes:

29. Anchors:—(a) For ashlar or courses balanced on the wall, shall be $\frac{1}{4} \times \frac{1}{4}$ in. or $\frac{1}{8} \times \frac{5}{8}$ in., or No. 6 gauge galvanized wire.

30. (b) For projecting courses not balanced on the wall, shall be not less than $\frac{5}{8}$ -in. round or square bars or equal cross section.

31. Hangers shall be $\frac{5}{8}$ -in. diameter round bars or other shapes of equal cross section area.

32. Clips and straps shall be $\frac{3}{8} \times 2$ in.

33. Pins shall be $\frac{1}{2}$ -in. diameter round bars.

34. Continuous rods on concrete wall faces to which Terra Cotta ashlar is clipped, shall be $\frac{5}{8}$ -in. diameter round bars which shall be secured to the masonry with $\frac{1}{2}$ -in. diameter round anchors placed not more than 2 ft. 0 in. on centers.

35. All steel or iron supporting metal work shall be clean and thoroughly protected with two coats of pure red lead and linseed oil paint, asphaltum applied hot, or other approved protective compound.

Protection of Supporting Metal Work

36. Metal work of every description, supporting Terra Cotta, shall be imbedded thoroughly in the masonry backing and when not so imbedded, metal work shall be protected against corrosion by encasing with cement mortar or in cement mortar masonry.

37. When the back of a Terra Cotta course comes in con-

tact with iron or structural concrete in such manner as to prevent the encasing of supporting iron from the rear, an opening shall be made in the top to admit of the placing of the encasing mortar as required above.

Mortar

38. All cement used for setting mortar shall be a standard brand of Portland cement fulfilling the requirements both physical and chemical of the standard specifications for Portland cement adopted by the American Society for Testing Materials.

39. All sand used for setting mortar shall be clean, sharp and well graded in size.

40. All mortar for setting and pointing shall be composed of one volume of Portland cement to three volumes of sand. Hydrated lime, not to exceed 9 pounds to the sack of cement, shall be added.

41. The sand and cement and lime, if any, shall be thoroughly mixed dry before any water is added. The use of retempered mortar shall not be permitted.

Setting

42. All Terra Cotta shall be set true to a line and carefully laid in a solid bed of mortar. All rebates in bed and cross joints from front to back and top to bottom, shall be filled solid with mortar leaving no voids. Each piece of Terra Cotta shall be tamped into place, excess mortar cut off and struck with a jointer or trowel. All sills, wall copings and other capping courses, shall be set in a thick bed of mortar and well pounded down so that the mortar fills all spaces around bottom of webs of Terra Cotta.

43. All Terra Cotta projecting courses shall be so set that the arris casting a shadow shall be true to line.

44. When the Terra Cotta work is of such scope or character that the proper handling and setting of the Terra Cotta require special skill and knowledge, the Terra Cotta manufacturer shall, if required by the contract, furnish a competent Terra Cotta setter to assist in the sorting, selecting and handling of the Terra Cotta, to co-operate with the setting contractor, to assist him when cutting or fitting of the Terra Cotta is necessary, to advise as to interpretation of setting drawings, and to help generally in securing rapid, efficient progress during the setting of the Terra Cotta. For such service the setting contractor shall pay such setter full time at his regular wage rate. When the furnishing of such a competent setter involves traveling expenses, the setting contractor shall pay the same and also make an allowance for his board.

45. When the services of such a competent setter are not required under the contract, the Terra Cotta manufacturer may, at his own option and expense, send such a representative to the work who shall perform the above services, and the setting contractor shall co-operate with and aid and facilitate the performance of such services by such representative.

Pointing

46. All joints in Terra Cotta shall be pointed and struck as the setting progresses except in freezing weather. In freezing weather and when re-pointing is necessary, all joints shall be raked or cut out to a depth of $\frac{1}{2}$ in. and the pointing mortar driven into the joint and struck with a jointing tool.

47. All joints in overhanging Terra Cotta, balustrades, parapets and free standing features shall have joints raked out one-half ($\frac{1}{2}$) inch, and pointed with an approved elastic cement.

Protection

48. All uncompleted walls including Terra Cotta and backing shall be protected by waterproof covering at night and at any time when liable to injury from storms or freezing.

(Note: All other protection required for projecting courses, jambs of openings, etc., is provided for under the work of other trades.)

Cleaning Down

49. Upon completion of the work, mason's wedges, shoring, supports and centering and all other false work and protections shall be removed and the Terra Cotta cleaned down. If satisfactory results can not be obtained by the use of abrasive soap or washing powder, a solution consisting of $1\frac{1}{2}$ pints of muriatic acid to a gallon of water may be used. In the use of acid solutions only wooden pails and fibre brushes shall be employed.

Glossary of Terms Relating to Terra Cotta

Surface Finish

50. Surface Finish designates the texture of the surface of the clay body prior to application of Ceramic Finish.

51. It may be:

- (a) *Smooth.*

- (b) *Tooled or Drove.*

(b1) Eight lines to the inch.

(b2) Six lines to the inch.

- (c) *Light irregular drag or combing.*

- (d) *Heavy irregular drag or combing.*

- (e) *Special.*

52. A special Surface Finish like "bush-hammered," "pitted," "vermiculated," etc., involves extra expense and, if required, should be clearly specified.

53. *Surface Finish for unglazed surfaces* may be smooth or may be tooled with a light or heavy drag. Flat surfaces of sufficient width may be tooled, while the curved surfaces of mouldings may be left smooth.

Surface Finish for glazed Ceramic Finish (whether lustrous or mat) is usually made smooth.

54. *Granite Colors*, if unglazed, may be made smooth or with irregular drag, or pitted. A bush-hammered or special surface involves extra expense, and if required should be clearly specified. If glazed Ceramic Finish is used for Granite Colors the surface treatment is usually smooth.

Ceramic Finish and Color

55. Ceramic Finish designates the surface and color applied by the ceramic processes of coating, glazing, burning, etc.

56. (1) *Unglazed Terra Cotta*: Terra Cotta with a Ceramic Finish producing an unglazed finish made in various shades of buff, gray, salmon, red and brown. Most colors thus made are vitreous.

57. (2) *Glazed or Enameled Terra Cotta*: Terra Cotta having an impervious Ceramic Finish of a glassy texture which may be either lustrous or mat (sometimes designated as full or dull glazes or enamels) made in various colors.

- 58. (3) *Granite Color Terra Cotta*:

(a) *Unglazed Granite Color*:—A mottled Ceramic Finish similar to unpolished granite.

(b) *Glazed or Enameled Granite Color*:—A mottled Ceramic Finish similar to polished granite, made either lustrous or mat.

59. (4) *Polychrome Terra Cotta or Faience*: Terra Cotta having two or more colors on the same piece.

(a) *Polychrome, Unglazed*:—Unglazed Terra Cotta having two or more colors on the same piece.

(b) *Polychrome, Glazed*:—Glazed Terra Cotta having two or more colors on the same piece.

(c) *Polychrome, Blended Colors*:—Made only in glazed Terra Cotta. If, in polychrome glazed work, the colors are not to be separated by definite lines or contours of ornaments, but are to be blended together by brush treatment, or the like, the term "Polychrome, blended colors" shall be used. The character of work expected should be explicitly described.

(Note: For polychrome work always clearly specify the work to be done and the number of colors on a single piece.)

60. (5) *Special*: There are a number of Ceramic Finishes used by individual manufacturers the processes for which are patented or the names copyrighted which are not included in this Glossary.

61. (6) *Semi-Glaze*: An ambiguous term which should never be used.

62. (7) *Fire-Gilding*: A coating of gold glaze either mat or lustrous, fixed by an additional burning. (The area of surface to be gilded should be clearly described.)

Short Form Specification for Incorporation in the Architect's Specifications

To be used in connection with Standard Specifications and the Standard General Conditions of the American Institute of Architects.

63. *Note to Architect*:—The Standard Specification does not state who shall set the Terra Cotta, who shall provide wood centering, scaffolding, hoists, cover boards and protection (except tops of walls against weather). It does not include any cement or concrete work in connection with forming gutter grades and washes on projecting courses and features, or the furnishing or setting of sheet metal flashings and gutter linings. It does not include the furnishing and erection of metal supporting members which are riveted or bolted with short bolts to the structural steel or structural concrete. It requires the architect to show on his drawings the sizes and arrangement of rolled or fabricated structural shapes used for supporting Terra Cotta. (See notes on corollary clauses at end of this specification for the work of other trades to take care of such omissions.)

General Conditions

64. The general conditions of the American Institute of Architects, Third Edition, shall form a part of this specification and contract and all work shall be subject to the provisions thereof.

Work Included

65. The work included in the contract comprises the manufacture, (and) delivery (and setting) of all Terra Cotta in accordance with the contract drawings and these specifications.

66. All (here insert a complete description of work) shall be of Terra Cotta.

Work Not Included

67. The following items are not included as a part of the contract for furnishing (and setting) Terra Cotta.

(a) Masonry backing. See specifications for (.....).

(b) The furnishing and erection of metal supporting members which are riveted or bolted with short bolts to the structural steel. See specifications for (.....).

(c) Cement or concrete grading for gutters, washes, floors, etc. See specifications for (.....).

(d) Furnishing and setting sheet metal, see specifications for (.....).

Materials and Workmanship

68. All Terra Cotta work under this contract, except as hereinafter specified, shall be executed in strict conformity with the Standard Specification for the Manufacture, Furnishing and Setting of Terra Cotta, adopted by the NATIONAL TERRA COTTA SOCIETY; which Standard Specification is hereby declared and made a part of this specification with the same force and effect as if written herein in full.

Surface Finish, Ceramic Finish and Color

69. All Terra Cotta

(Note: If several textures or finishes are to be used give location of each.) shall be

70. (1) *Unglazed.*

Surface Finish or flat members shall be

(a) *Smooth.*

(b) *Tooled or Drove.*

(b1) Eight lines to the inch.

(b2) Six lines to the inch.

(c) *Light irregular drag or combing.*

(d) *Heavy irregular drag or combing.*

(e) *Special.*

(Note: Special surface finishes like "bush-hammered," "pitted," "vermiculated," etc., should be described.)

71. The surface finishes of mouldings and curved surfaces generally shall be

(Note: Unless otherwise specified these surfaces are generally made smooth.)

72. (2) *Unglazed Granite Colors*—Surface finishes of flat members generally shall be (a, b, c, d, e). The surface finish of mouldings and curved surfaces generally shall be

(Note: Unless otherwise specified these surfaces are generally made smooth.)

73. (3) *Lustrous or Full Glazed or Enameled*—Surface finish shall be

(Note: Unless otherwise specified these surfaces are generally made smooth.)

74. (4) *Mat or Dull Glazed or Enameled*—Surface finish shall be

(See Note 3.)

75. (5) *Lustrous or Full Glazed or Enameled Granite*—Surface finish shall be

(See Note 3.)

76. (6) *Mat or Dull Glazed Enameled Granite*—Surface finish shall be

(See Note 3.)

77. The color of the Terra Cotta generally shall be (.....) as per approved sample or samples.

78. (7) The Terra Cotta comprising.... (described here in detail....) shall be (two, three, four) color polychrome. Colors (....specify where....) shall be blended.

79. (8) The surface finishes of (....specify where....) shall be fire gilded with (mat or lustrous) gold glaze.

(Note: Sections 1, 2, 3, 4, 5, 6 are alternates. If there is no polychrome work or no fire gilding omit sections 7 and 8. Sections a, b, c, d, e, are alternates for surface finish.)

Delivery

80. The Terra Cotta manufacturer shall furnish and deliver (f.o.b. cars factory with freight allowed to destination) (on trucks at the site of the building) (and set) all the Terra Cotta as indicated on the drawings or as here described.

Setting

81. All Terra Cotta shall be set by (Terra Cotta manufacturer) (mason.....). For such anchors and metal work

as are to be furnished by the setting contractor see Standard Specification.

(Note to Architect: If the Terra Cotta manufacturer is to set his material include the following clause in the Terra Cotta specification. See also suggested clauses at end of this specification to take care of these omissions and for incorporation in the specifications for the work of other trades.)

82. "Hoisting service, storage space, setting mortar delivered on the scaffold, outside and inside scaffolds, runways and platforms, water, temporary light and removal of refuse, shall be furnished to the Terra Cotta manufacturer free of charge by the (....mason contractor....)."

Terra Cotta Setter

(Note to Architect: If the work is of such scope or character that the proper handling and setting requires special skill, the following clause may be inserted:)

"The Terra Cotta manufacturer shall furnish at the expense of the setting contractor a competent Terra Cotta setter to assist in the sorting, selecting, handling and setting of the Terra Cotta."

Joints

83. (The Standard Specification does not require any joints to be rubbed. If rubbed joints are to be required it should be so stated here.)

84. (The Standard Specification requires all joints to be approximately 1/4 in. wide. If joints of a different width are desired it should be so stated here.)

Suggestions for Corollary Clauses

85. 1.—If the Terra Cotta is to be set by the Terra Cotta manufacturer, a clause similar in purport to the following should be included in the general requirements relating to masonry or brick work:

86. "Terra Cotta will be furnished and set by the Terra Cotta manufacturer. Hoisting service, storage space, setting mortar delivered on the scaffold, outside and inside scaffolds, runways and platforms, water, temporary light and removal of refuse shall be furnished to the Terra Cotta manufacturer, free of charge, by the (mason contractor)." A provision should also be included to the effect that the (mason contractor) shall construct the brick (concrete) backing for the Terra Cotta and "The backing shall proceed simultaneously with the setting of Terra Cotta. Each piece of Terra Cotta shall be backed up solid with brick and mortar, so as to make a perfect bond and homogeneous mass between wall lines. This backing shall extend beyond the wall line when necessary to structural stability. If concrete is used it shall not be stronger than a 1 to 9 mixture."

Also a provision under which the (mason) contractor shall place all concrete or cement grading for gutters, washes and balcony, loggia or other floors.

87. In the case of parapet walls specifications should state that flashing if used shall be carried through the wall, or if flashing be not used the back of the parapet wall shall be damp-proofed and the waterproofing carried through the wall.

88. 2.—In the specifications for sheet metal work there should be included a clause similar in purport to the following:

"The washes on all cornices and other exposed surfaces, where shown or specified, shall be covered with () which shall be turned up against vertical surfaces (cap flashed) and cemented into the raggles provided for the purpose in the Terra Cotta."

89. 3.—Structural Supports.

Under "Structural Steel," a clause similar in purport to the following should be included:

"Beams, channels, angles, T's, plates and fabricated members for supporting Terra Cotta, and which are secured to the structural steel with short bolts or rivets, shall be furnished and erected by the contractor for (structural steel.)"

90. Under "Structural Concrete" a clause similar in purport to the following should be included:

"Steel beams, channels, angles, T's, plates, fabricated brackets and outlookers and other members, bolts, rods, wires, anchors, and sleeves for supporting Terra Cotta, which are imbedded in the structural concrete, also shelf angles and continuous rods attached to structural concrete shall be furnished and set by the contractor for structural concrete, in strict accordance with setting drawings prepared by the Terra Cotta manufacturer." (For information as to the sizes and character of bolts, rods, anchors, etc., see Section E paragraphs 24 to 35 inclusive on "Supporting Metal Work and Anchors" of Standard Specification for the Manufacture, Furnishing and Setting of Terra Cotta. Such supports should be clearly shown on the drawings.)

91. 4.—Under "Rough Carpentry" or other suitable division of work, there should be included a clause providing that the contractor shall furnish, set and maintain all centering, cover boards, boxing and protection for Terra Cotta, and remove the same upon completion of the work.

Products

ARCHITECTURAL TERRA COTTA for exterior and interior of buildings.

Quality

This Company is a manufacturer of the highest grade of architectural terra cotta in glazed, unglazed, granite, polychrome and pulschrome finishes.

Production

THE NEW JERSEY TERRA COTTA COMPANY operates one of the largest and most modern plants in the East, and is equipped to manufacture work of any description.

Service

Architects and builders desiring expert advice on questions pertaining to architectural terra cotta may feel free to call on us for such service.

The Warwick, Northeast Corner of Sixth Avenue and 54th Street, New York, N. Y.

EMERY ROTH, Associate Architect

DWIGHT P. ROBINSON Co., Inc., Builders

The ornate window features above base course illustrate the use of terra cotta as a decorative material which can be economically duplicated. The modeler can mould the plastic clay to secure the fine ornamental lines required by the architect. An elaborate feature can then be reproduced any number of times at slight additional expense.

Products

ARCHITECTURAL TERRA-COTTA.
C P C STANDARD MACHINE-MADE PROFILES.

Terra-Cotta

Ceramic finishes of proved merit cover such a wide range that the variety of selection presented to architect and owner is almost limitless. The New York Company presents the results of forty years' constant research in this department.

The New York Company applies these ceramic finishes to terra-cotta which has been fabricated to outlast the building of which it will form a part.

Only the highest grade of selected clays, scientifically mixed and thoroughly pugged, tempered and aged enter into the construction of the New York Company terra-cotta.

With solidly pressed faces, sides and ends, all of honest thickness, and with heavy struts adequately placed, each piece of New York Company terra-cotta carries with it the New York Company guarantee.

C P C Standard Profiles

To meet the demand for selection of wide range of ceramic colors in standardized profiles for sills, copings, band courses, ashlar, mouldings, etc., we offer die run products made from precisely the same materials as the hand-made architectural terra-cotta, but at economy of price made possible only through standardization and machine fabrication. Because of the standardized method of packaging, this C P C machine-made product is available for the smallest jobs at the same price per unit charged for larger quantities. Small orders receive the same prompt and careful attention given to larger shipments. Packing schedule, etc., upon request.

Quality

For over forty years the New York Company has manufactured terra-cotta of the highest quality only. Its product meets the most exacting requirements of architect and owner.

Service

The New York Company has at its command most complete facilities for the rendering of steady and dependable service to its customers.

Among prominent buildings just completed, it has furnished all of the architectural terra-cotta, exterior and interior, for the Statler Hotel of Boston, Mass., to the plans of George B. Post & Sons, Architects.

THE NORTHWESTERN TERRA COTTA COMPANY

WORKS AND MAIN OFFICE

2525 Clybourn Avenue

CHICAGO, ILL.

WESTERN PLANT, DENVER, COLO.

SOUTHWESTERN PLANT, ST. LOUIS, MO.

SALES AGENCIES IN ALL PRINCIPAL CITIES

Products

ARCHITECTURAL TERRA COTTA for exteriors and interiors, in plain, ornamental or sculptured design, in all known finishes, and in any desired color or combinations of color.

Also Northwestern Terra Cotta in stock designs; Northwestern Multi-unit Sills for steel sash windows; Northwestern Chimney Pots; Northwestern Garden Pottery; Northwestern Faience.

Northwestern Service

More than fifty years of practical experience has equipped THE NORTHWESTERN TERRA COTTA COMPANY with both personnel and plants that insure a service unsurpassed in this industry.

For the *architect*: Northwestern experts co-operate with the architect, from the concept of the building, to furnish the technical information necessary to secure desired results.

For the *builder*: Northwestern executives give personal attention to the making of prompt and proper deliveries, thus reducing labor cost and obviating time penalties.

For the *owner*: Northwestern reputation and responsibility guarantees both the quality and the character of Northwestern Terra Cotta, which in turn insures a satisfactory yield on the owner's investment.

Northwestern Facilities

With the largest plant in the world devoted to the manufacture of architectural terra cotta (located in Chicago), with the most modern terra cotta plant in existence (located in St. Louis), and with the most unique plant in the Rocky Mountains (located at Denver), THE NORTHWESTERN TERRA

COTTA COMPANY has unsurpassed production facilities, for the largest or the smallest job.

Northwestern Terra Cotta

Glazed Northwestern Terra Cotta is impervious to moisture, and is made in any one of three degrees of gloss, viz.: bright, satin and matt.

Unglazed Northwestern Terra Cotta is covered with a slip coating of varying degrees of hardness and sheen.

Either glazed or unglazed material may have a plain, pulschrome, speckled, mottled, granite, old ivory, fire flashed, shaded, blended, or special color treatment.

All ceramic finishes are applied over a mechanical surface finish as selected: either smooth, tooled, drove, irregular drag or combing, bush hammered, rugged, pitted or special.

Northwestern Quality

Northwestern Terra Cotta is made from special fire clays, carefully selected by laboratory tests to produce a finished product rarely equaled and never surpassed for beauty and durability.

The Northwestern staff of ceramic experts, trained through three generations of constant improvement, are past masters of design, of color and of texture—the three essentials in architectural terra cotta.

Northwestern Specifications

In making out specifications for any terra cotta structure, always use the word "Northwestern," in connection with the color treatments, mechanical and ceramic finishes desired, and thus secure that quality of product and that character of service which has established Northwestern leadership for over half a century.

Pittsfield Building, Chicago
Owned by Marshall Field Estate

Northwestern Color Service

Recognizing the tremendous possibilities for the use of color architecturally, and appreciating the problems that will come with this development, THE NORTHWESTERN TERRA COTTA COMPANY has established a Consulting Color Service and places it at the disposal of any architect who may have a color problem to solve.

There is no charge for this service, neither does it carry with it any obligation from the architect to the company. It brings to you the results of years of thought, study and experiment in the application of color to the interior of buildings of all classes.

There are certain well-defined principles for the application of color to exteriors. These principles have been worked out not only by our own staff, but by consulting colorists of authority and repute, to the end, we hope, that this service may be the most practical and helpful ever offered to architects by any building material manufacturer.

Growing Trend to Color

You need only look through the pages of popular magazines to recognize and appreciate the tremendous trend to color in all lines of business. Note the brilliancy of the lacquers now so popular. Observe the color treatments of the most exclusive as well as the most popular automobiles. See how brilliant color has become the keynote for interior decorations.

These striking uses of color show conclusively that the American people appreciate color in every grade of its development.

The architects who recognize this national trend to color, and use color for the inspiring motif of their architectural masterpieces, will find an unusually sympathetic response on the part of their clients.

In the days of the Renaissance the architect was also a painter and a sculptor. He majored in

color as well as in form, as is evidenced by the masterpieces of Michelangelo and Raphael.

American architects now have the opportunity to follow in the footsteps of these illustrious masters, but they have better materials to work with.

Northwestern Advantages

Northwestern Terra Cotta offers all of the advantages of form that any other material can offer. It offers additional advantages in its various surfaces, different finishes, and enduring beauty. To these is added the charm of color, from pleasing tints to brilliant hues—either in plain, ornamental or sculptured surfaces.

Among a few of the notable Northwestern Terra Cotta structures are the:

Wrigley Buildings, Pure Oil Building, Bell Building and Pittsfield Building in Chicago; the American Insurance Union Citadel at Columbus, Ohio; the Union Central Life Insurance Annex, Cincinnati, Ohio; and hundreds of similar outstanding examples of American architecture.

Northwestern Floodlighting

The value of Northwestern Terra Cotta for floodlighting purposes is unsurpassed. Textures and finishes are designed especially by Northwestern to secure the greatest degree of illumination at the least cost for electric current.

This use of floodlighting has a direct bearing upon the value of Northwestern Terra Cotta structures in color effects—because the beauty of color treatments when illuminated at night is even greater than their charm in the daytime.

Architects or owners who desire more information regarding the use of Northwestern Terra Cotta, and the application of color to building design, are invited to write the Consulting Color Service of THE NORTHWESTERN TERRA COTTA COMPANY, Chicago, St. Louis or Denver.

DENISON LOAD-BEARING TILE.

Patents and License

The manufacture, sale and use of Denison Load-Bearing Tile are licensed under the "Wilson System Bearing Wall Construction" Patented; patents as follows: United States Patents No. 760,774; No. 784,476; No. 1,234,990; No. 1,171,913. Reissue No. 14,414; No. 1,350,399. Canadian Patents No. 151,165 and No. 178,744. Other domestic and foreign patents pending.

Advantages

(1) Two separate mortar beds in every course, both lying in same horizontal plane. (2) Dead air space insulates between these two mortar beds same as body of tile is insulated, thus preventing formation of frost or moisture lines on inside of wall. (3) This air space between mortar beds insures against conduction of moisture through wall. (4) Because of insulated mortar joints, plaster may be applied direct to the tile without the use of furring.

(5) All vertical webs are in perfect alignment to carry all load pressures. This gives a wall the greatest load-bearing capacity. (6) Tile is completely symmetrical, thereby facilitating laying. (7) It is a complete unit which will stand on its own base in a stable condition when stood on either face or end, thus facilitating handling and piling.

(8) Works out to all brick heights and thicknesses and bonds perfectly with any header course from third to ninth. (9) Dimension tile of fractional lengths furnished to facilitate laying any length of wall. (10) Furnished with scored or smooth face, as ordered.

(11) Corner tile permit turning inside or outside corner without destroying insulating efficiency of wall at corners.

(12) Jamb and half-jamb tile are furnished for either casement or box frame openings, which provide weatherproof joints with the frames and maintain the insulating efficiency of the wall.

Strength

These tile are guaranteed by the various manufacturers to have a minimum crushing strength of not less than 700 lbs. to the sq. in. net area of web section. Laboratory tests, made for the various manufacturers by such recognized testing laboratories as the following, show a crushing strength per tile ranging from 120,000 to 193,750 lbs.: Iowa State College; State Universities of Iowa, Minnesota and Wisconsin; Carnegie Institute; Drexel Institute; Pittsburgh Testing Laboratory; Department of Buildings of Minneapolis and Detroit.

Costs

Construction costs will vary somewhat, due to such local problems as freight rates; yet, in general, practice indicates that it is safe to say that a given wall can be built of these tile at a cost that is 20% to 30% less than the cost to build the same wall of common brick, and the same price as to build it with common tile.

Specifications and Details

The following may be used as standard specifications for the use of these tile in "Wilson System Bearing Wall Construction":

Denison Load-Bearing Tile shall be laid with the voids horizontal except for corners, jambs, piers or pilasters; all vertical joints shall be staggered and the tile above should overlap the tile below by at least 3 in. When the wall thickness is greater than that of the tile, it shall be constructed of a combination of whole and half thickness units, spaced apart from each other the distance of the void between the two lobes of the whole tile, and the next whole tile above shall bond two subadjacent tile below together by overlapping two bearing webs of each, retaining all bearing webs in alignment. Where joists rest on the wall they shall extend into same so that they will overlap at least two bearing members of the tile. Where wall heights do not work out to even courses of the tile being used, a smaller unit shall be used to complete the height. Dimension lengths, which are furnished in sufficient quantities, shall be used to complete lengths of walls and between openings, etc.

Working Drawings

A portfolio, containing a full set of detail and working drawings and standard specifications furnished free on request made to any licensed manufacturer.

← THESE — BUILD — THESE →

The No. 35 or the No. 23 and their allied units may be used in the place of, or in connection with, the No. 47 and its related units in this or in any of the other constructions shown here. In this way any desired height of wall can be reached that may be reached by using common brick.

An "F" tile is, in reality, one of the two lobes of either a No. 47, a No. 35 or a No. 23. It may be furnished ready split, or it can be split from the full standard unit on the job.

The "J" and "J6" units in the different sizes make possible weatherproof joints between the wall and a box frame without destroying the wall insulation.

These units in the different sizes make weatherproof joints between the wall and casement frames without destroying the wall insulation.

10"-#47 tile on end (#47I02) 47I02F

This corner unit enables either an inside or an outside corner to be turned without destroying the wall insulation. It bonds the two walls together into a strong and rigid corner.

The No. 11 is a hollow unit for backing up header courses of brick and maintains both the insulating and the load bearing efficiency of the wall.

CLAY PRODUCTS COMPANY, INC.

Manufacturers of Insul-Glaz Tile, Caentile and Vitrified Clay Conduit

GENERAL OFFICE

BRAZIL, IND.

Products

INSUL-GLAZ TILE.

CAENTILE (Smooth and Matt).

Also manufacturers of Vitrified Clay Conduit, Building Conduit and Textured Interlocking Tile.

Material

In Insul-Glaz and Caentile it has been our aim to perfect a material for wall construction which combines the many advantages of structural tile with surface finishes, that in quality and appearance are acceptable for the highest class of projects.

Insul-Glaz Tile—Insul-Glaz Tile is a smooth face vitrified fire clay tile with a uniformly heavy salt glazed finish and of a color most desirable in this class of material.

Caentile—Caentile is a vitrified fire clay tile with colors and textures of the highest grades of buff and gray, smooth or matt face brick.

Qualities

Insul-Glaz Tile and Smooth Caentile—Super Quality—The standard of perfection of smooth face vitrified tile, glazed or unglazed.

Commercial Quality—A high grade vitrified tile, glazed or unglazed, suitable for many purposes.

Matt Face Caentile—First Quality—Standard of buff matt face vitrified tile unglazed.

Color

Insul-Glaz super quality tile is furnished in either a light, medium or dark shade. A range of shade will be furnished which blended in the wall will have an extremely light effect or a dark effect, as desired, and a ceramic beauty possible only with a slight mingling of shade.

Super quality smooth Caentile is furnished in blended shades of buff gray or cream buff.

Matt Caentile and commercial grades of Insul-Glaz Tile and smooth Caentile are furnished in full range of shade only.

While every endeavor is made to furnish shapes of the same variations of shade as the standard units, greater latitude must be permitted, particularly on rush shipments.

Construction Features of Insul-Glaz and Caentile

Insul-Glaz and Caentile have many advantageous construction features—among them the following stand out: fire, acid, oil and grease resistant; insulation quality; sanitary finish; high crushing strength and low dead weight; indestructibility; attractiveness of finish; economy and rapidity of erection; permanency of color and finish; readily cleaned; minimum upkeep; low relative cost.

Some of the Principal Uses

Among the principal uses of Insul-Glaz and Caentile are: finishing rooms of public or semipublic buildings where one or more of the construction features listed above are a necessity. School buildings—particularly in corridors, playrooms, workshops, basements, gymnasiums, laboratories, lavatories; for wainscots, etc. Others include hotels, natatoriums, hospitals, food preparation plants, power plants, warehouses, etc.

Facilities and Service

CLAY PRODUCTS COMPANY, INC. operates three factories with a combined capacity in excess of 125,000 tons per year. The plant locations are such that shipments can be made over any one of four trunk line railroads. Ample stocks of standard units are always on hand for prompt shipment.

The Company maintains an engineering department which is ready at all times to render assistance to the architect, engineer or builder in the solution of construction problems where the Company's products may be involved.

Special sizes or shapes can be manufactured to meet unusual conditions.

Wall Thicknesses Which Can Be Built with Insul-Glaz and Caentile Units—*Veneer*— $1\frac{3}{8}$ and $1\frac{7}{8}$ in. (exclusive of mortar backing).

Single Faced— $3\frac{3}{4}$ and 8 in.

Double Faced— $4\frac{1}{4}$, $6\frac{1}{4}$, 8, $10\frac{1}{4}$, $12\frac{1}{4}$, $16\frac{1}{2}$ in. and up.

All walls from $4\frac{1}{4}$ in. may be of one finish of tile on one face and of a different finish of tile on the other face, i.e., a $4\frac{1}{4}$ -in. wall may be Insul-Glaz Tile on one face and Caentile on the other face.

NUMBER OF INSUL-GLAZ TILE OR CAENTILE REQUIRED PER SQUARE FOOT OF NET WALL

Thickness, in., of		Number of faces tile finished	Quantities required per sq. ft. of net wall
Veneer tile	Wall		
$1\frac{3}{8}$	1-veneer	1.05 No. 350
$1\frac{7}{8}$	1-veneer	1.05 No. 250
.....	$3\frac{3}{4}$	1	2.10 No. 400 or 1.05 No. 650
.....	$4\frac{1}{4}$	2	2.10 No. 250
.....	$6\frac{1}{4}$	2	1.05 No. 250 plus 2.10 No. 400
.....	8	1	2.10 No. 800
.....	$10\frac{1}{4}$	2	4.20 No. 400 or 2.10 No. 650
.....	$12\frac{1}{4}$	2	1.05 No. 250 plus 2.10 No. 800
.....	$16\frac{1}{2}$	2	2.10 No. 400 plus 2.10 No. 800
.....	$12\frac{1}{4}$	1-other face brick veneered; brick header every 6th course	4.20 No. 800
			0.70 No. 400 plus 1.40 No. 800 plus 7 face and 1 common brick.

Brick Displacement—Brick displaced by Insul-Glaz and Caentile equal 5x8x12-in. tile, 6 brick and 5x4x12-in. tile, 3 brick.

Crushing Strength—Approximately 3400 per sq. in. of gross bearing surface.

Absorption—Less than 5% of own weight in 48 hours.

Weight of Wall—Weight of Insul-Glaz and Caentile walls as compared to brick of equal thickness are given in the following table:

Insul-Glaz or Caentile		Equivalent Brick Wall*
Wall thickness, in.	Weight per sq. ft., lb.	Weight per sq. ft., lb.
$4\frac{1}{4}$	35	43
$6\frac{1}{4}$	55	84
8	60	84
$12\frac{1}{2}$	95	125

*Brick taken at 125 lb. per cu. ft.

Mortar Clinch—The $\frac{1}{2}$ -in. round holes in the exterior webs of the tile assure a permanent mortar clinch in the vertical joints of the tile wall, an important factor in exposed tile construction.

Hand Smoothed Edges—All cut edges are hand smoothed, in the green, so that finished faces will be free from any roughness or feathered edges, which are not only unsightly but cause chipping.

Mortar and Mortar Color—Insul-Glaz and Caen-

tile are designed for $\frac{1}{2}$ -in. joint and details of construction are standard for this size of joints. Some variation is possible to meet individual tastes.

Double Faced Walls—It is not recommended that double faced walls be built of one tile extending through the wall, but rather of two units as shown in details on plates following. This procedure will permit of alignment of both faces at a cost no higher than would be necessary with two-faced sorting.

Tests—The testing laboratory of the University of Wisconsin has made a series of tests on Insul-Glaz and Caentile. Copies of the reports of test will be sent upon request.

The following results of tests on three blocks are taken from one of the certified reports:

TEST ON STANDARD 5x8x12-IN. BLOCK

No.	Strength per sq. in.	*Percent of voids	Weight, lb.	Weight after 48 hr. immersion, lb.
Clay P. C. 4	3950	45.3	20.00	20.15
Clay P. C. 5	3690	44.5	19.02	19.13
Clay P. C. 6	3700	45.4	19.73	19.80

*Not including 10 small round holes lengthwise, 5 in. each vertical web.

Sorting, Packing and Shipping

Insul-Glaz tile are sorted for one face only, except shapes which are sorted for faces as marked on details.

Insul-Glaz tile are packed in the car with extreme care and thoroughness. Lath gates are used between tiers, lath and straw between rows and corrugated paper between faces.

Shipped by carload lots the minimum loadings are—

No. 800, 5x8x12 in., 3400 pieces

No. 400, 5x4x12 in., 5000 pieces

No. 650, combination 5x8x12 in. and 5x4x12 in., 3000 pieces.

Comparative Cost

Super quality tile average throughout the United States (east of Rockies) from 15 to 35% cheaper than salt glazed brick or interior face brick, in the wall.

Commercial grade tile average about the same as common brick, in the wall.

Samples

Samples of Insul-Glaz Tile, Smooth Caentile and Matt Caentile will be sent, without charge, to architects on request.

When Specifying

When specifying, give kind of material, quality, color range, whether bullnose or square closures, and whether cove base and wainscot cap units are desired.

Rights to manufacture and sell granted by the Heath Unit Tile Company, Tacoma, Washington, owners of the above patents.

A New Principle in Hollow Tile Construction

The Heath Cube is the outgrowth of all hollow tile, brickwork, and masonry in general. It is the first tile construction that recognizes the time honored brick dimension as established in masonry. The Heath Cube's adaptability is due to a size coinciding with brickwork. A brick is the unit of measure for the Heath Cube. It is a construction which gives an architect assurance of a dependable and scientifically constructed wall. It is dependable, as it cannot be incorrectly laid; and scientific, as it builds a wall with the webs and shells in fixed alignment.

The wall is built up in consistently formed tiers of load bearing members formed with the webs and shells in fixed alignment. This property is the same in either side-set or end-set cubes, or with halves and quarters. This is a property unique in Heath Cubes. There is no patch work in Heath Cube construction. Heath Cubes are the structural and economic solution of hollow tile construction. The inherent property of Heath Cubes is the constant and fixed alignment of the double webs over

two shells, which insures maximum strength in both side-set and end-set construction. No shear stresses are developed.

Architect's Detail Booklet

Write the Heath Cube Service or your nearest manufacturer for the Architect's Detail Booklet, which gives complete details, specifications, and full information pertaining to the use of Heath Cubes.

Quality Standards

Manufacturers have been selected to make Heath Cubes on their ability to produce high grade quality products. The required quality conforms to the specifications of the Hollow Building Tile Association and the American Society for Testing Materials. Heath Cubes are one standard size and quality throughout the United States.

Estimating Data

2 Half-Cubes build 1 sq. ft. of 4-in. wall.
2 Cubes build 1 sq. ft. of 8-in. wall.
2 Cubes and 2 halves build 1 sq. ft. of 12-in. wall.
3 Cubes and 2 halves build 1 sq. ft. of 16-in. wall.
4 Cubes and 2 halves build 1 sq. ft. of 20-in. wall.
3 Cubes equal 1 cu. ft., including mortar.
1 Cube equals 6 brick, including mortar.
167 Cubes equal 1000 brick in the wall.
1000 Cubes require 1 yd. of mortar.
120 lb. per sq. in. gross area, is the safe working load for either side-set or end-set construction.
Webs and shells are $\frac{5}{8}$ in. thick. Cube contains 52% solids and 48% voids.
One cubic foot of Heath Cube masonry weighs 60 lb.
Cubes are generally scored but they may be obtained smooth on as many faces as desired.

One Cube
18 pounds

Window Details for 8-inch Walls

- A—Recess for box frame, brick sill, reinforced lintel.
B—Box frame without recess, stone sill, angle iron lintel.
C—Metal sash frames, with jamb of Half and Quarter Cubes

Six Brick
30 pounds

Wall Construction

Cubes and Half-Cubes build walls same thicknesses as brickwork. Bonds face brick with through brick or metal ties for 8-in. walls. For walls 12 in. and thicker the Header-Cubes are used, bonding every third or sixth course of brick

Corner, 8-inch Wall

16 by 8-inch Pilaster

Method of building pilasters by end-setting Cubes, Half-Cubes and Quarter-Cubes. No special tile shapes are required

HOOSIER BUILDING TILE & SILO CO.

Glazed Tile for Interior and Exterior Wall Construction

ALBANY, IND.

Hoosier Interior Tile

Made from our light-burning fire clay, burned to an extreme degree of hardness.

Colors—Light or dark buff, gray or cream shades.

Finish—Smooth or wire-cut glazed, or semiglazed. All smooth finish product for interior wall construction has hand dressed edges.

Size—5x12-in. face. Furnished in 4 and 8-in. widths in regular or scored-to-split designs for working out different thicknesses of wall. (See accompanying illustration of blocks. Details of measurement on following page.)

Uses—The principal use of Hoosier interior tile is for sanitary walls in public and semi-public buildings. In school buildings it is particularly appropriate for corridors, workshops, basements, gymnasiums, laboratories, lavatories, etc., where it is used as wainscoting. This material is also used quite extensively in power plants, warehouses, store-rooms, factories, packinghouses, etc. We recommend our light gray and cream colors in the semiglazed finish for use above wainscot or in wall construction where the reflection of glazed tile would be undesirable.

Grading—Hoosier interior

Interior Wall of Hoosier Tile

Interior and exterior corners, wainscot cap and base with base in connection with window and door openings. Special shapes can be furnished for Hoosier interior wall tile construction.

tile is graded as "A," "B" and "C" grades. "A" grade is our standard of perfection. "B" grade is a good quality product, not sorted as to shade and admitting of certain mechanical defects not allowable in "A" quality in either the glazed or semiglazed finish. "C" grade consists of culls or, as they are sometimes termed, seconds. (Write for special detailed sheet.)

Loading and Packing—Hoosier interior "A" grade tile is packed with corrugated paper between faces and lath or paper between ends. "B" and "C" grades will be packed in straw unless otherwise agreed on.

Hoosier Exterior Tile

In light colors it is made from our light-burning clay and in dark colors from our dark-burning clay; thoroughly vitrified and furnished in salt-glazed, semiglazed and dull finish.

Colors—Light or dark brown, gray, cream, wine-black and special mixtures, all of which are designated by shade numbers.

Finish—Smooth or wire-cut glazed, or semiglazed.

Size—5x12-in. face, furnished in 4, 8 and 12-in. widths. (See illustrations at bottom of page.)

Smooth Glaze 8x5x12-in. Stretcher

Kerfed to make two 4-in. blocks with two finished faces

Regular 8x5x12-in. Matt Finish Stretcher

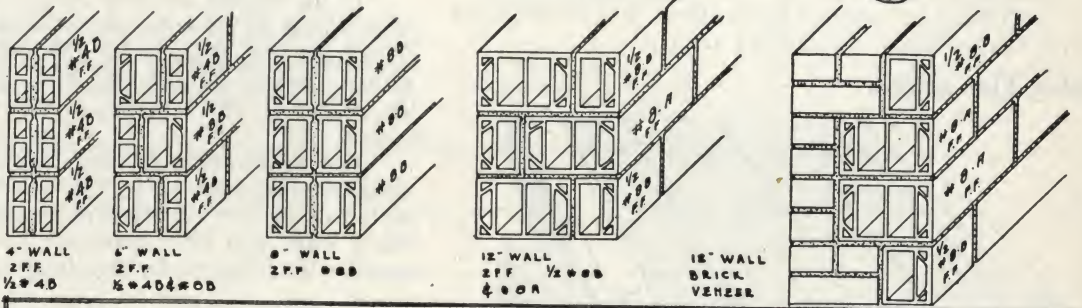

DETAILS BLOCKS IN PLACE

WINDOW CONSTRUCTION

Explanation

F. F. means finished face
 1 F. F. means one finished face
 2 F. F. means two finished faces
 8A and 8B, 4A and 4B, etc., is the stock number of the block
 Always order interior tile by stock number
 Measurements are as nearly accurate as possible, however, consideration must be made for slight shrink in burning, which is true of all clay products

Colors for interior: Buff, Gray and Cream
 Colors for exterior: Dark, Medium or Light Shades of Brown
 Colors in our "A" quality ware will be furnished according to our shade numbers with reasonable variation to bring out the ceramics
 For those looking for a good and less expensive job our "B" quality in full range of shades is quite popular

Special Shapes for Interior Wall Construction

Construction Features of Hoosier Tile

Uses—Hoosier wire-cut or mat-finish tile is used quite extensively for exterior finished wall in public buildings, such as churches, offices, storerooms, apartments, etc., and also in the more massive type of residence construction. Our smooth-glaze tile, in dark brown colors, we recommend for use in the construction of garages, factories, sidewalls of storerooms, basement walls, or in any class of building wherein line brick or cement block would be considered.

Grading—Hoosier exterior tile is graded as to first and second quality. Our first quality is our standard of perfection in this class of ware and is graded in different shades and blends, all of which are specified by shade number. Our second quality is a hard-burned product. No attempt is made to sort as to shade, and defects are admitted which are not allowable in our first quality. This grade will make a good wall in cases wherein appearance would not be considered.

Loading and Packing—All Hoosier exterior tile is loaded with straw between faces and ends. (Send for special color chart showing shades.)

May be summed up as follows:
 A crushing strength of more than 2000 lb. per sq. in., with a moisture test of less than 3%, make the product adaptable to load bearing finished walls. All tile are 5x12-in. face, with proper units to work in connection with openings to make bond. (See drawings.)
 Walls can be built in any multiple of 2 in. in width. Our 4 and 8-in. widths are the most popular. The former equals three brick and the latter, six. The unit is of such size that it lays up fast, eliminating unnecessary mortar joints and thereby saving both labor and mortar. As a natural consequence, there is a saving of from 20% to 30%, as compared to brick.
 In addition, are the advantages, of a hollow wall for insulation and the sanitary features of a hard-burned, glazed and non-absorbent wall with a load weight reduction of approximately 40% as compared with brick construction—a wall with an appealing and distinctive beauty that very much resembles brick in construction.

NATIONAL FIRE PROOFING COMPANY

Manufacturers of Hollow Tile

Fulton Building
PITTSBURGH, PA.

BRANCH OFFICES IN PRINCIPAL CITIES AND TWENTY-TWO FACTORIES IN THE UNITED STATES

Products and Services

STANDARD DENSE HOLLOW TILE for fireproof floors, roofs, ceilings, partitions, wall furring, column and girder coverings; for exterior walls of all kinds, including barns, silos, etc.

Also Kiln Bottom Brick and Fire Clay.

Contractors for FIREPROOF CONSTRUCTION in HOLLOW TILE in Chicago and New England Districts.

Facilities

We are the largest concern in the world devoted solely to hollow tile fireproof construction. Our output from 22 conveniently located factories in the United States and 1 in Canada insures economical transportation and prompt delivery.

Branding

We originated the policy of branding all our hollow tile with our trade-mark name, Natco. Special types bear individual marks of identification, as: Natco XXX, Natco Header-Backer, Natco Backup, etc.

Natco Floor Construction

Fireproof floors of Natco hollow tile can be set more safely and conveniently than concrete floors in winter, as construction dries out in a few days. Floors are of two general types: (1) short span arches (segmental or flat) between steel beams; and (2) long span slabs of hollow tile in combination with reinforced concrete, supported on bearing walls or girders (steel or reinforced concrete). Sound and fire proof.

Following are typical illustrations and descriptions of the Natco floors in everyday use:

Natco Flat Arches

PERSPECTIVE OF STANDARD NATCO FLAT ARCH

To find total dead load of any floor use the following weights: Rock asphalt tile or cement finish weighs about 140 lb. per cu. ft.; wood flooring, 3½ lb. per sq. ft.; wood sleepers, 30 lb. per cu. ft.; cinder concrete fill, 60 lb. per cu. ft.; hollow tile arch, see table following; plastering, 5 lb. per sq. ft.; steel I-beam, divide weight of beam by span in feet

WEIGHTS AND SPANS. NATCO FLAT ARCH

Depth of arch, in.	Approximate weight, lb. per sq. ft.	Maximum safe spans	
		ft.	in.
6	28	4	0
7	31	4	6
8	33	5	0

10	39	6	6
12	44	8	0
14	51	9	0
15	53	9	6
16	55	10	0

The flat arch, the accepted type of standard fireproof floor construction, meets every requirement as to

TRADE

NATCO
MARK

strength, fire protection, appearance and minimum weight. Natco flat arch is standard for this type.

Natco Segmental Arch

This form of arch combines great strength with economy and lightness. Suitable for warehouses, lofts, factories, sidewalks, or wherever a flat ceiling is not essential. A metal lath hung ceiling may be suspended from it to give a flat ceiling—a system employed in New York public schools, etc. It weighs approximately 35 lb. per sq. ft. for 6 in. arches.

TYPICAL SPAN OF NATCO SEGMENTAL ARCH

Natco Floors

These floors are of two types: (1) the regular one-way system of tile in combination with reinforced concrete; and (2) "Natcofloor"—a system of tile in combination with reinforced grout.

Both floors, adapted particularly to long span construction, eliminate girders and intermediate beams for clear spans up to 25 or 30 ft., doing away also with beam forms. They require one-third to one-half less flat centering, effecting great economy in erection—2x8-in. planks under each joist are sufficient.

In the regular one-way system of combination floor, rows of tile 12 in. wide are set between reinforced concrete joists 4 to 6 in. wide, which are poured monolithic with a concrete top, usually 2 or 2½ in. thick over the tile, mixed 1 part cement, 2 parts sand and 4 parts gravel.

For semicontinuous and continuous spans, proper reinforcement must be provided in top of slab over supports to take care of negative bending moment. Where heavy loads and long spans are encountered, the shear must be investigated by the designer.

PERSPECTIVE VIEW OF TYPICAL "COMBINATION" FLOOR
Note economical wood centering used; 2x8 or 2x10 in. under each joist is sufficient

TILE DEPTH AND STEEL AREA REQUIRED, "COMBINATION" FLOOR SLABS, 2-IN. CONCRETE TOP, JOISTS 4 IN. WIDE, 16 IN. O.C.

fc. = 650 lb. per sq. in.
fs. = 16,000 lb. per sq. in. $\frac{E_c}{E_s} = \frac{1}{15}$
Shear, 60 lb. per sq. in.

$\frac{3}{4}$ in. of concrete below reinforcement.

T=Tile; S=Steel.

*If moment $\frac{WL}{12}$ is used, investigate design for shear.

"Natcoflor" System of Fireproof Construction

In the "Natcoflor," rows of tile 13 in. wide, specially designed to resist compressive stress without cement top, are set between mortar ribs 2 in. wide of 1 part portland cement to 2½ parts sand.

The "Natcoflor" is an exceptionally light slab of wonderful strength designed to reduce the dead load of fireproof floor construction carried on girders, columns and footings. A minimum of centering required and an all-tile ceiling surface properly scored for plastering.

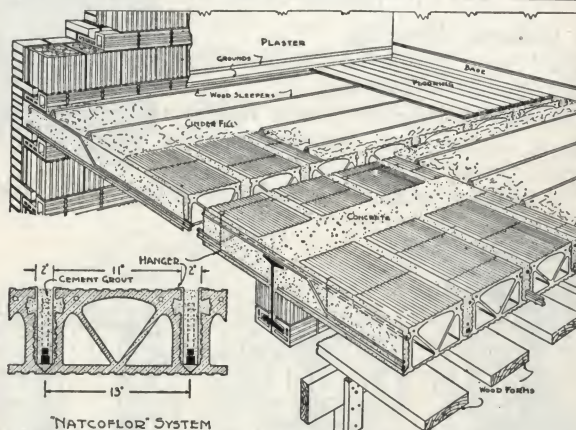

FIG. 3. PERSPECTIVE VIEW OF TYPICAL "NATCOFLOR"

Note simple method of reinforcing; also economical wood centering. 2x8 in. under each joist is sufficient.

Natco Girder Covering

Hollow tile beam and girder covering is made in various forms to fit the flanges of all standard steel beams and girders. It is self-supporting except where the width to be covered is more than 12 in.; then the soffit is supported by metal clips.

STANDARD NATCO BEAM COVERING

TYPICAL BOX GIRDER COVERING
Hung on metal clips**Natco Column Covering**

Steel and cast iron columns must be covered by at least 2 in. of hollow tile.

For square columns Natco hollow tile can be furnished in 3 and 4-in. thicknesses, and with rounded corners if necessary.

For circular columns, circular covering can be furnished in 3-in. thickness.

Square Column
CoveringCircular Column
CoveringSquare Column
Covering
Round Corners

STANDARD NATCO COLUMN COVERING

Natco Book Tile (for Both Roofs and Ceilings)

Natco book tile is used between and supported on T-irons to form flat, mansard and hip roofs. It is an effective preventive of condensation. It is also used for flat or hung ceilings.

Natco Furring Tile

Walls are furred to prevent the admission of moisture by lining the inside with Natco furring tile.

Natco Vitritile

Furnished in either light or dark shades, running from light grays or buffs to dark browns, either glazed

Natco Vitritile

or semi-glazed. Full range of shapes supplied. Used for interior walls of gymnasiums, laboratories, hotels, natatoriums, power plants, lavatories, warehouses, etc.

Samples of Natco Vitritile will be sent without charge to architects on request. Our Engineering Department is available to assist the architect, builder or engineer where required.

Natco Partition Tile

Fireproof, soundproof, easily erected, and the standard for stability, especially where called on to support plumbing fixtures, heavy picture frames, shelving, etc.

Stock sizes 2 to 12 in. thick, laying up 1 sq. ft. of wall surface. Half lengths also furnished.

Hollow tile partitions are commonly built of dense material: 3-in. tile can be used safely to a height of 12 ft.; 4-in. to 16 ft.; 5-in. to 20 ft.; and 6-in. to 24 ft.

TYPICAL SHAPES OF NATCO HOLLOW PARTITION TILE

Natco Building Tile (Smooth Face; Glazed and Unglazed, from Eastern Factories Only)

These particular tile are appropriate for bearing or curtain walls of all types of city or farm buildings. Samples sent on request.

Natco Double Shell Building Tile (Glazed and Unglazed, from Western Factories Only)

These Natco products are hollow tile units with combed and "Texture" face, affording a finished exterior surface when laid up in a wall. The Glazed Tex-Tile is a beautiful brown tone, while the unglazed comes in a variety of charming color combinations, shading from rich reds to browns. Tex-Tile have all the structural and artistic advantages of a good face brick with the added advantages of air spaces to check the passage of moisture, heat and cold, and a 30% decrease in cost of laying and mortar; manufactured in 8 and 6-in. thicknesses, with all necessary corners, jambs, sills, closures, joist tile, etc.

Superior Features—End construction (A) for greatest strength. Double shell (B) for ideal horizontal mortar joint. Moisture stop (C) for perfect insulation. (Illustration on following page.)

General Features—Burned clay tile—fire safety and permanence. Hollow (enclosed air spaces)—lightness and insulation.

REGULAR
WALL TILE
8x12x5 IN.

Large unit—rapid and economical handling.

Sizes and Types—6x12x5 in. for wall 6 in. thick.
8x12x5 in. for wall 8 in. thick.

Natco Header-Backer Construction (Patented)

This wall construction employs Natco load bearing tile as backing for face brick, properly bonded as required by all building codes. Its use assures a saving of tons of dead weight on structural frame and foundations and approximately one-quarter of labor and mortar expense over solid masonry construction. The Header-Backer wall is greatly superior to any other form of masonry for enclosure walls of office or loft buildings, hotels, warehouses, and for curtain or bearing walls of schools, banks, hospitals, garages, residences, etc.

Natco Header-Backer tile is furnished in 6, 8, 10 and 12 in. thicknesses, and the header and backer tile may be combined with the 4-in. face brick to form walls of 8, 10, 12, 14, 16, 18, 20, 22 and 24-in. thickness. The backer tile are cut to heights to work up properly with the joints and bonds in the face brick. The 8-in. header tile displaces $4\frac{1}{2}$ brick, while the 8x12x10 $\frac{1}{2}$ -in. backer tile (most commonly used) displaces 12 brick. For residences we supply 3 $\frac{3}{4}$ x12x10 $\frac{1}{2}$ -in. tile to be faced with 4 in. of brick which, when bonded with headers every fifth course makes an 8-in. masonry wall.

12-IN. WALL OF NATCO
HEADER-BACKER TILE

12-IN. WALL OF NATCO
HEADER-BACKER TILE

Natco Unibacker Construction

Natco Unibacker is a backing for face brick which increases speed of erection, and decreases dead load. It is furnished for 12,

NATCO
UNIBACKER
TILE WALL

14 and 16-in. walls. Unibacker provides so perfect a mechanical bond with the face brick that full bearing value is allowed on their own combined thickness. Floor joists have full bearing. Plaster may be applied directly to the inside surface, eliminating furring. Unibacker is used for both enclosure and bearing walls.

Natco Double Shell Load Bearing Tile

For wall bearing and curtain wall construction—hard burned tile exposed or to be covered with cement stucco finish.

NATCO DOUBLE
SHELL LOAD
BEARING TILE

Has a 12x12-in. face furnished for walls 6, 8, 10 and 12 in. thick. Scored for exterior stucco and interior plaster. Has exclusive enduring double shell feature with its moisture stops and wide surfaces for mortar beds. Soundproof and moistureproof. No cutting required. Furnished with reasonable percentage of corners, jambs, closures, sills, lintels and half tile.

Natco XXX Load Bearing Tile

NATCO XXX TILE

Furnished in same sizes for construction similar to that of Natco double shell load bearing tile. Has many of its advantages. One 8x12x12-in. tile of either type is equivalent to 14 brick in an ordinary 8-in. wall.

Write for Bulletin 174 on Natco Wall Construction.

TYPICAL EXTERIOR WALL CONSTRUCTION OF NATCO XXX HOLLOW TILE

TYPICAL DETAIL OF NATCO XXX EXTERIOR WALL AND COMBINATION FLOOR OF HOLLOW TILE AND REINFORCED CONCRETE

By erecting interior partitions of Natco hollow tile in conjunction with this type of construction, it is possible to completely fireproof private residences, stores, apartments, school buildings, libraries, etc., at a cost of approximately from 15 to 20% over the ordinary frame construction.

Natco Backup Tile

For backing up face brick. Sizes 8x5x12 in., and 3 $\frac{3}{4}$ x5x12 in., displacing 6 and 3 bricks, respectively, in 12-in. and 8-in. walls; smooth on one 5x12-in. face and scored for mortar or plaster on other three sides, assuring decreased weight, an insulated wall and economy in material setting.

WALL OF NATCO BACKUP TILE

Materials and Methods

The materials and methods illustrated and described herein have been determined by wide practical experience in Natco hollow tile construction, and have been approved by fireproofing engineers and architects generally.

Full details, not easily furnished in limited available space, will be supplied on application.

Specification Notes

For the assistance of all those desiring to take full advantage of hollow tile construction, with its low initial cost and minimum expense of upkeep, this company offers the following specifications for wall construction, floor construction, and stucco finish, which have been carefully developed through years of use and may be regarded as the manufacturers' standard specifications.

The adoption of these will insure equitable conditions in estimating, and produce results in accordance with best practice.

It is suggested that the first clauses of wall or floor specifications entitled "General" might be quoted in full, followed by clauses stipulating:

- (1) Which contractor applies cement coat to exterior of foundation walls of tile.
- (2) Whether dampproofing shall be integral or applied and by whom furnished and done.
- (3) Whether door or window openings are to be caked by hollow tile layer, as specified, or by carpenter.
- (4) How and by whom fireplaces and chimneys shall be constructed.
- (5) By whom centering for any arched or clear openings shall be provided.
- (6) By whom centering and sleepers for floors shall be provided and set.
- (7) Which system of floor construction is to be used, or whether alternate estimates are to be given, etc.

Specification for Hollow Tile Walls

General—The contractor for this part of the work shall furnish, deliver and erect all materials required for exterior and interior bearing walls and any interior subdividing partitions, as indicated on plans, of hard burned hollow tile, together with all necessary special shapes required at corners, at joist level, in working around openings or to complete buildings as called for in this specification to approval of architect. All hollow tile shall be true and regular in size, manufactured of such design that all bearing webs and shells are in direct compression when laid in the wall.

Tile shall have all faces scored with special dovetail scoring to offer a good surface for the stucco and plaster finish. Tile cracked or broken on the outside shells will not be acceptable under this specification.

In general all exterior walls and interior bearing walls shall be of Natco XXX or Natco double shell load bearing hollow tile; non-bearing, subdividing walls shall be Natco partition tile as manufactured by the NATIONAL FIRE PROOFING COMPANY.

Laying—All tile used in the exterior walls and any interior bearing partitions must be laid with the cells or voids vertical in the wall, in order to develop their full strength. Interior subdividing, non-bearing partition tile may be laid on side if

desired, but must be started on the structural floor and wedged against the floor above. Care must be taken that the tops of all unfinished walls are thoroughly covered or protected against stormy weather.

Mortar—All mortar used for laying up the hollow tile shall consist of a standard portland cement, lime putty or hydrated lime, and clean, sharp sand in the following proportions by volume: 1 part portland cement, 1 part lime and 6 parts sand.

Foundation Walls—Any foundation walls so indicated on plans from top of footings to the underside of first floor beams shall be constructed of Natco XXX or Natco double shell load bearing hollow tile to produce thickness shown. Care should be taken to use the proper Natco hollow tile at the corners. Outside of walls from footing to a point above the ground shall be given a heavy coat of waterproofed cement or other approved dampproofing.

Jamb Tile—Provide for all double hung windows Natco jamb tile with rabbeted openings to receive the window frame box. Fill well with mortar, the space between the tile and the frame box to within 1 in. of stop bead.

The contractor for the setting of the tile is to calk all doors and windows with roofers' cement or oakum, furnished and set by him, to prevent the passage of air or moisture.

Lintels—Openings not exceeding 5 ft. in clear span may be spanned with Natco load bearing tile reinforced with proper steel rods in lower cells and filled solidly with stone or gravel concrete.

Openings over 5 ft. in clear span to be spanned with reinforced concrete girder faced with tile, or with steel angles—size of structural or reinforcing steel variable with load and span; all to be furnished and set by the contractor for tile laying to approval of architect.

Sills—Form all sills of Natco special hollow sill tile.

Special care must be taken to fill all joints so as to prevent moisture working through the same; the wood sill of the frame to be set in a heavy bed of roofers' cement.

Arch Openings—Build all arch openings shown on plans of 2-course rowlock hollow brick header arches, carefully laid on substantial centers. Arches will spring from the hollow tile and must be well bedded on them.

Porch Columns and Piers—Construct any porch columns and piers, so indicated of hollow tile to sizes as shown. Where column finish is round, build the same of 3-in. circular hollow tile column covering, filling the column with concrete when the second story walls are supported by them. If steel reinforcement is used, care should be taken to band the steel against lateral deflection.

Square columns shall be built of the proper size Natco load bearing tile.

Floor Beam Bearings—Provide and set load bearing tile slabs 1-in. thick under all floor beams as bearing plates for the same. These slabs shall also be used for working up to levels and story heights when the full or fractional tile do not work out correctly.

Beam Courses—Wood floor beams are to be framed into exterior walls as shown on detail, using Natco load bearing hollow tile in accordance with the following:

In 8-in. walls, $3\frac{3}{4} \times 12 \times 12$ in. for facing ends of beams and for filling between beams.

In 10-in. walls, $3\frac{3}{4} \times 12 \times 12$ in. for facing ends of beams and $6 \times 12 \times 12$ in. for filling between beams.

In 12-in. walls $3\frac{3}{4} \times 12 \times 12$ in. for facing ends of beams and $8 \times 12 \times 12$ in. for filling between beams.

Roof Plates—Embed in cement grout in two upper courses of wall at intervals of 5 ft. $\frac{3}{4}$ -in. bolts 24 in. long. Bolts to project 6 in. above the top of the wall, to allow plate to be fastened down with nuts.

Specifications for Floor Construction

General—Floor construction shall be the type known as the one-way combination hollow tile and concrete floor construction consisting generally of 4-in. reinforced concrete beams spaced 16 in. on centers with Natco hollow tile between, and covered with concrete top as shown or "Natcofloor" without concrete covering, all to have at least 4-in. bearing on walls.

Concrete—All concrete used in floor construction shall consist of 1 part portland cement, 2 parts clean sharp sand, and 4 parts broken stone or gravel of such size as will pass through a $\frac{3}{4}$ -in. ring. Concrete will be of wet mixture, and must be well tamped and worked around reinforcing steel after pouring.

Reinforcing Steel—Steel rods for floor construction must be of such type as will have a mechanical bond with the concrete. Corrugated, twisted or similar type will be accepted. Steel must have an elastic limit of not less than one-half the tensile strength. Rods must be clean and free from rust scales before placing in position, and must be placed not over 1 in. above bottom of floor.

Tile—Depth of Natco tile and size of steel reinforcement will be as shown on the plans or as specified by competent engineers for the given spans and loads, etc. All tile must be wet before concrete or grout is placed, so as to insure proper bond with the concrete.

Centers—Centers must be of such size as to insure of their not deflecting under the weight of the wet materials, and must be provided in such quantity as to insure speedy work. Centers must not be removed before the concrete has properly set, and under long spans a center line of supports must be maintained for at least 3 weeks after the concrete has been poured. In cold weather the centers must be left in place until directed by the architect to remove them.

Natcofloor—Grout for Natcofloor shall consist of 1 part portland cement to $2\frac{1}{2}$ parts of sand. Specifications for reinforcing steel, tile and centering shall be the same as is given above.

Specifications for Stucco on Hollow Tile

The stucco shall consist of the following materials and be mixed in the following proportions:

(1) Portland cement which has met the requirements of the American Society for Testing Materials.

(2) Sand free from organic matter or loam, and uniformly graded in size from coarse to fine.

(3) Hydrated lime—any good brand of prepared hydrated lime or well burned slaked lime putty will be accepted.

First coat: 1 cement, $\frac{1}{10}$ lime, 3 sand.

Second coat: 1 cement, $\frac{1}{10}$ lime, 3 sand.

Third coat: 1 cement, $\frac{1}{10}$ lime, 3 sand.

All stucco shall be applied immediately after being mixed; no re-tempered stucco shall be used. No stucco is to be applied when it is liable to freeze before it sets. All stucco work shall be kept thoroughly wetted down until cement has set, in hot or dry weather, as too rapid drying will cause cracking.

The tile surface shall be free from all foreign material, and shall be thoroughly wetted down before the first or scratch coat is applied. The first coat shall be well troweled so as to key behind the dovetail scoring, also to prevent air bubbles or holes, and shall be thoroughly scratched to insure proper bond with the next coat. The second coat should be applied as soon as the prior coat has sufficiently set to allow working upon the same, and should be straightened with darby and straightedge, then floated with cork or wooden float to prevent waves showing on the finished wall.

Should it be impossible to apply the second and last coats as soon as the former coat has become thoroughly set, wet down the coat already applied before applying others, to give a better bond between successive layers.

The finish coat should, as far as possible, be applied to the entire area of one side of structure to the corners at one operation.

Thickness of each coat should average from $\frac{1}{4}$ to $\frac{1}{2}$ in. If only 2-coat work the material must have a total thickness of not less than $\frac{3}{4}$ in., exclusive of the dovetail scoring.

Finish coat of stucco is to be waterproofed with an approved brand of integral waterproofing compound or other approved compound in accordance with directions of manufacturers.

Co-operative Services

The engineering department maintained by this company is fully equipped to give details and recommendations for the fire-proofing of buildings, and furnish all possible help and information to patrons who wish to avail themselves of the advantages offered.

HENRY MAURER & SON

Manufacturers of Terra Cotta Hollow Tile Fireproofing

TELEPHONE

ASHLAND 1510

420 East Twenty-third Street

NEW YORK, N. Y.

PLANT, MAURER, NEW JERSEY

Products

"RARITILE" Enclosure Blocks for walls faced with brick. Standard sizes of INTERIOR PARTITION BLOCKS, WALL FURRING, and WALL BEARING BLOCKS.

For Fire Brick, see page A255.

Quality

Deservedly reputed of best quality and workmanship, true to size and shape, with minimum tendency to breakage.

Facilities

Extensive clay mines adjacent to plant premises, owned, developed and operated by the company; plant located on tidewater in New York Harbor and two railroads (Central Railroad of New Jersey and Lehigh Valley R. R.) insures prompt shipment by boat or rail; motor truck deliveries direct to building give uninterrupted supply for work in progress. Modern and complete machinery and equipment afford ample provision for the largest contract requirements.

Backing Tile

The "Raritle" is a backing system of simple design, and yet possesses every desirable feature sought by architects, engineers and owners. Only one size of block is used, making an ideal construction from a standpoint of permanence, simplicity and economy.

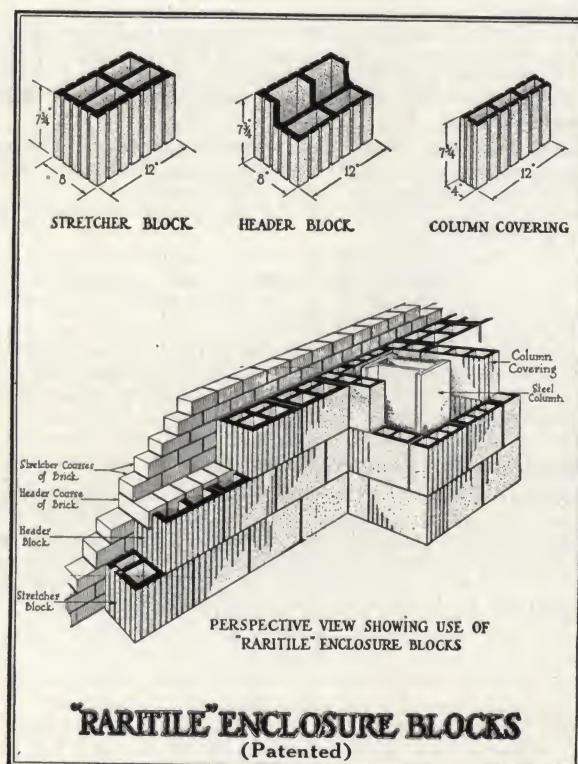

The webs and shells run vertically in perfect alignment, backing up both the stretcher and header face brick, with resultant maximum strength.

The air cells extend vertically the entire height from floor to floor with a continuous uninterrupted cubical air content, which creates absolute insulation as well as a true and complete furring into the wall; dampness can not penetrate as the cement joints are broken by the air cells.

Rigid unyielding support for the header face brick ties them in securely so they can not possibly sway or move out of place.

Catalogue

Descriptive catalogue on request.

RARITAN HOLLOW TILE CORPORATION

47 West 34th Street, NEW YORK, N. Y.

FACTORY: KEASBEY, N. J.

Products

HOLLOW TILE BLOCKS for partitions, furring, column and girder covering, etc.; LOAD BEARING EXTERIOR WALL BLOCKS and RARITILE ENCLOSURE BLOCKS for use with face brick.

of the various blocks are in perfect alignment. In this way all material acts in compression and the full bearing strength of the tile is utilized.

Facilities

The location of the company plant on the Raritan River two miles west of Perth Amboy and a direct connection with the Lehigh Valley R. R. places the RARITAN HOLLOW TILE CORPORATION in a position to make prompt shipment either by rail or water. And as all shipments are made direct from the factory, the company is solely responsible for materials and deliveries.

The clays are mined on the company property adjoining the factory, which is equipped throughout with modern machinery.

Raritle Enclosure Blocks

In the past few years, there has been a remarkable increase in the use of hollow tile blocks in conjunction with either common or face brick for building curtain walls for skeleton steel structures. This type of construction not only shows a marked saving in labor costs, but it also decreases the weight of the walls so constructed by about 30%, and thereby effects a proportional saving in the amount of steel required for wall columns and spandrel beams.

The Raritle Enclosure Tile protected by W. G. Demarest patents No. 1,426,048 and 1,479,379, has the good features common to systems in which hollow tile is tied in to face brick and has also the following additional advantages.

(1) A continuous vertical air cell on the interior of the wall running from floor to floor eliminates the necessity of additional separate furring blocks.

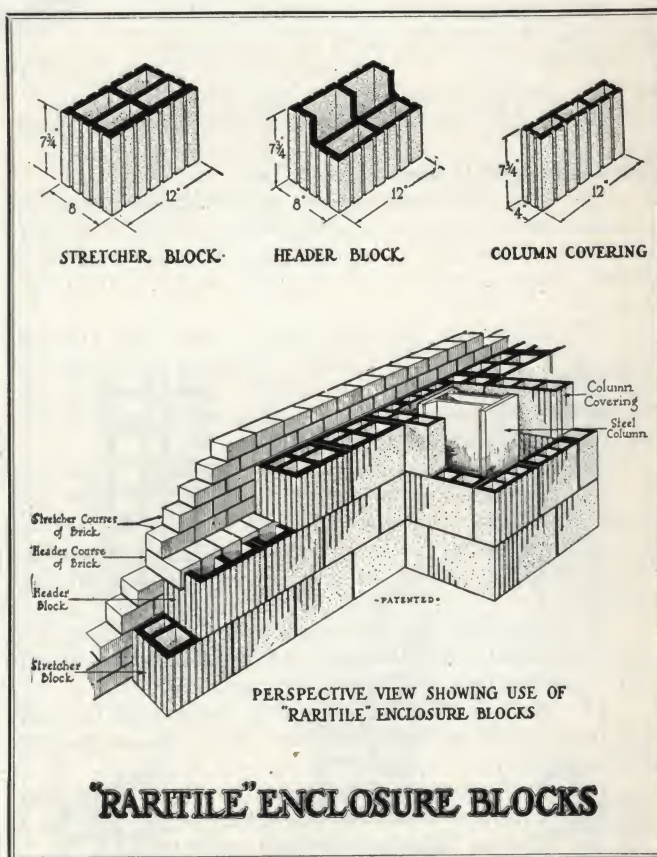

(2) The mortar joints are broken—there are no continuous joints through the wall.

(3) The blocks are of uniform height and approximately of uniform weight. This feature helps to speed up construction and makes it easy to tie in the face brick with any type of bond.

(4) The wall is so designed that webs and shells

Column Covering

For use with the Raritle standard wall block a 4-in. block of the same height is furnished for covering wall columns. This construction is simple and economical; the cost is approximately 30% less than a brick wall of the same thickness.

Product

HOLLOW BUILDING TILE for structural purposes of novel and improved design, suitable for all types and varieties of buildings in which burned clay products can be used.

Design

The Universal Unit was designed to overcome the disadvantages of the present commercial forms of structural hollow tile and to facilitate and reduce the cost of manufacturing, shipping, handling, estimating and laying.

TRADE-MARK

dimension, walls can be built entirely without brick or brick can be used anywhere in construction and they line and bond with the tile.

Quality and Marking

All load-bearing Universal Units are composed of properly prepared grades of hard burning clay, shale, fire clay or mixtures thereof to provide maximum strength and fire resistance. Each unit has trade-mark "UU" impressed thereon.

Advantages of Universal Unit Tile

- (1) One size and shape for all standard thicknesses of walls and details of construction. Starter, corner, jamb, sill, filler and all special shapes readily cut with trowel from standard unit leaving sections of usable size.
- (2) Units are two bricks wide, three high and one long, with mortar joints, thus displacing six bricks in wall. Building construction can be designed with the Universal Unit same as for brick as they cut into any necessary combination of brick sizes.
- (3) This construction offers maximum resistance to frost and dampness penetration. All mortar bed joints are offset, lead upward from exterior to interior face of wall and are interrupted by vertical rising voids. Stucco and plaster may be applied direct to tile without furring.
- (4) Latticed interior construction and direct line continuation of webs through entire Unit insures maximum load bearing and lateral strength.
- (5) No ties or reinforcing required except for arch and lintel construction; jamb tile make masonry bond with wall.
- (6) Brick veneer work can be figured in supporting strength of walls as Unit bonds perfectly with it.
- (7) Perfect balance, easy and quick to lay.
- (8) Units nest perfectly, hence minimum breakage.
- (9) Units simply yet positively interlock.
- (10) Size, shape and cut-up features simplify quantity calculations.
- (11) Facilitates placing grounds and plugs for interior finish without danger of moisture penetration.

Estimating and Construction Data

Face sizes of units 8x8x8 in. Two units lay exactly one face foot of 8-in. wall; three units for 13-in. walls; four units for 17-in. walls, etc. Units weigh between 17 and 18 lb. Lintels formed of standard units or cut sections reinforced and filled with concrete, as required.

Tests by recognized testing engineers show each unit to have crushing strength of 50,000 to 100,000 lb.

Use of Brick

As units are worked out to brick sizes in every

Non-bearing Construction

Universal Unit tile offers superior advantages for curtain and filler walls in pier and girder construction. The convenient size and shape, ease and rapidity of handling and laying, make it compare favorably in cost with plain tile. Its lightness, in addition to its fireproof, frostproof and dampproof feature, renders its use most desirable in construction of this class.

In cities and localities where the Universal Unit is now available, it is rapidly being given preference over other forms of hollow filler wall construction.

Farm Buildings

The advantages of fireproof construction on the farm is rapidly being realized. Universal Unit is a superior material for all types of farm buildings, houses, barns, silos, corn cribs, etc. The one size and shape builds all.

The simplicity and economy of this construction especially recommend it for use where skilled labor is difficult to obtain and construction costs must be minimized.

Availability

Universal Unit tile is available for immediate shipment in many sections of the South, Middle West and Pacific Coast, and additional territory will soon be covered. The nearest sales office or agency can be obtained from the Executive Offices, Scripps Building, San Diego, Cal.

Patents

Universal Unit tile is manufactured and sold under the Richard S. Requa patent issued May 25th, 1920. Other United States patents allowed and pending. Patents pending, or issued, in all principal foreign countries.

Engineering Service

Free engineering service for advice or data concerning construction problems in connection with the use of Universal Unit tile is available at the Executive Offices. Architects, engineers and contractors are invited to freely avail themselves of this service.

Catalogues and Construction Details

Catalogues, detail sheets, miniature samples and general construction data will be supplied from the Executive office or any of the branch offices.

Specifications for "Universal Unit" Structural Hollow Tile Work

Work Included—Exterior walls and wherever called for on drawings, to be built of hollow tile as hereinafter specified.

Quality and Make—All hollow tile to be in the interlocking and load-bearing type supplied under the trade-name of "Universal Unit." The tile shall meet the load-bearing and other requirements of the local Building Code.

Mortar—All mortar for tile work shall be composed of 1 part portland cement to not more than 3 parts clean sharp sand, to which may be added lime paste or hydrated lime not exceeding 15% of the volume of the cement.

Construction—Tile shall be laid in the wall with the voids running horizontally, with the lower projection on the exterior side of the wall, as per manufacturer's drawings. All horizontal joints shall be flushed solid, but the vertical section of the offset bedding joints shall be left free of mortar to prevent dampness being drawn through the wall. Tile shall be laid so that the wall throughout shall be thoroughly bonded with masonry bond. Corners to be formed with half-tile laid on end and filled with mortar where required for the additional strength.

Openings—All openings to be formed with the tile, cut to special shape as required. Jamb tile to be laid on end and all voids adjoining the exterior side of the wall shall be filled with mortar. Jamb tile shall be locked and bonded with the wall courses. There shall be no solid mortar joints extending through the wall.

Lintils—Lintils over openings may be formed of the tile with voids filled with concrete and reinforced as required for adequate strength, or they may be of reinforced concrete cast in place.

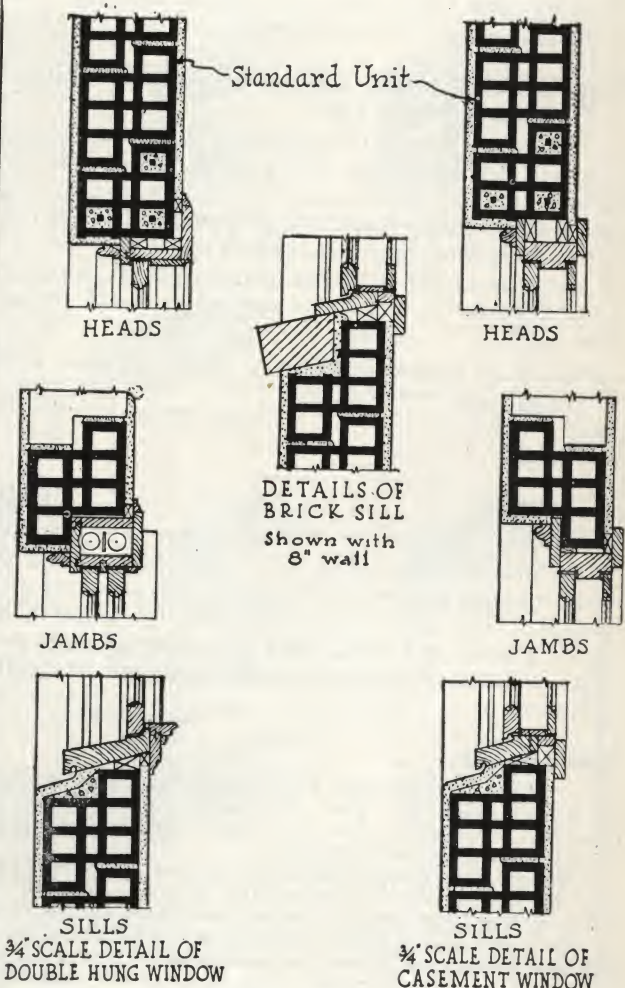

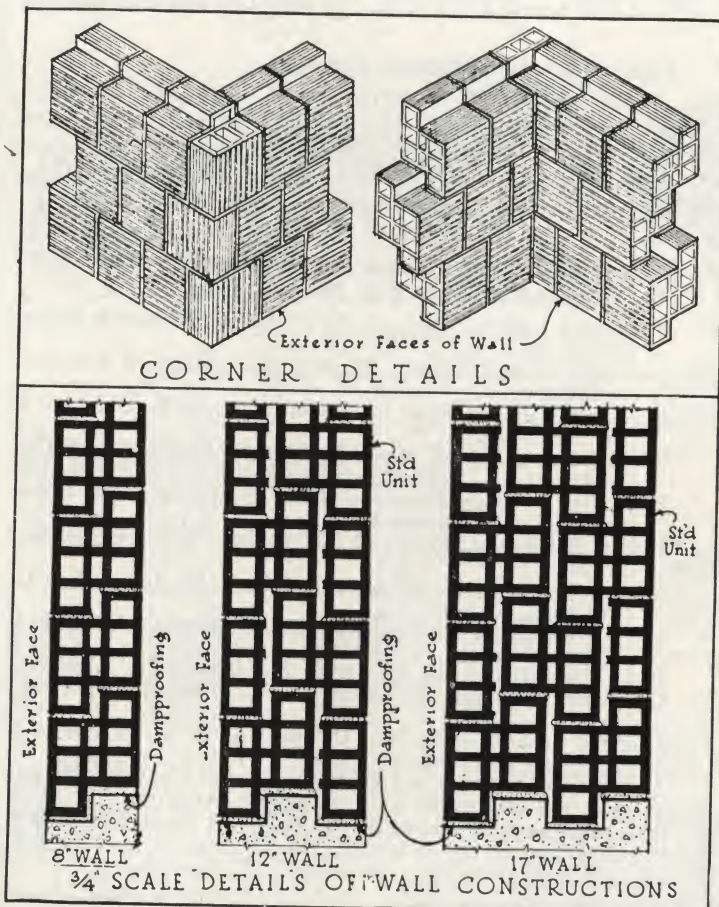

Anchoring Woodwork—The carpenter will place and accurately set all wood frames required in the openings in the tile walls, as the walls are built. Anchor these frames to the tile work each course with 10d nails driven partially into the frame and bent down over the tile. Bed ½-in. bolts supplied by and as directed by the Carpenter, every third course for securing end studs of frame partitions.

Joist Bearing, etc.—All joists, beams, etc., seated upon hollow tile walls shall extend into the wall so as to have full bearing on two supporting webs. Where heavy concentrated loads occur, the supporting section of the tile receiving the load shall be filled with concrete, and, if necessary properly to distribute the load, bearing plates of proper size or cast concrete shall be built in.

Stuccoed Work—Where walls are to be stuccoed on the exterior and plastered on the interior, the tile may be laid with no mortar in the vertical joints, the joints to be left open to provide an additional key for the plastering.

Chases for Pipes, etc.—Provide chases for pipes, conduits, etc., as directed. In no case shall the tile be cut through the second web so as to destroy the waterproof feature of the tile unless the spaces around the pipe are filled solidly with cement mortar.

Flashings—All flashings shall be built into the walls to the depth of the rebate. In building parapet walls, the tile work shall be brought up not less than 4 in. or more than 8 in. above the roof level and the work stopped at that point until the roofing has been laid and flashed into the rebate of the course, when the walls shall be completed to their required height.

Detail Drawings, Showing Simplicity of Construction, Waterproof, Fireproof, Interlocking and Load-bearing Features

A dampproof joint can readily be formed with the foundation by rebating top of foundation wall. This is easily done by laying 2"x4" in top of concrete as foundation is being finished. This surface can be treated with hot asphalt or a bonding coat, just before first course of tile is laid. Pockets for joists, concrete floors, etc., can be easily formed with this tile without weakening the construction or destroying the dampproof or fireproof features of the walls.

THE WHITACRE-GREER FIREPROOFING COMPANY

Manufacturers of Hollow Building Tile

WAYNESBURG, OHIO

CHICAGO, ILL., Builders' Building, 228 North La Salle Street

Products

HOLLOW FIRE CLAY BUILDING TILE.
GLAZED BUILDING BLOCKS; RADIAL CHIMNEY
BRICK.

Largest Independent Manufacturers of Hollow Tile in the United States

We have been exclusively engaged in the manufacture of hollow fire clay building tile for over 30 years, our product having been used in the construction of many of the largest buildings throughout the country.

Our three plants, situated in the great clay belt of Ohio and equipped with modern clay working machinery, have a combined capacity of 25,000 tons per month. Our exceptional facilities permit us to produce stock and special shapes on the shortest possible notice and at the lowest possible cost.

Hollow clay fireproofing as manufactured by us consists of practically all forms known to the trade—partitions, load bearing and back-up blocks, split furring, flat and segmental arch blocks, with all necessary shapes of girder and beam covering, column covering (both round and square), book tile and glazed building blocks.

Remarkable Physical Characteristics of Whitacre-Greer Hollow Tile

Whitacre-Greer hollow building tile is made from a famous clay containing high percentages of silica and alumina (the two components essential for insuring high fire resisting quality) and low percentages of impurities such as iron, lime, magnesia, potash and soda.

Because of the very low percentages of impurities in our tile, plaster and stucco applied to it will not discolor.

ANALYSIS OF WHITACRE-GREER HOLLOW BUILDING TILE

Components	Percentage
Silica	58.75
Alumina	26.43
Oxide of iron	2.57
Lime37
Magnesia77
Potassium oxide	1.49
Sodium oxide45

Whitacre-Greer hollow tile is burned hard and vitreous, insuring absolutely fireproof construction of great strength. The deep scoring provides for better bonding of plaster and stucco and the better general symmetry is due to the accurate machining by our unequalled equipment.

Specifications

All hollow tile shall be of hard burned dense fire clay as manufactured by THE WHITACRE-GREER FIREPROOFING COMPANY, Waynesburg, Ohio. No badly split, cracked, warped or underburned tile shall be used.

Hollow Tile Fireproofing—The hollow tile fireproofing shall be capable of withstanding the tests prescribed by the National Board of Fire Underwriters' standards for fire resistive floor, wall and partition construction. All arches shall be flat arch end construction with side construction keys and either end or side construction skewers. The faces of all tile that are to receive plastering or mortar shall have the standard scoring.

Fireproofing Steel—The thickness of fireproofing around steel members shall be 2 in. for soffit coverings on lower

flanges of beams and 2 in. on flanges of all beams or girders extending below the floor arches. Thickness of web covering is to be governed by the dimensions of the girder to be covered, but in no case to be less than 2 in. (The above shall be subject to variation in any particular locality depending upon existing state or municipal ordinances or by-laws).

Tile covering for square or round columns shall be at least 2 in. thick.

Detail Drawings—The contractor shall submit to the architect for approval, detail drawings showing the form and method of applying the fireproofing to the steel work before starting the manufacture of material. Stock shapes shall be used throughout where they conform to the requirements of this specification and fit the contour of the steel.

Partitions—All partitions and division walls other than load bearing walls, shall be constructed of light weight standard scored hollow partition tile of the several thicknesses indicated on drawings. All partitions to be set in cement mortar and bonded by breaking joints at least 3 in. in every course. All partitions under 14 ft. in height shall be 3 in. thick; from 14 to 18 ft. to be 4 in. thick; higher than 18 ft. to be 6 in. thick.

Load Bearing Tile—Standard load bearing tile shall have a heavy dovetail scoring and shall have an absorption of not more than 8%. Wherever possible, these tile shall be laid with cells vertical. All tile shall be capable of sustaining a load of 1200 lb. per sq. in. of gross area when laid with cells vertical.

Expert Advice Without Charge

Where special construction is necessary or when advice is desired regarding the best modern practice of fireproof construction, the assistance of our fireproofing engineers can be had for the asking. Estimates will be submitted upon receipt of plans and specifications.

Typical Perfection Header-Backup Tile Construction

Perfection Header-Backup Tile

Insures a permanent construction for backing up face brick in load bearing and curtain walls. Adaptable to the largest steel frame buildings or smallest garage. It is economical because its use saves steel, cement and labor. This fact has been proven in many buildings where this form of construction has been used. This tile makes a wall that has a load carrying capacity of solid brick, and is lighter in weight than solid brick and cheaper. It is free from dampness due to the air chambers and passageways which it forms. This eliminates the necessity of furring and provides a scored surface for receiving plaster.

Made in 8, 10 and 12-in. widths so as to make 12, 14 and 16-in. walls with face brick.

This tile is approved by the New York City Bureau of Buildings. Tests were made at Columbia University for load bearing capacity, with the following results—8-in. tile averaged 2292 lb. per sq. in. of gross area; 10-in. tile, 1544 lb.; 12-in. tile, 1664 lb. These tests were made with cells horizontal, same as laid in walls.

Products

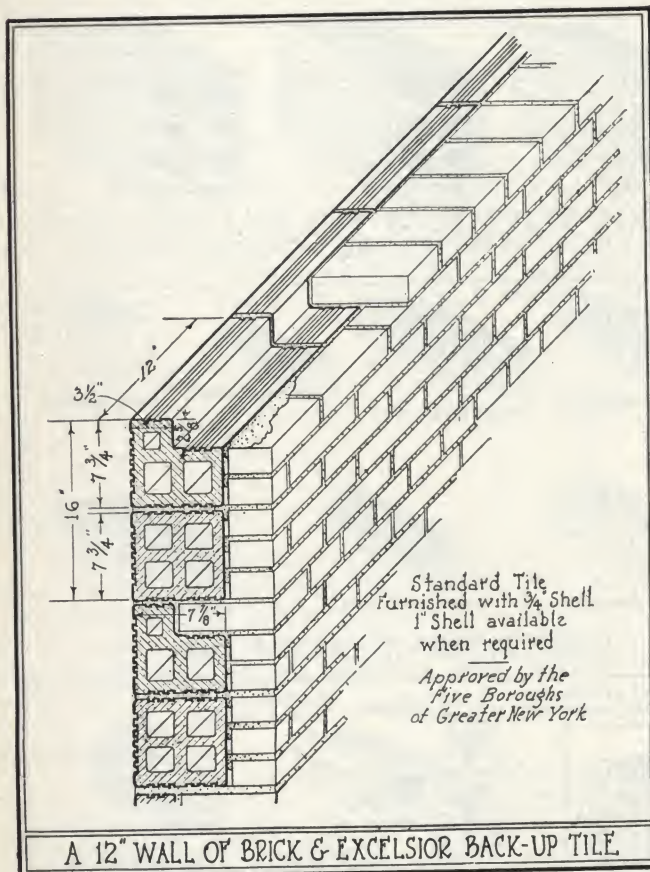

Designers and distributors of "EXCELSIOR" BACK-UP TILE and SALT GLAZED HEAVY DUTY TILE.

Also Heavy Duty Back-up Tile, Salt Glazed Tile and Brick, Textured Tile, Standard Partition and Wall Bearing Tile, Face Brick (all colors and textures).

"Excelsior" Back-up Tile

For all wall-bearing construction with brick facing.

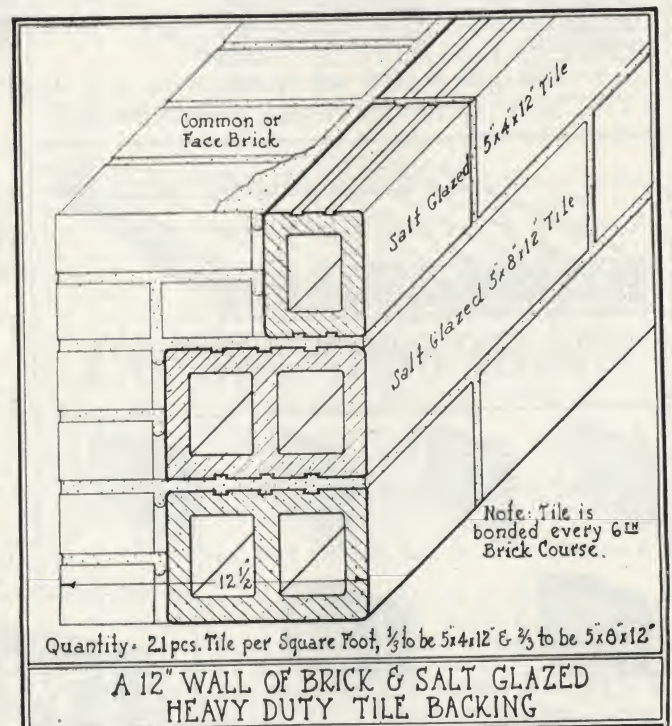

Advantages—All members of unit always under compression. Its simplicity promotes easy and effective bond with brick courses. Dimensions, weight and horizontal cells are most convenient for handling. A flat horizontal mortar bed for all joints—low mortar and labor costs with speed and strong construction. Plastering costs reduced. Horizontal scoring furnishes excellent plaster bond. Air insulation through many air cells. Can be furnished with smooth surface when tile are unplastered.

Salt Glazed Heavy Duty Tile

Adaptable to very diverse uses for interiors and exteriors of creameries, dairies, bakeries, packing houses, canneries; steam, electric, cold storage and manufacturing plants of all kinds; garages, fire stations; penal institutions; industrial laboratories, railroad buildings; country clubs, residences and many other structures. Can be used in gymnasiums, shower and locker rooms, corridors, stair-wells, cafeterias, kitchens, lavatories, lobbies, courts, power and boiler rooms, manufacturing rooms, residence basements and elsewhere.

Advantages—Sanitary, readily cleaned and light reflecting. Easily laid, as dimensions coincide with standard wall construction. Combinations of two units—5x4x12 and 5x8x12-in.—will build 8, 12, 16, and 20-in. walls of tile with brick or an all-tile wall. Exposed face of units (5x12 in.) make a pleasing appearance. Colors range from cream buff to rich mahogany. Economical to use—plastering and painting eliminated—easily handled by men on job. Wall bearing construction procured with sanitary facing in one operation—permanent glaze fused in burning to body of dense fire clay.

Products

FOUNDATION and WALL BEARING BLOCKS; PARTITION TILE; BRICK; REINFORCED LINTELS; SILLS; CHIMNEY BLOCKS; FLOOR ARCH BLOCKS.

Patents and License

The manufacture and sale of cinder concrete building units is protected by United States Patent No. 1,212,840 to Francis J. Straub, and United States Patent No. 1,466,083, to Sigurd Bo. Other patents pending. The Straub patent has been broadly sustained by unanimous decision of the United States Court of Appeals. All plants work under license agreement with NATIONAL BUILDING UNITS CORPORATION.

Advantages

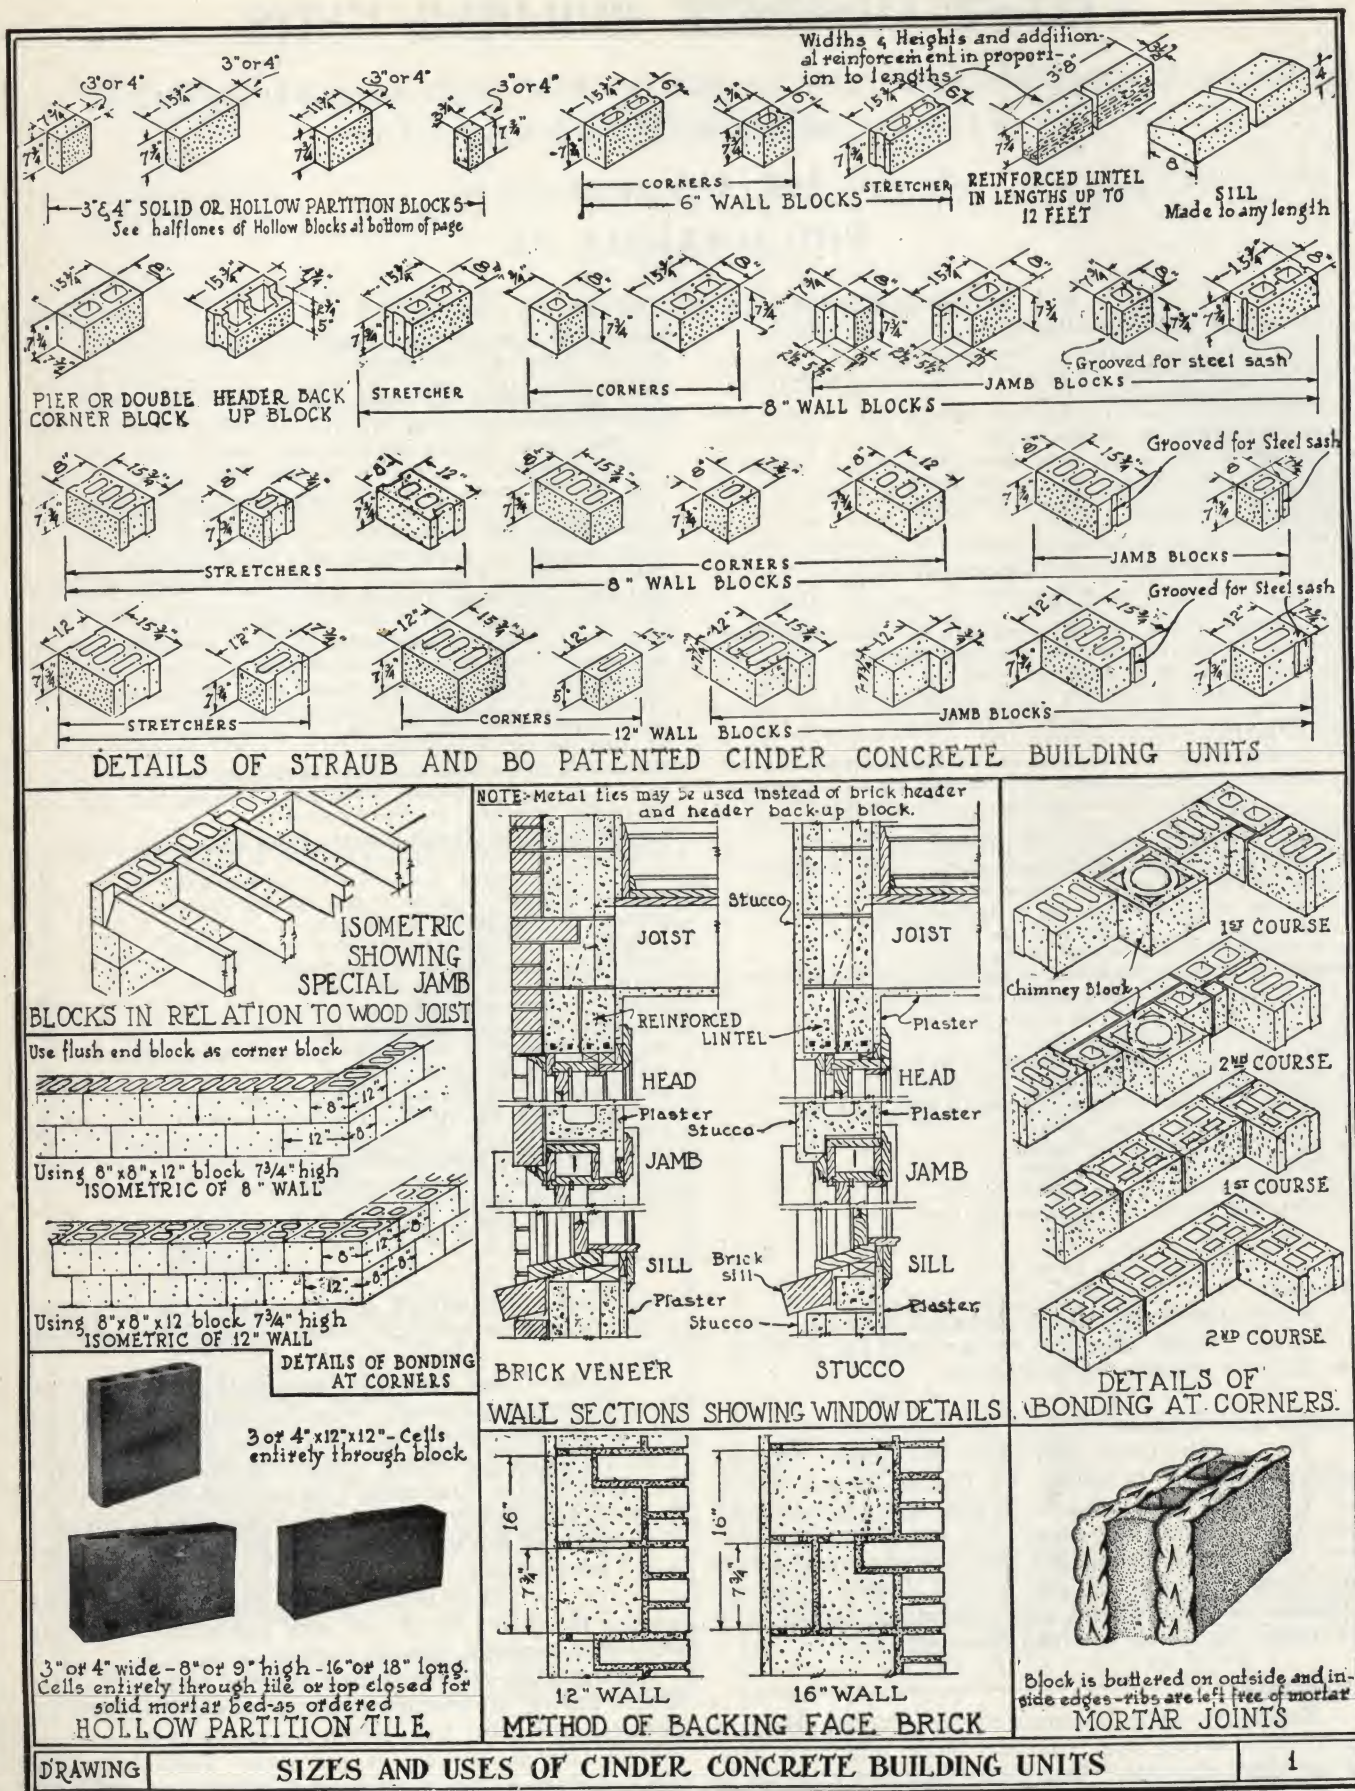

Economy—The lightness of the product effects a 20 to 40% saving over common brick, and 5 to 15% saving over clay tile. One 8x8x16-in. block displaces 12 brick and requires about one-quarter the mortar. Plaster is applied direct to cinder block, and the trueness of the wall, together with the texture, facilitate the

application. No nailing strips or plugs are necessary. Other economies will be found under other subheadings.

Tests—Tests made by Underwriters' Laboratories, Inc., Watertown Arsenal, Columbia University, University of Toronto, University of Illinois, Ohio State University, Rutgers College, Johns Hopkins University, Lewis Institute, Pittsburgh Testing Laboratory, Detroit Testing Laboratory, Kansas City Testing Laboratory, E. L. Conwell & Co., Philadelphia, Pa., and other recognized laboratories.

The NATIONAL BUILDING UNITS CORPORATION, or any of the plants listed will send copies of these tests and other pertinent data on request.

Strength—All plants are required to manufacture blocks having an average crushing strength of 800 lb. per sq. in. of gross area, which is equivalent to approximately 1200 lb. per sq. in. net area. Tests on cinder block walls at Columbia University show a ratio of wall strength to unit strength for cinder blocks of from 57 to 76%. This is the highest of any known masonry and consequently, carries a corresponding safety factor.

Breakage—Practically no breakage, even when the block and tile are dumped from trucks.

Fireproof—The official tests made for the National Board of Fire Underwriters at the Underwriters' Laboratories, Inc., in Chicago confirm the many demonstrations and results of actual fires. Prolonged exposure to fire and application of water to the wall causes no cracking or spalling, and the loss in strength is negligible.

Timeproof—Age increases the strength of cinder concrete building units. They are not affected by freezing or temperature changes. This is due to the toughness and cellular structure of the material.

Dampproof—The illustration shows the low capillary attraction of cinder blocks. This feature accounts for the fact that no water is drawn through the wall, even during the heaviest rain storm. It is also of importance in producing a stronger mortar joint in that the mortar is not robbed of its moisture.

Cinder Building Block Partly Immersed in Water

Illustrating the low capillary attraction of the material

For the same reason, stucco and plaster retain full strength on cinder concrete building units. The initial suction or absorption is rapid but limited. No wetting is necessary. The laying of these blocks during the winter months is thus made practicable.

Non-conductor of Heat and Cold—The cork-like structure of the material builds insulation into the wall. It insures an even temperature within the house all year round and effects a substantial saving in fuel. The insulative nature makes lining with special insulative materials unnecessary. Cinder concrete building units never "sweat"; are rotproof and verminproof; no mold forms, and decorations are never injured where plaster has been applied direct to exterior walls, even in the severest climate. The material is ideal for icehouses, refrigeration plants, fruit storage, dry kilns, etc.

Soundproof—Cinder blocks are used extensively in schools, hospitals, churches, and the like where the acoustic design is of particular importance. A wall of this material, exposed or plastered, reduces the reverberation and absorbs the sound. Cinder tile forms the ideal partition, because it reduces the amount of sound transmission more than any other masonry material.

Stucco and Plaster—The rough texture affords a perfect key for plaster and stucco. These materials are readily applied and dovetail into the small crevices on the surface of the cinder block or tile.

No Through Mortar Joints—Cinder block and tile are always buttered on the outside and the inside webs, but not on the cross webs. Through mortar joints, with their tendency to conduct moisture, heat and cold through the wall are thereby avoided.

No Furring Required—The low capillary attraction and the high degree of heat insulation of cinder concrete building units make it possible to plaster direct without any furring or lathing.

Light of Weight—From 30 to 40% lighter than sand concrete. The hollow units 50 to 60% lighter than brick. This speeds up the laying and reduces the dead load of the wall.

Rapid Laying—Light weight, uniformity and a good mortar bed contribute to easy, rapid and economical wall erection. Less waste of mortar or time of setting than with clay tile.

Nailing—As good as wood for nailing; holding power is equal to yellow pine. Nails never rust. See Pittsburgh Testing Laboratory report. Holding power increases by age. Wood ground and trim can be thoroughly secured by toe nailing. Pipe hangers and other supporting members can be readily secured by means of lag screws, expansion bolts, etc.

Cutting—Cinder concrete building units are furnished in all fractions. They can, however, be readily cut and they can be chased and channeled for pipe and conduits without fracture.

Corners—Details of this on preceding page show several methods, all retaining full insulating value.

Steel Sash Installation—Grooves are moulded into jamb blocks to admit steel window frames. Two lintels to an opening provide this advantage without cutting or channelling.

Lintels—Reinforced lintels of cinder concrete provide all the advantages of strength, lightness, nailability and dampproofness.

Several standard sizes—see drawing No. 1. Specials on order.

Details, Catalogues and Data

Each plant is in position to submit details and give required information to architects, engineers and builders.

TRADE-MARKS

DUNTILE

*Builds
Better Buildings
Cheaper*

What Is Duntile?

Duntile is a trade-marked and nationally advertised hollow concrete building unit adapted to the complete construction of all kinds of buildings. It is designed for maximum strength both in the unit and in the wall. It is manufactured by standardized methods and machinery insuring uniform quality.

Its wide range of permanent colors opens a new field of architectural treatment. It combines the strength and economy of concrete in a practical, universal building unit.

Mat Glazed Duntile for Color

Duntile is now available in some forty shades and colors, a few of which are shown on the following page. The rich tones and deep textures offer the architect unlimited opportunity for achieving new exterior and interior effects. Because of the method of mat glazing, no two units are alike. Each has its own texture and produces, in a wall, a pleasing variegation. The mat glazing is waterproof and as permanent as the unit itself. For the outside of any building, and for interiors of stores, gymnasiums, etc., it is a beautiful and economical finish.

**Duntile Without the Use of Steel
Supports the Entire Building**

This is the Premier Hotel, Benton Harbor, Mich. FOLTZ & Co., Chicago, Architects

Scientifically Designed

The design of Duntile is responsible for its unusual strength. The cylindrical air space provides strong corners, a full mortar bed, and an arch support to distribute the weight—three features that assure solidity and permanence in the unit itself and in the wall. Its strength and quality have been conclusively proven in tests conducted by such authorities as Columbia University, Armour Institute of Technology, Pittsburgh Testing Laboratory, and Robert W. Hunt.

Details of tests will be furnished on request.

Permanence at Low Cost

Duntile lowers construction costs. The three buildings shown on this page were all erected at a distinct saving and

each represents a different form of construction. A large proportion of the saving is in labor. The light weight, full mortar bed, and square edges of Duntile make it easy to lay, and builders have found it to save as much as 30% in labor alone. The mortar saving is also a large one because of the full mortar bed and economical size of the units. Plaster and stucco, if used, can be applied direct, eliminating furring and lathing.

Typical Duntile Construction Details

Sizes Available

Duntile is made in seven standard sizes to meet every construction requirement. The dimensions and weights are listed on the preceding page, with details. Note that by combining the units in different ways walls of any standard thickness can be obtained. This gives Duntile great flexibility and makes it adaptable for foundations, load bearing walls, curtain walls, and partitions in any size or style of building.

Typical Forms of Construction

The wall sections illustrated herewith are typical of a few of the available constructions.

Type A—Represents the highest type of masonry wall at practically the cost of frame. Years of actual use have shown the fine insulating properties of this triple-air-space construction. Plaster is always applied directly to the walls and has never been known to crack or loosen. This wall is most economical when mat glazed units are used for the exterior, but when left plain it forms an ideal base for stucco. A 9-in. triple-air-space wall with the faced units can be built in many localities, for 54¢ per sq. ft.; with plain units, 44¢.

Type B—Consists of one regular Duntile and one bond tile—in reality a tile and one-half, alternating in every course. This gives two horizontal continuous dead air spaces with no continuous mortar joints. Typical cost of 9-in. wall Glazed Duntile is 50¢ per sq. ft.

Type C—Shows a wall section for use where veneer construction is insisted upon. It has not the advantages of the all Duntile wall, but is considerably cheaper than face brick veneer and illustrates the adaptability of

No Loss from Breakage—Duntile Can Be Dumped Without Injury

Hotel Ponce de Leon, Kansas City, Mo.

"This structure embodies more innovations than any other. It departs from the types previously erected here both in design and construction. A sturdy steel frame supports curtain walls of Duntile construction with stucco exterior. It will be the first tall building here with exterior walls of stucco which lends itself well to the Spanish design. The work of Edgar C. Faris, Architect. The building contains seventy-six apartment units of varying sizes."—*Kansas City Star*

Duntile when used in conjunction with other materials. Mat Glazed Duntile Veneer costs, generally, 57¢ per sq. ft.

Type D—For use where face brick is demanded. Duntile backing makes a permanent fireproof wall and avoids that "efficient" fire trap—veneer on frame. The 9-in. wall costs 73¢; 13-in. wall, 5x8x12-in. Duntile for backing, 83¢ per sq. ft.

Specifications

Standard masonry specifications apply to the laying of Duntile as well as to brick, no special method of treatment is necessary.

Standard Uniform Quality

The Duntile made in every authorized plant is required to meet the high quality standard set by the engineering department of the W. E. DUNN MANUFACTURING Co., makers of the production machinery. Consequently there are over 400 dependable sources of supply for this material. Every one is owned and operated by local men of high standing who fully appreciate their responsibility.

Regardless of what building operations you are concerned with, it will pay you to let the nearest plant submit facts and figures. Their product is dependable, offers a full color selection, and will lower construction costs.

Your Nearest Supply

Wire the W. E. DUNN MANUFACTURING Co., Holland, Mich., at their expense. This company or any Duntile plant will be glad to furnish prices, colors, further construction details, or samples of mat glazed Duntile.

NATIONAL STONE-TILE CORPORATION

Patentees, Licensors and Manufacturers of Stone-Tile

625 Market Street, SAN FRANCISCO, CAL.

NEW YORK OFFICE, Graybar Building, 420 Lexington Avenue

For Local Licensees, see Telephone Book under "Stone-Tile"

Product

STONE-TILE.

Stone-Tile—A Load Bearing Concrete Tile

Stone-Tile is a pre-cast hollow concrete building unit, smaller and easier to handle than building block or hollow tile. It is one of the most economical materials for permanent, fireproof walls in houses, schools, churches and business or industrial buildings of every description.

Made to Rigid Specifications—The manufacture of Stone-Tile is conducted under Standard Specifications to which each manufacturer must adhere under his license contract. In the Stone-Tile mix the aggregates are graded and the water ratio controlled so as to secure a plastic or *quaking* consistency.

Produced in Quantity—Every Stone-Tile plant is equipped to fill the largest orders on short notice.

Distinctive Texture—Stone-Tile has a distinctive pitted surface which gives a pleasing texture to exterior walls and makes a firm bond with plaster.

Flexible in Treatment—The convenient sizes and shapes of Stone-Tile lend themselves to a wide range of architectural treatment. Can be used to form arches and lintels. See illustrations on following page.

Can Be Reinforced—Stone-Tile pilasters may be filled solid and reinforced where concentrated loads occur and the total cost will be less than reinforced concrete.

Easy to Handle—Stone-Tile units can be handled as easily as common brick. An average bricklayer can lay from 600 to 1200 of 6-in. size, and from 500 to

900 of 8-in. size, depending on nature of the wall.

Extremely Economical—Stone-Tile can be furnished and laid at a price seldom in excess of 35¢ per sq. ft. of 8-in. wall; other sizes in proportion.

A Unit That Meets Every Condition

Stone-Tile Units are furnished in three principal sizes: No. 4 for partitions; No. 6 for 6, 12 or 18-in. walls, and No. 8 for 8 or 16-in. walls. Half tile are also furnished, as well as other shapes listed below.

DIMENSIONS AND WEIGHT OF STONE-TILE

No.	Dimensions, in.	Approx. weight, lb.	Web thickness, in.	Ratio of air space
4	3 $\frac{3}{4}$ x12x3 $\frac{1}{2}$	8 $\frac{1}{2}$	1 $\frac{1}{4}$	25%
6	5 $\frac{3}{4}$ x12x3 $\frac{1}{2}$	12 $\frac{1}{2}$	1 $\frac{1}{2}$	32%
8	7 $\frac{3}{4}$ x12x3 $\frac{1}{2}$	16 $\frac{1}{2}$	1 $\frac{3}{4}$	22%

Mortar averages 1 cu. yd. per 1000 Stone-Tile of either size.

For Corners—Special corner tile are furnished in the No. 8 size. No. 6 tile require no special shapes at corners.

For Jambs—Appropriate jamb units (No. 6 or 8) are furnished for use at double hung windows, steel sash, and the like. (See first illustration on left below).

For Copings and Bearing Courses—Solid tile (No. 6 or 8) is used for bearing courses at joist lines and for capping walls at top.

For Arches, Pilasters, etc.—The standard units are adaptable for these purposes. Notice how these details are handled in the church building illustrated below on the left.

1—Jamb Tile for Steel Sash
2—8-in. Corner Tile
3—Recessed Jamb Tile
4—Half Tile

Stone-Tile Laid in Wall
Note the brick proportions

Church Built with Stone-Tile

Note the pleasing exterior appearance of Stone-Tile masonry and flexibility of use

Flexibility of Stone-Tile

Adaptable for arches, copings, cornices, etc.

Where to Procure Stone-Tile

Because of its strength, economy, pleasing texture and exceptional flexibility of treatment, Stone-Tile is being widely specified by architects. For their benefit we maintain a Service Department at the home office, which will co-operate in plans and specifications.

Stone-Tile can be procured from independent licensees in different parts of the country, by whom it is manufactured under the rigid Stone-Tile specifications.

Look in the telephone book under "Stone-Tile" for your local licensee—or write us for information.

Where Used

Stone-Tile has been and is being successfully and economically used in the following type of structures:

Apartment houses	Factories
Churches	Railroad stations
Residences	Schools
Stores	Theaters
Office buildings	Vaults
Hospitals	Warehouses
Mills	Garages

The illustrations show the beauty, strength and versatility of Stone-Tile.

Wall and Gateway of Stone-Tile

The Stone-Tile are set a little askew, the joints are raked out to give shadow lines and the whole brush coated

UNITED STATES GYPSUM COMPANY

Pyrobar Partition and Furring Tile; Beam and Column Covering

300 West Adams Street

CHICAGO, ILL.

For Sales Offices, see page B1359

Products

PYROBAR PARTITION and FURRING TILE; PYROBAR BEAM and COLUMN COVERING.

For Acoustical Plaster, see page A19; for Structo-lite Cement, see pages A44-45; for Floor Voids, see page A114; for Reinforced Roof Tile and Monolithic Floors and Roofs, see pages A166-170; for Dry Fill Insulation, see page A200; for Wallboard, see page B1258; for Sheathing, see page B1271; for Lath, see page B1323; for Gypsum Plasters and Finishes, see pages B1359-1361; for Colored Finishing Plaster, see page B1365; for Stucco, see page B1377; for Plastic Paint, see page B1697.

Pyrobar Partition and Furring Tile

Moulded of 98% gypsum and 2% special fiber by continuous automatic machine process, insuring accurate proportions and uniform size, weight, strength, and density.

This company will erect Pyrobar partitions.

Approved by Underwriters' Laboratories, Inc., for:

Non-bearing corridor walls, partitions, wall furring, false columns and pilasters, unplastered partitions and corridors in merchandise storage warehouses.

Fire division walls.

Elevators, stairways, dumbwaiter and corridor enclosures.

Light wells, pipe chases, heat and vent ducts.

As covering for columns, beams, girders and trusses and other steel members requiring fireproofing.

Advantages—

Fireproof
Light weight
Save plaster.
Perfect plaster base

Economical
High sound insulation
Speedily erected
Easily cut for alterations

Distinctive

Economy—Pyrobar units are 2½ sq. ft. each, speeding construction and making for economy in handling and erection costs. Pyrobar walls are straight and true, requiring uniform ½ in. of plaster on a side to finish.

Cost—Its extreme light weight and large, true units secure economy in freight, labor, handling, erection, and plastering. Note the comparisons.

Pyrobar Precast Gypsum Partition and Furring Tile

Approved by Underwriters' Laboratories, Inc.

Specifications for Pyrobar Partition and Furring Tile

Partitions—Unless otherwise specified or shown, all partitions (Note: also mention vent shafts, pipe chases, column and beam or girder fireproofing or any other special items required with partitions) shall be built of UNITED STATES GYPSUM COMPANY'S Pyrobar Partition Tile, of thickness indicated on plans. All partitions shall start with a mortar bed, and the tile shall be set plumb, straight and true with vertical joints broken, and shall be wedged at ceiling and slushed with mortar. Corners of all partitions shall be built log cabin fashion, tile interlocking.

All intersecting partitions shall be cross bonded not less than at every third course. All partitions coming in contact with existing walls or partitions or with brick or other masonry walls shall be securely anchored to such walls by means of metal ties, anchor straps, other approved fasteners or by 10d steel cut nails partially driven into the masonry joints at each gypsum tile course or by providing recess in wall.

Furring—All outside walls, where so shown on plans, shall be furred with Pyrobar Furring Tile of thickness and type indicated on plans, laid up against the wall, and securely anchored to the masonry every square yard with 10d cut nails, metal ties, anchor straps or other approved fasteners left in place by mason contractor.

Mortar and Laying—All Pyrobar Tile shall be laid up in mortar composed of UNITED STATES GYPSUM COMPANY'S Set-fast Cement—1 part cement to 3 parts, by weight, of clean, sharp dry sand, thoroughly mixed. (Important: Do not use portland cement or lime mortar.) No mortar shall be retempered. All tile shall be laid with full, flush joints to a line, with horizontal beds uniformly level on each course. All joints, chinks, and crevices between the tile and other work shall be filled with mortar well slushed in.

Grounds for Trim—Chair rail, picture moulding, plaster grounds, baseboards and similar trim shall be secured to grounds or to nailing blocks set in the tile construction for this purpose. Nailing blocks shall not be less than ¾ in. thick, shall be nailed directly to the end of the gypsum tile and shall be of such other dimensions as to completely cover the end of the tile. When nailing blocks are used, they shall be spaced not to exceed 30 in.

Blackboards, toilet and heavy fixtures shall be secured by bolting through the tile construction, or shall be nailed to nailing blocks not less than 1½ in. thick of the character required for other trim, and spaced not to exceed 15 in.

Lintels—Openings not greater than 22 in. in partitions of tile may be spanned with a single tile, which shall have a bearing at each end of not less than 4 in. When such openings are more than 22 in. but not more than 4 ft., the Pyrobar Tile over these openings shall be laid in the form of a jack-arch. Openings over 4 ft. but not over 6 ft. shall be spanned by reinforced gypsum lintels. Openings over 6 ft. shall be spanned by metal lintels of approved design. (Note: Specify under Miscellaneous Iron.)

Wood Frames—(For Carpenter Specifications)—The carpenter contractor shall set and secure the rough bucks for openings ahead of the contractor for this work so as to cause no delay. These bucks shall be left plumb and true by the carpenter and shall be made of 2-in. lumber of the same width as the thickness of the tile, and there shall be ½x2¼-in. grounds nailed to the bucks to the height of the door forming a rabbet to receive the Pyrobar Tile.

Trim—All wood or metal trim shall extend over the junction between bucks or grounds and the plaster coats. For narrow trim an unrabbetted buck may be used if securely anchored to the tile.

Note: For best construction, we recommend the use of door bucks which extend from floor to ceiling, and preferably anchored to the tile by means of metal ties, anchor straps, other approved fasteners or by 10d steel cut nails partially driven into the buck at each gypsum tile course. Bucks not extending to ceiling should always be well anchored. It is good practice to use a strip of metal lath, corrugated or perforated iron or a wire mesh in the mortar course over the tiles forming the lintel and extending 30 in. beyond the joint on each side. Where heavy doors are used, the plaster may be reinforced against cracking by use of a metal lath or wire mesh facing, nailed to the tile, over the corners of the door openings.

Pyrobar Beam and Girder Fireproofing

Pyrobar beam and girder fireproofing consists of shoe tile which fit closely over the lower flanges of the steel, as illustrated, and side covering of Pyrobar partition units set in place as shown. Both shoe tile and side covering are of such dimensions as to provide 2 in. of fireproofing at all parts, thus fulfilling the requirements of the Underwriters Laboratories, Inc.

For built-up girders larger than may be accommodated with the standard sizes of shoe tile, a combination of angle and soffit tiles are used. Due to the great diversity of requirements for this type of fireproofing, angle tile are not manufactured in stock sizes but are made on order to job requirements. The soffit pieces are usually cut to fit on the job from Pyrobar partition tile.

Shoe tile are machine moulded in a double unit 18 in. long and are easily split by the mason into the two individual units. The advantages of the double unit are less breakage, easier and less expensive to handle and the protection afforded the inner edges. The large light weight units facilitate rapid handling and decrease setting costs, require a minimum of mortar and a minimum of labor to place. The true, protected inside faces will be found to fit perfectly around the beam and girder flanges. The double units of shoe tile as shipped weigh as follows per lineal foot:

B40, 14 lb.; B50, 14 lb.; B65, 15 lb.; B80, 16 lb.

Pyrobar Column Fireproofing

Column fireproofing is accomplished with 2-in. solid or 3-in. hollow Pyrobar partition tile. When desired or required by code, the space between the covering and the steel may be solidly backfilled with broken gypsum blocks and gypsum mortar.

(At Left)
Built-up Girder Fireproofed with Angle and Soffit Tile

(Below)
I-Beam Fireproofed with Shoe Tile

Sketch of shoe tile as shipped to the job

Fireproofing Efficiency

Authorities recognize that fireproofing is essentially a matter of insulating the building members carrying the load from the effect of high temperatures. Steel commences to fail at about 600° F. and the importance of an insulative fireproofing can not be overestimated.

The tests of the Bureau of Standards and Underwriters Laboratories, Inc., definitely show, and their reports state, that with gypsum fireproofing the maximum temperature in the steel was much lower than those obtained in comparable tests with other covering materials.*

Specifications for Pyrobar Gypsum Beam, Column and Girder Fireproofing

Girder and Truss Covering—All girders, beams and trusses, unless otherwise specified, shall be covered with Pyrobar Beam Shoe and Covering Tile in accordance with the standards of the UNITED STATES GYPSUM COMPANY.

Column Covering—This contractor shall cover all exposed interior columns, unless otherwise indicated, with [2-in. solid] [3-in. hollow] Pyrobar Gypsum Tile. The tile shall be laid plumb and true, the corners built log cabin fashion, the tile interlocking.

(If it is desired to fill in solid between the steel and the covering, add the following clause:)

The space between the column and the fireproofing shall be solidly backfilled with broken gypsum tile well slushed with gypsum mortar.

Mortar and Laying—See specification for mortar and laying Pyrobar Tile on preceding page.

*Digest of report giving comparable tests on clay tile, concrete and gypsum fireproofing available upon request.

NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION

332 South Michigan Avenue
CHICAGO, ILL.

Product

VITRIFIED PAVING BRICK.

Uses

Vitrified paving brick is used architecturally for the wearing surfaces of driveways, ramps and walks serving residences, public buildings, factories and foundries; for passenger and freight platforms in electric and steam railway use; for railway and industrial freight yards; for bridge floors; for garden walks, terraces and rustic bridges.

Advantages

To the services listed above vitrified paving brick brings the same resistance to the wear and tear of traffic which has proved it the most economical surfacing material for street and highway paving.

Furthermore, because it is the only paving material which possesses a richness of color and texture, it is widely specified solely on the basis of appearance. In many instances, it is the only paving surface which contributes the proper setting to the structure it serves.

Its safety feature is also important. The rough, heat-hardened texture is virtually "skidproof" and is thus a protection to pedestrians, horses and motor vehicles, a particularly valuable asset in the construction of ramps, platforms or sloping driveways.

Even more important in many uses is the low repair cost and high salvage value of the vitrified brick pavement. When laid with asphalt filler, each brick remains a removable unit. Portions of the pavement can, therefore, be easily lifted and re-laid in the event that pipes or conduits need to be laid or repaired below the pavement; or the whole pavement can be moved to another

VITRIFIED
Brick
PAVEMENTS
OUTLAST THE BONDS

location with frequently 100% salvage of the brick. In the event of abusive traffic, asphalt-bound vitrified brick can be lifted and relaid with the untouched under surface up, providing a virtually new pavement at the least possible cost.

In factory or foundry use it is unaffected by heat or acids. It is dustless and will not absorb oil or grease.

It is sanitary. It does not rot, rut, roll or crack.

Standard Vitrified Paving Brick

Selection of type should be made from the standard types of the Committee on Simplification of Variety and Standards for Vitrified Paving Brick of the United States Department of Commerce. Subject to further simplification, these are four in number, as follows:

STANDARD VITRIFIED PAVING BRICK (AS USUALLY LAID)

Dimensions in inches—width x depth x length

Plain wire-cut brick (vertical fibre lugless).....	4	x2½	x8½
	4	x3	x8½
	4	x3½	x8½
Repressed lug brick.....	3½	x4	x8½
Wire-cut lug brick (Dunn).....	3½	x4	x8½

ESTIMATING DATA

Kind of brick	Laid	Depth of wearing surface	Number to lay 1 sq. yd.
Plain wire-cut brick:			
All sizes.....	Flat	2½, 3 and 3½ in.	36
3½ in. size.....	Edge	4 in.	40
Repressed lug brick:			
3½ in. size.....	Edge	4 in.	40
Wire-cut lug brick:			
All sizes.....	Edge	4 in.	40

Vitrified Brick Private Drive

Beauty, dignity, durability and a warm coloring combined in a single material

Vitrified Brick in Industrial Service

Anti-rutting, anti-crumbling, anti-absorbent and dustless, vitrified brick meets the severest industrial requirements

Joint Filler

Asphalt filler is the preferred type of joint filler for vitrified brick wearing surfaces, without prejudice to other types of filler which may have special utility in special instances of construction. Nature fights rigidity, and asphalt filler provides the necessary flexibility without robbing the brick surface of any of its qualities of hardness, toughness, density and smoothness.

Approximate Weights

The average weight of vitrified paving brick is approximately .084 lb. per cu. in.

With a 2½-in. depth of wearing surface, plain wire-cut brick, filler squeegeed, approximately 10 lb. of asphalt filler are required per square yard. Approximately 12 lb. of asphalt filler are required for the 3-in. depth brick and 14 lb. for the 3½-in. depth.

Up to 15 lb. of filler per square yard are required for lug brick in the 4-in. depth. Other depths about in proportion.

Specification

The NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION will furnish any desired specifications on request.

Prices

Request for price quotations made to the association will be referred to individual manufacturers who will then submit prices.

Free Handbook

The 92-page, fully illustrated data book, "*The Construction of Vitrified Brick Pavements*," which includes recommended specifications, will be found helpful when approaching any project requiring a paving specification.

Free to architects on request if professional letterhead is used.

Co-operative Service

The offices of the NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION and its members are always ready to respond promptly to any request for information or personal consultation made by any architect or engineer in regard to vitrified paving brick and its uses. It is their responsibility to furnish any detailed information within their power and be as useful to any architect or engineer as the opportunity offers.

Vitrified Brick Walks Around the Home

Beauty of texture plus beauty of color plus the opportunity for interesting patterns. Paving brick harmonize with beautiful surroundings

Vitrified Brick Pavements in Railway Service

Resisting abuse, never slippery, easy to maintain and repair, vitrified brick is the right choice for railroad platforms, ramps and freight yards

Vitrified Brick Pavement in Factory Service

Long life, low repair cost and a skidproof, non-absorbent, acidproof surface make vitrified brick the logical and foresighted selection

Selected by Napoleon

Holland boasts of brick pavements, still in use after more than a hundred years, built by order of Napoleon Bonaparte

AMERICAN BAR LOCK CO., INC.

Manufacturers of Sidewalk Light Construction

LONG ISLAND CITY, N. Y.

BRANCH OFFICES OR REPRESENTATIVES IN ALL LARGE CITIES

Products

"BAR LOCK CRUSHPROOF" DOUBLE REINFORCED CONCRETE SIDEWALK LIGHT CONSTRUCTION; SIDEWALK DOORS of all descriptions.

For Skylight Construction, see page A518.

"Bar Lock Crushproof" Double Reinforced Concrete Sidewalk Light Construction

The "Bar Lock Crushproof" cast iron shield protected glass makes it the most durable sidewalk light ever placed on the market in our 30 years' experience in this line of business. Especially designed for use where permanence, freedom from broken glass, leakage and maintenance charges are appreciated.

Made in completed factory finished slabs, ready to drop over the openings, or we will send our own mechanics, if preferred, to install in the field anywhere in the United States.

The cast iron shield insures an absolutely watertight joint under and around the glass, and the flange

"Bar Lock Crushproof" Round Lenses

on the outer surface insures a perfect anchor in the concrete.

The heavy body of reinforced concrete does not come in contact with the glass, eliminating another previous cause of breakage of glass from expansion.

The cast iron shields are solidly embedded in the heavy concrete construction and will last for the life of the building.

Special Features of "Bar Lock Crushproof" Replaceable Construction

Replacement—It is practically impossible to entirely prevent cracked or broken glass from accident or abuse, but a cracked or broken lens in the "Bar Lock Crushproof" construction may be replaced by unskilled labor in a few moments. There is no cutting of concrete, unsightly patchwork or likelihood of leakage.

The importance of this replacement feature will be readily appreciated.

Lazalite Glass—The glass used in this crushproof

construction is made not only from a specially prepared, tough mixture, but each piece is separately polariscope tested, which effectually prevents all cracking or breakage from expansion or contraction. The lenses, being of pure crystal annealed glass with sunburst or Fresnel-lens undersurface, insure the largest light transmission and diffusion.

"Bar Lock Crushproof" Square Lenses

Specification

"'Bar Lock Crushproof' Double Reinforced Concrete Construction, using Lazalite polariscope tested glass, protected by cast iron shields, with signed guarantee to furnish glass for replacement free of charge (f. o. b. factory) for a period of 5 years."

"Bar Lock" Flush Sidewalk Doors

Prices, Details, etc.

Prices, details, etc., will be furnished upon application.

Five-year Guarantee

With each and every "Bar Lock Crushproof" sidewalk light installation using our cast iron shield protected glass, the AMERICAN BAR LOCK CO., INC., will issue a written guarantee to furnish, free of charge (f. o. b. factory) any glass required for replacement for a period of 5 years.

AMERICAN 3 WAY-LUXFER PRISM CO.

Sidewalk Light Engineers

1313-1315 South 55th Court
CICERO, ILL.
(Suburb of Chicago)

37-28 30th Street
LONG ISLAND CITY, N. Y.

For 3-Way Armored Glass Skylights, see pages A516-517; for Transoms, see page B1751

3-Way Armored Glass Sidewalk Lights (Glass Guaranteed for 5 Years)

Everything that the architect, builder, or owner has wanted and demanded of sidewalk lights is found in 3-Way Armored Glass Construction.

Great light area	Great strength
Waterproof	Perfect walking surface
Weatherproof	Protected glass
Expansion proof	Instant replacement of glass
5-year guarantee on glass.	

3-Way Armored Glass Sidewalk Lights embody all the results of our quarter-century of experience. It is the proven construction, for installations ten years old are as good today as when put in.

In this construction, the glass—both square lenses and round lenses—is armored against both expansion pressure and the assaults of traffic. Each lens is caulked with tar and brimstone compound in a cast iron galvanized ring, or bottomless cup. This is built right into the concrete slab, being perfectly embedded with a permanent bond.

Cut-away View of 3-Way Armored Glass, Showing Shield Embedded in Concrete

These slabs are made to fit the sidewalk openings. Reinforcing is of approved types with great strength and freedom of vibration. To install, it is simply necessary to slip in place, and to seal and caulk the joints with 3-Way Caulking Compound.

Each lens is of polariscope tested Flintex-Lazalite Glass, annealed to assure toughness. Two types of lenses are available—No. 12, 2¾-in. round glass set in 3-in.

round shields; No. 13, 3½-in. square glass set in 4-in. square shields.

Instant Replacement of Glass—Should one of these perfect lenses be broken it can be replaced by any one in a minute's time, for no cement patching is needed. Just three moves: clean out old lens, drop in new one, seal joint with hot tar and brimstone.

5-year Glass Guarantee—We have proven this construction so perfect and so lasting that we absolutely guarantee the glass in it for a period of five years. Any glass broken by any cause will be supplied free for replacement, f. o. b. factory, for five years from date of installation.

3-Way Armored Glass Sidewalk Lights

Specifications—Sidewalk lights as shown on the plans shall be of the reinforced concrete type known as 3-Way Armored Glass, as made by the AMERICAN 3 WAY-LUXFER PRISM CO.

Glass shall be only Flintex-Lazalite quality as manufactured by the Jeannette Glass Co.; polariscope tested and guaranteed to be free of manganese and all internal strains. Each glass to be set in a galvanized cast iron shield that provides a seat for the glass and a flange to be embedded in the concrete. Glass shall be caulked into the shield with tar and sulphur compound.

All glass to be [3½-in. square, Fresnel lens design (No. 13) set in 4-in. galvanized iron shields spaced 4¼-in. centers] [2¾-in. round sunburst lens design (No. 12) set in 3-in. round shields, spaced 4½-in. centers]. Any glass broken in 5 years to be supplied for replacement free, f. o. b. factory.

Simplex Fresnel Floor Lights

A reinforced concrete construction, everlasting, strong, great light area, never needs paint or upkeep of any kind. Glass of two sizes, as desired—4-in. square, set 4¾-in. centers, or 6½-in. square, set in 7½-in. centers. Proven perfect construction under all kinds of traffic conditions. Used in floor of concourse of Chicago Union Station.

Products

GRAUER REINFORCED CONCRETE SIDEWALK LIGHTS, SKYLIGHTS, FLOOR LIGHTS, and MARQUISE LIGHTS; for all classes of buildings, tunnels, subways, train sheds, canopies, etc., installed in place or shipped in slabs ready to set.

Also manufacturers of Grauer Cement Floor Finish; Rubber, Linoleum and Cork Tile Floors, Composition Floors, Illuminating Sidewalk Doors, Coalhole Covers and Rings, Sidewalk Ventilators, Bullseye Glasses of every size for repairing sidewalk lights and skylights of any style or manufacture.

For Grauer-Watkins Red Asphalt Floor and Graustic Floor, see pages B1542-1543.

Advanced Design

Grauer daylighting installations for all purposes are built on a scientifically correct design which makes them positively proof against any conditions of weather or use. Accident or excessive abuse only can break them.

New type Grauer Shield Protected Lights eliminate repairs. Plastic cushions (non-leakable) around the glasses protect them from shaling and breakage due to expansion of surrounding concrete.

Skylights Over Restaurant, Nolan School, Detroit, Mich.

Grauer

SKYLIGHTS
 FLOOR LIGHTS
 SIDEWALK LIGHTS
 GRAUSTIC FLOORS
 RED ASPHALT FLOORS

With Grauer daylighting equipment, you can give buildings the great convenience and profitable investment of daylighting throughout, with assured permanent durability.

When breakage does occur, due to accident, new glasses are easily installed by unskilled labor at a trifling cost, and without showing the repair.

Fully Guaranteed

Grauer Shield Protected Sidewalk Lights are unconditionally guaranteed for one year, to be rust-proof, leakproof, and free from defect. Replacement glasses will be supplied free f.o.b. factory for five years.

Sidewalk Lights

The diagrams on following page, illustrate the construction of Grauer Shield Protected Sidewalk Lights. This construction carries a load of 300 lb. per sq. ft. and can be built to carry 1000 lb.

Glass—The best quality of glass (Grauer No. 20) is used, and guaranteed to be properly annealed, each glass having passed polariscope test.

Economy—The saving in electric current alone will pay for Grauer Shield Protected Sidewalk Lights in a short time, usually in one and a half years, the time depending on current rate. The added efficiency of employees or tenants using the basement, their health, comfort, and pleasant working condi-

Skylight Over Swimming Pool, Ferris School, Highland Park, Mich.

tions, pay many-fold for the daylight provided. Where basement spaces are daylighted, and used as salesrooms, the increased revenue frequently pays for the entire cost of construction in less than one year.

Ready-to-set-Sidewalk Slabs—Completely built slabs can be supplied on order, to fit specified spaces, when for any reason it is not desired to have our own skilled workmen install daylighting construction.

Specifications—The sidewalk lights shown on plans shall be constructed with carrying members of reinforced concrete. The glass shall be Grauer No. 20, set in rustproofed metal shields with an elastic compound. The design to permit glass replacement with unskilled labor. All glass is to be polariscope tested and guaranteed free of internal strains. The construction shall be capable of carrying a uniformly distributed live load of 300 lb. per sq. ft. without injury.

The entire construction is to be guaranteed waterproof and free of defects for a period of one year. Replacement glass to be furnished free, f.o.b. factory for five years.

Floor Lights

Floor lights permit the daylight to do double duty. Light thus admitted to a lower floor, even though diffused through one story, comes from above and is more efficient than light from side windows.

The construction is similar to that of Grauer Sidewalk Lights. The glass is, however, set directly in concrete as the extra expense of shields is unnecessary in interior installations.

Grauer Floor Lights maintain more weight than an ordinary floor will hold. They are permanently watertight, proof against rust and fire, require no upkeep expense.

The concrete carrying ribs are $3\frac{1}{2}$ in. in depth and on 6-in. centers both ways. The two styles of glasses are $4\frac{3}{4}$ in. square by $\frac{3}{4}$ in. thick. No. 89 is plain flat; No. 88 is diffusing and ornamental.

Specifications—The floor lights shown on plans shall be constructed of reinforced concrete and glass according to the Grauer System; installed complete in place by the manufacturer's own workmen. The glass shall be diffusing glass No. 88 [plain glass No. 89] $4\frac{3}{4}$ in. square, guaranteed free of strain by

polariscope test. Spans up to 8 ft. are to be made without intermediate beams, with a guaranteed safe live load of 250 lb. per sq. ft., with a factor of safety of 4.

The floor lights are not to be installed until after the surrounding floors have been laid complete. The floor light manufacturer is to provide an elastic, waterproof expansion joint of approved materials on the four sides of each opening.

The construction and glass is to be guaranteed for a period of one year, and any defects appearing within this period are to be promptly corrected to the satisfaction and without cost to the owner.

Skylights

Grauer Skylights with wire glass set in metal shields supported by a reinforced concrete grill, represent the greatest advance in skylight construction in years. Glass is protected from pressure, both structural and expansion. These skylights defy all weather conditions and are unconditionally guaranteed. If broken by smashing (the only way they can be broken) replacement is easy by unskilled labor.

Grauer Skylights may be walked on. They give large light area; are permanently watertight and proof against rust, fire and burglars. They require no upkeep expense.

Specifications—The skylights shown on plans shall have structural members of reinforced concrete, supporting permanent metal shields in which glass is set. Metal shields are to be rustproofed. Glass to be ribbed wire $8\frac{1}{4}$ in. square, $\frac{1}{2}$ in. thick, set in an elastic, watertight compound. Spans are to be made without intermediate beams up to 13 ft. clear. The entire construction is to be guaranteed for a period of one year and replacement glass is to be furnished free of charge for a period of five years.

Marquise Lights

The Grauer Skylight construction is admirably suited for use in marquises, and is now being generally utilized for this purpose. Architects, builders and building owners who have had trouble with the constant breaking of the ordinary sheet glass formerly used in marquise work, have come to realize the economy and satisfaction of permanently meeting this problem in the first construction. The Grauer System is a most durable product adaptable to work of this character.

National Service

This organization is equipped to install Grauer Shield Protected Daylights in any building anywhere. Skilled crews are placed in charge of each installation. Our experience of 22 years in the design and construction of daylighting equipment, assures scientifically correct installation and permanent satisfaction.

Illustrated bulletins on lights for all uses, quotations and information, will be supplied promptly.

P. M. BRUNER GRANITOID CO.

ESTABLISHED 1878

Sidewalk Lights, Floor Lights, Skylights

523-524 Frisco Building

ST. LOUIS, MO.

Bruner Construction

Bruner sidewalk lights, floor lights and skylights conform to recommendations adopted by United States Department of Commerce, Division of Simplified Practice, as per bulletin No. 49.

Standard Sidewalk Light Construction

In this construction there can be no leakage and no breakage of glass from structural or expansion stresses. Glass broken from accident or abuse can easily be repaired without disfiguring the construction in any way.

Specifications—The sidewalk lights shown on plan shall be of two-way reinforced concrete rib construction as shown in P. M. BRUNER GRANITOID Co.'s Standard Sidewalk Light Bulletin, capable of carrying safe live load of 300 lb. per sq. ft. The glass to be $3\frac{1}{2}$ in. square by $\frac{3}{4}$ in. thick at supporting edge, set in 4-in. square metal shields with elastic compound. The lenses shall be set 5 in. on center. The ribs shall be $2\frac{1}{2}$ in. deep.

Bearing furnished for this construction should be 3 in. wide by $2\frac{3}{4}$ in. deep.

The entire construction to be guaranteed waterproof and free of defects for a period of one year. Replacement glass to be furnished free f.o.b. factory for 5 years.

Bruner Skylight Construction

We recommend that concrete curbs be formed as part of the reinforced concrete roof. Bruner reinforced concrete skylights being laid over these curbs and projecting beyond with drip formed on under side (as shown), a permanently mechanical watertight job is assured.

Where required, however, this skylight construction can be made flush with roof by setting same in rabbet formed in reinforced concrete and calking with our special waterproof compound.

Specifications—The skylights shown on plan shall be of two-way reinforced concrete rib construction as shown in P. M. BRUNER GRANITOID Co.'s Skylight Bulletin. Glass to be ribbed wire $8\frac{1}{4}$ in. square, set in metal shields with elastic compound. Ribs shall be $3\frac{1}{2}$ in. deep, set $9\frac{1}{4}$ in. on centers both ways. The entire construction is to be guaranteed for one year, and replacement glass is to be furnished free of charge for a period of five years.

[Plans should show detail of bearing furnished.]

Broad Flexible Service

Bruner sidewalk lights, floor lights and skylights can be constructed in place, or made in panels at our factory and shipped anywhere.

We are at all times ready to give information, make details, or quote prices on our construction.

Standard Sidewalk Light Construction

Detail Bruner System Skylight Construction

Spans up to 10 ft. can be made without intermediate beams. Standard construction beams are on $9\frac{3}{4}$ -in. centers. Standard wire glass is $8\frac{1}{4} \times 8\frac{1}{4}$ in. The metal shield and protecting cushion construction is similar to that in the Bruner sidewalk lights.

Bruner Reinforced Concrete Skylights Mounted on and Projecting Beyond Concrete Curbs

J. MERRILL RICHARDS

Manufacturer of Sidewalk Lights and Glass Roofs

119-122 West First Street
BOSTON, MASS.

Products

RICHARDS' "UNITY" PERMANENT SIDEWALK LIGHTS and GLASS ROOFS, Standardized Constructions. For Magnalite Obscuring Glass, see page B1737.

Shield Protected Glass Constructions

Sidewalk Lights—Double reinforced concrete and glass construction, with glass set into hot-dip galvanized cast iron protecting shields with elastic material. $2\frac{3}{4}$ -in. diameter round, and $3\frac{1}{2}$ -in. square glass units.

Glass Roofs— $8\frac{1}{4}$ -in. square, $\frac{1}{2}$ -in. thick wired glass set into hot-dip galvanized shield with elastic material. Glass roofs are effective in barrel arches as shown below. They can be installed on flat pitch in interior courts or on roof to keep skylight off the skyline.

Advantages of Shield Constructions

Shields protect the glass from all compression in the top of the slab, eliminating glass breakage, even in marquises.

Glass broken by accident can be replaced in a moment's time by unskilled labor, making no unsightly repair patch.

There is no leakage.

Permanency.

Five-year glass guarantee.

Reinforced Concrete Sidewalk, Floor and Roof Lights

Manufactured in accordance with simplified practice recommendations adopted at Washington, D. C., November 18, 1925, by Sidewalk, Floor and Roof Light manufacturers, distributors and users, acting in conjunction with the Division of Simplified Practice.

Details Construction of Reinforced Concrete Sidewalk Lights

Glass

For Sidewalk Lights—3-in. diameter in *galvanized cast iron shields*; $3\frac{1}{2} \times 3\frac{1}{2}$ in. in *galvanized cast iron shields*.

For Floor Lights— $3\frac{1}{2} \times 3\frac{1}{2}$ in. in *galvanized cast iron shields*; 4×4 in. and $6\frac{1}{8} \times 6\frac{1}{2}$ in. without shields.

For Roof Lights— $8\frac{1}{4} \times 8\frac{1}{4}$ in. wire glass set in *galvanized cast iron shields*.

Guarantee—We will furnish free of charge f.o.b. our factory any glass broken in our *galvanized cast iron shield* type construction for a period of five years from date of installation, unless breakage is caused by fire or misuse.

Cast Iron Sidewalk Lights

We have discontinued furnishing cast iron sidewalk lights for new installations, but have patterns and glass for repairs and replacements.

Glass—For concrete setting 2, $2\frac{1}{2}$ and 3-in. diameters, 3 in. square, $2\frac{1}{2} \times 3\frac{1}{2}$ in. and $2\frac{1}{4} \times 5$ in.

For sulphur setting $1\frac{5}{8}$ -in. diameter.

Sidewalk Doors

Manufactured in flush or raised types, with either checkered steel or plain surface steel. In illuminating type, with various sizes of glass set in cast iron construction, or with square glass set in steel plates.

All doors are fitted with brass hinges, flush lift rings, device to hold in place while open, and slide bolt to lock from below. Flush door frames are cast with gutter to carry off water which seeps through the joints between doors and frames.

Flush Type Checkered Steel Sidewalk Door

Coalhole Covers and Frames

Sidewalk Type Stock Sizes—16, 18, 20, 24 and 30 in., with or without glass. Special sizes 26, 28 and 36 in.

Driveway Type Stock Sizes—20, 24 and 30-in. diameter; 20×20 , 24×24 and 30×30 in.

Estimates and Prices

Furnished promptly upon request, prices on sidewalk, floor or roof lights, given either f.o.b. cars or installed at building.

ROOFING MATERIALS:

For flat surfaces: BARRETT SPECIFICATION PITCH and BARRETT SPECIFICATION FELT; BLACK DIAMOND PITCH and BLACK DIAMOND FELT. For detailed specifications see Volume I, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

For steep surfaces: BARRETT SPECIFICATION FELT, BARRETT SPECIFICATION PITCH, ANCHOR ASPHALT, and S. I. S. ROOFING. For detailed specifications see Volume II, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

Waterproofing:

For foundations, reservoirs, swimming pools, subways, tunnels, floors, etc., special specifications submitted.

Insulating and Building Papers:

For sheathing, lining, etc.

Dampproofing and Preservative Paints, Wood Preservatives, Flooring.

For Flashings for Brick and Concrete Walls, see page A478, also Volume III, Barrett Architects' and Engineers' Built-Up Roofing Reference Series; for Roof Leader and Roof-Vent Connections, see page C2333, also Volume IV, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

The Barrett Specification Roof

A roof that is guaranteed by a twenty-year or ten-year surety bond, as desired.

A roof that passes the most rigid inspection.

A roof that is scientifically and mechanically correct in every detail.

A roof that contains more than twice as much actual waterproofing material as is generally used in other built-up roofing.

A roof that has a wearing surface which resists all sorts of abuse and the most severe weather conditions.

A roof that is fire retardant; it carries Class "A" rating by the Underwriters' Laboratories, Inc.

A roof that takes the base-rate of fire insurance.

A roof that needs no repairs or paint.

A roof that costs less per year of service than any other roofing suitable for flat surfaces.

The Guaranty Bond

A 20-year Guaranty Bond is offered on Barrett Specification Type "AA" Roofs and a 10-year Guaranty Bond on Barrett Specification Type "A" Roofs by THE BARRETT COMPANY without charge in accordance with Note 1 of The Barrett Specifications hereinafter printed. Guarantees and bonds do not keep out water, but The Barrett Guaranty Bond differs from every other roofing guarantee or bond, in that this Company does not apply the roof and has no contractor's profit as a motive for cheapening the roofing.

When applied by experienced and reliable roofing contractors, and carefully inspected by competent inspectors, Barrett Specification Roofs

The *Barrett* Company
TRADE-MARK

applied in accordance with the specifications are just as economical and serviceable without the bond as with it.

THE BARRETT COMPANY has prepared an inspection manual, known as "Requirements Covering Application and Inspection of Barrett Specification Roofs," for use by architects, engineers, and owners where the Company's inspection service is not available.

The Barrett Specification, Type "AA" Roof—for Use over Board Sheathing—5 Plies

Bonded for 20 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds two (2) inches to one (1) foot.

Roof-deck—The roof-deck shall be of seasoned lumber, smooth and free from loose boards, large cracks or knotholes, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—First—Lay one (1) thickness of sheathing paper or unsaturated felt, weighing not less than five (5) pounds per one hundred (100) square feet, lapping the sheets at least one (1) inch.

Second—Over entire surface lay two (2) plies of Specification Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, and nail as often as is necessary to hold in place until remaining felt is laid.

Third—Coat the entire surface uniformly with Specification Pitch.

Fourth—Over the entire surface lay three (3) plies of Specification Tarred Felt, lapping each sheet twenty-two (22) inches over preceding one, mopping with Specification Pitch the full twenty-two (22) inches on each sheet, so that in no place shall felt touch felt.

Such nailing as is necessary shall be done so that all nails will be covered by not less than two (2) plies of felt.

Barrett Specification Roofs
TRADE-MARK

Fifth—Over the entire surface pour from a dipper a uniform coating of Specification Pitch into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter ($\frac{1}{4}$) to five-eighths ($\frac{5}{8}$) inch in size, dry and free from dirt.

General—The felt shall be laid without wrinkles or buckles. Not less than one hundred and fifty (150) pounds of Specification Pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by THE BARRETT COMPANY. He shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty issued by the U. S. Fidelity & Guaranty Co., of Baltimore, covering a period of twenty (20) years from date of completion, in accordance with Note No. 1.

20-year Guaranty Bond—Note No. 1—THE BARRETT COMPANY will give its 20-year Guaranty Bond on all jobs of 5000 sq. ft. or more, in the United States and Canada, where its Inspection Service is available, providing the roof is laid by a roofing contractor approved by THE BARRETT COMPANY, in strict accordance with the above Specification and subject to Barrett inspection and approval.

Condensed Specification—Roofing—Shall be a Barrett Specification Roof, Type "AA," laid in accordance with The Barrett Specification (for use over Board Sheathing) by a roofing contractor approved by THE BARRETT COMPANY. The roofing contractor shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty for twenty (20) years, in accordance with Note No. 1 of said Specification.

The Barrett Specification, Type "AA" Roof—for Use over Concrete—4 Plies

Bonded for 20 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds one (1) inch to one (1) foot.

Roof-deck—The roof-deck shall be smooth, firm, dry, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—First—Coat the concrete uniformly with Specification Pitch.

Second—Over the entire surface lay four (4) plies of Specification Tarred Felt, lapping each sheet twenty-four and one-half ($24\frac{1}{2}$) inches over preceding one, mopping with Specification Pitch the full twenty-four and one-half ($24\frac{1}{2}$) inches on each sheet, so that in no place shall felt touch felt.

Third—Over the entire surface pour from a dipper a uniform coating of Specification Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter ($\frac{1}{4}$) to five-eighths ($\frac{5}{8}$) inch in size, dry, and free from dirt.

General—The felt shall be laid without wrinkles or buckles. Not less than two hundred (200) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by THE BARRETT COMPANY. He shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty issued by the U. S. Fidelity & Guaranty Company, of Baltimore, covering a period of twenty (20) years from date of completion, in accordance with Note No. 1.

20-year Guaranty Bond—Note No. 1—THE BARRETT COMPANY will give its 20-year Guaranty Bond on all jobs of 5000 sq. ft. or more, in the United States and Canada, where its Inspec-

tion Service is available, providing the roof is laid by a roofing contractor approved by THE BARRETT COMPANY, in strict accordance with the above Specification and subject to Barrett inspection and approval.

Condensed Specification—Roofing—Shall be a Barrett Specification Roof, Type "AA," laid in accordance with The Barrett Specification (for use over Concrete) by a roofing contractor approved by THE BARRETT COMPANY. The roofing contractor shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty for twenty (20) years, in accordance with Note No. 1 of said Specification.

The Barrett Specification, Type "A" Roof—for Use over Board Sheathing—4 Plies

Bonded for 10 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds two (2) inches to one (1) foot.

Roof-deck—The roof-deck shall be of seasoned lumber, smooth and free from loose boards, large cracks or knotholes, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—First—Lay one (1) thickness of sheathing paper or unsaturated felt, weighing not less than five (5) pounds per one hundred (100) square feet, lapping the sheets at least one (1) inch.

Second—Over the entire surface lay two (2) plies of Specification Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, and nail as often as is necessary to hold in place until remaining felt is laid.

Third—Coat the entire surface uniformly with Specification Pitch.

Fourth—Over the entire surface lay two (2) plies of Specification Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, mopping with Specification Pitch the full seventeen (17) inches on each sheet so that in no place shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than one (1) ply of felt.

Fifth—Over the entire surface pour from a dipper a uniform coating of Specification Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter ($\frac{1}{4}$) to five-eighths ($\frac{5}{8}$) inch in size, dry and free from dirt.

General—The felt shall be laid without wrinkles or buckles. Not less than one hundred and twenty-five (125) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by THE BARRETT COMPANY. He shall fur-

with Specification Pitch the full twenty-two (22) inches on each sheet so that in no place shall felt touch felt.

Third—Over the entire surface pour from a dipper a uniform coating of Specification Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The

TRADE-MARK

Application—The material shall be applied as follows:

First—Lay the unsaturated felt or sheathing paper, lapping each sheet one (1) inch over the preceding one.

Second—Lay two (2) full thicknesses of A.T.P. Approved Tarred Felt lapping each sheet seventeen (17) inches over the preceding one, and nail as often as may be necessary to hold the sheets in place until the remaining felt is laid.

Third—Coat the entire surface with A.T.P. Old Style Pitch mopped on uniformly.

Fourth—Lay three (3) full thicknesses of A.T.P. Approved Tarred Felt, lapping each sheet twenty-two (22) inches over the preceding one and mopping with A.T.P. Old Style Pitch the full width of the twenty-two (22) inch lap, so that in no place in the last three plies shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than two (2) plies of A.T.P. Approved Tarred Felt. Nailing not to exceed three (3) feet apart and about three (3) inches from upper edge of sheet.

Details and Enlarged Section of A.T.P. Built-up Roofing Over Boards (5 Ply)

An A.T.P. Built-up Roof

This is an ideal covering for flat roofs and will withstand the severest weather conditions.

It is a tarred rag felt built-up roof covering surfaced with either gravel, crushed stone or crushed slag.

It is composed of three, four or five layers of 14 lb. A.T.P. Approved Tarred Felt cemented together by A.T.P. Old Style Pitch and surfaced with 400 lb. gravel or crushed stone or 300 lb. crushed slag per 100 sq. ft. of finished roof. It is applicable to roof decks where the incline does not exceed 3 in. to foot horizontal.

It is fire retardant and approved by the Underwriters' Laboratories, Inc.—Standard Class A. It is effective against severe fire exposures, does not carry or communicate fire and possesses no fire brand hazard. It affords a high degree of heat insulation to roof deck.

It represents the maximum of life and minimum of expense in a roof for flat surfaces.

Instructions for Applying an A.T.P. Built-up Roof Covering Five-ply—for Use Over Boards

Incline—Following specification designed for roofs having an incline not exceeding three (3) inches to the foot.

Materials—There shall be used one (1) thickness of unsaturated felt or sheathing paper, weighing not less than five (5) pounds per one hundred (100) square feet, and five (5) thicknesses of A.T.P. Approved Tarred Felt weighing not less than fourteen (14) pounds per one hundred (100) square feet single thickness, and for each one hundred (100) square feet of completed roof there shall be used not less than one hundred and fifty (150) pounds of A.T.P. Old Style Pitch and not less than four hundred (400) pounds of gravel, or three hundred (300) pounds of slag, from one-fourth ($\frac{1}{4}$) to five-eighths ($\frac{5}{8}$) inch in size and free from dirt.

Fifth—Pour over the entire surface a uniform coating of A.T.P. Old Style Pitch into which, while hot, embed gravel or slag.

Alternate—If for any reason it is more convenient to lay the five (5) plies of A.T.P. Approved Tarred Felt at one time, the result will be identically as good as if laid as specified above, provided it is accomplished by lapping each sheet twenty-six (26) inches over the preceding one, thereby providing five (5) full thicknesses of A.T.P. Approved Tarred Felt over the entire roof surface, and mopping with A.T.P. Old Style Pitch the

full width of the twenty-six (26) inch lap so that the entire five (5) thicknesses are cemented solidly together and so that in no place shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than two (2) plies of A.T.P. Approved Tarred Felt.

The nailing is not to exceed three (3) feet apart and about three (3) inches from the upper edge of sheet. In the use of this alternate the first and fifth clauses of the above specification.

Write for instructions describing application of four ply over boards.

Instructions for Applying An A.T.P. Built-up Roof Covering Four-ply—for Use Over Concrete

Incline—This specification should not be used where roof incline exceeds two (2) inches to one (1) foot, and, where incline exceeds one (1) inch to one (1) foot, the concrete must permit of nailing, or nailing strips must be provided. Nailing not to exceed three (3) feet apart and about three (3) inches from upper edge of sheet.

Materials—There shall be used four (4) thicknesses of A.T.P. Approved Tarred Felt weighing not less than fourteen (14) pounds per one hundred (100) square feet, single thickness, and for each one hundred (100) square feet of completed roof there shall be used not less than two hundred

(200) pounds of A.T.P. Old Style Pitch and not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag from one-fourth ($\frac{1}{4}$) to five-eighths ($\frac{5}{8}$) inch in size and free from dirt.

Application—The material shall be applied as follows:

First—Coat the concrete uniformly with A.T.P. Old Style Pitch.

Second—Over the entire surface lay two (2) full thicknesses of A.T.P. Approved Tarred Felt lapping each sheet seventeen (17) inches over the preceding one, mopping with A.T.P. Old Style Pitch the full seventeen (17) inches on each sheet so that in no place shall felt touch felt.

Third—Coat the entire surface uniformly with A.T.P. Old Style Pitch.

Fourth—Over the entire surface lay two (2) full thicknesses of A.T.P. Approved Tarred Felt, lapping each sheet seventeen (17) inches over the preceding one, mopping with A.T.P. Old Style Pitch the full width of the seventeen (17) inch lap between the plies so that in no place shall felt touch felt.

Fifth—Pour over the entire surface of the roof a uniform coating of A.T.P. Old Style Pitch, into which, while hot, embed gravel or slag.

Alternate—If for any reason it is more convenient to lay the four (4) plies of A.T.P. Approved Tarred Felt, at one time, the result will be identically as good as if laid as specified above, provided it is accomplished by lapping each sheet twenty-four and one-half ($24\frac{1}{2}$) inches over the preceding one, thereby providing four (4) full thicknesses of A.T.P. Approved Tarred Felt over the entire roof surface, and mopping with A.T.P. Old Style Pitch the full width of the twenty-four and one-half ($24\frac{1}{2}$) inch lap so that the entire four (4) thicknesses are cemented solidly together and so that in no place shall felt touch felt. In the use of this alternate the first and fifth clauses of the above specification remain unchanged.

Write for instructions describing application of three ply over concrete.

Tarred Felt

Made from the best quality of dry felt. Saturated with the proper amount of pure dehydrated coal tar, thereby insuring a finished product of uniformity and maximum lasting qualities.

Thoroughly seasoned before shipment.

A.T.P. Approved Tarred Felt, put up in rolls of 432 sq. ft. each, 32 in. wide and weighing approximately 65 lb. per roll. Underwriters' Label.

A.T.P. No. 3 Tarred Felt, put up in rolls of 432 sq. ft. each, 32 in. wide and weighing approximately 55 lb. per roll.

A.T.P. Old Style Pitch

A straight run distillation of coke oven tar—resulting in a pitch of the best quality and highest binding efficiency. The supply of crude tar from large sources insures a uniform product.

A.T.P. Old Style Pitch is put up in barrels (light or heavy cooperage) weighing approximately 400 to 600 lb. each—also metal drums averaging 350 lb. each. Underwriters' Label.

Inspection

Thorough inspection is made of all felt and pitch before shipment.

TRADE-MARKS

Roofing Asphalt, heated to a temperature of approximately 400° to 500° F., uniformly mopped, using approximately 30 lb. per 100 sq. ft.

The reinforcing factor shall be Genasco All-rag Standard Felt and Genasco All-rag Extra Heavy Felt (formerly known as Cap Felt), 32 in. wide. The Genasco Standard Felt shall weigh approximately 15 lb. per 100 sq. ft. and the Genasco Extra Heavy Felt shall weigh approximately 30 lb. per 100 sq. ft.

Application—The roof shall be laid in the following manner, using the above materials:

First Operation—After the roof deck has become thoroughly dry and set hard, prime the concrete with Genasco Concrete Primer, using approximately 10 lb. (1¼ gal.) per square.

Second Operation—Over the concrete thus primed, mop down approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square, into which, while hot, apply 1 layer of Genasco Extra Heavy Felt, lapping each sheet 2 in.

Third Operation—Over the Genasco Extra Heavy Felt thus laid, mop down approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square, into which, while hot, apply 2 layers of Genasco Standard Felt, lapping each sheet 17 in., mopping the full width of the lap, using approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square.

Fourth Operation—Over the Genasco Felts thus laid, mop down approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square, finishing the roof in a uniform and workmanlike manner.

APPROXIMATE QUANTITIES OF MATERIAL FOR 100 SQ. FT. OF ROOF SURFACE

2 layers Genasco Trinidad Lake Roofing Asphalt.....	60 lb.
	105 lb.

This roof contains 84 lb. of waterproofing factor and 21 lb. of reinforcing factor, or 80% waterproofing factor and 20% reinforcing factor.

Specifications for Genasco Economy Trinidad Lake Asphalt Built-up Roof—Over Concrete

Materials—The primer shall be Genasco Concrete Primer.

The waterproofing factor shall be Genasco Trinidad Lake Roofing Asphalt, heated to a temperature of approximately 400° to 500° F., uniformly mopped, using approximately 30 lb. per 100 sq. ft.

The reinforcing factor shall be Genasco All-rag Standard Felt and Genasco All-rag Extra Heavy Felt (formerly known as Cap Felt), 32 in. wide. The Genasco Standard Felt shall weigh approximately 15 lb. per 100 sq. ft. and the Genasco Extra Heavy Felt shall weigh approximately 30 lb. per 100 sq. ft.

Application—The roof shall be laid in the following manner, using the above materials:

First Operation—After the roof deck has become thoroughly dry and set hard, prime the concrete with Genasco Concrete Primer, using approximately 10 lb. (1¼ gal.) per square.

Second Operation—Over the concrete thus primed, mop down approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square, into which, while hot, apply 1 layer of Genasco Extra Heavy Felt, lapping each sheet 2 in.

Third Operation—Over the Genasco Extra Heavy Felt thus laid, mop down approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square, into which, while hot, apply 1 layer of Genasco Standard Felt, lapping each sheet 2 in. The laps of the Genasco Standard Felt shall fall midway between the laps of the Genasco Extra Heavy Felt.

Fourth Operation—Over the Genasco Felts thus laid, mop down approximately 30 lb. of Genasco Trinidad Lake Roofing Asphalt per square, finishing the roof in a uniform and workmanlike manner.

APPROXIMATE QUANTITIES OF MATERIAL FOR 100 SQ. FT.
OF ROOF SURFACE

1 layer Genasco Concrete Primer.....	10 lb.
3 layers Genasco Trinidad Lake Roofing Asphalt.....	90 lb.
1 layer Genasco Extra Heavy Felt.....	30 lb.
1 layer Genasco Standard Felt.....	15 lb.
	145 lb.

This roof contains 124 lb. of waterproofing factor and 21 lb. of reinforcing factor, or 85% waterproofing factor and 15% reinforcing factor.

Specifications for Genasco Membrane Waterproofing

Materials—The primer shall be Genasco Concrete Primer.

The waterproofing factor shall be Genasco Waterproofing Asphalt.

The reinforcing factor shall be Genasco Waterproofing Cloth weighing approximately 8 lb. per 100 sq. ft.

Application—Genasco Membrane Waterproofing shall be laid in the following manner, using the above materials:

First Operation—Prime the surface to be waterproofed with Genasco Concrete Primer, using approximately 10 lb. (1¼ gal.) per square.

Second Operation—Over the surface thus primed, mop down approximately 40 lb. of asphalt per square.

Third Operation—Into the hot asphalt apply 3 layers of Genasco Waterproofing Cloth lapping each sheet two-thirds of its width and mopping the full width of the lap, using approximately 40 lb. of asphalt per square for each mopping.

Fourth Operation—Over the 3 layers of Genasco Waterproofing Cloth thus laid, mop down approximately 40 lb. of asphalt per square, finishing the membrane in a uniform and workmanlike manner.

APPROXIMATE QUANTITIES OF MATERIAL FOR 100 SQ. FT.
OF SURFACE

1 layer Genasco Concrete Primer.....	10 lb.
4 layers Genasco Waterproofing Asphalt	160 lb.
3 layers Genasco Waterproofing Cloth	24 lb.
	194 lb.

Note: For use above ground level where temperatures are variable use Genasco Waterproofing Asphalt "B."

This system contains 185 lb. of waterproofing factor and

9 lb. of reinforcing factor, or 95% waterproofing factor and 5% reinforcing factor.

Where 2 plies are desired, lap cloth one-half of its width.

Specifications for Genasco Asphalt Mastic Floors

Base—The concrete or other base shall be prepared ready to receive the mastic surfacing inches below and parallel to the final finished floor grade with proper slopes established to take care of any required drainage. (If the floor is to be laid over wood, first lay one thickness of building paper and flash at all posts, walls, etc., with a paint coat of Genasco Priming Paint.)

Materials—The block shall be a Genasco Asphalt mastic as produced by THE BARBER ASPHALT COMPANY. The flux shall be Native Trinidad Lake Asphalt of proper penetration for the work involved. The sand shall be fairly sharp, free from loam or any foreign matter of vegetable origin and shall be well graded from coarse to fine, all passing a 10-mesh sieve and not over 3% passing a 200-mesh sieve. The coarse aggregate shall be a gravel, crushed trap rock, crushed gravel or other crushed sound stone, all passing a ¾-in. screen and retained on a 10-mesh sieve.

A formula giving the proportions of mastic block, flux, sand and coarse aggregate for the proposed mixture to be submitted to the engineer or architect, together with a sample of the sand and coarse aggregate which the contractor proposes to use.

Construction—On the base, as above specified, lay a Genasco Asphalt Mastic Floor, not less than inches in thickness, laid in layer. The Genasco Asphalt Block shall be brought to the site of the work, broken and melted in suitable kettles, together with the proper amount of flux, sand and coarse aggregate (the two latter previously dried and heated) in proportions satisfactory to the engineer or architect. (THE BARBER ASPHALT COMPANY will give its opinion, if requested, as to formulae for mastic mixes for various conditions, provided samples of the aggregate to be used for the work are submitted for examination.)

After sufficient heating and stirring, the mixture shall be spread on the established base to a uniform thickness of inches and worked under wooden floats until it is free from voids. A half and half mix of fine sand and portland cement shall then be sprinkled on the floor and the surface rubbed smooth.

The mastic mixture is to be laid in approximately 6-ft. strips. In making joints the hot mastic shall overlap the preceding strip about 4 in. so that the edge of the cold strip will become soft, thus allowing the finisher to make a perfect joint after the surplus material spread over the cold strip has been cut away.

Note: Thickness of mastic to be according to conditions and service to which floor is subjected. Where acid conditions exist Genasco Acid-proof Mastic Block and silicious aggregate must be used. Where mastic is to be more than 1 in. thick, it is to be applied in 2 layers of inches, each with joints in top layer so made as not to coincide with joints in bottom layer. Top layer only to be rubbed with the sand-portland cement mix.

Genasco Latite Asphalt Shingles

Slate surfaced asphalt shingles, of unique and distinctive design. Finished with a double butt, and applied in honeycomb design. Present a "shadow line" and depth of texture not found in ordinary asphalt shingles. Genasco Latite shingles lock together tightly on the roof, by means of a metal band or key in the butt of each shingle, so that wind or rain can not penetrate.

They are particularly adapted for re-roofing operations, being applied directly over old, worn out surfaces. Made in four colors—red, green, blue-black or mix-tone; and in two sizes—16x16 and 12x12 in. "They Weather all Weather."

Our booklet, with illustrations in color and complete data, sent on request.

Genasco Roll Roofings

Made of highest quality commercial rag felt, thoroughly saturated, and then coated on both sides with Trinidad Lake asphalt cement. The waterproof and weatherproof qualities of Trinidad Lake asphalt give them exceptional durability.

Manufactured in several types: smooth surface, medium, heavy and extra heavy, slate surface, red, green or blue-black color. Kant Leak Kleets, the most scientific and efficient roof fastening device made, furnished with each roll.

Genasco Asphalt Paints and Coatings

The several types of Genasco asphalt paints and coatings are manufactured under strict laboratory supervision. Each is designed to meet the exacting requirements of the particular purpose for which it is recommended.

There are Genasco asphalt paints for preserving metal or prepared roofs, for painting machinery or other industrial uses, for resisting acids and gases, for priming, and many other purposes.

Experience and Facilities

Established in 1873, THE PHILIP CAREY COMPANY has furnished millions of squares of roofing, distributed and applied to buildings of every description throughout the world.

The Carey mills are modern, and facilities for handling large business are maintained at a high standard.

Carey Roofs

Carey roofs are laid strictly in accordance with the Carey specifications for various weights and thicknesses adapted to meet the requirements of the roof structure, and the conditions to which the roofing will be subsequently exposed.

Selecting the Right Roof

The roof construction of all buildings is not the same.

Various materials are used in constructing the roof base, such as concrete, tile, cement slabs, gypsum, wood, steel, etc.

Roofs are subjected to various conditions of exposure and abuse not all alike, but depending upon the type of building, its location and the circumstances.

It is highly important that the owner of the building be interested in securing a roofing material, built up of the proper kind of felt, and of sufficient weight and thickness to offer the greatest possible resistance to whatever condition may be

Carey Asbestos Built-up Roofing

Applying Carey Built-up Roof

Carey Feltex Built-up Roofing

prevalent, and at the same time insure maximum service and durability.

The Carey method of providing roofs to meet the requirements of each particular building, using felt of the proper kind and weight, has met with universal success and approval of architects and builders everywhere.

Carey Felts

Carey felts consist of the best grade of stock, carefully prepared and saturated in asphalt to insure absolute waterproofing protection and permanent flexibility.

Fiberock (Asbestos Asphalt Impregnated Felt)—Used in Carey built-up roof specifications, also for waterproofing and weatherproofing work. Put up in rolls containing 324 sq. ft.; width, 36 in.; weight about 45 lb. per roll.

Feltex (Asphalt Saturated Felt)—

Used in Carey built-up roofs, waterproofing and weatherproofing work. Furnished in rolls containing 324 sq. ft.; width 36 in.; weight, about 45 lb. per roll.

Manco (Carey Asphalt)

More than forty years' experience in asphalt refining is back of Carey Manco. For roofing purposes no other asphalt has so far equaled its splendid qualities.

Manco is prepared with a high melting point, offering the greatest resistance to high and low temperatures. Its flexible quality also offers all necessary protection when exposed to ordinary expansion and contraction.

If interested in high grade asphalt, write to this company stating requirements.

Correspondence

Information and advice respecting the adaptability of Carey Roof Specifications to meet any particular requirement, will be furnished on request.

Write for samples and further information.

Carey Asbestos Built-up Roofs

Asbestos is used in the construction of roofs exposed to gases, fumes and similar severe conditions. Consideration should be given to the severity of such exposure and the roof prepared with sufficient layers of asbestos and asphalt to insure satisfactory service.

Asbestos Built-up Roofs may be applied over wood or concrete roof construction and the specifications for such roofing should be prepared to meet the conditions as they may be found in each particular case.

Specifications for Carey Roofs

(1) **Work by Other Trades**—Provision for the following work should be included under the proper specification headings:

(2) **Preparation of Wood Surfaces**—Roof surface is to be prepared and made ready for the application of Carey Roofing with dry seasoned sheathing boards of uniform thickness, closely laid. On permanent buildings, tongue and grooved sheathing 6 to 8 in. wide, is recommended. All sheathing boards to be surfaced nailed with at least two nails to each purlin in addition to any blind nailing. Sheathing boards to be placed on building horizontally. Remove or hammer down all projecting nail heads; cover all knotholes, etc., in the sheathing and sweep the sheathing clean before the roofing is applied.

(3) **Preparation of Concrete, Tile or Gypsum Surfaces**—All concrete, tile or gypsum surfaces shall be prepared for the application of Carey Roofing with a comparatively smooth, hard finish, free from holes and loose particles of sand and cement, and the expense of rectifying any extensive irregularities, such as depressions in the plane of the roof surface, which must be filled, shall be chargeable to (—Contractor). All sharp angles to be rounded out so as to avoid rough or sharp edges. On steep surfaces provision shall be made for anchoring the roofing sheets, the anchor strip to consist of a wood strip embedded into the concrete surface at the ridge. All down-spout openings must be sufficient size and the gutters properly graded by the cement contractor, so that water will not stand at any point.

(4) **Sheet Metal Work**—Counterflash all walls with No. 26 gauge galvanized iron, or if preferred, copper or Carey Fiberock counterflashing may be used. Metal counterflashing to be firmly attached to wall with suitable plugs and portland cement. (If furnished by the roofing contractor, both material and labor of installation shall be charged to the acceptor of this proposal as an extra, unless otherwise specifically stated in proposal.)

(5) **Nailing Strips**—(General Contractor) to provide nailing strip in wall for roof flashings not more than 12 in. nor less than 6 in. above roof line.

General Notes

(1) **Work Proposed**—This specification contemplates furnishing all material and labor required to apply the roofing and base flashing and line the gutters. (No metal work included.) Sheathing must be dry before applying the roofing.

Carey Feltex Built-up Roofs

Constructed of Carey high grade Feltex (Asphalt Saturated Felt). For the general class of building, Feltex makes an ideal roofing material for the reason of its great tensile strength and its ability to stretch and adjust itself to meet ordinary contraction and expansion.

Feltex Roofs are built up from two to six plies in thickness depending upon the conditions to be met. Manco Asphalt is used in the construction of all Carey Built-up Roofs as a binder between sheets and surface finish.

Specification No. 14—Carey Feltex Built-up Roof (For Application to Wood Sheathing)

(1) **Work Proposed**—Use paragraph 1, General Notes.

(2) **Materials**—Carey Feltex 30 lb. per square, Carey Manco Asphalt 25 lb. per square, Carey Feltex 15 lb. per square, Carey Manco Asphalt 25 lb. per square, Carey Feltex 15 lb. per square, Carey Manco Asphalt 25 lb. per square, Carey Feltex 15 lb. per square, Carey Manco Asphalt 25 lb. per square, 7/8 or 1 in. large head nails 1 lb. per square.

Weight per square, when applied, to be approximately 176 lb.

Carey Feltex Built-up Roof Specification No. 14 Over Wood Sheathing

(3) **Application**—The roof shall be covered with sheets of Carey Feltex 36 in. wide, weighing about 30 lb. per square; lap the sheets not less than 2 in., then nail the sheets at the joints with large head 7/8 or 1-in. nails on 6-in. centers, with one additional row of large head nails spaced 11 in. apart lengthwise through center of sheet.

After the 30-lb. Feltex sheets have been completed in accordance with the above instructions, proceed to cover the same with 3 layers of Carey Feltex, weight about 15 lb. per square each, cementing solid between sheets and joining same to the 30-lb. sheet, so that at no place shall felt touch felt, each sheet to overlap the previous sheet so that 11 in. are left exposed, making a continuous 3-ply built-up over the 30-lb. base Feltex sheet (no nails to be used through the top sheets except where necessary to anchor on steep surfaces).

(4) **Gutters**—Use paragraph 4 specification No. 5.

(5) **Flashing**—Use paragraph 5 specification No. 5.

(6) **Counterflashing**—Use paragraph 6 specification No. 5.

(7) **Roof Finish**—Use paragraph 7 specification No. 5.

Specification No. 15.—Carey Asbestos Built-up Roof (For Application to Wood Sheathing)

(1) **Work Proposed**—Use paragraph No. 1, General Notes.

(2) **Materials**—The materials for each square used in the construction of this roof shall be as follows:

One roll (110 sq. ft.) Carey Asbestos Asphalt Impregnated Roofing Felt, weight approximately 65 lb. Two sheets (weight 15 lb. per square each) Carey Fiberock (Asbestos Impregnated Felt). 80 lb. Carey Manco Asphalt. Nails and flat tin caps. Weight per square, when applied, to be approximately 175 lb.

(3) **Application**—The roof surface shall be covered with Carey Asbestos Asphalt Impregnated Roofing, lapping the sheets so that there will be a lap of not less than 3 in., cementing between the laps with Manco Asphalt, and secure with nails and caps, spacing the nails along the lap 4 in., also secure through the center of sheets with two rows of nails and flat tin caps, staggered, spacing nails crosswise of sheet 11 in., and lengthwise of sheet 15 in. This surface to be mopped with Carey Manco Asphalt into which, while hot, shall be laid 2 layers of 1-ply Fiberock (Asphalt Impregnated Asbestos Felt), cementing solid between sheets, so that at no place shall felt touch felt, each sheet to overlap the previous sheet, leaving 17 in. exposed. All sheets shall be laid crosswise of the sheathing boards and so lapped that at no place shall one lap or cross-seam occur upon another.

(4) **Valleys and Gutters**—Line all gutters in the same manner as described under "Application," using sheets full length and cut to a width of not over 18 in. After the base sheet of heavy asbestos roofing has been nailed in position, then cement 2 sheets of 1-ply Fiberock over the base sheet, breaking joints in the usual manner.

Note: We recommend, wherever possible, adding an additional sheet of 1-ply Fiberock in all valley and gutter construction.

All valley and gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets, the heavy base sheet of asbestos roofing shall extend on all vertical surfaces approximately 2 1/2 in., the extension to be uncemented.

Note: All concrete or brick walls to be flashed shall be primed (Carey Asphalt Primer) to full height of flashing.

(5) **Flashing**—The general contractor or owner to provide suitable nailing strips in the walls at the time of construction, or raggle block, together with necessary cant strips,

nailing strips, etc., to enable the roofing contractor to properly construct flashing work.

Note: Height of flashing, width of cant strip and flashing materials may be regulated to suit height of wall, and other conditions prevailing.

(6) Counterflashing—See under "Work by Other Trades."

(7) Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt, applied in a light thin coat, less than $\frac{1}{8}$ in. thick, and spread to a uniform finish.

Specification No. 3—Carey Asbestos Built-up Roof (Over Wood Sheathing)

(1) Work Proposed—Use paragraph 1, General Notes.

(2) Materials—One roll (108 sq. ft.) 2-ply Fiberock Roofing, weight 40 lb. 30 lb. Carey Fiberock Asphalt Impregnated Asbestos Felt. 80 lb. Carey Manco Asphalt Pitch. 1 lb. $\frac{7}{8}$ -in. nails. $\frac{3}{4}$ lb. flat tin caps.

(3) Application—Roof surface shall be covered with 2-ply Fiberock Asbestos Roofing, laid next to sheathing boards. All joints to be lapped 2 in., cap-nailing sheets at joints securely

to the sheathing board every 6 in. with one additional row of nails and caps 11 in. apart through the center of the sheet. This surface to be mopped with Carey Manco Asphalt and on to this surface shall be laid 2 layers of 1-ply Fiberock Asphalt Impregnated Asbestos Felt, cementing solid between these sheets so that at no place shall felt touch felt; each sheet to overlap the previous sheet so that 17 in. are left exposed. After these materials are applied spread over the entire surface a coating of Carey Manco Asphalt in an even, uniform manner.

(4) Flashing—The 2-ply Fiberock base sheet shall extend from main deck to lap the full height of cricket. A strip of 2-ply Fiberock (18 in. wide, more or less, depending on conditions) shall be nailed to top edge of nailing strip in wall and this asbestos strip to be thoroughly cemented over cricket and same to lap on to main roof deck at least 4 in. The final 2 plies of Fiberock from main roof are then run to top edge of flashing, each being cemented in solid over cap sheet. Height of flashing, width of cricket and flashing material, may be regulated to suit height of wall and other prevailing conditions.

(5) Counterflashing—See under "Work by Other Trades."

Specification 4-Ply—Carey Asbestos Built-up Roof (Over Concrete or Tile)

(1) Work Proposed—This specification contemplates furnishing all material and labor required to apply the roofing and base flashing and line the gutters. (No metal work included.) The concrete, or roof base, must be thoroughly dry and clean before the roofing is applied.

(2) Materials—1 gal. Carey Asphalt Primer. 60 lb. Carey Fiberock Asphalt Impregnated Asbestos Felt. 140 lb. Carey Manco Asphalt.

(3) Application—The roof surface shall first be coated with Carey Asphalt Primer applied cold and thoroughly brushed in. Then mop entire surface with Carey Manco Asphalt, into which, while hot, embed 4 layers of Carey Fiberock (Asphalt Impregnated Asbestos Felt) each layer of which is thoroughly bonded with Manco Asphalt so that at no place shall felt touch felt; each sheet to overlap the previous sheet so that 9 in. are left exposed. After proper application of such materials the entire surface is given a light coating of Carey Manco Asphalt, spread in an even, uniform manner.

(4) Flashing—All walls to be flashed shall be given a coat of Carey Asphalt Primer. Cement strip of Fiberock Felt 6 in. wide in angle of wall, 3 in. to wall and 3 in. to flat deck. The Fiberock sheets from main roof to be cut so they will extend up on all fire walls, skylights and other vertical surfaces to a height of 6 in.; this extension to be cemented to vertical surface. A cap sheet of Fiberock Felt cut 12 in. wide to be cemented in 6 in. to wall and 6 in. to flat deck.

(5) Counterflashing—See under "Work by Other Trades."

Specification No. 5—Carey Feltex Built-up Roof (Over Wood Sheathing)

(1) Work Proposed—Use paragraph 1, General Notes.

(2) Materials—Carey Feltex, 30 lb. per square. Carey Manco Asphalt, 25 lb. per square. Carey Feltex, 15 lb. per square. Carey Manco Asphalt, 25 lb. per square. $\frac{7}{8}$ or 1-in. large head nails, 1 lb. per square.

Weight per square, when applied, to be approximately 96 lb.

(3) Application—The roof surface shall be covered with 1 sheet of Carey Feltex, 36 in. wide, weighing about 30 lb. per square. Lap the sheets not less than 2 in., then nail the sheets at the joints with large head $\frac{7}{8}$ or 1-in. nails on 6-in. centers, with one additional row of large head nails spaced 11 in. apart lengthwise through the center of the sheet. After the 30-lb. Feltex sheet has been completed in accordance with above instructions, proceed to cover the same with 1 layer of Carey Feltex, 36 in. wide and weighing about 15 lb. per square. The 15-lb. sheet to be cemented with Manco Asphalt securely to the 30-lb. sheet, lapping the top sheets not less than 2 in. between the joints of the lower sheet—no nails to be used through the top sheet (except steep surfaces).

(4) Gutters—Line all gutters in the same manner as described under "Application."

In certain types of construction it is desirable to reinforce all gutters and valleys with an extra sheet of felt, weighing not less than 15 lb. per square, well mopped with Manco Asphalt. (This extra reinforcement, if required, to be charged for as an extra on time and material basis.)

Note: All concrete or brick walls to be flashed should be primed to full height of flashing.

Application of Carey Asbestos Built-up Roof for Wood—Specification No. 3

Method of Flashing Carey Asbestos Built-up Specification No. 3 for Wood

Carey Fiberock Built-up Specification 4-Ply Over Concrete

CAREY ASBESTOS BUILT-UP ROOF

(5) **Flashing**—(General Contractor or Owner) to provide suitable nailing strips in the walls at time of construction—usual size about 2x4 in.; also provide cant strip for bridging angle of wall and roof deck.

Note: Height of flashing, width of cant strip and flashing materials may be regulated to suit height of wall and other conditions prevailing.

(6) **Counterflashing**—See under "Work by Other Trades."

(7) **Roof Finish**—The entire surface of the roof applied shall be mopped with Manco Asphalt, applied hot and spread to a uniform finish.

Specification No. 7—Carey Feltex Built-up Roof (Over Wood Sheathing)

(1) **Work Proposed**—Use paragraph 1, General Notes.

(2) **Materials**—Carey Feltex, 30 lb. per square. Carey Manco Asphalt, 25 lb. per square. Carey Feltex, 15 lb. per square. Carey Manco Asphalt, 25 lb. per square. Carey Feltex, 15 lb. per square. Carey Manco Asphalt, 25 lb. per square. $\frac{7}{8}$ or 1-in. large head nails, 1 lb. per square.

Weight per square, when applied, to be approximately 136 lb.

(3) **Application**—The roof surface shall be covered with sheets of Carey Feltex, 36 in. wide, weighing about 30 lb. per square. Lap the sheets not less than 2 in., then nail the sheets at the joints with large head $\frac{7}{8}$ or 1-in. nails on 6-in. centers, with one additional row of large head nails spaced 11 in. apart lengthwise through center of sheet.

After the 30-lb. Feltex sheets have been completed in accordance with the above instructions, proceed to cover the same with 2 layers of Carey Feltex, weight about 15 lb. per square each, cementing solid between sheets and joining same to the 30-lb. sheet so that at no place shall felt touch felt, each sheet to overlap the previous sheet so that 17 in. are left exposed, making a continuous 2-ply built-up over the 30-lb. base Feltex sheet—no nails to be used through the top sheets.

(4) **Gutters**—Use paragraph 4, Specification No. 5.

(5) **Flashing**—Use paragraph 5, Specification No. 5.

(6) **Counterflashing**—Use paragraph 6, Specification No. 5.

(7) **Roof Finish**—Use paragraph 7, Specification No. 5.

Specification No. 8—Carey Feltex Built-up Roof (Over Concrete, Tile or Gypsum Block)

(1) **Work Proposed**—Use paragraph 1, Specification 4.

(2) **Materials**—Carey Asphalt Primer (1 gal.), 9 lb. per square. Carey Manco Asphalt, 50 lb. per square. Carey Feltex Felt, 15 lb. per square. Carey Manco Asphalt, 25 lb. per square. Carey Feltex Felt, 15 lb. per square. Carey Manco Asphalt, 25 lb. per square. Carey Feltex Felt, 15 lb. per square. Carey Manco Asphalt, 25 lb. per square.

Weight per square, when applied, to be approximately 179 lb.

(3) **Application**—The concrete shall be coated with Carey Asphalt Primer, applied cold, and thoroughly brushed in. The surface shall be mopped with Carey Manco Asphalt, into which, while hot, embed 3 layers of Carey Feltex (Asphalt Saturated Felt), cementing solid between the sheets so that at no place shall felt touch felt; each sheet to overlap the previous sheet so that 11 in. are left exposed, making 8 courses of asphalt and felt.

(4) **Gutters**—Apply 3 layers of Carey Feltex Felt lengthwise with the gutter. Each sheet to overlap the previous sheet so that one-third of its length is left exposed. (Use sheets cut to uniform length.)

All gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets and are to be applied as specified under "application."

Note: All concrete or brick walls to be flashed should be primed to full height of flashing with Carey Asphalt Primer.

(5) **Flashing**—Cement strip of Feltex 6 in. wide in angle of wall, 3 in. to wall and 3 in. to flat deck. The Feltex sheets from main roof to be cut so they will extend up on all fire walls, skylights and other vertical surfaces to a height of 6 in.; this extension to be cemented to vertical surface. A cap sheet of Feltex cut 12 in. wide to be cemented in 6 in. to wall and 6 in. to flat deck.

General Contractor to leave opening in the walls for inserting counterflash.

(6) **Counterflashing**—See under "Work by Other Trades."

(7) **Roof Finish**—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt, applied hot, evenly spread to a uniform finish.

Facilities and Distribution

Certain-teed products are handled by jobbers and dealers throughout the United States and in principal countries throughout the world.

Certain-teed—Highest Quality

Nothing is omitted which can safeguard the quality of Certain-teed products. They are manufactured according to tried and proved formulas under the watchful supervision of experts. Only the best materials are used and each is carefully tested to make certain that it is of the required quality. You can rely on products bearing the Certain-teed label—it is a sure guide to satisfaction.

There is a Certain-teed roofing for every type of building—from temporary shelters to the most expensive structures.

Certain-teed Roofing—Talc Surfaced

Certain-teed roofing is the first grade product manufactured by the CERTAIN-TEED PRODUCTS CORPORATION. Millions of squares are giving satisfactory service in all parts of the world under all conditions—from the extreme cold of the northern frontiers to the intense heat of the tropics.

There are many large important buildings throughout the country that are sheltered by Certain-teed roofs. Certain-teed was the choice for the roofs of the Pullman shops, the General Motors Company at St. Louis, Mo., etc.

Owners, architects and builders of such roof areas as these insist upon knowing before it is laid that the roofing will give long years of protection. They can rely on Certain-teed, the highest quality possible to manufacture, as long years of service and world-wide use have proved.

Put up in rolls of 108 sq. ft. Nails and cement are enclosed in the roll. Packed one square per roll—enough to cover 100 sq. ft. of roof surface with 8 sq. ft. for laps.

- No. 1, light, about 35 lb. per square, guaranteed 5 years.
- No. 2, medium, about 45 lb. per square, guaranteed 10 years.
- No. 3, heavy, about 55 lb. per square, guaranteed 15 years.
- No. 4, extra heavy, about 65 lb. per square, guaranteed 15 years.

Certain-teed Slate Surfaced Roll Roofing

Made from the same high grade felt used in Certain-teed talc surfaced roofing. Surfaced with non-fading red, green, blue-black and color-blend crushed slate. It is widely used on residences, bungalows, garages, etc., where a decorative roof at minimum expense is desired. Guaranteed ten years. Put up in rolls of 108 sq. ft. Weight 85 to 90 lb.

Certain-teed Asphalt Felt

It is used extensively under slate, tile, asbestos shingles and other roofing materials requiring a waterproof sheathing or liner. It is extensively used for all sheathing and insulating purposes as it is absolutely waterproof and verminproof. It is also preferable to tarred felt as the felt layer in built-up roofs. It has the advantage of longer life than tarred felt.

Certain-teed asphalt felt is made in the following weights:

- No. 12, 432 sq. ft., about 48 lb. per roll.
- No. 15, 432 sq. ft., about 65 lb. per roll.
- No. 20, 216 sq. ft., about 44 lb. per roll.
- No. 30, 216 sq. ft., about 60 lb. per roll.

Certain-teed Shingles

The modern roof for homes is one that is both attractive and economical. Certain-teed shingles give such a roof. Their red, green, blue-black and color-blend tones harmonize perfectly with any surroundings and give to the finished structure an added touch of beauty. Surfaced with natural crushed slate, the colors do not fade.

Color-blend is an harmonious blending of several colors on each shingle.

Certain-teed shingles are economical. They save not only in the cost of material, but also on the superstructure necessary to support the roof, as they are lighter in weight than most other forms of decorative roofing. The upkeep cost of Certain-teed shingles is practically nothing.

Certain-teed Hexagonal Slab Shingles—A shingle of beauty and strength. Gives the effect of hexagonal shaped shingles. The beauty of the variegated effect obtainable is enhanced by the prominent shadow line.

Designed to give extra protection against weathering.

Red, green, blue-black or color-blend. Size, 11½x36 in., 86 shingles per square (2 bundles per square).

Weight about 160 lb. per square.

Certain-teed 4-width Shingles—Four shingles in one. The slate surfacing is separated into four equal areas by ½-in. black strips from which slate has been removed. Complete directions for laying. Made in the following sizes:

- Approximately, 10 x36 in.; wt., about 200 lb. per square (two packages).
- Approximately, 12½x36 in.; wt., about 255 lb. per square (three packages).

Certain-teed Cut-out Shingles—Standard square-butt cut-out shingle. Cut-outs are 4-in. deep. Put up two packages per square. Made in following sizes:

- Approximately, 10 x36 in.; wt., about 200 lb. per square (two packages).
- Approximately, 12½x36 in.; wt., about 245 lb. per square (three packages).

Certain-teed Universal Shingles—A distinctively improved type of asphalt shingle, unique in artistic design. Because of the interlocking feature an interwoven thatched like shadow line stands out giving exceptional beauty and texture. May be laid in three courses, 7½, 6 and 4½-in. exposure.

Red, green, blue-black or color-blend. Size, 16x18 in. Weight, approximately 68 lb. per bundle.

- 7½-in. exposure requires 2 bundles per square.
- 6-in. exposure requires 2½ bundles per square.
- 4½-in. exposure requires 3½ bundles per square.

Certain-teed Individual Shingles—Beautiful vari-colored effects may be had by blending shingles of the red, green and blue-black surfacings. Each color is packed separately and blending may be done to suit individual requirements.

- Regular size: 9x12½ in.; wt. about 245 lb. per square (4 packages).
- Jumbo size: 12x16 in.; wt. about 300 lb. per square (4 packages).

Certain-teed Insulating Paper

For insulating and sheathing against heat, cold, sound or moisture. A product superior to ordinary sheathing paper which is not moisture-proof, tarred saturated paper, etc. Saturated and coated; jet black and has a glossy finish. Waterproof and verminproof. When used for house lining, between double floors, etc., it saves fuel in winter and keeps out heat in summer. Used for residences, stores and industrial structures. Also used for refrigerator linings in dairies, refrigerators and icehouses and for packing cases, etc. 36 in. wide, put up in rolls containing, approximately, 500 sq. ft. Made in two weights: Medium, about 35 lb. per roll; Heavy, about 50 lb. per roll.

Certain-teed Sheathing Paper (Red Rosin Sized)

An inexpensive, non-waterproof sheathing paper used as a liner under clapboards, shingles, siding, etc. Put up in rolls 36 in. wide of approximately 500 sq. ft. in the following weights:

- No. 20 about 20 lb.; No. 25 about 25 lb.; No. 30 about 30 lb.;
- No. 35 about 35 lb.; No. 40 about 40 lb.

Certain-teed Deadening Felt

A thick felt for laying between double floors and in walls for insulating against sound, heat and cold. It is made in 50 yard rolls 36 in. wide in the following weights:

- No. 40, about 40 lb. to roll.
- No. 50, about 50 lb. to roll.
- No. 75, about 75 lb. to roll.

Certain-teed Asphalt Roof Coating

For re-saturating asphalt roofing (smooth surfaced). Renews the life of the roofing and, if applied at intervals of from three to five years, will preserve the roofing almost indefinitely.

For waterproofing exterior of basement walls. Cellar walls may be waterproofed by applying the coating on the outside of the walls below grade. The walls should be free from dirt or other foreign substance before applying.

THE RUBEROID CO.

Manufacturers of Genuine Ruberoid Weatherproofing Products

95 Madison Avenue
NEW YORK, N. Y.

CHICAGO, ILL.

BOSTON, MASS.

Products

BUILT-UP ROOFING; ASBESTOS SLATES; ASPHALT SHINGLES (Massive Units and Massive Hex-strips, Standard Units, Standard Strips—Hexagonal, Octagonal and Square-tab); WATER-PROOFING COMPOUND.

Also, Roll-roofing (Smooth-surfaced and Mineralized); Building Paper; Felts.

Samples and descriptive literature of any Ruberoid product will be gladly sent upon request.

Genuine Ruberoid Built-up Roofing

A Ruberoid Built-up Roof consists of one layer of Ruberoid Asphalt Felt and two layers of Ruberoid Cap-sheet bonded together with Ruberoid Roofing Asphalt. Every part is made of time-tested materials.

Ruberoid Roof Showing Special Tile Finish

Part of 1100 Squares of Ruberoid Built-up Roof on the Buildings of the Union Stock Yards, Omaha, Neb.

Ruberoid Cap-sheet in itself is a mechanically perfect barrier against the ravages of the weather. The felt, saturant and coating are the same as those used in Ruberoid Roll-roofing which has stood the test of service for more than 30 years. The fact that the asphalt coating is applied by machine in our factories reduces the risk from human error or negligence in application, and permits the use of a tougher, denser and more durable asphalt than could possibly be handled on the job by labor.

The heavy weather coating of Ruberoid Cap-sheet makes it unnecessary to apply a special surfacing. If special finishes are desired, however, Ruberoid Built-up Roofs are adaptable to a wide range of treatments. They may be painted with green or red Ruberoid Roof-coating or finished with slag, gravel, tile, etc.

The bonding material, Ruberoid Roofing Asphalt, is 98.5% pure. It is practically smokeless and free from dirt. Roofers' kettles seldom need cleaning until the job is finished. It heats readily to mopping consistency but will stand unusually high temperatures without flashing or altering in composition.

Specifications—There are several specifications for Ruberoid Built-up Roofs—a quality roof to meet all requirements and every appropriation. *Send for a bound set for your files.*

TRADE-MARK

Ruberoid Asbestos Slates

Ruberoid Asbestos Slates are made from ingredients long recognized for durability—*asbestos and cement*. They will not warp, crack or decay and are as fire-retardant as any materials known and used for roofing.

They may be obtained in two styles—the Hexagonal and the American.

The Hexagonal type is in two sizes: 16 by 16 and 12 by 12 in. and in colors of Apple-green, Venetian-red, Natural-gray and Blue-black.*

The American type is 8 by 16 in. and comes in the same colors as the 12 by 12 in. Hex—also Variegated-green, Variegated-brown and Mottled-brown.

*16 by 16-in. Hex does not come in Blue-black.

Ruberoid Asbestos Slates

Genuine Ruberoid Massive Unit and Massive Hex-strips

In Ruberoid Massive Unit Shingles or Massive Hex-strips, you have a choice of two substantial roof coverings. While widely different in design, they are identical in quality. Each is 40% thicker than the usual shingle of its type. Each can be secured in a variety of rich, non-fading colors and blends. The Hex-strips can also be had in 4-tones, packed pre-assorted, ready to apply.

Ruberoid Massive Hex-strips

Ruberoid Massive Units

Either of these extra-thick shingles give pronounced depth of shadow line—the roof massiveness you have heretofore looked for in asphalt shingles, but seldom found. In addition, the extra thickness assures greater protection and longer roof life. Due to labor-saving features, this finished roof costs no more than one laid with ordinary composition shingles.

Ruberoid Waterproofing Compound

Ruberoid Cement Waterproofing, when mixed with portland cement, makes leaky cellars or pits bone dry. Its use in stucco entirely eliminates "hair cracking." It differs from other waterproofing compounds in that it does not delay the set or reduce the strength of the mortar.

SAMUEL CABOT, INC.

Stained Shingles

141 Milk Street
BOSTON, MASS.

For Branch Offices and Agencies, see page B1614

Products

CABOT'S CREOSOTE-STAINED SHINGLES.

For Building Insulation, see pages A182-183; for Paints, Stains and Wood Preservatives, see pages B1614-1615.

Cabot's Creosote-stained Shingles

Description—Grade A, U. S. Dept. of Commerce Standard, red cedar shingles, ready-stained with Cabot's Creosote Shingle Stains.

Sound live wood; uniform thickness; straight grain; even butts; do not warp or curl. Thoroughly preserved by complete immersion in Cabot's Creosote. Sold in original bundles, as packed at the mill, guaranteeing full count.

The warmest, the most economical and the most picturesque house finish.

Standard Colors—*Weathering Browns, Light and Dark Bungalow Browns, Bark Brown, Warm Brown; Light and Dark Tile Reds, Maroons, etc.*—A complete range of these handsome and durable colors for roofs and walls.

Light, Dark and Medium Moss-Greens—Our moss greens have a richness and depth of color such as

Roof Stained with Cabot's Creosote Stains, Walls and Chimney with Cabot's Old Virginia White
CHARLES A. PLATT, Architect, New York

can only be produced by the strongest and purest pigments.

Weathered Grays—Our grays give the true natural seashore gray tones.

White Shingles—Cabot's Shingles are also furnished ready-stained with No. 1166 White Primer, to be finished after the shingles are laid, either with (1) a brush coat of No. 1166, (2) one or two brush coats of

Cabot's Old Virginia White or (3) one or two coats of Cabot's Double-White. See pages B1614-1615 for description of these materials.

Blended Roofs—Every variety of blended or variegated roof coloring easily produced in Cabot's Stained Shingles.

Samples

Samples of standard colors sent on request.

Deliveries

Prompt deliveries from staining plants in Boston, Chicago, Baltimore, Philadelphia, Omaha, Newark, New Rochelle, Dayton, Cleveland, Los Angeles, etc., and from warehouses at all central points.

Cabot's Creosote Stained Shingles

Sizes

24-in. "Royals," 18-in. "Perfections" and 16-in. "XXXXX," the highest grade shingles made, are used exclusively for Cabot's Creosote-stained Shingles.

"Royals" for walls, laid with 10 to 12-in. exposure, are much more artistic than dressed siding, much warmer and the cost is actually lower. "Perfections" and "XXXXX" are the standard regular sized shingles for walls and roofs.

COVERING CAPACITY OF CABOT'S CREOSOTED SHINGLES, SQUARE FEET PER SQUARE AT VARIOUS EXPOSURES—STANDARD GRADES—RANDOM WIDTHS

	Approx. weights per square, lb.	4-in. exp.	4½-in. exp.	5-in. exp.	5½-in. exp.	6-in. exp.	6½-in. exp.	7-in. exp.	7½-in. exp.	8-in. exp.	8½-in. exp.	9-in. exp.	10-in. exp.	11-in. exp.	12-in. exp.
1 square of 16 in. (4 bun. 20/20 pack)	160	80	90	100	110	120	130	140	150
1 square of 18 in. (4 bun. 18/18 pack)	180	100	109	120	129	138	148	157
1 square of 24 in. (3 bun. 14/14 pack)	167	75	80	85	90	100	110	120

Note: This table is based on 100 sq. ft. to each square. But Cabot's Shingles are all sold in the original bundles as packed at the shingle mills under the Official Grading and Packing Rules of the Shingle Manufacturers Association and the tables of the Red Cedar Shingle Bureau show that our square actually covers from 3% to 8% more than our table claims.

THE CONSOLIDATED SHINGLE MILLS OF BRITISH COLUMBIA, LTD.

Manufacturers of Red Cedar Shingles

VANCOUVER, B. C.

Edgwood Shingles

Made from western red cedar, grown in British Columbia, where red cedar attains its greatest degree of perfection owing to soil, drainage and climatic conditions.

Manufactured only by certain British Columbia mills which have inaugurated a rigid inspection service. This inspection ensures that every Edgwood Shingle is cut edge-grain and positively will not warp, cup or curl. This is the essential difference between Edgwood Shingles and the ordinary red cedar shingles which are cut slash-grain from inferior timber. The Edgwood trademark is a guarantee of a red cedar shingle that is as near perfect as it is humanly possible to make it—it is cut edge-grain, free from knots, shakes and sap.

They may be had natural or stained.

Methods of Application

Edgwood Shingles are made in three lengths—16, 18 and 24 in. 16-in. shingles are generally laid $4\frac{1}{2}$ to 5 in. to the weather; 18-in. are laid $5\frac{1}{2}$ in. to the weather; and 24-in. are laid $7\frac{1}{2}$ in. to the weather.

Roof boards (1x3 or 1x4 in.) spaced $4\frac{1}{2}$ to $7\frac{1}{2}$ in. center to center, depending on weather exposure of shingles. Tight sheathing adds warmth to the roof.

If shingles are not to be stained, wet thoroughly with water before applying. Starting at eaves, lay first course two-ply, allowing $1\frac{1}{2}$ -in. projection over crown mould and 1-in. projection at gables. The 16-in. shingles that measure 5 butts to 2 in. or thicker should be laid not to exceed 5 in. to the weather. The 18-in. shingles should be laid not to exceed $5\frac{1}{2}$ in. to the weather. The 24-in. shingles should be laid not to exceed $7\frac{1}{2}$ in. to the weather. All shingles should be side-spaced at least $\frac{1}{8}$ in. apart, seeing that no break comes directly over another on any three consecutive courses. This covers all nails and is extremely essential for a serviceable roof.

Nails

Nail roof boards with 8d nails.

Do not use anything but zinc-clad, pure zinc or copper nails. The ordinary steel wire shingle nail has an average life of seven to twelve years. Edgwood Shingles should last forty years, or more. Use nails that will not rust—that will last as long as the shingles.

Re-roofing Over Old Roofs and Re-finishing Sidewalls

It is unnecessary to remove old roofs or sidewalls in order to apply Edgwood Shingle roofs and side walls. It is much cheaper, saves much litter and annoyance, simply to apply Edgwood Shingle roofs and sidewalls over the old roofs and sidewalls. Send for working details.

Cracked, discolored and unsightly old stucco sidewalls are just as easily refinished with Edgwood Shingles as with top boards and siding. Send for working details.

Durability

Edgwood Shingles on roofs or sidewalls should last forty years, or more. Red cedar is endowed by nature with time-resisting qualities which make it impervious to decay.

Economy

Edgwood Shingle roof and sidewall economy is twofold: it consists not only of the first-cost saving—the original cost being considerably lower to cover exterior surfaces—but, owing to its remarkable durability, its economy, based on the life of the structure, is still more striking.

Insulation

Heating engineers have made tests which prove that Edgwood Shingles have greater insulating qualities than many other exterior roof or sidewall materials. Detailed information supplied on request.

Beauty

The broken lines and overlapping butts of Edgwood Shingles on roofs and sidewalls give high-lights and shadows that result in a rhythm of scale and texture which is impossible of attainment in most other building materials. They may be applied in various patterns by variation of exposures. They may be applied in their natural state, or stained to harmonize beautifully with lawns and foliage.

Ease of Alterations and Additions

Buildings protected with Edgwood Shingle roofs and sidewalls may be altered or enlarged as circumstances require, with a minimum of labor. Such alterations do not leave a "patchy" appearance and, if made with ordinary care, defy detection.

Specifications for Roofs and Side Walls

Roof Shingles—All roof surfaces shall be covered with Edgwood Shingles, as manufactured by THE CONSOLIDATED SHINGLE MILLS OF BRITISH COLUMBIA, LTD., each bundle to bear the Edgwood quality mark. (Here insert length and thickness of shingles.) Roof shingles shall be laid with well broken joints, in. weather exposure.

Sidewalls—All sidewall surfaces shall be covered with Edgwood Shingles, as manufactured by THE CONSOLIDATED SHINGLE MILLS OF BRITISH COLUMBIA, LTD., and each bundle of shingles shall bear the Edgwood quality mark. (Here specify length and thickness of shingles.) Sidewall shingles shall be laid with well broken joints and shall have in. exposure to the weather.

Nails—Shingles shall be nailed with (here specify type of nails required). Each shingle shall be nailed with at least two nails, well covered by the next course.

Note: Always specify zinc-coated, pure zinc or copper nails.

Service to Architects

THE CONSOLIDATED SHINGLE MILLS OF BRITISH COLUMBIA, LTD., are prepared to supply architects with complete and specific information. Samples of Edgwood Shingles and technical literature, on application.

Leading Lumber Dealers Everywhere Carry Stock

Creo-Dipt Stained Shingles are carried in stock by lumber dealers in all parts of the United States and Canada. Shipments are made from our plants at North Tonawanda, N. Y., Minneapolis, Minn., Kansas City, Mo., and Vancouver, B. C.

Co-operative Service

A Service Department is maintained to co-operate with architects, contractors and home builders. We go over plans carefully, criticizing them if requested and offering suggestions giving approximate quantity of Creo-Dipt Stained Shingles required for the thatch effect and other unusual roof treatments. There is a trained Creo-Dipt salesman in every locality, who will welcome the opportunity to serve you.

Superiority of Creo-Dipt Stained Shingles

Genuine Creo-Dipt Stained Shingles are made only from selected cedar with the grain of the wood running 100% straight from top to bottom of each shingle. This means that they will lay flat and will not split. They come stained, bundled, and ready

CREO-DIPT

TRADE-MARK
(Reg. U. S. Pat. Off.)

to lay in grades 16, 18 and 24-in. long.

Genuine Creo-Dipts are preserved by the exclusive Creo-Dipt process, which protects them against rot and covers the entire shingle surface with a thorough coating of color and creosotive oils.

Creo-Dipt Stain is made from the strongest pigments ground to the finest possible condition in linseed oil in our own mills. Excepting Dixie White, Creo-Dipt Shingles do not require brushcoating after they are on the building. (See the paragraph on Dixie White.)

Stain for Retouching, Patching and Cutting

With every order of Creo-Dipt Shingles, a small can of Creo-Dipt Stain is shipped for retouching the shingles which have to be trimmed or cut to fit flashing, valleys and other conditions.

Sizes and Styles of Creo-Dipt Stained Shingles

Note: In specifying, give the name indicating the thickness in addition to the length of the shingles.

Thatched Effect—Special Creo-Dipt Stained Shingles are furnished for thatch roofs ready for application. Complete instructions and details will be supplied to architects and builders.

Graduated Exposure—The best effect is secured by starting at the eaves with the large Creo-Dipt Aristocrat at wide exposure, working through thinner grades at decreasing exposures up to the ridge.

Graduated Color Treatment—Unusual artistic results can be obtained by using several shades of the same color starting with the darkest shade at the eaves, working to the lightest shade at the ridge.

Flat Grain

Vertical Grain

Flat Grain Shingle
After a few years' service it curls, splits and rots

100% Vertical Grain Shingles
Sound and free from imperfections, they will not rot, split nor curl

Comparison of Flat Grain and Vertical Grain Shingles

Variegated Effects—Creo-Dipt Shingles can be furnished packed promiscuously in each bundle in any proportion of the various shades which you select.

Dixie White—Creo-Dipt Dixie White is a soft velvety white shingle stain. Two brushcoats give the desired Colonial White effect to the Creo-Dipt Stained Shingles after they are laid—the shingles having been creosoted and stained at our factories with a special preparation, color No. 207, which acts as a filler, primer, binder and preservative. Special samples on request.

Creo-Dipt Aristocrats—24 inches long; random widths; 1 inch in thickness at the thick end.

Creo-Dipt Pilgrims—(Hand split) 22 to 24 inches long; random widths; $\frac{1}{2}$ to $1\frac{1}{4}$ inches in thickness at the thick end.

Creo-Dipt Ambassadors—(Shakes) 24 inches long; random widths; $\frac{1}{2}$ inch thick; corrugated face to give effect of old hand-split shingles.

Creo-Dipt Royals—24 inches long; random widths; $\frac{1}{2}$ inch in thickness at the thick end.

Creo-Dipt Perfections—18 inches long; random widths; 5 shingles will measure $2\frac{1}{4}$ inches in thickness at the thick end.

Creo-Dipt Eurekas—18 inches long; random widths; 5 shingles will measure 2 inches in thickness at the thick end.

Creo-Dipt XXXXX—16 inches long; random widths; 5 shingles will measure 2 inches in thickness at the thick end.

Creo-Dipt XXX—16 inches long; random widths; 6 shingles will measure 2 inches in thickness at the thick end.

Covering Capacity of Creo-Dipt Stained Shingles

All shingles are sold on the basis of the square (100 square feet).

The table below gives the covering capacity of a square of shingles at various exposures:

Name	Length in.	Exposure to the weather, inches									
		5	5½	6	6½	7	7½	8	10	10½	11
Aristocrats*	24	75	...	100	105	110
Pilgrims*		70	75	...	100	105	110
Ambassadors*		75	...	100	105	110
Royals*		75	...	100	105	110
Perfections	18	...	100	111	120	129	138	148
Eureka		...	100	111	120	129	138	148
XXXXX	16	100	110	120	130	140
XXX		100	110	120	130	140

*These shingles usually laid 10 inches to the weather on sidewalls and 7 or 7½ inches on roofs. Pilgrims, being hand-split, require a water-tight sub-roof.

Shades

Creo-Dipt Stained Shingles are manufactured in any color or combination of colors. A color pad, showing a wide choice of shades, will be sent on request. We will make special shades or submit samples without charge.

Creo-Dipt Color Pad

Do Not Be Mis-led

Do not be mis-led into thinking that any stained shingles are Creo-Dipt. The trade-mark, "CREO-DIPT" on every bundle protects you and your client. The quality of Creo-Dipt Shingles has no substitute. Be sure to get real Creo-Dipt.

WEATHERBEST STAINED SHINGLE COMPANY, INC.

Manufacturers of Red Cedar Hand Dipped Stained Shingles

NORTH TONAWANDA, N. Y.

FACTORIES: NORTH TONAWANDA, N. Y. AND ST. PAUL, MINN.

Products

WEATHERBEST EDGE GRAIN RED CEDAR STAINED SHINGLES for roofs and sidewalls; WEATHERBEST 24-IN. COLONIAL WHITE STAINED SHINGLES; WEATHERBEST THATCHED EFFECT STAINED SHINGLES; WEATHERBEST "DOUBL-THIK" STAINED SHINGLES; WEATHERBEST GENUINE HAND RIVED SHAKES.

Used on Roofs and Sidewalls

WEATHERBEST stained shingles are used on sidewalls as well as roofs and are adaptable to practically every type and style of building—from the small cottage or bungalow to the stately country home. The soft, semi-transparent colors add much to the attractiveness of a home. WEATHERBEST stain emphasizes the grain in the wood just enough so that the flat tone of a painted surface is absent. WEATHERBEST stained shingle sidewalls cost 30% to 50% less than walls of bevel or Colonial siding and will last fully as long. A WEATHERBEST stained shingle roof laid with zinc coated nails will give perfect service for over 50 years.

Reliability

WEATHERBEST stained shingles and stain have been on the market for the past 16 years and can be thoroughly relied upon to give entire satisfaction. Each bundle of WEATHERBEST stained shingles carries the green WEATHERBEST label and is our guarantee of perfect material and lasting colors.

Quality of Weatherbest Shingles

Only the finest grade of all clear, strictly 100% edge (vertical) grain, red cedar is used in the manufacture of WEATHERBEST stained shingles. Every shingle is perfect from tip to butt. Extreme care is exercised that all shingles are entirely free from any trace of dampness before being subjected to the WEATHERBEST process of staining.

Quality of Weatherbest Stain

WEATHERBEST stain consists of the strongest color pigments obtainable, high grade wood creosote preservatives and pure linseed oil as binder. These ingredients are mixed in our factories by our color and oil experts in the correct proportion to insure colors that are rich and soft in tone, and, above all—durable.

Weatherbest Staining Process

All shingles are unbundled at our factories and stained separately—not bundle-dipped as is the case with many other stained shingles. The WEATHERBEST process treats each shingle so thoroughly and perfectly that additional brush coating after they are laid is unnecessary. After staining, the shingles are dried and rebundled ready to lay.

Always Lie Flat

Because they are 100% edge (vertical) grain and because of the WEATHERBEST preserving solution, WEATHERBEST stained shingles always lie flat. They will not check, crack or curl during their many years of service. The edge grain is also, to a large degree, responsible for the exceptionally long life of WEATHERBEST colors, as edge grain allows the color pigments to enter deep into the pores of the wood.

Weatherbest Variegated Color Roofs

WEATHERBEST stained shingles in several shades of one color, or different colors, may be used on roofs with decidedly pleasing results. For this purpose, there are standard WEATHERBEST variegated color schemes in browns, greens, reds, grays, etc.,

worked out to just the correct proportion of colors. No extra labor is required to lay as the different colored shingles are mixed and then re-bundled at our factories so that the carpenter lays them as received. Ask for panels in miniature showing variegated color schemes.

Sizes, Colors and Covering Capacity

WEATHERBEST stained shingles are furnished in following sizes:

12 in. WEATHERBEST	XXXXX	5 butts to 2 in.
16 in. WEATHERBEST	XXXXX	5 butts to 2 in.
16 in. WEATHERBEST	XXX	6 butts to 2 in.
16 in. WEATHERBEST	"Doubl-Thik"	5 butts to 3½ in.
18 in. WEATHERBEST	Eurekas	5 butts to 2 in.
18 in. WEATHERBEST	Perfections	5 butts to 2½ in.
24 in. WEATHERBEST	No. 1 Royals	½ in. butts
24 in. WEATHERBEST	"Doubl-Thik" No. 1 Royals	1-in. butts

The standard WEATHERBEST colors consist of 20 different shades of greens, browns, reds and grays. WEATHERBEST stained shingles are also furnished in a color combination similar to weathered straw for WEATHERBEST thatched effect roofs, and in many variegated color schemes. Special colors are also furnished without extra charge. Color samples on request.

Roof: 16-in. Green WEATHERBEST Stained Shingles. Walls: 24-in. WEATHERBEST in Colonial White

Weatherbest Genuine Hand Rived Shakes

To those desiring the beauty of the oldtime shakes, or hand split shingles, we recommend WEATHERBEST Genuine Hand Rived Shakes (U. S. Patent, March 23, 1926). These shakes come in two sizes. The 24-in. length shakes are resawn one side to provide the taper. The 37-in. length shakes are tapered and show the hand rived surface on both sides. Either size is adaptable to roof or sidewall and is furnished in any color desired.

Write for illustrated literature giving full descriptions of WEATHERBEST Genuine Hand Rived Shakes and color suggestions. Full size samples will gladly be sent on request.

24-in. Weatherbest Colonial White Shingles

The large 24-in. heavy butt, WEATHERBEST Colonial white stained shingles are used extensively on sidewalls for the wide course effect. The wide exposures possible (10 in. and 11½ in.), and the pure, non-glaring white of WEATHERBEST Colonial white stain combine to make a sidewall that is far more attractive than the monotonous white of a painted clapboard siding. WEATHERBEST Colonial white stained shingles are first treated at our factories with a filler coat of our No. 500 white preserving stain. After they are laid on the sidewalls, the shingles should then receive two light brush coats of WEATHERBEST Colonial white stain to produce the true whitewashed effect.

Weatherbest Standard Specifications

To guard against substitution of inferior material, we advise incorporating the following in specifications:

Shingles: To be (insert size and color) WEATHERBEST, all clear, all edge grain stained shingles, as manufactured by WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y., and St. Paul, Minn.

Weatherbest Thatched Straw Effect Roofs

Combining attractiveness with long life, a WEATHERBEST thatched effect stained shingle roof offers the means of a radical but artistic departure from the conventional sharp angle roof.

WEATHERBEST thatched stained shingles are furnished ready for application. They come bent with the grain (lengthwise) to a 20-in. radius for the rounded surface of hips and valleys and for capping the ridges; bent with the grain to a 10-in. radius for the curves or roll at rakes; bent to a 20-in. radius against the grain (crosswise) for the curve at eaves and rounding of ridges, and flat for the flat surfaces of the roofs. On all WEATHERBEST thatched stained shingles except for the double first course at eaves, butts are specially sawn so that when laid, irregular, wavy courses will result.

Weathered Straw Color

Colored in three shades of weathered straw with an occasional spot of dull red and brownish green, the WEATHERBEST color scheme is a true reproduction of weathered straw. The different colored shingles come properly mixed and are laid as received. WEATHERBEST thatched stained shingles are also furnished in other color combinations if desired. One very pleasing color treatment is the WEATHERBEST method of graduating colors so that a roof may be green at eaves and gradually shade into a brown at ridges.

Thatched Effect Instruction Book and Service

Full information for constructing a WEATHERBEST thatched effect stained shingle roof is given in our book, "The Construction of WEATHERBEST Thatch Roofs," which is furnished on request. This book is complete in

every respect, showing actual photographs of WEATHERBEST thatched effect roofs, working drawings showing rafter construction, furring, blocking, and method of laying shingles to secure the true thatched effect.

When thatched effect roofs are specified we ask that a set of plans be sent to us in order that we may estimate the quantities required of the different shingles.

Standard Specifications for a Thatched Effect Roof

The following specifications are standard for a WEATHERBEST thatched effect roof and should form part of the general specifications when this type roof is planned. Adherence to these specifications will insure complete satisfaction in finished roof by avoiding substitution of improperly bent, inferior flat grain shingles.

Special Rafter Construction—All rafter construction at ridges, rakes or gable ends, hips, valleys and eaves is to be in accordance with the instructions and detail drawings appearing in the book, "Construction of WEATHERBEST Thatch Roofs," furnished on request by the WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y.

Furring of Rafters—(While desirable to accentuate the convex appearance of the roof, it is not entirely essential and may be omitted.) Main rafters to be furred to a height of 5 to 6 in. midway between eaves and ridges, diminishing to nothing at eaves and ridges where it merges with curves. Ridge board to be furred to height of 5 or 6 in. at center of roof diminishing to nothing at apex of gables.

Shingle Lath—Rafters at eaves and ridges and blocking at valleys, hips, rakes or gable ends to be covered with 1x2-in. shingle lath, spaced 1 in. apart, running parallel with rafters at rakes or gable ends, hips and valleys and at right angles to rafters at eaves and ridges.

Roof Shingles—All roof surfaces shall be covered with WEATHERBEST thatch stained shingles as manufactured and supplied by the WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y., and St. Paul, Minn.

At eaves lay one double course of square butt WEATHERBEST stained shingles bent against the grain. Cover the curve at eaves with WEATHERBEST thatch stained shingles bent against the grain. Flat WEATHERBEST thatch stained shingles are to be used on all flat surfaces of roof and those bent with the grain to a radius conforming with curve for hips and valleys. Cover roll at rakes or gable ends with WEATHERBEST thatch stained shingles bent with the grain to a 10-in. radius. Cover curve of roof on each side of ridge board with WEATHERBEST thatch stained shingles bent against the grain, capping the ridge with those bent with the grain to a 20-in. radius.

Exposure of Shingles—Lay all shingles in irregular, wavy courses following procedure given in WEATHERBEST instruction book. Exposure to be from 1 to 3 in. (average 2 in.) on curve at eaves and 1 to 5 in. (average 3 in.) on all other sections of roof.

Nailing—Nail all shingles bent against the grain (at eaves and ridges) with 6d zinc coated nails, nailing 3 in. from the butt. Shingles on all other portions of the roof to be nailed with 3½d zinc coated nails in regular manner.

Color of Shingles—Color of shingles to be WEATHERBEST weathered straw. (If other color scheme is desired change to color number shown in our samples, or "to match.....")

SALES OFFICES IN ALL PRINCIPAL CITIES

Products

Sole manufacturers of EDHAM KOLORED SHINGLES for roof and sidewall covering, made in 31 colors, in addition to any variegated or mixed color effect. Special colors to order, as specified.

EDHAM KOLORED THATCH SHINGLES, to produce thatched effect.

Edham Kolored Shingles

They are manufactured from red cedar, which wood contains a natural preservative, and attains its greatest degree of perfection in the forests of the Canadian Province of British Columbia, owing to soil properties, rain fall and drainage peculiar to that region. Edham Kolored Shingles are cut from these forests and manufactured in one of British Columbia's most modern mills, located in Vancouver, B. C. They are 100% clear and edge grain—they cannot warp, cup or curl.

Following their manufacture they are placed in slow drying kilns that remove all excess moisture and make them receptive to color and oil without affecting the strength or lasting qualities of the wood. They are then distributed to our staining operations, where their treatment is completed.

A roof is no stronger than its weakest shingle. The illustrations we use here show the difference between the edge grain shingle and the flat grain shingle.

**Edham
KOLOR
Shingles**

The stain used in the treatment of Edham Kolored Shingles is manufactured from the raw color to the finished product in our own mills. The color used is made, in all cases, from 100% pure earth pigments ground with linseed oil in stone mills until they are of liquid smoothness. The pigments are then mixed in a vehicle of linseed oil containing sufficient creosote and other oils to insure maximum penetration.

The process of treatment adopted is what is referred to as the *hand dipping* process—the bundles, after the shingles have been thoroughly dried and are free from moisture, are broken open and each shingle treated separately and individually. Then, after the color has dried and thoroughly set, the shingles are repacked into bundles, tagged and piled on trucks ready for loading. This treatment insures unusually permanent colors which will not rub off, check or peel.

Edham Kolored Shingles have demonstrated that they will last two or three times as long as shingles that have been brush coated, painted or treated in any other manner on the job where they have first been exposed to the weather and dampness.

Samples submitted without charge. Color pads and miniature panels showing the different variegated effects obtainable will be sent to architects upon request.

A Flat Grain Shingle—It Will Warp

Note the uneven grain of the wood, which indicates uneven stresses and strains that will cause warping, cupping and curling

Edham Kolored Edge-grain Shingles Will Not Warp

Note the parallel and vertical grain of this Edham Edge-grain shingle. It positively cannot warp, cup or curl

Edham Kolored Variegated Effects—The variegated effects are obtained by using two or more shades of Edham Kolored Shingles. The shingles are packed promiscuously in the bundles ready for the workmen to lay. Many artistic effects are thus achieved which would be impossible to secure in any other way.

They Save Labor—A considerable saving in labor can be effected by the use of Edham Kolored Shingles, as compared with shingles stained on the job. The bundles, in both straight colors and in variegations of two or more shades, are packed ready to lay, and can be carried in pack to any position required, in this way greatly reducing the cost of handling.

They save the labor of dipping and of additional brush-coating which is often necessary for shingles stained under other conditions.

Adaptable to Many Styles of Architecture—Architects know that the beauty of a house is largely dependent upon certain essentials of good design—rhythm and repose; proportion and scale; texture and color. One architect summed up the possibilities of Edham Kolored Shingles in this respect, in the following manner:

"The great variety of color schemes possible with Edham Kolored Shingles, combined with the harmonious blending of each shingle and surface in general give, on wall or roof, life and interest and the essentially distinctive color values."

Sizes and Covering Capacity—Edham Kolored Shingles are procurable in every grade, thickness and length manufactured. Standard grades and colors are carried in lumber yards in most cities.

Where we have no local representative, we will be glad to arrange for delivery of material upon request from architect.

Sizes—*Edham Kolored Supremes*—24 in. long; random widths; 1 in. thick at the butt.

Edham Kolored Process Shakes—24 in. long;

random widths; $\frac{9}{16}$ and 1 in. thick at the butt. Sawn to produce the hand split effect.

Edham Kolored Royals—24 in. long; random widths; $\frac{1}{2}$ in. thick at the butt.

Edham Kolored Perfections—18 in. long; random widths; 5 shingles will measure $2\frac{1}{4}$ in. at butt.

Edham Kolored Eureka's—18 in. long; random widths; 5 shingles will measure 2 in. at butt.

Edham Kolored XXXXX—Clears—16 in. long; random widths; 5 shingles will measure 2 in. at the butt.

Edham Kolored XXX—Clears—16 in. long; random widths; 6 shingles will measure 2 in. at butt.

Edham Kolored Thatch Shingles—16 in. long; random widths; 5 shingles will measure 2 in. at the butt; sawn in patterns to specifications.

Covering Capacity—All shingles are sold on the basis of the square (100 sq. ft.). The table following gives the covering capacities in square feet of the square of shingles on various exposures:

Name	Length, in.	*Exposure to weather, in.									
		5	5½	6	6½	7	7½	8	10	10½	11
Supremes Royals Process Shakes	24	75	...	100	105	110
Perfections Eureka's	18	...	100	111	120	129	138	148
XXXXX Clears XXX Clears	16	100	110	120	130	140

*In choosing amount of exposure, due consideration should be given to location, i.e., steep roofs, rather flat roofs, side walls, etc.

24-in. Supremes, 5 $\frac{8}{16}$ course bundles constitute one square.

24-in. Shingles, 3 $\frac{13}{14}$ course bundles constitute one square.

18-in. Shingles, 4 $\frac{18}{18}$ course bundles constitute one square.

16-in. Shingles, 4 $\frac{20}{20}$ course bundles constitute one square.

Edham Kolored 24-in. Shingles for Sidewalls

Many architects have specified the Edham Kolored 24-in. Shingles for sidewalls, during the past year. They desire to give the effect of the old-fashioned shingle of Colonial days, and these shingles are especially

Thatch Roof of Edham Kolored Shingles

applicable to the Colonial style of architecture. Shingles are generally laid 10 in. to the weather on sidewalls and $7\frac{1}{2}$ in. on the roof.

Prompt Shipment

Edham Kolored Shingles are shipped promptly to all parts of the United States and Canada, from our factories at Minnesota Transfer, St. Paul, Minn., Toronto, Ont., and Vancouver, B. C.

Architectural Service

We are always glad to send architects, on request, specific information, samples and special literature. Edham Kolored Shingles are nationally advertised for the purpose of creating consumer acceptance. All Edham Kolored Shingle advertising recommends that the homebuilder employ the services of an architect.

Specifications for Roofs and Sidewalls

Shingles—All roof and sidewall surfaces shall be covered with Edham Kolored Shingles (here specify grade and color), as manufactured by THE EDHAM COMPANY, INC., Minnesota Transfer, St. Paul, Minn., and bearing the Edham Kolored red tag and Edham Kolored band-stick. Shingles shall be laid with well broken joints with....in. exposures to weather.

Nails—Shingles shall be nailed with (here specify type of nails required); each shingle shall be nailed with at least two nails under cover of the following course.

Note: We recommend zinc-clad, pure zinc or copper nails.

Standard Specifications for Edham Kolored Shingles Laid Irregularly for Thatch Effects

Shingles—All roof surfaces to be covered with Edham Kolored bent or straight shingles manufactured by THE EDHAM COMPANY, INC., of Minnesota Transfer, St. Paul, Minn., in the following grades and colors (here clearly specify grades and colors required).

Preparation of Roof—All surfaces and angles of the roof timbers, including eaves, gables, hips and ridges, valleys, etc., to be furred and blocked or shaped to present rounded, cambered or hollowed surfaces, to carry out the intention of the drawings, and to produce the thatch effect in the finished roofs.

Nails—All shingles to be nailed with (specify hot-dip zinc-clad, pure copper or zinc nails), using the 3d ordinary $1\frac{1}{4}$ -in. nail for bent shingles, and 3d fine for flat surfaces, and an occasional 6d nail at quick bends.

Note: On high class work, the architect is recommended to specify copper nails; and in specifications for sheet metal work, is urged to specify copper flashings and eaves troughs, etc.

Working Specifications—The standard working specifications or recommendations and the standard illustrative details of THE EDHAM COMPANY, INC., are to be read as a part of this specification.

(Copies of the standard working specifications

for Edham Kolored Thatch Roofs may be had on request to THE EDHAM COMPANY, INC., Minnesota Transfer, St. Paul, Minn.)

CAREYSTONE ASBESTOS-CEMENT WALL BOARD.

CAREYSTONE CORRUGATED ASBESTOS-CEMENT ROOFING and SIDING.

For Waterproofing and Dampproofing Materials, see pages A56-57; for Pipe Coverings, see pages A210-211; for Built-up Roofing, see pages A400-403; for Asphalt Shingles, see page A421; for Flooring, see page B1537.

Careystone Asbestos-Cement Products

Careystone Asbestos-Cement Building Materials, made of asbestos and special portland cement—two of the most durable fire-resistant materials known—are vermin-proof, dampproof, dustproof and fireproof. They will not rot or rust. They are manufactured in a new million dollar plant, recently added to the Carey manufacturing resources at Lockland, Cincinnati, Ohio. The guaranteed quality of these asbestos products is backed by the Carey reputation—a reputation based on over fifty years of service to the building trades.

Careystone Asbestos-Cement Shingles

Furnished in a variety of shapes for application by the French or American method.

For the French method, two shapes are available, with two sizes for each shape—16x16 in. and 12x12 in.

For application by the straight, or American method, four shapes are available with two sizes for each shape—8x16 in. and 6x12 in., or 16x16 in., and 12x12 in.

Colors—Careystone Asbestos-Cement Shingles, in all shapes and sizes, are available in six colors—brown, pottery red, blue-black, slate gray, purple and green.

Advantages—Careystone Asbestos-Cement Shingles can be laid over old wooden shingles as easily as on new roof construction. They will outlive the building itself, for they actually grow stronger with age. They are fire-

Careystone
ASBESTOS-CEMENT
PRODUCTS
TRADE-MARK

proof, weatherproof, and require no painting. They are light enough to need no special supporting construction. And the variety of shapes, sizes and colors give the architect an unlimited field for designing a roof to meet individual tastes.

Rating—When laid French method, Careystone Asbestos-Cement Shingles take a Class "B" rating of the Underwriters' Laboratories, Inc. With the American method, they take a Class "A" rating.

Asbestos-Cement Sheathing

Careystone Asbestos-Cement Sheathing can be sawed, joined and fitted very easily by any ordinary mechanic, no special knowledge or skill being required to get excellent results. It is fireproof, tough and practically indestructible. And it is sufficiently elastic to permit expansion and vibration without breaking or cracking. It can be grained, veneered or painted to a beautiful finish, making it particularly desirable for interior as well as exterior use. It is supplied in the natural color of slate gray in thicknesses of from $\frac{1}{8}$ to 1 in. Standard sizes are: 42x48 in., 42x96 in., 48x48 in., 48x96 in.

Asbestos-Cement Wall Board

The fireproof composition of Careystone Asbestos-Cement Wall Board makes it an ideal material for lining and fireproofing all classes of buildings. The only tools needed for its application are an ordinary hammer and saw. The material cuts and nails like ordinary lumber. It can be washed, scrubbed and cleaned with ease, and can be painted, grained or stained to represent natural wood.

Made in two standard sizes, each with a standard thickness of $\frac{3}{16}$ in., as follows: 48x48 in.; 48x96 in.

Application Manual and Reference Book

Our new Application Manual and Reference Book contains complete information about the Carey line of Asbestos Building Materials. A copy will be sent on request.

AMBLER ASBESTOS SHINGLES for roofs and side-walls, AMBLER ASBESTOS CORRUGATED ROOFING and SIDING; AMBLER ASBESTOS ROOFING TILE.

Also Ambler Asbestos Roofing Cement.

For Ambler Linabestos (Asbestos) Board, Ambler Linabestos (Asbestos) Siding, and Ambler Asbestos Lumber, see page B1260.

The Company and Its Products

This Company supplies all the necessary appurtenances required in the installing of its products. All nails, clips, etc., exposed to the weather are heavy gauge copper, and the concealed nails are triply galvanized. Copper driving nails supplied if desired.

Ambler Asbestos Shingles

Ambler asbestos shingles are absolutely fireproof and waterproof, made of selected asbestos fibers and portland cement scientifically combined in water and formed under enormous hydraulic pressure. They are made in two general styles—uniform thickness, and tapered.

American Method No. 9—A $\frac{1}{4}$ -in. shingle of uniform thickness, 9 in. wide and 18 in. long. The approximate weight per square is 675 lb. Furnished in straight butts, except when broken butts are specified. The colors are: *Newport gray*, Pearl gray, Indian red, Tuscan red, Spanish brown, purple, buff, blue black and green veneer.

American Method No. 16—A $\frac{5}{8}$ -in. shingle of uniform thickness, 8 in. wide, 16 in. long. Approximate weight per square 425 lb. Furnished in broken butts if so specified; otherwise straight butts furnished. Made in the following colors: *Newport gray*, pearl gray, red, brown and slate black in solid colors, and also red and green veneer.

Honeycomb Method No. 4—A $\frac{5}{8}$ -in. shingle of uniform thickness, 16 in. square, with the lower corners cut off so that when laid they produce a honeycomb or hexagonal effect. Weight approximately 290 lb. per square. Furnished in the same colors as American Method No. 16, listed above.

Tapered Ambler "English Thatch" Asbestos Shingle Roof

French or Diagonal Method No. 3—The same size, weight and colors as the Honeycomb Method No. 4. The lower corners are not cut off, however, and when laid produce straight diagonal lines.

Tapered English Thatch Method—A tapered shingle, $\frac{1}{2}$ -in. butt, $\frac{1}{8}$ -in. upper end. Rough surface, edges and butts. Random widths, 6 to 18 in., 20 in. long. Approximate weight per square, 978 lb. Made in a variety of reds, browns, purples, greens, buffs and grays, and in black.

Tapered Colonial Method—A tapered shingle, $\frac{1}{2}$ -in. butt, $\frac{1}{8}$ -in. upper end. Random widths, 6 to 17 in., 19 in. long. Smooth surface; edges and butts cut square—designed for use where ordinary wood shingles might be specified, but where the architect desires to obtain a fireproof roof. Approximate weight per square, 930 lb. Colors same as for Tapered "English Thatch."

Tapered Ambler "Colonial" Asbestos Shingle Roof

Specifications for American Method of Laying Ambler Asbestos Shingles

Sheathing—All roofs specified to be covered with asbestos shingles, to be tightly sheathed with well seasoned boards, free from loose knots and to be well spiked to the rafters.

Felt—Over roof boards lay 1-ply slater's felt, weighing 15 lb. to the square, tacked on with 4-in. lap, and on hips and valleys with at least 1-ft. lap.

Ambler Asbestos Shingles—

Note: The following specification is written for both the $\frac{5}{8}$ -in. No. 16 and the $\frac{1}{4}$ -in. No. 9 shingle. To specify the No. 16, omit bracketed items; for No. 9, use bracketed items, omitting the others.

Over the felt, apply Ambler Asbestos Shingles (give color), as manufactured by the ASBESTOS SHINGLE, SLATE & SHEATHING Co., according to the American, or straight laid, method, following the manufacturer's details. Nail $\frac{1}{8}$ x 1-in. cant strip flush with the lower edge of roof board. Apply 1 course of No. 16A [No. 9A] shingles end to end laterally, overhanging the eaves $1\frac{1}{2}$ to $1\frac{3}{4}$ in. Over this lay 1 course of No. 16 [No. 9] shingles with long edge at right angles to eave line breaking joints. Lay next course in same way, allowing 6-in. exposure. Balance of roof to be covered with No. 16 [No. 9] shingles 8x16 in. [9x18 in.] laid perpendicularly, breaking joints and exposed 7 in. [8 in.] to the weather. Each shingle to be nailed with two $1\frac{1}{4}$ -in. galvanized iron needle point nails as indicated by the nailhole in the shingles, nails not to be driven down too tight. Hips and ridges to be covered with Ambler Asbestos Ridge and Hip Roll, properly flashed and fastened to hip or ridge pole of sufficient height, rabbeted to fit hip or ridge, with regular copper fasteners made for this purpose. All hips and ridges to be made watertight previous to the application of the ridge roll. (Hip and ridge can be covered according to regular Boston hip scheme, if desired.)

Flashing—At all hips, valleys, chimneys, and against all abutting sidewalls, except as otherwise specified, flash and counterflash with each course of Ambler Asbestos Shingles, using

Specifications for Honeycomb, and French or Diagonal Methods of Laying Ambler Asbestos Shingles

Sheathing—See specifications for American Method.

Felt—See specifications for American Method.

Note: The following specifications cover both Honeycomb and French Methods. To specify the Honeycomb, omit bracketed items; to specify French, use bracketed items, omitting the others.

Ambler Asbestos Shingles—Over the felt, apply Ambler Asbestos Shingles (give color), as manufactured by the ASBESTOS SHINGLE, SLATE & SHEATHING CO., according to the Honeycomb [French] Method. Apply 1 course of No. 16-B [No. 3] end to end overhanging the eaves $1\frac{1}{2}$ to $1\frac{3}{4}$ in., over which lay a course of No. 4 [No. 3-A] entirely covering the No. 16-B [No. 3], exposed 13×13 in. to the weather. Each shingle to be nailed with two $1\frac{1}{4}$ -in. galvanized iron, needle-point nails, and the No. 4 [No. 3-A] to be fastened down at the tip with patented copper "Storm" nails. Hips and ridges to be covered with Ambler Asbestos Ridge and Hip Rolls, fastened in place to hips or ridge poles of sufficient height and rabbeted to fit hips or ridges, with regular copper fasteners made for this purpose. All hips and ridges to be made watertight previous to the application of the ridge rolls.

Flashing—See specifications for American Method.

Specifications for "English Thatch" or "Colonial" Tapered Ambler Asbestos Shingles

Note: The following specifications are written to cover both the "English Thatch" and "Colonial" Tapered Ambler Asbestos Shingles, as sold by the ASBESTOS SHINGLE, SLATE & SHEATHING CO., Ambler, Pa. When specifying the "English Thatch" omit the items in brackets; for "Colonial" substitute those bracketed and omit the others.

Felt—Apply the sheathing boards so that the distance between same shall not be more than $\frac{1}{4}$ in.; then apply a 30-lb. saturated asphalt felt over entire roof surface. This felt should be lapped 6 in. on all joints and a double thickness should be used on all hips, ridges and in valleys.

Starting Course—Asbestos starters, 9×18 in. \times $\frac{1}{4}$ in. thick, designated as No. 9-A, shall be laid end to end laterally, covering the eaves and projecting over the edge of the roof boards $1\frac{1}{2}$ or 2 in. However, before these starters are applied, a wood strip $1\frac{1}{4} \times \frac{1}{4}$ in. shall be nailed to the roof flush with the eaves, to give the starters and shingles the proper cant.

Shingles—Over top of and flush with the starters, "English Thatch" ["Colonial"] Tapered Ambler Asbestos Shingles shall be applied. Details regarding the random exposures and various widths shall be supplied by the architect in charge of construction. We, however, recommend that none of these "English Thatch" ["Colonial"] Tapered Ambler Asbestos Shingles be applied with less than a 3-in. headlap.

Nails—We recommend that copper nails be used, of sufficient length so that they will be driven into the wood sheathing boards at least 1 in. Care should be taken in application to eliminate the possibility of nailing the shingles too tightly to the roof as there is a certain amount of expansion and contraction in a cement product and this must be considered. Galvanized nails can be used in place of copper if desired.

Hips and Ridges—All hips and ridges shall be covered with "English Thatch" ["Colonial"] Tapered Ambler Asbestos Shingles 6 in. wide (or any other width desired), and applied according to the Boston Method (or, if desired, the last course of shingles may be mitered on hips and ridges and thus eliminate additional covering).

Flashing—All metal flashings and counterflashings shall be 16-ounce soft, cold rolled copper and sufficient shall be used so as to guarantee a watertight application. Lead may be used in place of copper if desired.

Ambler Asbestos Corrugated Roofing and Siding

This material is made of asbestos-fiber and hydraulic cement and is the same as Ambler Asbestos Shingles in its structure and quality. It is made in two widths of sheets, $27\frac{1}{2}$ in. and 42 in.

**These specifications also cover the application of No. 20, 12×12 in. Honeycomb shingles, using No. 21 Under Eave and No. 20 second starter.*

The $27\frac{1}{2}$ -in. material is $\frac{1}{8}$ in. thick on the ridges and in the valleys, and $\frac{1}{4}$ in. thick at center of slope. Corrugations are $2\frac{1}{2}$ in., center to center. Sheets are available in lengths of from 4 to 10 ft., inclusive. Weight, $3\frac{1}{2}$ lb. per sq. ft.

The 42-in. material is $\frac{1}{4}$ in. thick on the ridges and in the valleys, and $\frac{3}{8}$ in. thick at center of slope. Corrugations are 2½ in., center to center. Sheets are available in lengths of 4, 5, 6, 7, 8 and $8\frac{1}{2}$ ft. Weight, $3\frac{3}{4}$ lb. per sq. ft.

A separate catalogue covering this commodity more completely will be furnished on request.

Ambler Asbestos Roofing Tile

Ambler asbestos roofing tile lays up 200 pieces per square (100 sq. ft.). When no definite number of top and pan tile is specified an equal number of each is shipped.

Weight of tile, laid on roof, per square, 775 lb.

Weather exposure of tiles, $13\frac{1}{2}$ in.

Ambler asbestos roofing tile is supplied in red veneer and green veneer only.

Specifications for Ambler Roofing Tile

Entire roof to be sheathed tight, and when completed to have an even surface over the entire roof. All chimneys and walls above roof line to be completed before tiling is commenced. All gutters or gutter brackets for hanging gutters to be installed before starting the tile work.

Strips 1×3 in., known as field strips, to be nailed on roof at 11-in. centers and at right angles to the eaves. At hips and ridges a 1×5 -in. strip is used, known as a hip or ridge strip. Care must be taken in the application of these strips not to puncture the valley flashing.

Tiles shall be neatly cut and laid at the valleys, keeping the line of cut 3 in. from the center of the valley. Each and every tile must be cut to the proper length, and must also be cut so the edge terminates at right angles from the roof, and must also show a straight line when sighting up the valley. A snake or jagged edge will not be tolerated.

Along hips and ridges, cut tile so they miter as nearly as possible with the wood nailing strips. Apply hip and ridge tiles (regular top tiles) nailing same to the hip or ridge strips, as the case may be, with the top of the tiles.

Various Types of Ambler Asbestos Roof Tile

ETERNIT, Inc.

Asbestos Shingles, Asbestos Lumber and Asbestos Corrugated Sheets

PHILADELPHIA, PA.

BRANCH OFFICES

BOSTON, MASS. ST. LOUIS, MO. JACKSONVILLE, FLA. NEW ORLEANS, LA. HOUSTON, TEX. SAN FRANCISCO, CAL.

Products

ETERNIT ASBESTOS SHINGLES, rigid shingles made of portland cement and asbestos fibre.

ETERNIT ASBESTOS LUMBER, a fireproof insulating board made of the same materials as ETERNIT Shingles, but furnished in large sheets.

ETERNIT ASBESTOS CORRUGATED SHEETS, made of the same materials as ETERNIT Lumber and Shingles.

Eternit Asbestos Shingles

Eternit Asbestos Shingles are made of asbestos fibre and portland cement, two practically indestructible materials. The cement and asbestos fibre are combined by the Eternit process of laminating or building up the materials, layer upon layer, after which the mass is submitted to great hydraulic pressure and thoroughly seasoned before the final operation of trimming and punching. The shingles are die cut and all necessary nail-holes and notches are provided for convenient application.

Eternit

TRADE-MARK

Eternit Asbestos Shingles have been given highest ratings by the Underwriters' Laboratories, Inc., which is supported by the National Board of Fire Underwriters.

Colors—Colonial Gray, Indian Red, Quarry Blue, Autumn Brown, Copper Green and the Heather blends.

Specification for the Preparation of Sheathing

Tongue and groove sheathing of good grade and uniform thickness shall be laid, breaking joints. Slater's felt (.... oz.) shall be laid over the sheathing, parallel with the eaves, with a 2-in. lap and a reinforcing sheet at all hips and valleys. This felt shall be securely nailed with large head roofing nails and kept absolutely free from holes. A $\frac{3}{8}$ -in. cant strip shall be provided along the eaves.

Hips and Ridges—To be covered with Eternit Ridge Roll fastened to the hip or ridge pole by copper nails and special Eternit ridge roll clips.

Flashing—Valleys, chimneys and against abutting side walls, except as otherwise specified, flash and counterflash with each course of Eternit Asbestos Shingles, using 16-oz. copper.

Horizontal Method

Specification—The first course of shingles is laid parallel with the eaves and protruding 1 in. Each shingle is laid with a side lap of 4 in. The second and succeeding courses of shingles lap the top of the preceding course 3 in. and the copper hook is nailed into the sheathing at the joint and holds the

lower edge of the shingle above securely down in place. Use $1\frac{1}{4}$ -in. copper roofing nails (or galvanized nails). These shingles shall be laid in accordance with the manufacturer's instructions which are attached to the specifications.

Note: Include the general specifications on the preparation of sheathing when using the above method.

The above is a typical installation of the new Horizontal Method 12x24 in. laid 9x20 in. exposed

Illustration shows guide lines snapped horizontally on roof, method of laying shingles, and the laps

Hexagonal Method

Specification—Over the slater's felt apply Eternit Asbestos Shingles, 16x16-in. [12x12-in.] Hexagonal Method, color. Apply 4x16-in. Eternit First Starters, allowing the lower edge to protrude 1 in. below the edge of the roof. Over the starting course apply a course of Eternit Second Starters with the lower edge flush with the edge of the first starters. The balance of the roof is to be covered with standard shingles as specified

above, laid in accordance with the manufacturer's specifications and directions. Use $1\frac{1}{4}$ -in. copper roofing nails (or galvanized nails). The tip of each shingle is to be fastened down by Eternit Copper Storm Nails as shown by the manufacturer's instructions.

Note: Include the general specification on the preparation of sheathing, hips and ridges, flashing, etc., when using the above method.

The Hexagonal Method is typically shown in the above illustration. Made in two sizes: 16x16-in. laid 13x13-in. exposed, and 12x12-in., laid 9x9-in. exposed.

The first starters, second starters and Hexagonal Method shingles are applied as indicated by the above drawing. Guide lines are snapped vertically up the roof

American Method

Specification—Over the slater's felt apply $\frac{1}{4}$ -in. thick by 9x18-in. [8x16-in.] American Method Eternit Asbestos Shingles, color. The first course of shingles shall be laid horizontally at the eaves, with the edge of the starting course overhanging the eave 1 in. Over this starting course lay the second course of shingles vertically, the lower edge of the shingle flush with the lower edge of the starting course. The next course will be laid in the same way, breaking the vertical joints and allowing an exposure of 8x9 in. (If 8x16-in. shingles are used,

exposure is 7x8 in.) Continue up the roof in the same manner, breaking joints, allowing the same exposure with a minimum head lap of 1 in. $1\frac{1}{2}$ -in. copper roofing nails shall be used (galvanized needle point nails can be substituted if desired). The nails are not to be driven down too tight, but just sufficient to hold the shingles in place.

Note: Include the general specification on the preparation of sheathing, hips and ridges, flashing, etc., when using the above method.

Furnished in two thicknesses and sizes: Standard thickness in 8x16-in. size; $\frac{1}{4}$ -in. thickness in 9x18-in. size. $\frac{1}{4}$ -in. size furnished in Heather blend combinations

Illustration shows how the guide lines are snapped on the roof, method of laying the shingles, and the laps. The dimensions are for the 8x16-in. American Method

Eternit Asbestos Lumber and Corrugated Asbestos Sheets

Asbestos Lumber—Eternit Asbestos Lumber is made of the same materials and by the same process employed in making Eternit Asbestos Shingles. It is recommended for use in place of wood for all types of fireproof construction. It *resists* all extremely high temperatures without warping, disintegrating, igniting or showing any sign of being affected by the heat. Eternit Asbestos Lumber is *immune* to the effects of acids and chemicals. There are no organic materials to rot. Under transverse load its strength is great. It is easily cut, drilled, finished or painted. Nails can be driven through it, and screws hold better in it than in wood.

Uses—Ceilings, walls, partitions, acid fume ducts, laboratory equipment, switch panels, heat insulation with dielectric qualities, fire doors, elevator shaft fireproofing, industrial roofing, siding on residences, imitation tile.

Thicknesses— $\frac{5}{32}$, $\frac{3}{16}$, $\frac{1}{4}$, $\frac{5}{16}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$ and 1 in.
Standard Sizes—42x48, 42x96, 48x48 and 48x96 in. Size 36x72 in. can be furnished on orders shipped direct from factory.

Special Sizes and Shapes—Material will be cut to special sizes to meet requirements. Cutting charges are quoted on each particular job.

In addition to flat sheets, pattern shapes can be made by the factory on order for special purposes, such as heater linings, tank covers, etc.

Asbestos Corrugated Sheets—This is made of the same materials and by the same process employed in making Eternit Asbestos Shingles and Lumber. This material is particularly adapted for industrial roofing, because it is impervious to acid fumes and absolutely fireproof. It can be easily and economically applied.

Instructions, Samples, Literature and Service Department

Complete instructions for the application of Eternit Asbestos Shingles, including full information on flashings, valleys and curved surfaces, will be sent to any architect upon request. These instructions are illustrated with drawings and this work represents one of the most complete texts on shingle roofing.

Small samples in the various colors or full size samples will be sent to any architect upon request.

Literature, illustrating the different designs and colors and giving more detailed information, is available to any architect.

The Service Department gladly co-operates with architects to secure special color schemes or to solve any roofing problems that might arise.

This service is free and may be had by any architect.

TAPERED ASBESTOS SHINGLES.

FLOOR TILES and FLAGGING.

Mohawk Tapered Asbestos Shingles

Made in thicknesses of $\frac{3}{8}$, $\frac{5}{8}$ and $\frac{7}{8}$ in. at butt. Standard size, 8x16 in. Random widths, 4, 8, 12 and 16 in. Seven color tones, gray, dark gray, browns, purples, buffs, reds, and black.

Plain butt and Rustic Colonial type (rough butt).

The exceptional beauty of a Mohawk roof lies in the distinctive characteristics and architectural qualities of the Mohawk Shingle. Their taper produces a thick butt that casts a pleasing shadow line. Rough texture and mottled surface afford soft shades that blend beautifully into a colorful and picturesque effect that enhances the charm of the home or building on which they are used.

Method of Laying Mohawk Shingles

The hand hewn butts of the Rustic Colonial type lend a weatherworn appearance, as if aged by the very elements, and a tapestry effect. Graduated effects in random widths to express individuality and maintain the character of the structure in the roof are possible with the three thicknesses of shingle and the random widths. Color blends that harmonize or contrast with the exterior can be adopted.

The service of a Mohawk roof is everlasting. Composed of portland cement and selected asbestos fibers and moulded under heavy pressure, they are impervious to all climatic conditions and absolutely fire-proof. Will not crack or exfoliate from natural causes, but rather harden and strengthen with age. Their resiliency takes care of any slight contraction or expansion on the roof. They have a considerable insulation value and help to keep a more even temperature in the interior.

The Mohawk Shingle has the advantage of being comparatively light in weight. The $\frac{3}{8}$ -in. thickness

MOHAWK
TAPERED
ASBESTOS SHINGLES

weighs approximately 650 lb. per square, the $\frac{5}{8}$ -in. 800 lb. per square and the $\frac{7}{8}$ -in. 1300 lb. per square.

Mohawk Asbestos Hip and Ridge Roll

Made of same materials as the shingles, and in same colors; sections 16 in long. 93 sections of ridge roll cover 100 lin. ft. of ridge or hip.

Mohawk Asbestos Saddle Hip Tile—for Hips Only

Made of same materials as shingles and in same colors. Exposed $4\frac{1}{2}$ in., meet and break joints on each shingle course.

Approximately, 3 pieces required for each lineal foot.

Shingle Specifications

All roof surfaces shall be covered with Mohawk Tapered Asbestos Shingles (specify thickness and type), as manufactured by the MOHAWK ASBESTOS SLATE Co., INC., of Utica, N. Y.

Note: In Carpenter's Specification specify that roof boards shall be laid in the usual manner, breaking joints and nailing securely at every bearing, leaving no loose ends. All roof sheathing shall be of narrow width and well seasoned.

Over all roof sheathing lay one thickness of good quality slater's felt as furnished by the MOHAWK ASBESTOS SLATE Co., INC., making laps not less than 4 in., except on hips and valleys, where laps must be not less than 10 in.

At edge of eaves provide cant strips, using $\frac{3}{8}$ -in. thick laths for this purpose.

The starting course at eaves shall be Mohawk Tapered Asbestos Shingles, cut 11 in. from butt as starters, laid parallel with and overhanging the eaves $1\frac{1}{2}$ in.

The second course shall be standard size (random widths) Mohawk Tapered Asbestos Shingles, covering the first course and breaking joints with it.

Proceed with laying the shingles in precisely the same manner as with natural slate, exposing the asbestos shingles 7 in. (except where staggered effect is desired, specify "staggered") to the weather except that the Mohawk Shingles having beveled edges should be laid close together instead of separated as with natural slate.

All nails shall be galvanized needle point or copper roofing nails ($1\frac{1}{4}$ in. for $\frac{3}{8}$ -in., $1\frac{1}{2}$ in. for $\frac{5}{8}$ -in., or 2 in. for $\frac{7}{8}$ -in. shingles) as furnished by the MOHAWK ASBESTOS SLATE Co., INC. The nails shall be driven flush with the asbestos shingle surface, but not down too tight.

For all hips and ridges provide Asbestos Ridge Rolls, or saddle hip tile for hips only, manufactured by the MOHAWK ASBESTOS SLATE Co., INC.

Mohawk Asbestos Flooring and Flagging

Of the same composition as shingles, and likewise moulded under heavy pressure. Affords a wearproof material, that will not dust, disintegrate or exfoliate. Either wet or dry it is *non-slip*, muffles sound, and is easily cleaned. For interior flooring its varied color tones, soft and subdued, harmonize with textured wall effects. For exterior use it allows the color scheme of the house and roof to be carried into the porch flooring and garden walks. Made in 1 in., $\frac{3}{4}$ in. and $\frac{1}{2}$ -in. thicknesses, sizes 16x16, 8x16 and 8x8 in.

THE PHILIP CAREY COMPANY

Manufacturers of Asfaltslate Shingles

LOCKLAND, CINCINNATI, OHIO

BRANCHES AND DISTRIBUTORS IN PRINCIPAL CITIES

FACTORIES: LOCKLAND, OHIO, AND PLYMOUTH MEETING, PA.

Products

CAREY SHINGLES.

For Waterproofing and Damp-proofing Materials, see pages A56-57; for Pipe Coverings, see pages A210-211; for Built-up Roofing, see pages A400-403; for Asbestos Shingles, see page A415; for Flooring, see page B1537.

Carey Shingles

Asfaltslate, Cork-insulated and Strip Shingles are produced in the same factories from the highest obtainable grades of material.

Carey Asfaltslate Shingles—

Composed of a heavy rag felt base, thoroughly saturated with a highly refined asphalt saturant and coated on both sides with a uniform layer of pure asphaltic cement.

Carey shingles are surfaced with a uniform layer of natural crushed slate thoroughly rolled into the hot coating under roller pressure.

Asfaltslate shingles are made in two sizes—8x12 $\frac{3}{4}$ in. and 10x15 $\frac{3}{4}$ in. The regular size is laid 4 in. to the weather, and weighs, approximately, 240 lb. per square. The large size is exposed 5 in. to the weather and weighs, approximately, 300 lb. per square.

Carey Cork-insulated Shingles—Are made in the same manner as the regular Carey Asfaltslate shingle with a layer of granular cork added to the underside.

Tests made by Mellon Institute of Industrial Research show that when these shingles are laid in the regular way (three thicknesses) they are equivalent in insulating value to: $\frac{1}{2}$ in. of fibre insulating material, $4\frac{1}{2}$ in. of slate, 10 in. of sandstone, 8 in. of concrete and are 231% better heat insulators than ordinary felt shingles.

They are 50% thicker than the ordinary shingle and cast deep dark shadow lines giving texture to the roof, an effect wholly lacking when thin shingles are used.

Carey Cork-insulated shingles are made in the same two sizes as the regular Carey Asfaltslate shingle—the large size weighing approximately 350 lb. per square and the regular size weighing approximately 290 lb. per square.

Carey Strip Shingles—Square Tab Strip shingles, 4 in 1, 2 sizes: 36x10 in., 190 lb. per square; 36x12 $\frac{1}{2}$ in., 240 lb. per square. Hexagonal Strip shingles, 2 sizes: 10x40 in., 160 lb. per square; 12 $\frac{1}{2}$ x36 in., 200 lb. per square.

Carey
SHINGLES
TRADE-MARK

Carey Shingles
Furnished in three colors
Red, green and blue-black

Package

Carey individual shingles are packed in bundles containing one-eighth square, or metal strap packages containing one-quarter square. One square of shingles packed for shipment occupies 7 cu. ft. of space. Carey strip shingles 36x10 in. are packed two bundles per square; 36x12 $\frac{1}{2}$, three bundles per square.

Underwriters' Label

Carey shingles are tested and accepted as standard by the Underwriters' Laboratories, Inc.

All Carey shingles bear the underwriters' Class "C" label.

Specifications

Shingles shall be Carey (state brand here) shingles, and shall be delivered on the job in packages bearing Carey labels.

Sheathing boards must be thoroughly dried, not over 6 in. wide and laid parallel with eaves. Line valleys with valley lining, 18 in. wide, nailing 4 in. in from either side (nails 12 in. apart); do not nail in center. Lay 9-in. wide starter strips along eaves, extending over $\frac{1}{2}$ in. Nail 1 in. from lower edge, nails 6 in. apart.

Begin with full sized shingle parallel to and flush with outer edge of roof, lower end flush with lower edge of starter strips. Use large headed 1-in. galvanized nails, 2 nails to each shingle, 4 $\frac{1}{2}$ in. from lower end and 1 in. from sides. Allow $\frac{1}{2}$ in. space between shingles.

Start second row using two-thirds width shingle, leaving 4 in. of first row exposed.

Start third row using one-third width shingle, same spacing. In starting fourth row use a full size shingle and continue as shown in sketch below.

Carey Cork-insulated Shingles

Method of Applying Carey Asfaltslate Shingles

BIRD & SON, inc.

Manufacturers of Roofings, Building Papers and Wall Board

MILLS AND GENERAL OFFICES

EAST WALPOLE, MASS.

CHICAGO OFFICE AND PLANT: 1472 West 76th Street

NEW YORK OFFICE: 295 Fifth Avenue

HAMILTON, ONTARIO, CANADA: BUILDING PRODUCTS LTD., BIRD & SON DIVISION

Products

BIRD'S ASPHALT SLATE SURFACED SHINGLES, PAROID ROOFING, BIRD'S BUILT-UP ROOFS, NEPONSET WALL BOARD, NEPONSET BLACK BUILDING PAPER and other Waterproof Building Papers.

Bird's Standard Individual—8x12½ inches, laid 4 inches to the weather. A high grade individual shingle of standard dimensions. Recommended for residential work.

Giant Individuals—10x15½ inches, laid 5 inches to the weather. An unusually heavy and massive giant shingle giving an impression of thickness and weight adequate for the more expensive residences.

Application—Bird's Asphalt Shingles should be applied over dry roof boards laid close together, sheathed with Neponset Black Building Paper; roofer to follow instructions enclosed in each bundle of shingles.

Experience and Facilities

BIRD & SON, inc., was established in 1795, and after years of experience in paper manufacturing became one of the pioneers in specializing in the manufacture of waterproof building paper and asphalt roofings.

The highest quality of materials is maintained through the most up-to-date machinery and methods and a highly efficient personnel. The several mills and warehouses of the company provide for prompt shipment anywhere.

Bird's products have been distributed and applied to buildings of every description throughout the world and have long been known to be of the highest grade.

Bird's Asphalt Shingles

Bird's Asphalt Shingles are distinctive. They are made in a variety of styles suitable for all sorts of buildings, from the low price house to the costly residence.

They are surfaced with crushed slate direct from the quarries.

Bird's Asphalt Shingles are made in plain shades of red, green and blue-black. They are also made in an unusually attractive and colorful effect, produced by a selection of several shades of brown, reds and russets, known as "Bird's Art-Blende."

Neponset Twin Shingle

The following types of shingle are particularly recommended for the architect's specifications. All but the Standard Individual are available in the Art-Blende color.

Neponset Twin Shingles—12½x20 inches, laid 4 inches to the weather, giving a ½-inch overlap beyond three layers.

Bird's Super Twin Shingles—12x20 inches, laid 5 inches to the weather. An extra heavy twin shingle combining the features of Neponset Twins with extra weight and massive appearance.

Paroid Roll Roofing

Paroid Roll Roofing is of the highest quality, protected with a coating on both sides and with a special talc surfacing of bright gray color.

Paroid is most satisfactory for specifications for large roof surfaces, such as: barns, freight sheds, train platforms, garages, etc. It may also be specified for low pitch roofs on porches and dormers of all types of residences.

Paroid comes in rolls of either 108 or 216 square feet with lap cement and nails. Made in three weights, 45, 55 and 65 pounds per square. Roofer should apply according to directions enclosed in each roll.

Neponset Black Building Paper

Neponset Black Building Paper has been known and specified by architects for years as a waterproof building paper of the highest grade. A strong bodied paper thoroughly saturated with asphalt, protected with asphaltic coating on both sides, giving an absolutely waterproof paper. Recommended particularly for use:

- (1) Under all kinds of roofing.
- (2) Behind clapboards and shingles or stucco on the walls of buildings.
- (3) Between floors.
- (4) Between double floors that extend over an open porch.
- (5) Within walls of house, store or factory in place of backplaster.
- (6) For cellar lining.
- (7) For cold storage work.

Put up in rolls 36 inches wide containing 500 square feet, weighing 50 pounds per roll.

Specifications for use of Bird's Neponset Black Waterproofing Building Paper—

Beneath Clapboards and Shingles—Underneath the clapboards or shingles shall be applied 1 layer of Bird's Neponset Black Waterproof Building Paper, lapped not less than 2 inches and tacked to hold in place.

Beneath Roofing—Underneath the roofing, 1 layer of Bird's Neponset Black Waterproof Building Paper shall be applied; paper to be lapped not less than 2 inches and tacked along the seams, sufficient to hold in place.

Back of Stucco—Over the sheathing boards 1 layer of Bird's Neponset Black Waterproof Building Paper lapped not less than 2 inches. Hold paper in place with furring strips spaced about 16 inches on center. Nail metal lath firmly to furring strips and apply stucco to the lath.

Beneath Double Floors—Between the double floors or underneath the parquetry shall be placed 1 layer of Bird's Neponset Black Building Paper. Paper to be lapped not less than 2 inches and tacked sufficiently to hold in place.

Neponset Wall Board, Cream White Finish

Neponset Board is a high grade laminated fibre board that will not chip or crack. The finish is a beautifully embossed cream white surface thoroughly moisture-proofed. The reverse is a tan color, waxed to keep out moisture. The cream white surface may be painted for any desired effect. Neponset Board comes in sheets 48 inches wide, 7 to 12 feet long. Nailhole positions are indicated by dents along the edge of the boards.

Bird's Paroid Built-Up Roof

Bird's Paroid *Built-Up* Roof, built up of successive layers of asphalt felt, asphalt compound applied hot, and Paroid Cap Sheet, gives a heavy, impenetrable mass of absolutely weatherproof materials, capped with the well-known Paroid Smooth Surfaced Roofing. There is no slag or gravel to fall off and clog the gutters.

The illustration and specification which follow are for the most usual type of Paroid Built-Up Roof over sheathing boards. We will furnish on request specifications as follows:

- (1) Bird's Paroid Built-Up Roof, light, over sheathing boards.
- (2) Bird's Paroid Built-Up Roof, standard, over sheathing boards. (See specification below.)
- (3) Bird's Paroid Built-Up Roof, extra heavy, over sheathing boards.
- (4) Bird's Paroid Built-Up Roof, light, over non-combustible roof decks.
- (5) Bird's Paroid Built-Up Roof, standard, over non-combustible roof decks.
- (6) Bird's Paroid Built-Up Roof, extra heavy, over non-combustible roof decks.

Specifications for Bird's Paroid Built-Up Roof, Standard for Application over Sheathing—

Preparation of Sheathing—The roof shall be laid upon seasoned sheathing preferably tongued and grooved, not over 6 inches in width. All rubbish and projections shall be removed from the roof by the contractor preceding the roofer. The ends of all sheathing boards shall rest on rafters or purlins, properly nailed and secured. The sheathing shall be reasonably free from knots and holes, and where holes do occur these shall be covered with metal securely nailed. The roof shall be properly graded to outlets and all drainage connections set to permit the free flow of water. All this work to be done by the general contractor preceding the roofing contractor. Triangular wood strips about 2 inches high shall be installed by

owner or general contractor in all angles formed by the roof and a vertical surface.

Flashings—All brick or concrete walls, etc., shall be primed with Bird's Asphalt Primer before flashing with the roofing material. Where not otherwise shown on plans, walls and all elevations above the roof such as skylights, curbs, etc., shall be flashed at least 6 inches high. The flashings to be built up in the same manner and of the same material as the roof itself. Flashings shall be reinforced by a base flashing of Bird's Cap Sheet 9 inches wide, mopped 6 inches up the wall and 3 inches on the roof. An approved metal counterflashing shall extend down over the wall flashing at least 4 inches, and where pipes, vents, etc., come through the roof, they shall be flashed with a lead collar, both to be furnished and installed by the general contractor or owner.

Material—Materials required per 100 square feet of completed roof surface—gross weights:

2 layers Bird's 14-lb. Asphalt Felt (36-inch width)	31	pounds
2 layers Bird's Built-Up Roof Compound....	50	pounds
1 layer Bird's Paroid Cap Sheet (coated one side only, 36-inch width)	37½	pounds
Flexible extra large head roofing nails (¾ inch long)	1	pound
Total weight of finished roof.....	119½	pounds

The quantities above stated do not include the material necessary for flashings nor do they include wastage.

Note: Many roofers recommend the use of a layer of sheathing paper to be used next to the sheathing boards. This is especially good over roof boards that contain pitch or sap.

Application—First: A sheet of Bird's Asphalt Felt 18 inches wide shall be laid along the lowest edge of the roof. This felt shall be mopped with Bird's Compound heated to not less than 400° F. and while hot a second sheet of asphalt felt 36 inches wide shall be rolled into same. Similarly succeeding sheets of asphalt felt 36 inches wide shall be laid lapping each sheet 19 inches until the surface of the roof shall be covered with two layers of asphalt felt mopped together with hot compound, so that felt does not touch felt. Flexible large head roofing nails shall be used, nailing 4 inches apart along the lower edge of each sheet, as applied.

Second: The Bird's Asphalt Felt along the lower edge 36 inches wide shall be mopped with Bird's Compound heated to not less than 400° F. and while hot a sheet of Bird's Paroid Cap Sheet 36 inches wide rolled into same. The cap sheet must follow mop closely to insure a perfect bond. In a similar manner the second and succeeding sheets of Bird's Cap Sheet 36 inches wide shall be mopped in, overlapping the preceding sheet 2 inches. All cross laps of the cap sheet shall be mopped and lapped 4 inches.

The surfaced side of Bird's Cap Sheet shall be laid to the weather.

Bird's Paroid Built-Up Roof, Standard Over Sheathing

ALUMINUM COMPANY OF AMERICA

Manufacturers of Aluminum Roofing
PITTSBURGH, PA.

Products

ALUMINUM ROOFING including Shingles, Flashings, Hip and Ridge Coverings, Valleys, Gutters, and Downspouts.

For Aluminum and Aluminum Alloys, see page A741; for Aluminum Paint, see page B1609.

Aluminum Shingles

Aluminum shingles, as manufactured by the ALUMINUM COMPANY OF AMERICA, are fabricated from No. 24 B & S. gauge (.0201 in.) aluminum sheets, in plain and ribbed patterns. Size, $9\frac{1}{4} \times 24\frac{7}{8}$ in. over all.

There is no exposed nailing and an air space beneath each shingle permits the drying of condensed moisture and affords a desirable heat insulation layer of dead air.

Colors

Aluminum shingles are made in natural finish which weathers to a soft, neutral, silver-gray tone; also in two standard colors (dark red and light green), or in special colors. The colors are sprayed on, not dipped, a special grade of paint being used.

Advantages of Aluminum Shingles

Resistance to Corrosion—Aluminum shingles successfully resist the effects of moisture, salt-laden air, sulphur, sulphuric acid fumes, certain organic acids, and other corrosive agents found in the atmosphere.

Light Weight—Aluminum shingles weigh 50 lb. per square (100 sq. ft.), which is considerably less than the weight of other roofing materials in general use.

Durability—In addition to their durability because of their non-corrodable properties, aluminum shingles are more rigid than some other metal shingles, and the durability is further increased by the use of thick metal (.0201 in.). Possible damage from snow, hail, ice, tree branches, falling bricks, and the like is greatly reduced. Extreme cold does not make aluminum shingles brittle; they retain their strength, rigidity, toughness, and ductility in all kinds of weather.

Easily Worked—Aluminum shingles are easily bent and cut without cracking and, once formed, hold their shape. This speeds up work of application and reduces expense.

Pleasing Appearance—The appearance of an aluminum shingle roof is pleasing with its silver-gray

Oakmont (Pa.) Country Club
Aluminum shingles applied over old wood shingles

tint and pronounced relief. The $\frac{5}{8}$ -in. butts and heavy vertical ridges give a light-and-shadow texture without approaching an ornate pattern.

Non-staining—Aluminum forms no colored salts, consequently it will not discolor adjoining materials from drip or splash of watershed.

Weathertight—Weather sealing and expansion and contraction are taken care of in aluminum shingle roof construction. A roof with a pitch as low as 3 in. to 1 ft. is practicable with aluminum shingles.

How Aluminum Shingles Are Laid

Aluminum shingles are laid 8×24 in. to the weather, giving $1\frac{1}{4}$ in. horizontal and $\frac{3}{4}$ in. vertical interlocking joint connection with complete provision for expansion and contraction, drainage, and waterseal against capillary attraction. The height of the butt is $\frac{5}{8}$ in.

Seventy-five full size ($9\frac{1}{4} \times 24\frac{7}{8}$ in.) aluminum shingles are required to lay one square (100 sq. ft.).

One-third pound of 1-in. No. 12 gauge aluminum roofing nails are required to lay one square of aluminum shingles on a new roof and one-half pound of $1\frac{1}{2}$ -in. No. 12 gauge nails over a wood shingle roof.

Other Aluminum Roofing Materials

In addition to shingles, aluminum roofing materials are also available in the form of flashings, hip and ridge coverings, valleys, gutters, and downspouts to form a complete, non-corrodable, durable, light weight roofing job.

How to Specify Aluminum Shingles

All roof surfaces shall be covered completely with full size aluminum shingles, three-quarter size starter shingles, eaves starting strips, right and left-hand side finish pieces, valley sheets and valley flashing, ridge cover and ridge flashing, hip cover and counterflashing, around all walls, chimneys, etc., as required to produce a roof of proper mechanical construction in accordance with the manufacturers' standard instructions.

All aluminum shingles and flashing to be fastened with aluminum nails, also $\frac{7}{8}$ -in. hip and ridge boards, for properly applying hip and ridge covering.

Sheathing—All roof sheathing shall be good common boards of equal thickness laid horizontally or diagonally without open joints and securely nailed and properly spaced to insure secure nailing.

Entire roof sheathing shall be covered with 15-lb. asphalt saturated felt, lapped 2 in. and secured with 1-in. aluminum roofing nails.

Note: No felt is required when laying aluminum shingles over wood shingles.

THE RICHARDSON ROOFING COMPANY: CHICAGO, NEW YORK, BOSTON, CINCINNATI, NEW ORLEANS

THE CHATFIELD MANUFACTURING CORPORATION: CINCINNATI, NEW YORK, BOSTON, NEW ORLEANS, CHICAGO

Products

COPPERCLAD SHINGLES; THICK BUTT COPPERCLAD SHINGLES.

Copperclad Shingles

Copperclad is a copper roofing in a new and economical shingle form. To a special extra heavy insulating base of felt, impregnated with asphalt, is added a wearing surface of copper 99.99% pure. The copper covers completely all the exposed surface of the shingle. Thus the entire wearing surface of pure copper is continuous and is integral with the insulating and waterproofing base. Both copper and asphalt are recognized as superior roofing materials. When combined, no chemical action of any kind takes place. Hence the combination is ideal for roofing purposes. The inexpensive asphalt provides an entirely suitable base for the copper and, in addition, has insulating qualities which are highly desirable.

Cost

The cost of Copperclad is about one-third to one-half the cost of a sheet copper roof. It is less expensive than a good grade slate or tile, and only slightly more expensive than the best asphalt or wooden shingles.

Life

Copper roofs have lasted for centuries with practically no expense for maintenance or repair. Copperclad Shingles are capable of resisting for long periods, without failure, ordinary deteriorating influences. They are guaranteed for twenty years.

Color

Copperclad Shingles are supplied in copper green, and in the natural copper red. The green is similar in appearance to the permanent natural patina which copper normally acquires after exposure. The applied green, while not permanent, will, under ordinary conditions, last until the natural patina forms.

The natural copper color darkens on exposure to the air, gradually acquiring beautiful blending "shadows" of brown and green.

Fire Resistance

The Standard Copperclad has been tested and approved by the Underwriters' Laboratories, Inc., of the National Board of Fire Underwriters, and carries their Class "A" label.

Application

Copperclad Shingles are self-spacing and self-aligning—easily and quickly applied. By reason of these merits, the cost of applying them is less.

No allowance in application has to be made for expansion or contraction as with other metal shingles. Copperclad Shingles may be cut at valleys and hips with ordinary tinner's snips. Large head copper nails are used and copper only should be used for base and cover flashings, hip flashings and valleys. Detailed instructions for laying are in each bundle.

Anaconda-Flintkote Copperclad Hip and Ridge Shingles (individual, size 10x12 in.) are also available for use on hips and ridges.

Dimensions—Length of strip, 32 in.; width of strip, 12 in.; exposure to weather, 5 in.; number of strips per square, 90; bundles per square, 3; average weight per square, 230 lb. (thick butt weight 270 lb.); number of nails used per square, 360. Trim: use only copper nails and copper trim.

Specifications

Copperclad Shingles and Thick Butt Copperclad Shingles, as furnished by the above companies, are laid in accordance with the instructions contained in each bundle.

How Obtainable

The 6000 distributors of these companies can furnish Copperclad Shingles.

Prices, literature, samples and lists of installations are obtainable from the offices of THE FLINTKOTE COMPANY, the Richardson Roofing Company and the Chatfield Manufacturing Corporation, or their representatives.

Thick Butt Copperclad Shingles

Standard Copperclad Shingles are ideal for most roofing purposes. When an extra play of shadows and a heavier shingle is desired, the Thick Butt style is recommended. Thick Butts have an extra coating of asphalt in which is firmly embedded an additional surface of crushed minerals. This heavier type of shingle affords all the charm of the hand wrought, producing unusually beautiful effects.

Manufacture

The copper is electrolytically applied by the Anaconda Copperclad Co., Rutherford, N. J., a subsidiary of the Anaconda Sales Company and of THE FLINTKOTE COMPANY.

The special base is made by THE FLINTKOTE COMPANY. The result is a long life roofing shingle with great strength and adequate rigidity.

Recommended Uses

For all roofing purposes Copperclad Shingles have the advantage of strength, flexibility and the distinctive beauty characteristic of copper.

Copperclad Shingles can be used where the pitch exceeds 4 in. to the foot; they are suitable for residences, churches, schools, hospitals, clubs and other buildings where permanency, fire safeness, waterproofing, and beauty are required in a roof.

Reroofing Over Old Shingles

Copperclad can be applied directly over old wooden shingles. Applied in this way or to the roof boards after the wooden shingles have been removed, Copperclad makes a permanent roof of long life and lasting beauty.

ANACONDA SHEET COPPER, ROLL COPPER and ECONOMY STRIP COPPER.

For Anaconda Extruded Architectural Bronze Mouldings, etc., see pages A746-747; for Anaconda Brass and Copper Pipe and Benedict Nickel Pipe, see page C2301.

Quality of Anaconda Sheet Copper

Anaconda Sheet Copper is 99.9% pure, and guaranteed by THE AMERICAN BRASS COMPANY, the world's largest and most experienced manufacturers of copper and brass products. Manufacturing processes, developed during more than a hundred years of practical experience, insure uniform temper and accurate gauge.

Copper in a More Convenient Form

For valleys, flashings, gutters, gutter linings and similar purposes, THE AMERICAN BRASS COMPANY has developed Economy Strip Copper.

This product is furnished perfectly flat, with edges parallel, in lengths of from 5 to 10 feet, inclusive, widths of 6 to 16 inches, and in 16-ounce weight. Economy

Strip Copper is correctly tempered for forming. Its use eliminates the labor cost of flattening, cutting and trimming standard sheets. In addition, because of standardized production in large volume, Economy Strip Copper costs less than standard sheet copper.

Economy Strip Copper Is Trade-marked

As a permanent mark of identification, every length of Economy Strip Copper (Trade-mark Reg. U. S. Pat. Off.) carries the Anaconda trade-mark rolled in the metal. This mark is an assurance of full weight and a guarantee of 99.9% pure copper.

Anaconda Service is Nationwide

Large stocks of Anaconda Copper Sheets, Rolls and Strips at Ansonia, Conn., Buffalo, N. Y., Detroit, Mich. and Kenosha, Wis., enable distributors to meet any unusual requirement. The convenient location of these shipping points means prompt service and a saving in freight.

RECOMMENDED SIZES AND WEIGHTS OF COPPER FOR SHEET METAL WORK

Anaconda Economy Strip Copper should be used for all purposes where the required width does not exceed 16 inches. Where the required width exceeds 16 inches Anaconda Standard Sheet Copper should be used.

Purpose	Designation	Temper	Weight, oz.	Sizes	Number strips packed to crate	Area or length covered
Roofs	Flat seam	Soft	*16	14 x 20-in.	112	180 sq. ft.
				10 x 14-in.		82 sq. ft.
	Standing seam	Soft	*16	20 x 96-in.	25	284 sq. ft.
				30 x 96-in.		448 sq. ft.
	Ribbed seam	Soft	*16	20 x 96-in.	25	284 sq. ft. outside of battens
				30 x 96-in.		448 sq. ft. outside of battens
Flashings and Gutter Linings	Base	Soft	*16	6 in. x 6, 8, or 10-ft.	25 or 50	50 lin. ft., 8 sq. ft. for 2 x 3-in. ribs
				12, 14, 16, or 18-in. x 6, 8, or 10-ft.		150, 200, 250, 300, 400 or 500-lin. ft.
	Cap	Soft	*16	10 in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
				18 in. x 6, 8, or 10-ft.		150, 200, 250, 300, 400 or 500-lin. ft.
	Gutter linings	Soft	*16	12, 14, 16, or 18-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
				12, 14, 16, or 18-in. x 6, 8, or 10-ft.		150, 200, 250, 300, 400 or 500-lin. ft.
	Skylight base	Soft	*16	12, 14, 16, or 18-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Window heads, etc.	Soft	*16	6 or 8-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.

Note: For flat seam roofs use 4 cleats to each sheet with 2 nails to each cleat.

For standing seam roofs use 9 cleats to each sheet with 2 nails to each cleat.

For ribbed seam roofs use 10 cleats to each sheet with 2 nails to each cleat.

*16-oz. copper meets all ordinary conditions, but in special cases heavier or lighter weights are sometimes used.

MILLS: TAUNTON AND NEW BEDFORD, MASS.

Products

EAGLE BRAND COPPER, BRASS, COMMERCIAL BRONZE, YELLOW (MUNTZ METAL) in Sheets, Shapes and Rods as used by the building trade—also Copper Shingles, cut Copper, Brass and Bronze Nails and Tacks.

Trade-mark

Since 1826 the TAUNTON-NEW BEDFORD COPPER Co. has supplied non-ferrous metals for the building trade. The products have been marketed under the Eagle Brand trade-mark and name which have become synonymous with quality and service.

EAGLE BRAND

Its physical and chemical characteristics make it the outstanding metal for long service under severe conditions.

Because there are no appreciable maintenance costs its service value increases with age.

Durability of Copper Roofs

A roof of pure sheet copper will last for generations, possibly for centuries. Numerous important buildings, as well as fine residences in the United States have copper roofs over a hundred years old; in Europe and

Asia are countless examples which have lasted for centuries.

Copper for Roofs

Copper is regarded as the leading material for general sheet metal purposes—particularly for roofing, eaves troughs, gutters, leaders, flashings, ridge rolls, ridge caps, leader heads, cornices, etc.

Copper retards appreciably the corrosive action of acid fumes and is a most effective material for use under extreme atmospheric conditions such as are found in manufacturing localities and cities. Even near the sea coast its durability is unquestioned.

Bristol County Courthouse, Taunton, Mass., Roofed with
Taunton-New Bedford Eagle Brand Copper

The green carbonate coating which appears on copper after exposure to the atmosphere not only acts as a shield against deterioration, but also makes it a most beautiful roofing material. Other color effects can be produced and can be made permanent. Wherever used on a building copper adds beauty, dignity and character.

Light Weight of Copper Roofs

The non-corrosive properties of copper make it possible to use a thin sheet, and its use in construction work without the necessity of heavy supporting structures. However, it is not fair to a good material to use too thin a sheet. There is no question as to durability in the thinner gauges, but the matter of extraneous damage must be considered.

Copper sheet weighing 1 lb. per sq. ft., commonly known as 16-oz. copper, has been considered the standard sheet sufficiently strong to withstand extraneous injury.

A certain variation in the weight of sheet copper is to be expected in practice. This is usually figured at 3%.

The use of 16-oz. material is consistent with good practice and insures a satisfactory roof.

Economy of Copper Roofs

Freedom from repairs or maintenance expense, combined with durability and absolute protection against the weather under all conditions, makes copper one of the most economical and best roofing materials obtainable. It does not require painting or special protective treatment of any kind. First cost is the only expense involved in the use of copper for building purposes.

Fundamentals in Sheet Copper Roof Construction

There are a few fundamental requisites in applying a sheet copper roof, the observance of which cannot be over-emphasized.

Use soft copper sheets only. Soft copper will give the most satisfactory results. Hard (cornice temper) sheets, though sometimes used, are not recommended. The soft sheet is, as can be readily understood, more easily workable, especially for flashings, where bends are necessary.

Never drive a nail through a copper sheet. Always secure the copper sheet in position by means of copper cleats, the cleats only being nailed to the roofing boards, the battens or wood ribs. Never use nails or iron or steel to fasten copper at any place or under any circumstances.

If possible, never use copper in contact with another metal, but if the plan of construction requires the use of iron or steel, by all means see that the iron or steel device is heavily tinned, or that sheet lead is in-

serted between the copper and the other metal. The use of brass devices is recommended.

Nails holding the roofing boards in position should be well set before the paper is applied.

The temperature at the time the work is done must be taken into consideration by the contractor in allowing for expansion and contraction. A roof laid in July needs little room for expansion, as it is being laid in a high temperature. It does, however, require ample provision for the contraction which comes with cold weather. The reverse is, of course, true when a roof is laid in cold weather and under these circumstances the contractor must be particularly careful to provide ample room for expansion.

As soon as a portion of the roof is finished it should be carefully cleaned of all flux, scraps and dirt.

Cut Brass, Bronze and Copper Nails

Nails are seldom given the consideration they deserve. Every one concedes that "a chain is as strong as its weakest link"; yet nails made of a metal extremely susceptible to corrosion continue to be used for uniting longlife materials. Nails that are *everlasting* are readily obtainable upon demand, and their use adds but slightly to the total cost of the job.

The owner is fast realizing the fallacy of using anything but copper and bronze or brass where metal is exposed to the weather or other corroding action.

Eagle Brand cut brass nails are strong and stiff and drive easily. They are made from a special mixture of metals and are guaranteed to last as long as the roofing material they hold in place.

Extruded Shapes

Eagle Brand non-ferrous extruded shapes afford the architect, and the manufacturer of building details, suitable and economical material for the construction of exterior or interior finish and hardware. Extruded shapes are much stronger than cast shapes, in consequence a great saving in weight and cost may be effected by the reduction that may be made in the thickness of the walls of the desired section. It is only necessary to bear in mind that while some shapes may be extruded with a thickness of $\frac{3}{8}$ in. it is desirable to so arrange the design that $\frac{1}{8}$ in. is the minimum thickness of metal in any part of the cross section.

Estimates on Extruded Shapes

Upon the receipt of drawings showing the desired cross section, estimates will be cheerfully made and, if necessary, suggestions given in order that the architect and fabricator may enjoy to the fullest extent the many advantages obtained by the use of Eagle Brand extruded shapes.

HORSE HEAD ROLLED ZINC.

FLAT SHEET ZINC.

STANDING SEAM HORSE HEAD ZINC ROOFING.

CORRUGATED SHEET ZINC ROOFING and SIDING.

For Paint Pigments and 40-40-20 Paint, see page B1648.

Uses

For roofing (standing seam, batten or ribbed seam, shingles and corrugated), siding, conductor pipes, eaves troughs, valleys, flashings, and all exposed sheet metal work.

Advantages of Zinc

Durability—Zinc is a metal (not an alloy of other metals) which is extremely resistant to the corrosive action of the elements. It rapidly acquires a very adherent protective coating which will always form whenever any raw zinc is exposed.

Color—This protective coating has a light battleship gray color which will darken with age and approach the color of slate.

No Stain—Zinc sheet metal work can not stain marble, stucco or light colored surfaces.

Cost—The cost of zinc is approximately halfway between that of copper and galvanized steel of equal thickness.

Weight—The weight of zinc per square foot is less than that of copper, lead, galvanized iron, or steel, of an equal thickness.

Painting—Zinc does not require paint as a protection against the elements, but paint can readily be used if other than the natural color of zinc is desired.

Wood Shingles—Since most wood shingles, notably redwood and red cedar, exude acids which are harmful, the use of zinc for sheet metal work is not recommended on buildings covered with this material.

Roofing—Specifications (Condensed)

(1) **Shingles**—Shall be made from Horse Head Rolled Zinc not less than 0.018 inches thick and laid in accordance with the manufacturer's specifications. Minimum slope 4 inches per foot.

(2) **Standing Seam**—Use the standard Standing Seam

Horse Head Zinc Roofing installed in accordance with the specifications sent with each square of roofing. Minimum slope 2 inches per foot.

(3) **Batten or Ribbed Seam**—Roofs of this type shall be made from either Horse Head Rolled Zinc (2) or New Jersey Sheet Zinc. The metal used shall be not less than 0.024 inches thick for battens spaced not more than 18 inches on centers. For wider batten spacings, heavier metal shall be used. Minimum slope 3 inches per foot.

Valleys—All valleys shall be made from Horse Head Rolled Zinc not less than 0.024 inches thick and shall be attached to the roof by zinc clips. The nails holding the roofing material must not pass through the valleys.

Note: Horse Head Rolled Zinc is not manufactured wider than 20 inches.

Flashings—All flashings shall be made from Horse Head Rolled Zinc not less than 0.024 inches thick. When used on masonry, concrete, or stucco, they shall be laid on a good grade of waterproof sheathing paper. The reglet for the cap flashing shall be pointed up with elastic roofing cement.

Conductor Pipes and Eaves Troughs—These shall be made from Horse Head Rolled Zinc not less than 0.024 inches thick. The eaves troughs shall be hung on galvanized shank and circle hangers spaced not over 2 feet on centers. Conductor pipes shall be supported by galvanized rack and pin pipe fasteners securely soldered to the pipe.

Corrugated Sheet Zinc Specifications (Condensed)

The New Jersey Corrugated Zinc Sheets have corrugations $2\frac{1}{2} \times \frac{7}{8}$ inches deep. These are furnished both for roofing and siding in standard widths and specified lengths.

(1) **Roofing Sheets**—Corrugated Zinc Roofing Sheets shall be not less than 0.024 inches thick when used over a fully sheathed surface and not less than 0.032 inches thick when used over open purlins not over 40 inches on centers. For wider purlin spacings, heavier gauge sheets shall be used.

(2) **Siding Sheets**—Corrugated Zinc Siding Sheets shall be not less than 0.024 inches thick.

Write for Detailed Specifications

Further and more detailed specifications on any zinc work will gladly be furnished on request. Our engineering services are always available in connection with the uses of our materials. Please do not hesitate to consult us.

HOYT HARDLEAD PRODUCTS

UNITED LEAD CO.
HOYT HARDLEAD PRODUCTS DIVISION
111 Broadway
NEW YORK, N. Y.

Products

LEADER PIPES, LEADER HEADS, GUTTERS, FINIALS, SPANDRELS, STATUARY; GARDEN ORNAMENTS; ORNAMENTAL LEAD WORK of every description; LEAD SHEETS for roofing purposes, X-ray rooms and fume ducts, and all purposes where sheet metal is practical.

For Lead Cames, see page B1703.

Hoyt Hardlead

Hoyt Hardlead has a much greater tensile strength than soft lead, which permits its use in comparatively thin sheets making it thoroughly practical and adaptable to modern building construction. It can be stamped, formed or cast in any shape desired. When exposed to the atmosphere it takes on a soft gray, non-staining patina that brings out the true value of adjacent materials and gives a balance to these materials that can not be obtained with other metals. It will lend dignity and character to any structure where permanence and beauty is desired.

Catalogue

Our catalogue illustrates a more complete line of architectural and ornamental lead work. Will be sent to architects on request.

Hoyt Hardlead Spire, First Presbyterian Church, Utica, N. Y.

CRAM & FERGUSON, Architects, Boston, Mass.
Rushmer & Jennison, Associates, Utica, N. Y.

Hoyt Hardlead Made Especially for Roofing Purposes

It is used for roofing, flashings, cornice coverings and other building purposes where it is practical to use sheet metal.

It is rolled in sheets 24 in., 30 in., and 36 in. wide and 96 in. long, weighing $2\frac{1}{2}$, 3, 4, 6 and 8 pounds to the square foot.

The proper weight of Hoyt Hardlead sheets depends upon the purpose for which they are to be used. For roofing, cornice coverings and base flashings generally, the 3-lb. sheet is recommended, and for cap flashings and batten roofs where the battens are spaced 18 in. or less on centers the $2\frac{1}{2}$ -lb. sheet may be used.

rust-resisting properties. The value of this material is attested by the fact that a number of state-highway departments specify iron sheets exclusively.

Corrugated Steel Sheets

Made of best quality regular and copper content black and galvanized sheets.

Corrugated sheets are the strongest form of sheet metal and are used for roofing and siding. The corrugations make the sheet more rigid and allow for expansion and contraction, adding strength to the structure to which applied. They are manufactured from flat sheets made in our own plant.

2½-in. Corrugated Steel Sheets

Apolloy Metal, Its Manufacture

The new materials entering into the various stages of fabrication are carefully analyzed in our own laboratory, assuring the use at all times of materials of the proper composition for the ultimate purpose intended.

The fundamental sheet mill operation—hot rolling—is done on the most approved rolling mill machinery under the direction of plant superintendents who give each order their careful and individual attention.

All sheets are rolled from soft ductile steel of special analysis to suit each individual requirement.

Apolloy Metal, Its Uses

Apolloy Copper Content Steel Sheets are manufactured in blue annealed, black and galvanized finishes. This brand has established for us an enviable reputation among our customers who have been using these sheets in the manufacture of their numerous products.

These sheets are especially recommended for exterior work such as roofing, siding, cornices, etc., for underground work such as vaults, culverts, tanks, etc., in fact, wherever the sheets will be exposed to the weather or other corroding agencies.

The extra cost of Apolloy Metal Copper Content Sheets is surprisingly low. Write to our nearest sales office for further particulars.

Apolloy Metal Copper Content Sheets

Commercial Pure Iron Copper Content Sheets

It is a known fact that the impurities in metal are the first to be attacked by corrosion. By eliminating impurities in-so-far as possible, it would follow that the resultant metal would have rust-resisting properties of the highest quality.

To supply the demand for this class of material we have specialized in commercial pure iron sheets. These sheets are especially suitable for use as corrugated metal culverts. Copper may be added in proper quantity and this imparts additional

Commercial Pure Iron Copper Content Sheets

Plain Roll Roofing

Black and galvanized; 28 gauge and lighter. Put up in rolls, of five sheets, full 50 ft., 26½-in. wide; each roll has covering surface of 100 sq. ft.

"ARMCO" INGOT IRON SHEETS: "ARMCO" Ingot Iron Galvanized Sheets, "ARMCO" Ingot Iron Galvanized Corrugated Sheets, "ARMCO" Ingot Iron Black Sheets, "ARMCO" Ingot Iron Blue Annealed Sheets, "ARMCO" Ingot Iron Formed, Galvanized Roofing Sheets.

Ingot Iron

(4) All work that is to be furnished hereunder shall be installed at the proper time and as rapidly as the progress of the surrounding work requires or permits.

(5) The sheet metal contractor shall verify all measurements given and shall obtain at the building such additional measurements, sizes and other required information for the correct installation of this work.

(6) All cutting, drilling, tapping or fitting of sheet metal work required for its installation or to receive or accommodate the work of other contractors shall be done in an accurate manner.

Rust Resistance

One of the five outstanding qualities of ARMCO Ingot Iron is its ability to resist rust. This is due to its unparalleled freedom from the impurities that promote rust. The impurities in ARMCO Ingot Iron never exceed 16-100ths of 1%.

Cost

Galvanized ARMCO Ingot Iron costs slightly more than ordinary galvanized steels. The labor cost is the big item in sheet metal construction. Costly repairs and replacements are postponed when ARMCO Ingot Iron is used.

Under all ordinary conditions, galvanized ARMCO Ingot Iron for roofs, roof drainage parts, etc., will last the life of the building at less than one-quarter the materials cost of copper or lead; and one-half the cost of zinc.

ARMCO Ingot Iron is the sheet metal of *lowest cost per year*.

Standard Specifications for Sheet Metal Work

(1) Furnish material and labor for completion of all sheet metal work required by drawings and specifications. All such work, unless otherwise specified, shall be made from ARMCO Ingot Iron galvanized sheets as manufactured by THE AMERICAN ROLLING MILL Co., Middletown, Ohio, and of gauge (see recommended gauges for different classes of work) except for parts otherwise indicated on drawings.

RECOMMENDED GAUGES FOR DIFFERENT CLASSES OF WORK

Installation	Gauge No. for residences	Gauge No. for offices and public buildings	Gauge No. for factories and warehouses
Roofing.....	26 to 28	26	18 to 24
Siding.....	24 to 26	22 to 26	20 to 26
Cornices.....	24 to 26	22 to 26	22 to 24
Skylights.....	24 to 26	20 to 26	20 to 26
Ventilators.....	24 to 26	18 to 24	16 to 24
Heating and ventilating ducts.....	22 to 26	16 to 26	16 to 26
Eaves troughs.....	24 to 26	24 to 26	22 to 24
Leaders.....	24 to 26	24 to 26	22 to 26
Flashing.....	26 to 28	26	may be lighter than roof
Valleys.....	24 to 26	24 to 26	same gauge as roof
Ridge roll.....	26 to 28	26	may be lighter than roof
Window frames.....	22 to 24	22 to 24	22 to 24
Window sash.....	24	24	24

The heavy gauges shown above should be used where unusually severe corrosive conditions are present.

(2) The iron shall be galvanized with a high grade zinc coating. This coating shall be clean and free from blisters and other mechanical defects.

(3) Each sheet shall be stenciled with the Blue ARMCO Ingot Iron trade-mark showing the gauge of the metal.

Standard Gauges and Sizes

ARMCO Ingot Iron Galvanized Sheets are carried in stock in the following sizes: Gauges 16, 18, 20, 22, 24, 26 and 28. Widths, 24, 26, 28, 30 and 36 in. Lengths, 96 and 120 in.

ARMCO Ingot Iron Black Sheets are carried in stock in even gauges from 14 to 26, inclusive, and in the same sizes as galvanized.

ARMCO Ingot Iron Corrugated Sheets for roofing and siding purposes are made with 5, 3, 2½, 1½ and ⅝-in. corrugations. For general building purposes we recommend and carry in stock a 2½-in. corrugated sheet, 26 in. wide (after corrugating) for siding, and 27½ in. wide (after corrugating) for roofing. This size covers 24 in. in the width and allows for a one corrugation lap for siding and a one and one-half corrugation lap for roofing.

These sheets may be had from stock in the following sizes: Gauges, 20, 22, 24, 26 and 28. Widths, 26 and 27½ in. Lengths, 60, 72, 84, 96, 108, 120 and 144 in.

All of the above sizes are termed standard sizes because they are carried in stock and used most frequently. All grades of sheets may be had in special sizes when an order is placed for 2000 lbs. or more of a size.

APPROXIMATE THICKNESS AND WEIGHT OF GALVANIZED ARMCO INGOT IRON

A Helpful, Practical Book—"Galvanized Iron for Roofs and Roof Drainage"

This book is a comprehensive compilation of information on the most approved method of galvanized iron roof and roof drainage construction. The complete index affords ready reference to any desired subject. The information, tables, scales, and working data contained in this book, make it an extremely helpful addition to any architect's or engineer's library.

It has been carefully edited in collaboration with capable architects and reviewed by The Producers' Research Council (affiliated with The American Institute of Architects).

We will send a copy without charge or obligation, to any architect or engineer who is really interested in having it for the help it is able to give.

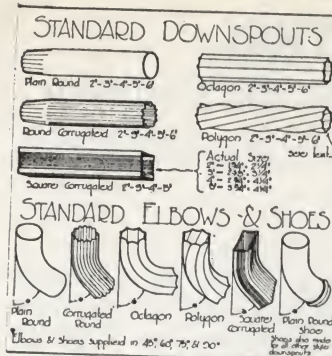

Fig. 1—Downspouts, Elbows and Shoes

The plain round and square corrugated designs are standard in the industry in the sizes noted. Other styles shown made up to order.

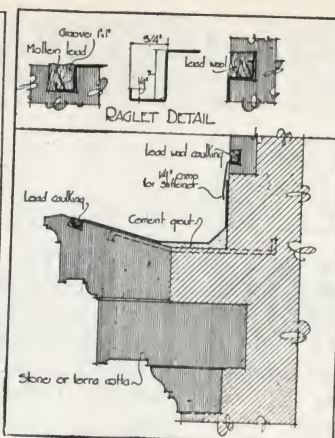

Fig. 2—Details Method of Securing and Flashing Gutter Linings on a Stone or Terra Cotta Bed

Armco Ingot Iron Double Cross-Lock Roll Roofing

Especially adapted to roofs with less than 2-in. pitch to the foot, or when but 1-in. fall is given. Gauges, 26 and 28

Union Station, Kansas City, Mo.

When the station was built in 1913, Jarvis Hunt, architect of Chicago, saw to it that the heating and ventilating investment was protected with rust-resisting ARMCO Ingot Iron. Now after 14 years' service, his judgment has been more than vindicated—there has not been a single replacement

Square Corrugated Conductor Pipe
Sizes, 2 to 5 in. Gauges, 28 to 24.
Dimensions, 1 3/4 x 2 1/4 to 3 3/4 x 5 in.

Plain Round Conductor Pipe
Sizes, 2 to 6 in. Gauges, 28 to 24

Armco Ingot Iron Galvanized Plain Ridge Roll
Standard 10-ft. lengths. Sizes: roll, 1 3/4 to 3 in.; girt, 7 to 18 in.; apron, 2 to 6 in.; gauges, 28 to 24

Standing Seam Corrugated Roofing Sheets

Made in all standard sizes, gauges, and corrugations. Also supplied in 1 1/4 and 2 1/2-in. regular corrugated sheets, 5 to 10-ft. lengths, in 22 gauge and lighter

Distribution

Distributors in all parts of the United States and Canada sell complete lines of ARMCO Ingot Iron galvanized sheets and sheet products, also in some instances, black and blue annealed sheets. Ingot Iron shops everywhere stock and use ARMCO Ingot Iron sheets and sheet products. Many of these shops are well equipped to work with architects on exacting sheet metal construction. If you desire, we shall be glad to give you the names of those distributors and shops in any territory in which you may be planning structures requiring any kind of sheet metal equipment.

Munroe Building, Chicago

CENTRAL ALLOY STEEL CORPORATION

Manufacturers of Toncan Copper Mo-lyb-den-um Iron Rust and Corrosion Resisting Sheets
MASSILLON, OHIO

Products

TONCAN IRON SHEETS: Black, Blue Annealed, and Galvanized.

TONCAN IRON ROOFING: Roll, V-Crimped, Pressed Standing Seam and Corrugated.

TONCAN IRON SIDING: Corrugated, and Reproductions of Rock Faced Stone, Rock Faced Brick and Lapped Weatherboard.

Also Toncan Iron Corrugated Sheets, straight and curved, for use with concrete work and other special purposes.

Description and Uses

Toncan is a carefully made commercially pure iron alloyed with copper and mo-lyb-den-um to obtain the greatest possible resistance to rust and corrosion. Its long life and easy working qualities are a matter of common experience.

Toncan Iron is widely used for expanded metal lath, eaves trough, conductor pipe, ridge roll, valleys, flashing, cornice, balcony, marquise, window frames, skylights, tanks, ventilation, refrigeration—in fact, for every purpose which demands a durable sheet iron.

Roll Roofing

Painted or galvanized. Excellent for low pitched roofs. Covering width, 24 in. Each roll lays 100 sq. ft. on the building

Three V-Crimp Roofing

An attractive form of Toncan roofing, covering width 24 in.; gauges, No. 20 and lighter; also made with 2 and 5 V-form

Expanded Metal Lath

Many architects specify Toncan lath for all lath work as an extra assurance of lasting service. It should always be used for stucco and other exterior or exposed work.

Toncan Expanded Metal Lath

Made in standard weights of 2.2, 2.5, 3.0 and 3.4 lb. per sq. yd. Sheets, 24x96 in., 9 sheets or 16 sq. yd. per bundle

Corrugated Sheets for Roofing and Siding

Gauges No. 10 and lighter; 1 1/4 and 2 1/2 in. corrugations are standard

Toncan Iron Conductor Pipe

Round corrugated, square corrugated and plain round conductor pipe. Lengths, 8 and 10 ft. All diameters. Elbows, miters and cut-offs to match

Toncan Iron Eaves Trough

Length, 10 ft. All widths; and gauges Nos. 28, 26 and 24

Corrugated Ridge Roll

2 1/2 or 1 1/4 in. corrugations. Lengths, 27 and 96 in.

Corrugated End Wall Flashing

Flat side on wall, 2 in. Corrugated apron, 4 in. Lengths, 27 and 96 in.

Advantages

In Toncan Iron lies the architect's most satisfactory solution for the sheet metal problem. It enables him to specify a moderate priced sheet metal of unquestionable durability—a durability proved by many years of use in thousands of structures and in every form of severe sheet

metal service.

Identification

The trade-mark shown above is stamped in two or three places on every Toncan Iron sheet and die stamped on eaves trough, conductor pipe, elbows, etc.

Sources of Supply

Jobbers and tinnners everywhere sell Toncan Iron sheets and products. On request, we will supply names of manufacturers or dealers who can furnish any special Toncan Iron product you may have in mind.

Specification Data

"All sheet metal work shall be of Toncan Copper Mo-lyb-den-um manufactured by the CENTRAL ALLOY STEEL CORPORATION, of Massillon, Ohio," is a safe specification; for Toncan meets all the requirements of modern sheet metal practice.

For trough and pipe, we recommend No. 26 gauge. For gutter, flashing, valleys, etc., No. 24 or, better still, No. 22 gauge. Roofing may be No. 26, 24 or 22 gauge. The heavier gauges should always be used where corrosive conditions are severe as along the sea coast or in a smoky atmosphere. Further information on Toncan Iron will be supplied promptly on request.

References

THE NEWPORT ROLLING MILL CO., INC.

Sole Manufacturers of Gohi (Genuine Open Hearth Iron) Rust-resisting
Sheets, Roofing, Siding and Accessories

NEWPORT, KY.

Products

GOHI (GENUINE OPEN HEARTH IRON) includes Black and Galvanized Sheets, Plain or Corrugated; Corrugated Arches; Corrugated Awnings; Corrugated Ridge Rolls; Pressed Standing Seam Roofing; Plain Roll Roofing; Roll and Cap Roofing; Weather-board Siding; Beaded Ceiling; Beaded Siding; Brick Siding; Rock Face Brick Siding; Rock Face Stone Siding; Metal Shingles; Plain Ridge Roll; Cornices; Louvers; Eaves Trough; Conductor Pipe; Elbows and Shoes; Mitres; Cut-offs; Skylights and Metal Ceilings.

Description

GOHI (Genuine Open Hearth Iron) pure iron copper alloy rust-resisting sheets and formed products will analyze approximately 99.875% pure—considering as impurities the dangerous rust and corrosion agents,

namely: carbon, manganese, phosphorus, sulphur, silicon, nitrogen, hydrogen and oxygen. In addition, GOHI (Genuine Open Hearth Iron) has a copper content of not less than two-tenths (.2) of one per cent (1%) or over three-tenths (.3) of one per cent (1%). This addition of copper to the pure base metal produces a superior lasting and rust-resisting quality product.

Advantages

GOHI (Genuine Open Hearth Iron) is absolutely uniform in quality, being manufactured from the highest grade of selected materials, thus assuring one of the best rust-resisting metals for any and all conditions. GOHI will give longer life and is more durable than re-worked muck bar, charcoal iron, steel, or other iron sheet metal. On account of its superior working qualities, labor costs are reduced and are actually less than in working up steel or other iron sheets. Lasting qualities considered, GOHI is more economical than other sheet metal building materials you can specify.

Sources of Supply

Jobbers, dealers, hardware concerns, etc., everywhere sell GOHI (Genuine Open Hearth Iron) sheets and formed products. On request, we will supply names of distributors who can furnish GOHI in sheets or in the formed products specified above.

Service

GOHI has been produced on a foundation of quality, and knowing it to be as good as human ingenuity can make it, THE NEWPORT ROLLING MILL Co., INC., has directed all efforts to improved service.

We recently had prepared by a firm of architects, a file folder containing a complete analysis and specifications of GOHI (Genuine Open Hearth Iron). This valuable information should be in the hands of every architect specifying quality sheet metal work. A copy is yours for the asking.

We have also available for your reference, leatherette folders containing sample gauges of GOHI which are mailed free upon request.

Regardless of whether you are buying many carloads or a small emergency order, you are assured of speedy service. Our organization has been built up to render prompt attention to sheet metal problems and you can depend on it.

SHEET STEEL
TRADE EXTENSION COMMITTEE

SHEET STEEL TRADE EXTENSION COMMITTEE

Use of Sheet Steel for Roofs

Oliver Building
PITTSBURGH, PA.

For List of Supporting Members, see page A796

For Sheet Steel Cornices, see page A558; for Interior Uses of Sheet Steel, see pages A796-797

Advantages

Durability—Thousands of sheet steel roofs more than a quarter of a century old and still giving satisfactory service are sufficient evidence of durability.

Adaptability—There is a sheet steel roof for every style of architecture and for every type of building.

Beauty—Because of its wide adaptability with many varying types, sheet steel provides the architect a roofing

Batten Roof of Sheet Steel on the New Taylor-Allderdice High School, Pittsburgh
72,400 sq. ft. of sheet steel used on this job

material with which he can satisfy his artistic desires and attain those beautiful effects so necessary in roofing.

Economy—The long life and low maintenance cost of sheet steel roofing results in genuine roofing economy. Many steel roofs in service for twenty-five years and more have never had a cent spent on them for repairs.

Triple Protection—The sheet steel roof stands almost in a class by itself from the standpoint of protection against fire, lightning and water. It cannot burn. It keeps internal fires from spreading, and is proof against flying sparks and fire brands. Properly grounded it is absolutely proof against lightning. It is impervious. When properly and adequately coated it is not subject to corrosion. Heat and cold, expansion and contraction, inflict no damage.

Types

Sheet steel is available in the following forms which challenge architectural attention by their beauty of line and color and their adaptability in roofing residences, schools, business structures and churches:

Standing Seam Roof of Sheet Steel which Harmonizes with the Architectural Design of This Residence

Battens—In the newer type, the batten design has proportions which express the architect's conception of balance in light and shade. They can be readily decorated in pleasing color contrasts. Illustrations upon request.

Porcelain Enameled Steel Tile—This is the most recently developed type of sheet steel roofing. It appeals to the architect because of its diversity of form in harmonious and permanent colors. Illustrations upon request.

Standing Seam—The old Colonial type with which the White House at Washington, the New York City Hall and many others of our most distinguished historical buildings have been roofed, is receiving marked appreciation for its quiet dignity, and is being used on many important public buildings and notable residences.

Spanish Tile—These steel tile give the effect of the roofs of old Spain, with the advantage of much lighter weight and lower cost. Long life and freedom from breakage are additional merits.

Spanish Metal Tile Easily Lend Themselves to the Most Complicated Roof Designs

Gauges

For the standing seam and batten types of sheet steel roof, not less than No. 28 gauge galvanized or long terne sheets should be used. For tile roofs not less than No. 26 gauge should be used.

Maintenance

If appearance is maintained, no further maintenance is required.

Specifications

The SHEET STEEL TRADE EXTENSION COMMITTEE will furnish gratis any information on the types mentioned upon request.

Service

The research and engineering facilities of the SHEET STEEL TRADE EXTENSION COMMITTEE are at the service of any architect without obligation.

KLEIN & KAVANAGH

INCORPORATED

Masters in Roof Reproduction and Craftsmen in Metal
207-209 East 120th Street, NEW YORK, N. Y.

Products

"ANTIQUE FINISH" LEAD COATED COPPER LEADER PIPES, HEADS, GUTTERS, SWAN NECKS, ORNAMENTAL HAND WROUGHT and CAST LEAD WORK, ANTIQUE ROOF REPRODUCTIONS OF SLATE STONES and TILES.

work—lead coated copper, plain copper, lead or bronze—is fabricated, wrought or cast in our own plant to exacting requirements. Flashings and metal work generally are built-in at the building scientifically—with due allowance for contraction and expansion.

Chimneys are flashed through to the flue lining, all flashings built well into or through the walls and concealed from view, if desired, with absolute safety. Standing seam or batten roofs are installed in accordance with our special method (patent applied for) eliminating all soldering of joints, allowing full freedom for movement of the metal and insuring absolute weathertightness.

Specialized Roofing Service

We design, fabricate, assemble and erect, upholding, with startling fidelity, the infinite standard of right maintained by the old masters.

Our service precludes the misunderstandings that frequently arise when quarry, foundry, mill, roofer and sheet metal contractor each expresses his individual interpretation of the architect's specifications. *For we handle the entire roofing and metal problem from its inception.*

The slates or tiles are quarried or manufactured under our supervision in accordance with a pre-determined scheme, and the colors, texture, sizes, etc. are assembled and checked by our inspectors at their point of origin before shipment is made.

The success of the roof is predetermined by careful study of perspective from vantage points around the building. The color is distributed in accordance with accepted principles of color combination. Varying thicknesses are worked out to gradually decrease in weight from eave to ridge. Thus, the general ensemble has no suggestion of the "violence" which results when roofs are treated in a hit-or-miss, indifferent manner by allowing haphazard courses of color, thicknesses or sizes of slate or tile.

Exceptional Metal Work

Our "Antique Finish" lead-coated copper is made in *our own plant* under a patented process, and is a true reproduction of old cast lead. All of our metal

Roofing and Sheet Metal Specifications

The most comprehensive specification cannot express the interesting nuances, the effectively uneven character of the slates, the subtle refinement of detail that culminate in the truly correct roof on the French, English or Colonial residence.

We could suggest many paragraphs covering points of construction and description of results desired, but we have too often seen exquisite potentialities ruined by unfortunate interpretations of plans and specifications left to competitive bidders. Consequently, may we suggest your discussing and pre-determining in collaboration with our architectural consultants the treatment of your roofing and metal work and then incorporating in your specification the following clause under the heading of "Roofing and Sheet Metal Work":

The general contractor will allow the sum of \$..... for all roofing and sheet metal work indicated on the plans and necessary, in the opinion of the architect, to insure the weathertightness of the building. All labor and material required for this work will be furnished by KLEIN & KAVANAGH INC., and upon completion, they will deliver to the owner their guarantee, bonded if necessary, to make good any of their work which may prove defective within the period of 10 years from the date of completion.

LYON, CONKLIN & CO. INCORPORATED

Manufacturers of Lyonore Metal Products

BALTIMORE, MD.

WASHINGTON, D. C., 930-932 E Street, N. W.

Products

"LYONORE METAL" GALVANIZED SHEETS, CONDUCTOR PIPE, EAVES TROUGH, ROOFING TERNE PLATE, etc.

Lyonore Metal
an alloy

TRADE-MARK

Lyonore Metal Galvanized Sheets

Adapted for all forms of sheet metal work, for ventilating ducts, or any of the uses listed. Because of the texture of the metal, the spelter coating adheres tightly and does not peel, even in the most difficult or sharp bending operation.

Lyonore Metal—Corrosion Resistance

A knowledge of the resistance of the alloy Lyonore Metal to chemical influences is of considerable practical importance.

Nearly all articles of metal are exposed to the action of gases contained in the atmosphere; besides nitrogen, there are oxygen, carbonic acid and aqueous vapors, such as steam and fog. In inhabited localities there is nearly always present sulphur, ammonia, etc. These gases together with moisture, rain or snow, readily create a condition that makes a metal exposed to them subject to the influence of electrolysis, the cause of rust, corrosion or disintegration.

Lyonore Metal is an alloy that is electrically balanced, the constituents being of such a nature and proportionately combined as not to be unduly influenced by electrolysis.

Its ability to resist the corrosive action generated by the gases mentioned above proves Lyonore Metal to be the most perfectly balanced alloy that science has been able to compose up to this period.

Several of the constituents entering into the composition of Lyonore Metal are of the same substance as the metal that was used by the Egyptians in the joints of the stone work of the Pyramids in Egypt. This metal has resisted corrosion for more than five thousand years.

Other Features—Lyonore Metal is of a finer texture, and more homogeneous than steel or iron. It is pliable, yet tough. Can be worked with less labor and expense and, when formed, holds its shape. Has a tensile strength of 48,000 lb. per sq. in. Its pliability and toughness make tighter seams possible and its finer texture holds galvanized coating better.

Lyonore Metal Terne Roofing Plates

Made in two brands, according to pounds coating: Lyon Brand and Glendale. Lyon Brand carries 40 lb. coating.

Glendale Brand will outwear any steel base plate which carries 40 lb. coating.

Both are made on Lyonore Metal Base of carefully selected, perfect sheets. Coated by the genuine *pure palm oil process*, with pure new tin and new lead, in the proportions of 1 part tin and 2 parts lead, making this a *genuine terne plate*. 1C thickness is generally used for roofing. 1X thickness for valleys and gutters.

Roof of Galvanized Lyonore Metal

Exposed to smoke and gases over retort in gas plant at Charlotte, N. C. In service 11 years and still in excellent condition

Southern Hotel, Baltimore, Md.

Lyonore Metal was used throughout. For ventilating ducts, spouting, refrigerator lining, etc.

Corrugated Sheets

Lyonore Metal is furnished in galvanized corrugated sheets in all standard gauges. Standard corrugations are $\frac{5}{8}$, $1\frac{1}{4}$, 2, $2\frac{1}{2}$, 3 and 5 in. Standard lengths are 5, 6, 7, 8, 9, 10 and 12 ft. Covering width is 24 in. Can also be furnished in pressed standing seam, V-crimped, weather board siding, beaded ceiling, brick and stone siding, etc. These sheets are strong, rigid, easily applied and but little subject to expansion and contraction.

Lyonore Metal Crimped Sheets for Cornice, Soffits, Panels, Conductor Pipe, etc.

Made in gauges Nos. 27, 26, 24 and 22. These sheets, crimped $\frac{1}{8}$ in., are especially suitable for cornice. They are stronger, not easily dented, and, when painted, give the appearance of stone. See illustration at bottom of page. Conductor pipe and eaves trough can also be made from crimped sheets.

Conductor Pipe

All size and gauges, plain round, corrugated round, plain square and corrugated square.

Eaves Trough

In all sizes, styles and gauge.

Standard Specifications for Tin Roofing

For Lyonore Metal Tin Roofing in standing seam, flat seam or ribbed. All tin roofing on this building shall be Lyonore Metal Base, Glendale Brand [Lyon Brand 40-lb. coated], 1C thickness for all roofing, and 1X thickness for valleys and gutters, to be done in accordance with the Standard Specifications of National Association Sheet Metal Contractors.

Standard Specifications for Sheet Metal Work

All galvanized sheet metal on this building shall be Lyonore Metal of gauges specified for each class of work.

Note: For best results, we recommend that the following gauges be specified for various classes of sheet metal work.

For conductor pipes, hanging gutters and eaves trough.....	No. 26 gauge
For cornices	No. 24 gauge
For skylights	No. 24 gauge
For gravel strips and flashings.....	No. 26 gauge
For ventilating ducts and dust conveyors (inside work), specify gauge number according to size of duct as follows:	
16-in. diameter and smaller.....	No. 26 gauge
18-in. diameter	No. 24 gauge
Larger than 18-in. diameter.....	No. 22 gauge
For paneling and moulding.....	No. 24 gauge
For special work.....	No. 24 gauge

Literature and Samples

We will submit samples of various forms of Lyonore Metal and literature bearing on its use.

Write for File 12c7 containing valuable information for architects and engineers.

A Lyonore Cornice

Sample of cornice made from Lyonore Metal crimped sheets—the appearance of stone without the cost, and eliminating the menace of a heavy cornice cracking or breaking away, endangering pedestrians

N. & G. TAYLOR COMPANY

Manufacturers of Tin Plate of all Kinds

ESTABLISHED 1810
118TH YEAR

Liberty Trust Building, Broad and Arch Streets
PHILADELPHIA, PA.

WORKS
CUMBERLAND, MD.

Products

"TARGET AND ARROW" BRAND OF ROOFING TIN, formerly known as "Taylor's Old Style."

"Taylor's Extra Coated 40-lb. Copper Bearing, Open Hearth"; "Taylor's Fire Door Standard Terne"; with other brands of Roofing Tin, Terns, Bright Tin Plate and Black Plate.

Advantages of Tin Roofing

These can be summed up briefly as follows:

(1) Durable. (2) A time-tried, long established material. (3) Easily applied. (4) Adaptable to any kind of surface. (5) Moderate first cost. (6) Low cost of maintenance. (7) Easily and quickly repaired if damaged. (8) Loses nothing in appearance with age. (9) Light in weight. (10) Weatherproof. (11) Not affected by heat or cold. (12) Gives protection against lightning. (13) Incombustible and prevents spread of fire. (14) Can be painted any color.

Maintenance

A coat of paint every four or five years, to keep the surface in first class condition.

Use for first coat only metallic brown, Venetian red, iron oxide, red lead, or white lead, with pure linseed oil. Afterward any color to suit the color scheme of the building.

Each painting restores the roof to its original condition. With this slight attention a "Target and Arrow" tin roof will usually outlast the building it covers.

"Target and Arrow" Brand Roofing Tin

This is our highest grade and the same durable quality of roofing tin that this company has supplied to the American sheet metal roofing trade for more than 70 years. It is an old specialty, made by a process handed down from the early days of our business. The base plate is a special quality, developed in our complete works, following the best practice of former years.

Extreme durability is obtained by an oldtime coating process of ours, by which an exceptionally heavy coating is applied, rich in pig tin. The black sheets used are cut accurately to the finished standard size, 14x20 in. or 28x20 in. before tinning, to prevent uncoated edges. The finished sheets are closely inspected, and only the primes or perfect sheets are stamped with the "Target and Arrow" trade-mark.

Trade-mark Stamped on Each Sheet

This tin has in many cases lasted in good condition on the roof for more than 60 years.

Furnished in standard thicknesses, known as IC (pronounced *eyesee*), approximately No. 30 gage U. S. Standard; IX (pronounced *one-cross*), approximately No. 28 gage. Odd sizes can be made to order.

For Fireproof Buildings

The small amount of wood required for a light deck, supported by steel roof framing, and covered with tin, represents so small a fire risk as to be negligible in the case of fireproof buildings. The tin roofing protects the roof from exposure risks, and in the case of fire within the building prevents the flames from breaking through. Moreover, there is a considerable saving in using this type of roof in contrast with heavy, costly forms.

Distribution

"Target and Arrow" brand is carried in stock by leading wholesale hardware and sheet metal jobbers throughout the United States.

Specifications for Standing and Flat Seam Roofing

Form recommended by the National Association of Sheet Metal Contractors for the use of architects:

Tin Roofing Work—All tin used on this building shall be Taylor's "Target and Arrow" brand. No substitute for this brand will be allowed. Use IC thickness for roof proper, decks, etc., and IX thickness for valleys, gutters, flashings and spouts, as required by design. One coat of red or white lead, iron oxide, metallic brown, or Venetian red paint, with pure linseed oil, shall be applied to underside of tin before laying.

For Flat Seam Roofing—Edges of sheets to be turned ½ in.; all seams to be locked together and well soaked with solder. Sheets to be fastened to sheathing boards by cleats spaced 8 in. apart; cleats locked into seams and fastened to roof with two 1-in. barbed wire nails; no nails to be driven through the sheets.

For Standing Seam Roofing—Sheets to be put together in long lengths in shop; cross seam to be locked together and well soaked with solder. Sheets to be made up the narrow way in the rolls and fastened to sheathing boards by cleats spaced 1 ft. apart. Valleys and gutters to be formed with flat seam well soldered; sheets to be laid the narrow way. Flashings to be let into joints of brick or stonework, and cemented. If counterflashings are used, lower edge of counterpart shall be kept at least 3 in. above roof. Solder to be of best grade, bearing the manufacturer's name, and guaranteed one-half tin and one-half lead—new metals. Use rosin only, as a flux—never use acid.

Caution—No unnecessary walking over tin roof or using it for storage of material shall be allowed. In walking on the tin, care must be taken not to damage paint nor break coating of tin. Rubber soled shoes or overshoes should be worn by men on the roof.

Painting Tin Work—All painting of tin work to be done by roofer, using red or white lead, iron oxide, metallic brown, or Venetian red paint, with pure linseed oil. No patent dryer or turpentine to be used.

All paints to be applied with a hand brush and well rubbed on. Tin to be painted immediately after laying. A second coat shall be applied in a similar manner, two weeks later.

No deviation from these specifications shall be made unless authority be given in writing by the architect. Only a first class roof will be accepted.

Note: Extra copies of this form ready for insertion in building specifications will be sent on request.

ESTABLISHED 1870

THE AULD & CONGER COMPANY

Producers of Slate for Roofs, Floors, Terraces and Garden Walks

GENERAL OFFICES

1920 East 75th Street, CLEVELAND, OHIO

QUARRIES: POULTNEY, VT. AND BANGOR, PA.

Products

SLATE for Roofs, Floors, Terraces, Garden Walks, and for Structural Use.

Roofing Slates

Since the establishment of this company in 1870 many thousands of buildings have been roofed with our "Slates of Quality," and many floors, terraces, and garden walks installed. Our Architectural Service Department will gladly furnish samples of our slate and cooperate with architects with suggestions, if desired, as to size, color, thickness, texture, and method of application best suited to the type of building contemplated, all of which are important—taking into consideration location, rafter lengths, surroundings, etc., of the building.

We shall be glad to send you suggested specifications we have formulated for distinctive types of architecture.

Vermont Colored Slates

Our Mammoth Vein Weathering Greens, Purple Vein Slates, Unfading Greens, Unfading Mottled Grays, Unfading Clear Purples, etc., are all well known; as are our "Agecraft Rustics" assembled by us with extreme care to create a charming color-blend roof, we having in mind the necessity of varying the percentages of color exposure for the different lengths of rafters.

Pennsylvania Blue-black Slates

Our Genuine Bangor Slate is famous for its unfading and lasting quality and architects are requested to be careful in specifying as noted below, so that inferior material with some "Bangor" name will not be substituted.

Size—Thickness of Roofing Slate

In Vermont we make all sizes and thicknesses—standard (to average $\frac{3}{16}$ in.), $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$ and 1 in.

In Pennsylvania, we make all sizes and standard thickness only (to average $\frac{3}{16}$ in.).

Roofing Slate Specifications

In specifying Genuine Bangor slate write "Genuine Bangor Slate, the slate to be labeled and with certificate of the Bangor Slate Association," and then see when the material is delivered to the building the slates have this label on them. Otherwise, they are not the Genuine Bangor slate that you specified. Insist on seeing, too, a certificate sent with every shipment.

ROOFING SLATE BEARING
THIS TRADE MARK IS GUARANTEED
GENUINE BANGOR SLATE
—BEWARE OF IMITATIONS—
B BANGOR SLATE ASSOCIATION
INC.

For "Agecraft Rustics"

Preparation—Slate roofer shall examine roof boards and advise carpenter of anything likely detrimental to the durability of the finished roof and shall see that any defects are corrected before applying felt. Carpenter shall apply a cant strip nailed about 2 in. above eaves and shall apply saddles back of chimneys and elsewhere required. Carpenter shall also build up forming where curved slate valleys are shown and place all blocking required by roofer. Roofer shall furnish and apply elastic cement wherever necessary.

Felt—Cover surfaces, including dormer cheeks, with asphalt felt weighing 30 lb. to 100 sq. ft., lapped 6 in. where joined (Note A). Where curved valleys are shown felt shall be of double thickness.

Slate—When surfaces are prepared as above, cover with Agecraft Rustic Slate, as quarried by THE AULD & CONGER COMPANY, Cleveland, Ohio, the thickness, colors, exposure, and method of laying to be as indicated on roof layout prepared by THE AULD & CONGER COMPANY and approved by the architect.

"Agecraft Rustics" Dave R. Jones Residence, Cleveland, Ohio
BLOODGOOD TUTTLE, Architect

Nails—Copper nails (Note B) of proper length shall be used.

Flashing—Sheet metal contractor shall furnish and roofer shall install 16-oz. soft rolled copper built-in flashings, as required, at closed valleys, chimneys, dormers, and necessary places. Flashing shall extend not less than 4 in. under slate and have not less than 4 in. exposed above the slate on a line at right angle to the roof. Roofer shall insert all aprons required. These to be furnished by sheet metal contractor. Sheet metal contractor shall apply counter flashing and make secure against leaks.

Open Valleys—Shall be 16-oz. soft rolled copper (Note C) 20 in. wide, nailed only at top. When applying slate care must be used that nails do not penetrate sheet metal valleys.

Closed Valleys—Shall be flashed with 16-oz. copper flashing over each course. Flashing to lap at least 2 in. and to extend 10 in. either side of valley.

Rounded Valleys—Are to be carefully fitted and laid with long slate, carefully flashed.

Ridges, Hips—Shall be laid mitered or Boston style if design so requires, ridges and hips shall have 16-oz. copper ridge and hip rolls (Note D) as shown.

Guarantee—Roofer shall furnish to keep all slate roof surfaces in a watertight condition for one year from completion.

Using Standard Slate in Agecraft Rustics, etc.

Preparation—Felt Guarantee, same as for Agecraft Rustics, with necessary modifications.

Slate—When surfaces are prepared as above cover with Agecraft Rustics (Note E) as quarried by THE AULD & CONGER COMPANY, Cleveland, Ohio; the colors, exposure and method of laying to be as indicated on roof layout prepared by THE AULD & CONGER COMPANY and approved by the architect.

Specification Notes

Note A: For standard slate we recommend a No. 1 Asphalt felt.

Note B: Away from salt air or for less expensive work galvanized or copper-clad nails.

Note C: Substitute zinc galvanized iron or tin, but copper is recommended.

Note D: Substitute 4-lb. sheet lead or galvanized iron.

Note E: Substitute, if desired, Purple Vein, Weathering Green, Unfading Mottled Gray, Genuine Bangor (see preceding page and insert full wording), one size, or random lengths and widths.

Specifications for Floors, Terraces, Walks, and Flat Roofs (Interlocking Slabs, Patent Pending)

THE AULD & CONGER COMPANY's Interlocking Floor Slabs (as illustrated—patent pending)—loose slate cast in reinforced slab form, approximately 3 ft. square and 1 in. thick, as per layout of THE AULD & CONGER COMPANY and approved by the architect.

Note: These slabs are made to conform exactly with the architect's desire for color, harmony, and design, and save about 75% labor cost over setting loose tiles and about one-half the cost of a concrete setting bed. These slabs are made for a perfect surface or as rugged a surface, as is desired.

Directions for Installing—(Where two inches, or more, exists from subfloor to finished floor level). Masonry slab to be

broom cleaned, wetted thoroughly, and sprinkled with dry cement. Put dry one-to-three mix (consistency of putty) on surface, tamp to 1 in. level, sprinkle with cement, and lay after wetting the backs of the Auld & Conger Company's Interlocking Slabs as numbered and designed on their layout. By following layout all cutting becomes unnecessary.

Specifications for Floors, Terraces, Walks (Individual Pieces)

For these purposes, natural split, or "Quarry Cleft" surfaces are desirable, but the standard rubbed surface can also be furnished. For floors and terraces our range of colors provides the eye-resting tones of nature and unequalled appearance. For outdoor work, random rectangular or irregular sizes and shapes give a most artistic effect.

Sizes—The size and shape of the pieces are determined by the arrangement and pattern desired. Any desired size and thickness of slate can be furnished.

Directions for Installing—The following are the recommended methods of laying slate floors, terraces, and walks:

On Soil with Grass Joins—Mark out location of walks and terraces and wet and tamp soil thoroughly, filling in all holes and depressions. Lay slate directly on soil. Where cinder subbed is required, excavate soil to 8 or 10 in. Fill with 6 or 8 in. of cinders well tamped and rolled, and cover with 2-in. layer of soil. Then lay slate and fill joints with soil.

Laid in Concrete on Earth—Mark out location and excavate to depth of 10 in. or more. Fill with cinders tamped to within 5 in. of level desired and top with 3 in. of cinder concrete. Follow immediately with setting mixture (3 parts sand, 1 part cement); level, sprinkle with portland cement and lay after applying putty coat to back of slate. Point all joints with concrete (2 parts sand, 1 part cement).

On Masonry Slab Laid in Concrete—On suitable waterproofing course place a concrete setting bed 2 to 2½ in. thick, with expansion joints extending full depth, 15 ft. apart in each direction and filled with calking or plastic compound. On this bed place setting mixture; level, sprinkle with cement and apply putty coat to back of slate then embed, pointing each joint with concrete. Where no waterproofing is required simply place from 1 to 2 in. of setting mixture directly on concrete slab; level, sprinkle with cement and lay after applying putty coat to back of slate.

To Replace Existing Wood Floors—Remove present floor, lower floor joints to depth required for construction of slate floor and construct on top of them a false wood floor of not less than 1½-in. thick by 6-in. wide boards, laid about ¼ in. apart and securely nailed to each joist. Cover false floor with two layers of asphalt saturated rag felt, place on this a 1 to 2-in. thick concrete setting bed; level, and follow immediately with a ½ to 2-in. setting mixture. After sprinkling with cement and applying putty coat to back of slate, pointing all joints with concrete (2 parts sand, 1 part cement).

Over Existing Wood Floors—Cover existing floor with two layers asphalt saturated felt. Lay wire mesh or metal floor lath on felt and cover with ½ to 2-in. setting mixture. Level off, sprinkle with cement, apply putty coat to back of slate and point all joints with concrete.

Product

The members of the BANGOR SLATE ASSOCIATION are the Sole Producers of GENUINE BANGOR ROOFING SLATE—a blue-gray slate of the highest quality.

Genuine Bangor Slate

The reputation of Genuine Bangor Slate is so well established that for many years it has been the standard by which other slate has been judged. Without sacrificing tensile strength or hardness, this slate possesses toughness and flexibility to a degree far beyond that of the majority of slates. Genuine Bangor Slate is practically non-weathering, and years of exposure on the roof show no appreciable change in color.

Mill stock for structural purposes, Genuine Bangor Slate Flagging, and Blackboards, are also produced by some of the members of the Association.

Label and Certificate Protection

All Genuine Bangor Slate bears the trade-mark of the Association and all shipments are accompanied by a certificate of quality. Genuine Bangor Slate is guaranteed by the Association to conform to rigid specifications for material and workmanship. To insure the protection afforded by this guarantee, architects should insist on only slate bearing the Genuine Bangor label and request the contractor to furnish a certificate.

Certificate Issued with Every Car of Genuine Bangor Slate

Selections of Genuine Bangor Slate

No. 1 Clear—The finest grade of blue-gray slate produced. Uniform throughout, as to color and texture, and free from knots and knurls that in any way interfere with the safe conveyance or the laying of the slate on the roof. Entirely clear stock. Maximum bend not to exceed $\frac{1}{8}$ in. in 16 in., nor $\frac{1}{4}$ in. for lengths from 16 to 24 in. The customary tolerance to be allowed for thickness. Corners to be square.

No. 1 Ribbon—Similar in all respects to No. 1 Clear stock except that one or more ribbons of darker material may cross the slate in such manner that when laid with the regulation 3-in. lap, the ribbons shall not be exposed to the weather. Fracture tests prove that the ribbon is stronger than the slate.

Genuine Bangor Architectural Slate—This grade has been established by the Association due to the demand for roofs of more character than may be obtained in the standard roof. The more pronounced texture and knurled surface of this slate show varying shades of blue-black and gray, making an especially attractive roof. It varies in thickness from about $\frac{3}{8}$ in. to, approximately, $\frac{1}{2}$ in. and is furnished in random widths. This grade possesses the durable qualities which have made Genuine Bangor famous.

To Specify Genuine Bangor Slate

Architects who desire Genuine Bangor Slate should specify only by the full name "Genuine Bangor Slate, with labels and certificate of BANGOR SLATE ASSOCIATION". This wording will protect the architect and his client against the substitution of inferior materials. Copies of complete specifications for roof boarding, felt, flashings, and slate work, will be furnished upon application to the Association.

Short Form Specifications "A"

On sloping surfaces (Specification "A")—All materials and labor in connection with the sheet metal and slate work shall be furnished and performed in strict compliance with Specification "A" of the BANGOR SLATE ASSOCIATION, Bangor, Pa.

The slate shall be Genuine Bangor Certificate Slate (grade and size), with labels and certificate of the BANGOR SLATE ASSOCIATION.

Stock Sizes Available at All Times

Due to the vast production of the Bangor Quarries, a complete stock of the sizes given in table and in standard thickness of approximately $\frac{1}{8}$ in. is available at all times. All shipments are made from quarries at Bangor or East Bangor, Pa.

THE CHAPMAN SLATE COMPANY

BETHLEHEM, PA.

Member of the National Slate Association

Products

Makers and shippers of "WILLIAM CHAPMAN" BLACK ROOFING SLATE in all regular stock sizes, also in graduated lengths and thicknesses and random widths.

Quarries

The quarries of THE CHAPMAN SLATE COMPANY were opened in 1850, and today, with a capacity of over 3000 squares per month, produce more roofing slate than any other single hard vein quarry operating in the country.

The Chapman product today is quarried from a depth of over 200 ft.; is made by highly skilled mechanics, many of whom have long been in the service of the company, and the entire output is most carefully inspected to insure the proper grading.

Heavy "Old English Cleft" Special Rough Slate

Owing to the numerous and constantly increasing demands from architects, the company has, for the past years, been making a heavy rough "Old English Cleft" slate ranging from $\frac{1}{4}$ to 1 in. in thickness, and in graduated lengths and random widths.

The artistic effect of a roof laid with the genuine "William Chapman" "Old English Cleft" special rough slate gives tone and character to a building which can not be produced by the use of any other roofing material.

For manufacturing plants or other places where particularly hard wear is required, the company recommends the use of "William Chapman" special rough slate, $\frac{1}{4}$ in. thick.

Standard Roofing Slate

The excellence of the "William Chapman" roofing slate lies in the toughness of the fiber, which is very hard and close grained, thus insuring a durability beyond any known limit of time. "William Chapman" roofing slate absorbs no moisture and will not decompose. Largely owing to these characteristics there is practically no breakage in transportation.

The stock of regular sizes is large and complete.

These slate are about $\frac{3}{16}$ in. thick, weighing approximately 680 lb. to the square, allowing for the standard 3-in. lap.

There are 14 different sizes ranging from 6x12 to 14x24 in. Special sizes will be made to order when required.

Labels

To prevent substitution of inferior quality slate, the company has instituted the practice of labeling about 2% of each shipment of genuine "William Chapman" roofing slate with a label, facsimile of which is repro-

duced herewith, on which is indicated the grade, whether No. 1 or No. 2.

"William Chapman" Slate Label

Colored Slate

Quotations furnished on colored slate upon request.

Shipping Facilities

The company ships direct from the Chapman quarries to every state in the Union, to Canada and Mexico, or to seaboard for export to Europe or South America.

With the present capacity, any size order for "regular" stock can be supplied promptly.

available and as designed by our Architectural Department fully meet the requirements of the individual building.

Thatchslate

In Thatchslate Roofs, designed and produced by THE JOHN D. EMACK Co., exclusively, the designer is offered a roof of rich color and texture at a cost between that of an ordinary commercial slate and the more expensive Olde Stonesfield Roofs.

Circulars

Circulars regarding Thatchslate, Olde Stonesfield Roofs and Olde Stonesfield Flagging will be mailed on request.

Architectural Service

We will be pleased to co-operate with you in the preparation of specifications or designs of roofs or floors, estimating cost or furnishing such information as may be desired.

Suggested Specifications for Olde Stonesfield Roofs and Thatchslate Roofs

(1) **Roofing**—All sloping roofs (and sides of all dormers), except where otherwise indicated on plans or elevations, shall be covered with slate as hereinafter specified.

(2) **Felt**—All surfaces which are to be covered with slate shall first be covered with an approved asphalt saturated felt weight 40 lb. [30 lb.] to the square. Lap well at all joints and fasten with the proper metal clips and nails to the roof sheathing.

(3) **Cant Strips**—At all eaves provide a wood strip of sufficient thickness to give the slate the proper cant. (The thickness of this strip is controlled by the thickness of slate at the eave.)

(4) **Slate** — *Note:* Use either paragraph A or B.

(A) Over the felt lay an Olde Stonesfield Roof designed and produced by THE JOHN D. EMACK Co., Philadelphia and New York. Roof to be laid in accordance with roof layout and instructions furnished by THE JOHN D. EMACK Co. and approved by the architect.

(B) Over the felt lay a Thatchslate Roof designed and produced by THE JOHN D. EMACK Co., Philadelphia and New York. Roof to be laid in strict accordance with roof layout and instruction sheet furnished by THE JOHN D. EMACK Co. and approved by the architect.

(5) **Head Lap**—All slate shall be laid with at least a 3-in. head lap.

(6) **Hips and Ridges**—Mitered hips shall be used throughout. Finishing or ridge courses shall be of slate of the same average exposure and widths as the courses of the roof immediately below. No long stretchers are to be used.

(7) **Valley**—*Note:* Use either paragraph C or D.

(C) All valleys, except where otherwise indicated, shall be round. Carpenter to build valley framing and roofer shall cover with slate in accordance with instructions and working drawing furnished by THE JOHN D. EMACK Co.

(D) Straight closed valleys shall be used as shown or indicated on the architect's drawings.

(8) **Flashing**—All flashing shall be of copper [lead] [galvanized iron] as specified under sheet metal.

(9) **Nails**—Slate shall be fastened to the roof with copper [re-dipped galvanized iron] nails of sufficient length to penetrate the sheathing at least $\frac{7}{8}$ in.

(10) **Cement** — A high grade elastic roofer's cement shall be used liberally in valleys, hips, ridges, at dormers and in any other place where necessary.

(11) **Guarantee**—The roofing contractor shall guarantee all workmanship and material furnished under these specifications free from defects for a period of one year and shall make good at

Thatchslate Roof

HERBERT SPIELAMANN, Architect

his expense all defects arising within this period of time.

Suggested Specifications for Olde Stonesfield Flagging.

For (here mention the rooms) floors as well as the exterior walks, terraces, and wherever indicated on the architect's drawings, furnish Olde Stonesfield Flagging produced by THE JOHN D. EMACK Co., Philadelphia and New York, in shapes as indicated on architect's plans and in colors as selected and approved by the architect.

Detail of Thatchslate Roof
NORMAN W. MCBURNEY, Architect

The interesting feature of THATCHSLATE, as shown on the left, is the exceptional, fine texture that is obtained at a minimum cost and you will note that the exposure of no two slates in any one roof are exactly alike.

Consulting Service

Technical knowledge has become a valuable factor in assembling proper color combinations, exposures and thicknesses in the Old European roofs, properly adapted to a given roof project.

This concern affords, through its consulting service, an experience of over 40 years in quarrying slate and working out the most advanced installation problems. Our service includes supplying architects with technical facts covering actual quarry possibilities in slate, specification suggestions and plans of layouts.

Individual building projects will be worked out to meet their respective requirements.

Old European Slate Roofs

The ordinary type slate roof while highly practical, yet because of the uniformity of dimension of the individual slates, its one color (generally black), failed to lend itself to the modern requirements of architecture.

Our Old European slate roof is all that modern artistic demands can possibly desire. Marked in texture, graduated in exposures and thickness, random in widths, colors placed haphazard throughout the roof, with more or less departure from symmetry of lines, gives a brief word picture of these beautiful roofs.

Colors range in reds, purples, grays, greens and blacks of varying shades, with some weathering to buffs. An interesting color feature of these roofs is the fact that they grow in beauty with age in direct contrast with manufactured roofings.

Cost will vary in range from that of the ordinary slate roof upwards.

Low cost roofs in this line can be worked out to contain some of the attractive features.

Each building project calls for individual treatment both in colors and arrangement on the roof. For this reason we make no standard suggestions, but offer our experience of 40 years in quarrying and assembling these roofs to bring out the best results.

We invite requests for detail features and advice.

Old European Terrace, Floor and Garden Flagging

The features of these floors are their pleasing texture and beautiful color effects which are everlasting. The colors are generally purple and green with black, red and buff introduced in such quantities as the individual job requires. The material offers a pleasing texture in its natural quarry surface. The individual pieces are either irregular shapes, varying in size from about 1 sq. ft. to 4 sq. ft.; or square and rectangular. The thickness approximates 1 in., which is sufficient for any purpose.

Snow Guards

The patent snow guard standard, in connection with $\frac{3}{4}$ -in. (outside measurement, 1 in.) galvanized gas pipe, composes the "pipe" or "rail" guard. This standard is adjustable to any pitch of roof. The plate is made the thickness of Standard No. 1 slate and of the same dimensions as the slate upon the roof where used, the plate taking the place of a slate and being well secured to the roof with wood screws or otherwise as may be desired.

Standards with plates of greater thickness than Standard No. 1 slate will be made to suit heavier slate at an additional charge. Plates will also be made of suitable form for use on tile or other roofs.

Standards are placed along the eaves of all roofs from 5 to 6 ft. apart and are made for 3 pipes.

When ordering, specify the size of slate to be used on the roof (Standard No. 1 thickness is understood unless otherwise ordered).

Snow Guard Standard

Pipe or Rail Guard Complete

Slating Nails

The nails used for fastening slate should be of the most durable material, since most slate roof troubles are due to slates falling out because the nails have corroded. Cut yellow metal or copper wire nails are recommended.

Our nails are made up and shaped distinctly for slating purposes—the result of many years' experience.

Structural Slate

Furnished in various shapes and sizes for use for steps, platforms, risers, wainscoting, base, toilet slabs of all kinds, floors, electrical slabs, etc.

This can be supplied in regular ribbon black, clear black, light green and mottled purple and green.

The light green and mottled purple and green slates present a very fine appearance and are especially suitable for use in entrances, lobbies, stairways, etc., where architectural beauty is desired. They compare favorably with marble but are considerably cheaper.

Slate Blackboards

These are made from the best black slate with the highest grade of machine rubbed finish. Spaces made up of stated dimensions.

ESTABLISHED 1876

NORTON BROTHERS

E. R. NORTON, SOLE OWNER

Manufacturers of Roofing Slate

GRANVILLE, N. Y.

Products

COMMERCIAL STANDARD and ARCHITECTURAL ROOFING SLATE; GARDEN FLAGGING and FLOOR SLATE.

Quarries

The quarries of NORTON BROTHERS were opened in 1876. They are located in the towns of Wells and Pawlet, Vermont, where the finest veins of quality roofing slate exist. All Norton Slate is quarried and produced at these two locations and all shipping is done from Granville, N. Y., where large quantities of standard sizes and colors are available for immediate distribution.

Colors

All kinds of Norton Slate are available in the following colors: weathering green, unfading green, unfading mottled green and purple, purple and green variegated, silver gray green and mottled gray black.

Weathering Green—A commercial sea green which is exceedingly strong and tough and of excellent texture. Upon exposure to the elements some slates weather and are transformed into soft tones of brown, buff and gray while others retain their original shade. This weathering action of the elements serves to beautify a roof of this material and in no way affects the durability of the slate. Most widely known and used Vermont basic slate color.

Unfading Green—A true sea green. Whatever slight fading or weathering takes place is so uniform that a permanently green roof color is assured.

Unfading Mottled Green and Purple—No two slates have exactly the same markings or colors. They consist of slightly varying shades of purples, sometimes almost clear, frequently clouded with spots or traces of green, others with light and dark clouds of purple. Occasionally there are some having only a purplish tint that might otherwise pass for green slate.

Purple and Green Variegated—These slates are of a predominating purple tone, some having spots or streaks of green of varying size. In a small percentage, green may predominate with only tints of purple. Some change upon exposure to harmonious shades of brown, while others present an unchanged appearance.

Silver Gray Green—A unique and beautiful light colored slate. Basically green with shadings of silver and a darker tone of gray. A semi-fast color product.

Mottled Gray Black—Some are unfading and others weather. Most of the gray slates are mottled by streaks of darker gray and for this reason are often used to advantage with other slates.

These slates will make a very handsome appearance when used for the entire surface, without combining with others.

MEMBERS OF

**Commercial Standard Roofing Slate**

Because of the great demand for Vermont slate for standard roofing, NORTON BROTHERS have specialized in producing an excellent slate for this use.

The surface is straight and reasonably smooth the full length both front and back. Each slate is free from knots or knurls that in any way might interfere with the safe conveyance or the laying of the slate on the roof.

The corners are reasonably full so that no nailing strength is sacrificed and the roof may be laid watertight.

Made in the standard thickness of approximately $\frac{3}{16}$ in. and in lengths of 12 to 24 in.

Architectural Roofing Slate

The architectural slate can be furnished in various sizes, thicknesses and colors or combinations of colors to specifications. This slate is used extensively by architects and gives a beautiful effect as it weathers. It is of a rougher texture than the standard. Varying shades are frequently used to enhance the color effect, which, with the characteristics just mentioned, add interest in line and texture to the roof design, as well as harmonize with the general character of the building.

We especially recommend Norton's Renaissance, a natural stone slate of rough texture, which has a color-blend feature of unusual merit.

Samples and details gladly sent upon request.

Roofing Layouts and Estimates

NORTON BROTHERS with their 50 years' experience in the layout of roofs for many important installations throughout the country, are prepared to furnish layouts and cost estimates for any style of slate roofing. They also will be pleased to collaborate with architects in the preparation of layouts and specifications.

Garden Flagging and Floor Slate

Made to order or furnished from stock in irregular sizes. Can be furnished with split surface and natural edges, or split surface and trimmed edges. In mixture of colors if desired.

selected split finish; carborundum sawn edges, standard $\frac{3}{8}$ -in. joints allowed for. Full assortment of colors. Suitable for all types of interior or exterior floors.

Production

The fact that this company owns and operates numerous quarries in addition to controlling the production of a number of others insures quality and uniformity of result in all slate. This is especially true of architectural slate, which is quarried to order under trained architectural supervision.

Architectural Specialties

"Tudor Stone" Roofing Slate; also the following, which are variations of the "Tudor Stone" group: Golden Pheasant, Valenheli, Verde Unique, Yorkshire Gray, Cotswold, "Tudor Stone, Jr.," etc. These are distinct types, not ordinary slate parading under new names, as can readily be seen by comparison.

Commercial Roofing Slate

Sea Green, Unfading Green, Weathering Green, Mottled Green and Purple, Clear Purple, Purple Vein, Rustics, Red, etc., quarried in Vermont.

Genuine Bangor, Albion or Jackson Bangor, Washington Bangor, Franklin, Chapman, Peach Bottom, etc., quarried in Pennsylvania and elsewhere. Monson and Brownville, quarried in Maine. Buckingham, quarried in Virginia.

Flooring Slate and Garden Flagging

Split surface or rubbed surface, trimmed or sawn edges. Irregular shapes, random sizes, rectangular shapes and regular size pieces. In full range of weathering and unfading colors in all thicknesses.

"Tudor Stone" Slate Tyle

Manufactured in standard tile sizes from $1\frac{1}{4} \times 2\frac{1}{2}$ in. up to 12×12 in.; $\frac{1}{2}$ or 1 in. in thickness. Rubbed or

Samples and Booklet

Samples of any slate desired forwarded on request.

We have booklets and architectural leaflets showing examples of our products. We would be pleased to forward copies of these on request.

A Roof of Tudor Stone
DAVIS, DUNLAP & BARNEY, Architects

Architects' Service Department.

The Service Department established in the Architects Building, 101 Park Avenue, New York City, is under trained architectural direction, and is equipped and maintained by this company for the convenience of architects and others who may require information in reference to roof design and construction.

Architects are requested to make use of the facilities offered, either for preliminary work or for the preparation of complete roof layouts and estimates of costs.

This service is rendered without any obligation.

Specifications for "Tudor Stone" Roofing Slate

Preparation—Slatting contractor shall examine roof boarding and report to carpenter all defects which would be detrimental to the durability of the finished roof, and shall see that defects are remedied before applying felt.

Carpenter contractor shall furnish and apply a cant strip nailed about 2 in. above the eave line of the slate and shall put water shedding cant strips back of chimneys and up the sides of dormers and where else required. The carpenter contractor shall also build up forming where curved slate valleys are shown and furnish and place all blocking required by roofer.

Roofing contractor shall furnish and apply elastic cement where in his judgment the same is necessary.

Felt—Cover surface to be slated, including cheeks of dormers, with slater's asphalt impregnated roofing felt weighing 30 lbs. to 100 sq. ft. lapped 6 in. at joinings. (See Note 1.)

Where curved slate valleys are shown felt shall be double thickness.

Slate—All surfaces prepared for slate as above described shall be covered with "Tudor Stone" Roofing Slate, as made by the RISING & NELSON SLATE Co., West Pawlet, Vermont.

Thickness, exposure to the weather and character of laying shall be as indicated on roof layout prepared by the Architects, Service Department of the RISING & NELSON SLATE Co., under the direction of the architect. The contractor shall include in his estimate a sum sufficient to pay the expense of an expert from said Service Department to visit the work and assist the roofer in obtaining the architectural effect desired.

Nails—Nails shall be copper (see Note 4) slater's nails of sufficient length to adequately penetrate the roof boards using not less than 2 to each slate.

Flashing—The sheet metal contractor shall furnish and the slate contractor shall install 16-oz. soft rolled copper built-in flashings as required at closed valleys, chimneys, dormers and other necessary places. Flashing shall extend not less than 4 in. under slate and have not less than 4 in. exposed above the slate on a line at right angle to the roof and shall not be nailed to the vertical surface. Roofing contractor shall insert all aprons required, which will be furnished by sheet metal contractor. Sheet metal contractor shall apply counterflashing and make same secure against leaks.

Open Valleys—All open valleys shall be 16-oz. soft rolled copper (see Note 5), 20 in. wide, nailed at top only. In applying slate, care shall be used that no nails penetrate the sheet metal valleys.

Closed Valleys—All closed valleys to be flashed with 16-oz. copper flashing over each course. Flashing to lap at least 2 in. and to extend 10 in. either side of valley.

Round Valleys—To be carefully fitted and laid with special long slate. No metal used unless specially directed, but care must be taken to preserve continuity of roof color and texture.

Ridges—Ridges and hips shall be of slate laid mitered (or Boston style). If design should so require, ridges and hips should have 16 oz. copper hip and ridge rolls (see Note 6) as shown and detailed.

Guarantee—Contractor shall guarantee to maintain all slate roof surfaces in a water tight condition for a period of 2 years from completion.

Specification for Plain Hipped Roof with Valleys and Dormers Using Commercial Grade Slate

Preparation, Cement, Felt and Guarantee to be specified as described under heading "Tudor Stone" Roofing Slate with such modifications as may be necessary to meet the individual problem.

Slate—All surfaces prepared with felt as above described shall be covered with No. 1 Weathering Green (see Note 2) Roofing Slate, as furnished by the RISING & NELSON SLATE Co., West Pawlet, Vermont.

Slate shall be of random widths and 16 in. long (see Note 3); laid with 3-in. head lap so that distance to the weather shall be 6½ in.

Nails (see Note 4), **Valleys Flashing** and **Ridge** to be specified as described under heading "Tudor Stone" Roofing Slate.

Specification Notes

Note 1—For best commercial work 30-lb. felt is recommended. For slate not over ¼ in. thick 16-lb. felt may be used.

Note 2—Substitute, if desired, "Tudor Stone Jr." Weathering Green, Unfading Green, Mottled Green and Purple, Clear Purple, Red or Pennsylvania Slate.

Note 3—Substitute other lengths or uniform widths if desired, but note that commercial slate are made in lengths from 10 to 24 in., always in even inches, and that slate should have 3-in. head lap on second slate.

Note 4—Substitute for less expensive work away from seashore, galvanized iron or copper clad steel nails.

Note 5—Substitute zinc, galvanized iron or tin if desired. Copper is recommended. Curved slate valleys require special attention and when required should be specified to be watertight and of uniform appearance to adjoining slate.

Note 6—Substitute 4-lb. sheet lead or galvanized iron if desired, or specify slated "Boston" hips and ridges or mitered slated hips and ridges. Plumbing specifications should call for 4-lb. sheet lead flashings, 18-in. square, turned up 4 in. around all plumbing pipes, with separate lead cap flashing extended down to the slate and calked into first joint of pipe above the roof.

Specifications for Slate Floors, Terraces and Walks

Slate—The contractor shall furnish and lay all slate for walks, floors and terraces listed below. Slate shall be (here specify color, thickness, surface, size when necessary, shape of pieces, style of edges and width of joints).

On Soil with Grass Joints (Soil or Turf Subbed)—If ground is not well settled, wet and tamp thoroughly. Lay slate directly on soil in (here specify arrangement and pattern). Each piece of slate shall rest on a solid, even bed with the top surface level.

On Soil with Grass Joints (Cinder Subbed)—Mark out location of all walks and terraces to be laid with slate with grass joints and excavate to a depth of 8 to 10 in. Fill excavations with cinders from 6 to 8 in. deep, well rolled and tamped to an even surface. On top of cinder bed place a 2-in. layer of soil and on soil lay slate in (here specify arrangement and pattern). Fill all joints with soil to level of surface of slate and sow grass seed.

On Masonry Slab Laid in Concrete—Place from 1 to 2 in. (depending on final level) of setting mixture (3 parts sand with 1 part of cement). As soon as this setting bed is leveled, sprinkle with pure portland cement to perfect bond between bed and slate and lay slate in (here specify arrangement and pattern.) Thoroughly wet pieces of slate and firmly embed to desired level. Point all joints with concrete mixed 2 parts well-sieved sand and 1 part cement.

Cleaning Slate — (Note: Only required for slate floors with concrete mixture joints). Sponge all slate as set on exposed surface with clean water to remove mortar stains, and, if necessary upon completion, rub down with a solution 3 parts coal oil and 1 part linseed oil. (If light or weak solution of muriatic acid is needed and used for cleaning, care should be taken to wipe only exposed slate surfaces to avoid eating out cement joints.)

Completion—Upon completion, all slate shall be sound, whole and clean; the work shall be left smooth and in every respect a neat example of craftsmanship.

Production

PENNSYLVANIA BLUE-GRAY SLATE, including Genuine Bangor and Genuine Washington.

QUARRY CLEFT SLATE—a new creation in Architectural Slate exclusively Vendor.

METTOWEE STONE ARCHITECTURAL and COMMERCIAL ROOFING SLATE.

METTOWEE FLOORING and GARDEN SLATE.

Genuine Washington Big Bed and Provident Big Bed—A very high quality slate of a darker blue shade than Genuine Bangor. Very uniform in color and unfading.

Specified and accepted by the United States government because of its excellent quality and dependability of color.

This slate is produced in the Slatington region of Pennsylvania and on roofs of large area it is unequalled, owing to the absence of varying shades of color. This is due to the large size of the beds of slate from which it is produced.

Genuine Franklin Big Bed—This slate is produced in the Slatington region of Pennsylvania and is of the same general excellence as the other Big Beds. It is dependable in both color and strength.

Genuine Albion—This slate has an excellent reputation for strength and color.

Rough Textured Slate (Architectural)—Produced from selected beds that have a rough textured cleave.

Neither surface nor thickness is uniform (purposely so). Thickness varies from $\frac{3}{8}$ in. to full $\frac{1}{4}$ in., and this, combined with the rough surface, provides an architectural effect that is impossible with the smoother surfaced slates.

Quarry Cleft Slate—A mixture of different grades of Pennsylvania slate with irregular cleft butts producing a pronounced degree of ruggedness closely resembling the "thatched" lines of the original slate roofs used in England over 400 years ago. Admirably adapted to homes of English architecture and where subdued dignity and uniqueness without too much uniformity is desirable. Our literature will interest you.

Note: As the Monson, Buckingham and Peach Bottom slates are produced in very limited quantities, the VENDOR SLATE Co. can not offer the same degree of service as in the high grade slates of the Bangor and Slatington regions, but will be pleased to quote prices on request and give an approximate idea as to date of delivery.

Quarries

The VENDOR SLATE Co. is the largest slate organization in the United States. It operates and controls the output of the most important slate quarries in America, among them being the famous "Old Bangor" quarry, the Pen Argyl operations, the "Genuine Washington" and "Provident" quarries, the "Old Red" quarry and many Vermont Architectural Slate quarries.

Architects' Service Departments

The VENDOR SLATE Co. maintains architects' service departments in New York, N. Y., and Easton, Pa.

These departments are under the direction of trained architects and are maintained wholly for the use of architects and others requiring information concerning slate roof design and construction.

Pennsylvania Blue-Gray Slate

Where the architecture of a building requires a roof of uniform subdued tone with simple harmony, nothing answers so appropriately as Pennsylvania blue-gray slate. The beds in the region producing this slate are so numerous and varied that a difference in quality is quite manifest. Caution should therefore be exercised in an endeavor to see that the kind of slate specified is shipped.

For the protection of architects and owners, the VENDOR SLATE Co. issues a certificate of quality guarantee with each shipment of the several standard grades.

Classifications of Pennsylvania Blue-Gray Slate

In the following list, practically every slate of American origin is given under its basic name with a brief and accurate description of its physical characteristics.

Genuine Bangor—The highest quality slate produced in the blue-gray slates of Pennsylvania. It is unfading.

Genuine Bangor slate, while all produced from the same beds, is divided into two classifications as follows:

No. 1 Clear—Tolerably uniform as to surface. Thickness averages $\frac{3}{8}$ in. Straight, with square corners and entirely clear stock.

No. 1 Ribbon—Produced from the same beds of slate as No. 1 clear, but contains dark streaks entirely hidden when laid on the roof with the regulation 3-in. head lap.

Note: Genuine Bangor slate needs no further recommendation than its name. To protect architects and users against substitution of inferior grades such as Jackson Bangor, Albion Bangor, etc., the producers have formed the Bangor Slate Association, and with all shipments of Genuine Bangor slate is furnished a certificate of the Association.

"Mettowee Stone" Colored Roofs

Mettowee Stone is produced exclusively by VENDOR SLATE Co. It is quarried in the Penrhyn Hills lying along the border line of Vermont and New York.

Mettowee Stone is of exceptional beauty, ranking highest in quality and architectural excellence.

Mettowee Stone is produced in standard commercial thickness as well as heavy architectural thicknesses for roofs of low cost, yet it possesses individual character and refinement. Mettowee Stone is produced in the following colors:

Antique Red—A deep red containing markings of burnt sienna, quartz and streaks of moss green.

Florentine Red—Similar to antique red but of a lighter shade and without markings.

Verdelite Unfading Green—A slate of excellent quality, permanent in color and having a definite greenish cast.

Mottled Gray—A light gray slate having streaks of mottling of darker gray.

Dark Gray—An Oxford gray most suitable for reproducing antique effects.

It will weather slightly.

Clear Purple—A dark purple slate with minute green markings.

Slates in this range are produced in both unfading and weathering qualities.

Variegated Green and Purple—A beautiful slate of an opal blend in greens and purples. Light and dark shades.

Black—Produced in a variation of black, blue-black and dark gray.

Weathering Green—A tough, durable green-gray slate when newly quarried. An uncertain percentage will, after exposure, change to tans, buffs and browns.

Sea Green—A slate similar in color to weathering green when freshly quarried, but which will weather to yellows and tans.

Mottled Green and Purple—A slate of purple base with mottlings of green varying from, approximately, the size of one's thumb to sometimes half the slate. It is of weathering nature.

Rustics—Commonly termed "freak" slates. Not produced in thicknesses less than a scant $\frac{3}{8}$ or a full $\frac{1}{4}$ in. They are from top rock formation producing delightful variations in colors of bronze, browns, buffs, rustic greens, grays and blacks.

Specifications for Mettowee Stone Roofs—See

general specifications below for application of roofing slate.

"Mettowee Stone" Colored Flagging and Flooring

"Mettowee Stone" as used for flagging and flooring is a specially quarried slate. This product is ideally suited for this purpose because it is durable, beautiful in color and texture and lends itself to all types of architecture.

Descriptive Classification—Colors obtainable are variegated green and purple, unfading green, clear purple, weathering green, brown, gray, black and red.

Specifications—Descriptive literature showing many beautiful installations as well as specifications will be sent on request.

Specifications for Application of Roofing Slate

On Sloping Surfaces (Specification "A")

The following are based on the Standard Specifications for War Building Projects of the Building Materials Division of the U. S. War Industries Board, and on the normal essential points from other specifications: *The first section "Roof Boarding" should of course be transferred to "Carpenter Work."*

Roof Boarding—Roof boarding or sheathing to be $\frac{7}{8}$ in. thick, and not more than 8 in. wide, tongued and grooved and surfaced one side, and free from wanes, shakes, loose or large knots. The boards, to allow for swelling, are not to be driven up tight and are to be laid with the surfaced side against the rafters with tongues toward the ridge, and to be nailed with 10d nails, with all joints occurring over rafters or purlins.

Leave an even surface free from chips, loose nails, etc., and ready to receive the slater's felt.

Note: Another type of roof boarding, costing less, but presenting more joints and not offering the same even plane, consists of the regulation 1x10 or 1x12-in. unsurfaced common sheathing boards. In some localities, slate are laid on lathing strips, without sheathing or "felt."

Roofing Felt—All roof boarding (as specified under "Carpenter Work") shall be covered with one thickness of "slater's felt" weighing not less than 11 lb. for commercial roofs, and 30 lb. for architectural roofs, per 100 sq. ft., and laid in horizontal layers with joints lapped toward eaves at least 3 in. and tacked down.

Flashings—A base flashing course (of 16-oz. copper, 4-lb. lead, 1X-tin or prepared roll roofing weighing not less than 37 lb. per 108 sq. ft.), extending 4 in. on the roof (if showing—or full depth of top slate, if covered by same) and not less than 4 in. vertically, shall be laid against all chimneys, parapet and party walls, roof posts, and porch roofs where they connect with walls. Similar flashings, 4x4 in. by length equal to "weather" plus "lap," laid in with each course of slate, shall be carried up all rakes.

Where base flashings are not covered by slate or siding, a cap or counter flashing course (of 4-lb. lead, 16-oz. copper or 1X-tin) shall be tightly built into masonry at least 2 in. and shall cover the vertical leg of the base flashing at least 3 in. All vertical joints of cap flashings to be sealed tight with elastic roofing cement.

Note: Here enumerate any other flashings, such as at sides of dormer window frames, pans under sills of same, etc., referring to Figures on Service Sheets applicable and in the case of tin, specifying the manner of painting.

Valleys, Gutters, Spouting, etc.—*Note:* The design of the building will determine the specification requirements for any valleys, the gutter stops, hanging gutters, conductors or down-spouts that are to be provided.

Open Valleys—Provide 16-oz. soft rolled copper flashing 24 in. wide, nailed at top only.

Closed Valleys—Flash all closed valleys with 16-oz. copper flashing over each course. Flashing shall lap 2 in. and shall extend 12 in. on each side of the valley.

Rounded Valleys—Slate shall be carefully fitted and laid with special long slate. Flashing shall be slip or shingle flashing.

Note: In the case of open valleys the exposed width of the valley at the top should be stated as well as the width of flashing. The 4 in. total minimum open width in the case of a ridge which is any considerable distance below another, should be increased proportionately to the flow of water from the higher roof.

Note: If closed valleys are to be used, the flashing material should be inserted over each course of slate.

Note: Down-spouts should never discharge from one roof across the slate of another.

Slating—The main (and porch) roofs, the roofs and sides of dormer windows, and all other surfaces so indicated on the drawing shall be covered with (..... kind, grade and size) slate as furnished by the VENDOR SLATE CO., Easton, Pa., laid over the slater's felt.

(If slate are to be punched at the quarry, so state.) No broken or cracked slate shall be used and nails shall be driven so as not to produce a strain on the slate.

The slate shall project 2 in. at the eaves, and $\frac{1}{2}$ in. at all gable ends, and shall be laid in horizontal courses so that the third course shall lap 3 in. over the first, and each course shall break joints with the preceding one. (The lap shall be 4 in. on porch roofs.) The slate shall begin at the cornice, line or eave with a starting course canted $\frac{1}{8}$ in. so that the succeeding courses will have a flat contact. The slate shall be fastened to the roof boards with broad flat headed galvanized (copper or yellow metal) "slate roofing" nails, two to each slate and of sufficient length to penetrate roof boarding 1 in. All exposed nailheads shall be covered with elastic roofing cement of same color as the slate.

Slate at the eaves, ridges (valleys, hips, etc.), shall be cut and laid so that their bond pattern shall be preserved. The ridge course shall be laid double saddled (or combed).

Top course of slates of all ridges and of any tight hips shall be laid in elastic roofing cement. (Slates at other hips and valleys to be laid in elastic roofing cement, when and as so specified.)

On completion all slate must be sound, whole and clean and the roof shall be left in every respect tight and a neat example of workmanship.

On Flat Surfaces, Embedded in Hot Asphalt (Specification "F")

All loose rubbish, chips and nails shall be swept from the roof by the contractors preceding the roofer, and the roof surface left perfectly clean. Ends of all sheathing boards to rest on rafters or purlins properly nailed and secured. Sheathing boards shall be free from loose knots and holes, and properly graded to outlets, by the carpenter and contractor.

Application—First—Lay one thickness of sheathing paper or unsaturated felt weighing not less than 5 lb. per 100 sq. ft., lapping the sheets at least 1 in.

Second—Over entire surface lay two plies of tarred felt, lapping each sheet 17 in. over preceding one, and nail as often as is necessary to hold in place until remaining felt is laid.

Third—Coat entire surface uniformly with coal tar pitch.

Fourth—Over entire surface lay three plies of tarred felt, lapping each sheet 22 in. over preceding one, mopping with coal tar pitch the full 22 in. on each sheet, so that in no place shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than two plies of felt. Use an average of 80 lb. of coal tar pitch to 100 sq. ft. of roofing.

Fifth—Spread over the entire surface a uniform coating asphalt (Trinidad or equal) and coal tar pitch in proportions of 50% each, using an average of 50 lb. to 100 sq. ft., into which while hot, thoroughly embed the slate; grade, size inches by inches (grade and size to be inserted, 10x6 to 12x10 in. recommended); slate to be perfectly dry when placed.

Flashings—Shall be constructed as shown in detailed drawing of building.

Note: Specifications for use over concrete and for embedding in plastic compound (cold) will be furnished on request.

J. W. WILLIAMS SLATE CO.

Producers of Highest Quality Slate Roofs and Slate Specialties

MAIN OFFICE

Drake Building, EASTON, PA.

VERMONT OFFICE, POULTNEY, VT.

ARCHITECTURAL SERVICE DEPARTMENT, 103 Park Avenue, NEW YORK, N. Y.

Production (Slate Roofing)

The J. W. WILLIAMS SLATE Co.—with the production of “Verdelite Unfading Green” slate at the Penrhyn quarries in Vermont, Unfading Purple, the beautiful and varied weathered effects in Penrhyn Stone, from the same regions, and the “Blue-Greys” from the quarries which it operates in Pennsylvania—is in position to give the best possible service.

Architectural Roof Design

The Company's organization with its ten years' experience in the layout of roofs for numerous important projects throughout the United States, and its intimate knowledge of the possibilities connected with the slate produced and available in the Vermont and Pennsylvania quarries, is prepared to collaborate with the architectural profession in the preparation of specifications for the artistic roofing of any style of architecture.

A department for this service is maintained at 103 Park Avenue, New York City.

Penrhyn Stone

Penrhyn Stone is the product of a series of quarries operating in the Penrhyn Hills on the border of the State of Vermont.

The wonderful texture and coloring of this material allows of harmonious combinations that are adaptable to any type of architecture or period reproduction. The various shades and variegated colorings of purple, gray, green, brown, etc., are so intermingled and weathered that a newly laid roof has all the aged appearance that is characteristic of the roofs on the ancient castles and homes in England.

Penrhyn Stone is produced by skilled craftsmen. It is quarried, split, and trimmed entirely by hand into sizes and thicknesses required by each individual roof, as determined by a study of the architect's plans. Either dark or colorful effects can be produced just as the architect desires or period reproduction demands. The nature of the rock does not admit of being split into commercial thickness and it is, therefore, particularly suited for roofs where texture is the paramount feature.

Verdelite Unfading Green Slate

Produced at the Penrhyn quarries in the State of Vermont and sold exclusively by the J. W. WILLIAMS SLATE CO.

This slate is of a beautiful dark green color. The quality is excellent, of architectural texture, dependable and pleasing in color, and never fades or weathers. Equally as ef-

fective when laid in graduated thicknesses or restricted to a single thickness in graduated lengths.

It is produced in both commercial and architectural thicknesses and is especially suitable for structures that are of a plain or severe type of architecture, and especially so for roofs of large area. Among the many buildings on which Verdelite Unfading Green has been used are the following:

Netherlands Embassy, Washington, D. C.
United States Veterans Hospital, Tupper Lake, N. Y.
New York State Hospital Buildings, Thiells, N. Y.
Southern Theological Seminary, Louisville, Ky.
Home for Aged, Salisbury, Md.
Shriners Hospital for Crippled Children, Philadelphia, Pa.
St. Patrick's Church, Jersey City, N. J.
Dalhousie University, Halifax, N. S.
St. Dominic's Church, San Francisco, Calif.
Wilmington High School, Los Angeles, Calif.
High School, South Orange, N. J.
New York Public School, Eltingsville, S. I., N. Y.

Rough Cleft Blue-Grey Slate

Although the use of Pennsylvania Blue-Grey slate is usually confined to a smooth surfaced slate of standard thickness, the demand for a heavier rougher slate of architectural quality has become insistent. To meet this demand we are producing a Rough-Cleft slate in thicknesses from $\frac{1}{4}$ to 1 in. in varying lengths and widths. For graduated exposures in either a single thickness or graduated thicknesses.

Specifications for Graduated Architectural Slate Roofs

In specifying graduated thicknesses, the incorporation of commercial thickness ($\frac{3}{16}$ in.) for the upper section of the roof, although more economical, should be avoided, if texture is to be maintained—the minimum should be not less than $\frac{1}{4}$ in. Commercial thickness slate comes from beds that lack the necessary texture and color for harmonious intermixture with the slates of a heavier thickness, and, while they make an admirable roof when used alone, their use with the more textural slate is liable to cause a marked difference or “band” on the completed roof.

W. R. Lewis Residence, Beverly Hills, Calif.

ALBERT FARR, Architect, San Francisco, Calif.
Roofed by W. R. TOBIAS, Los Angeles, Calif.

Penrhyn Stone for Floors, Garden Walks, Garden Seats, Wainscoting, Base, etc.

The wonderful applicability of slate for both interior and exterior effects, with its beautiful and especially effective yet subdued natural colorings, is now fully recognized by the architectural profession.

It has the advantage over other materials in that it can be used with either a rough cleft surface in any degree of roughness desired, or with a rubbed finish similar to a marble tile. The range of colors obtainable is extensive and when carefully selected and blended the result is exceptionally striking and artistic.

The use of slate for terrace and porch floorings in random irregular shapes in mixed colorings is coming more and more into use in America. In Europe, it has been used for centuries—as a reference to illustrations of the floorings and walks of these old structures will testify.

For steps, risers, coping and window sills, slate has many advantages over other materials—it does not absorb moisture, and the colorings can be selected to harmonize with the slate roof.

Suggestions for Installing Garden Walks, Outdoor and Interior Floors

On Soil with Grass Joints (Soil or Turf Sub-bed)—Mark out location of all walks and terraces to be laid with grass joints. If ground is not well settled, wet and tamp thoroughly. Fill any holes or depressions with thoroughly tamped soil, and lay slate directly on soil. Each piece of slate should rest on a solid even bed with the top surface level.

Cinder Sub-bed—Excavate to a depth of 8 to 10 in. Fill excavations with cinders from 6 to 8 in. deep, well rolled and tamped to an even surface. On top of cinder bed place a 2-in. layer of soil and on soil lay slate. Fill all joints with soil to level of surface of slate and sow grass seed.

When Set in Cement—Excavate walks to depth of 6 in., fill in 4 in. with cinder concrete. When this is thoroughly hardened, build up the remaining 2 in. with cement—using a mixture of 3 parts sand and 1 part cement. Grout all joints before cement hardens and point up all joints in color desired.

Stepping Stones—Place stone in desired position on lawn, cut around edge with sharp pointed trowel, lift out sod, remove sufficient earth to permit setting of stone about $\frac{1}{2}$ in. above finished level; tamp well, fill in around edges with earth and sow with seed.

Terrace Floors, Interior Floors, Porch Floors, etc.—Bring rough concrete finish to within 2 in. of desired level for finished floor. Remaining 2 in. shall be built up with cement—3 parts sand 1 part cement. Set each piece of slate separately. Grout all joints before cement hardens and point up all joints.

Over Existing Wood Floors—(a) Cover existing floor with 2 layers of asphalt saturated rag felt of not less than commercial 14-lb. weight. Each sheet of felt shall lap over preceding one, and shall be nailed only as is necessary to hold it in place.

(b) Lay wire mesh or metal floor lath on the felt and, depending on level desired, cover with from $\frac{1}{2}$ to 2 in., of setting mixture—3 parts sand, 1 part cement. After this bed is leveled sprinkle with pure portland cement and bed slate thereon, thoroughly wetting each piece of slate before bedding. Point all joints with concrete mixed 2 parts well sieved sand and 1 part cement.

Cleaning Slate (Floors Laid with Concrete Mix-

Residence and Grounds of Dr. Ernest Cadgine,
Englewood, N. J.

FLAVIO B. GROSSO, Architect
Veranda floor, walks and roof of Penrhyn Stone

ture Joints)—Sponge all slate, as set, on exposed surface with clean water to remove stains and, if necessary upon completion, rub down with a solution 3 parts coal oil and 1 of linseed oil. If light or weak solution of muriatic acid is needed and used for cleaning, care should be taken to wipe only exposed slate surfaces to avoid acid eating out cement joints.

Suggestions as to Thickness, Surface, Finish, Shapes and Size of Slabs

Penrhyn Stone is especially well adapted for all underfoot surfaces, either interior or exterior, and once laid it requires little or no expense for maintenance. A natural cleft surface is the most desirable for all installations whether the design is in random rectangles or irregular shaped slabs.

For stepping stones and garden walks a roughish surface is invariably required by Landscape Architects but for terrace and porch floors a comparatively smooth surface (though natural cleft) should be selected so as not to interfere with the free use of the porch furniture.

Where a sub-base of cement is used the thickness of the slabs need not be more than half inch but where the Stone is laid in soil a thickness from $\frac{3}{4}$ to 1 in. is advisable.

The maximum size of the slabs should be determined by the dimensions of the space to be covered—large areas lend themselves to the use of individual slabs of a dimension that could not be successfully used on smaller areas.

Penrhyn Stone in rectangular shapes can be furnished with a rubbed surface finish similar to marble—this finish combined with the varied colorings makes a most artistic floor.

ESTABLISHED 1901

O'BRIEN BROTHERS SLATE COMPANY, INC.

Quarriers and Manufacturers of Roofing Slate

OFFICE

GRANVILLE, N. Y.

NEW YORK, N. Y., 120 East 41st Street—Telephone, Ashland 5150

Products

ROOFING SLATE, FLOOR SLATE and GARDEN FLAGGING.

Service

Architects and engineers are invited to consult with our Service Department at 120 East 41st Street, New York, N. Y., for information and specifications in the preparing of details for a graduated thick slate roof. We are also prepared to make sketches and offer suggestions for the use of slate in landscape work.

**Production**

All orders executed under our personal supervision, assuring our clients that the years of our experience as slatemakers have gone into the preparing of their roof.

Unfading Green

Emerald Unfading Green is admitted to be the greenest colored slate produced. It is of a dark green color and never changing. This slate is furnished with an absolute guarantee not to change color.

Unfading Mottled Green and Purple

Unfading mottled green and purple slate produces a roof full of warmth and life. An effect of either green or purple predominating can be produced, if so desired. This slate should be given consideration by architects who desire to obtain the best in a slate roof.

Unfading Gray

A gray-green slate with irregular shaped dark

splotches. Some slate are a solid gray with no markings.

Rustic Gray

A very desirable colored slate to blend with other colors. Dark streaks run through the slate. Some fade to a brown and beautiful buff color.

Vermont Black

Some are a gray-black, while others are real shiny "Niggerhead Blacks." This slate is unfading and used to the best effect in a heavy roof.

Weathering Green

The commercial sea green makes a very durable watertight roof at the least possible expense. After a few month's exposure on the roof some fade to a brown and buff color while others retain their original gray-green color.

Architectural Slate

By blending the various Vermont colored slates in the proper percentages, an effect can be obtained similar to the autumn foliage. This type of roof should be planned in conjunction with our Architectural Department to secure the proper coloring and thickness of slate suitable for the roof being planned.

Garden Flagging

Natural cleft, irregular flagging is being used extensively for landscape work. This can be obtained in any desired pattern as shapes cut to size or in rectangular shapes. Can be furnished in all colors.

Samples

Small size samples will be mailed free on request.

PLANTS AT POULTNEY, PAWLET AND RUPERT, VERMONT

The Company and Its Service

We are generally recognized as the largest individual producers of colored roofing slate and slate products of every kind for both commercial and architectural purposes, from quarries actually owned and operated under our personal supervision. This not only enables us to maintain the uniform quality which has established the superiority of Sheldon's slates, but insures prompt and satisfactory execution of all commissions entrusted to us.

Exclusive Specialties

Sheldon's Semi-Weathering Mottled Purple and Green—A predominating purple tone when first manufactured, some having spots or streaks of green of varying size. A uniform percentage change upon exposure to harmonious shades of brown, while others present an unchanged appearance.

Sheldon's Unfading Mottled Purple and Green—A mixture of green and purple tones in each individual slate. No two alike. Some with more green than purple—others vice versa—of steadfast color and durability.

Sheldon's Unfading Green and Gray—The green is a sage green. The grays can be had in light and dark shades; the former practically clear and of a light gray tone; the latter mottled with dark streaks or clouds.

Sheldon's Clear Arabian Red—Exclusive and distinctive. Strictly unfading. Production facilities ample to insure the prompt execution, within reasonable time limits, of all orders, either for roofing or structural purposes. Washington County, New York, is the only place in the world slate of this color has been found in deposits of commercial value.

Sheldon's Hard Vein Freaks—

Just what the name implies—freak slates—from rock formations centuries old, of a character that will not permit the manufacturing of any under $\frac{3}{8}$ -in. thickness and from this up to 2 in. for architectural purposes. A great array of colors are available, comprising gray-blacks, opals, bronzes, buffs and browns, grays, blue-grays and others, so varied and unique that when displayed en masse, one is reminded of a beautiful tapestry.

Sheldon's Olde English Special Rough Cleft—Furnished in any individual color or combination of colors; random lengths and widths and promiscuous thicknesses ranging from

$\frac{1}{8}$ to $\frac{3}{8}$ in. The use of these slates, in accordance with our layout and specifications, guarantees the finest low priced architectural roof extant.

Sheldon's National Black—A strictly high grade Sheldon product. Guaranteed absolutely unfading. Delivered to many localities at a considerable saving in cost over Maine, Peachbottom, or Buckingham.

Sheldon's Slate Flagging—In all sizes, colors, shapes and finishes for interior and exterior uses.

Sheldon's Semi-Weathering Green and Gray Slates

Sheldon's Semi-Weathering Green and Gray are produced from the Sheldon mines in Vermont, the largest in the district, from the deep slate formations of the Cambrian period. A uniform percentage remains unchanged; the balance, upon exposure to the elements, weather to soft tones of brown and buff—all blending together in natural harmony with no suggestion of sharp contrasts.

Prompt deliveries guaranteed. Any size or thickness.

Exact Reproduction at Full Maturity of Sheldon's Semi-Weathering Green and Gray Roofing Slate of Standard Commercial Thickness Averaging $\frac{1}{8}$ in.

Strength, Absorption and Acid Tests—Made by Cambria Steel Company, Johnstown, Pa., and certified by S. M. Marshall, Engineer of Tests, March 26, 1914, to establish the strength and absorption of *No. 1 Commercial Semi-Weathering green and gray slate*. The results are a correct basis for comparison as to real strength when compared to other roofing material.

Thickness, in.	Width, in.	Load, lb.	Span, in.	Breaking stress, lb.
0.165	10	385	8	17,000
0.165	10	435	8	19,200
0.160	10	395	8	18,500

Some specimens of the slate were put in water for 24 hours and others in a 5% sulphuric acid solution for the same period of time, to determine the absorption and loss in acid action.

Gain in weight 24 hours in water	Loss in weight 24 hours in 5% acid solution	
	Actual loss	Corrected for absorption
0.49% (less than ½ of 1%)..	0.29%	0.39%

Sheldon's Slate for Architectural Purposes

All of the slate described, herewith, are available, and are being extensively furnished from the Sheldon quarries, in thickness ranging from ¼ to 2 in., and in graduated, or random sizes as desired.

Layout Suggestions for Architectural Slate—

A—20% each 1, ¾, ½, ⅜ and ¼-in. thickness.

B—20% each ¾, ½, ⅜, ¼ and ⅓-in. thickness.

C—10% 1 in., 15% ¾ in., 20% ½ in., 25% ⅜ in., 30% ¼-in. thickness.

Sheldon's Olde English Architectural Slate Combination No. 12

As shown below in actual natural colors, consists of a combination of various thicknesses, sizes and colors, designed particularly for producing the finest type of architectural roof.

These slate can be furnished in any range of thicknesses and exposures, either in medium or extremely rough textures. The same combination of colors is also available in random rectangular flagging for flooring, garden walks, etc.

The illustration shows a range in thickness from

D—10% ¾ in., 15% ½ in., 20% ⅜ in., 25% ¼ in., 30% ⅓ in. thickness.

Sizes as desired. Lower percentages of thick and higher percentages of thin slate than in graduation "C" and "D" are not recommended. Percentages are based on length of rafter. Heavier slates can be furnished when required up to 2-in. thickness.

Shipping Weight in Pounds per Square—

Commercial ⅓ in. 700, ¼ in. 1000, ⅜ in. 1500, ½ in. 2000, ¾ in. 3000, 1 in. 4000, 1 ¼ in. 5000, 1 ½ in. 6000.

Waveline Roof

Here is something new—we call it the Waveline roof. Available in Semi-Weathering Green and Gray, Unfading Mottled Purple and Green, and Arabian Red. Applied with standard 3-in. lap, same as the ordinary slate roof. Nominal thickness ⅓ to ¼ in. Can be furnished in other thicknesses when required.

The Waveline Roof

1 to 1 ¼ in. with exposures varying from 10½ to 5½ in. The slate is of medium texture.

Due to the extent of our quarrying operations and production facilities, timely deliveries are assured. Simply specify—"Roofs to be covered with Sheldon's Olde English Slate Combination No. 12" (following with maximum and minimum thicknesses and exposures) "as manufactured by F. C. SHELDON SLATE COMPANY, Granville, N. Y., in accordance with detailed layout to be furnished by them and approved by architect."

Olde English Architectural Slate Combination No. 12

C. G. BOSTWICK

Manufacturers of Snow Guards for Roofs

69 Bartholomew Avenue
HARTFORD, CONN.

Products

"CAMPBELL" PATENTED SNOW GUARDS for slate, tile, and other steep roofs.

"Campbell" Patented Snow Guards

The "Campbell" is a positive snow guard that stays put and will not break, bend nor wear out. It is made of pure copper only and will last as long as the building upon which it is installed.

An especially valuable feature of the "Campbell" snow guard is that it can be installed on roofs already laid, without breaking or removing slates.

Construction Details

The snow stop or guard head (a) is so designed and constructed that it can not bend or collapse under the weight of the snow or ice.

The broad, flat, thin supporting strap (b) gives a distributed bearing, does not lift the slates and positively will not cause them to break.

The hook end (c) on the supporting strap is broad and will not split nor injure the slates and stays put.

The fingers (d) on the hook end are designed for quick and easy installing on roofs already slated without damage to slate or tile.

Number of Guards to Set, Per Square

This varies according to the size of the slates, pitch of the roof and special needs.

For graduated, random slate roofs, space the guards from 16 to 24 in. apart horizontally and so spaced up and down as to properly stagger in alternate courses. The following table is worked out by this method:

Size of slate, in.	Guards required per square	Where to place guards	
		Horizontally	Perpendicularly
12x6	60	Every 3rd slate	Every 3rd course
12x7	50		
12x8	40		
14x7	45	Every 3rd slate	Every 5th course
14x8	40		
14x10	35	Every 2nd slate	Every 4th course
16x8	30		
16x9	60	Every 2nd slate	Every 2nd course
16x10	55		
16x12	45		
18x9	50		
18x10	45		
18x12	40		
20x10	40		
20x12	35		
22x11	35		
22x12	30		
24x12	30		

Directions for Installing

The only tools required are two screwdrivers. Push a screwdriver under the butt of the slate at each side of the joint where the guard is to be installed. Then

First Operation

Second Operation

Finished and in Place

push the guard into place, remove the screwdrivers and continue with the succeeding guards in a like manner.

If the guards are securely hooked on the slates no staging will be required after the first course has been installed.

Start installing at the eaves and work up to the ridge, using the guards as a foothold to work on. However, as a precaution, it is well to have a rope or plank.

Architects' Specification

Install "Campbell" Patented Snow Guards, as manufactured by C. G. Bostwick, Hartford, Conn., spaced not more than 24 in. nor less than 16 in. apart, and so spaced up and down that they will properly stagger in alternate courses.

Spacing of Snow Guards on Typical Roof

CLASON WIRE SNOW GUARD FOR ROOFS

Manufactured Only by

THE M. N. CARTIER & SONS CO.

Cartier Building, 275 Canal Street
PROVIDENCE, R. I.

Product

WIRE SNOW GUARDS for slate, tile, metal and other steep roofs.

Their Purpose

To lessen chances of damage suits against owners of property by increasing both personal and property safety.

There are many buildings so situated that the use of snow guards is essential to personal safety; there are more cases where the use of snow guards could protect the surrounding roofing and sheet metal work against costly damages.

Sliding snow and ice often injure roofings, and puncture or tear away gutters, etc. The use of our snow guards forestalls these dangers, as they hold the ice and snow where they form. They are a cheap and unobtrusive preventive against damage.

Important Notation

We note a growing tendency to permit the installation of three, four, or five courses of snow guards near the roof eaves. The result is that a few guards are compelled to hold not only the weight of snow and ice which they are located to care for, but also to withstand the tremendous tearing force of slides starting from the roof surfaces above.

No guards will withstand such conditions, and their installation in such a manner precludes the *purpose* for which they are used. When specifying our guards please do so according to our table and *insist* upon the roofer following the specification.

Manufacture

We make our guards in our own plant, and are not dependent upon the facilities or services of others.

These guards are manufactured either from pure copper wire or galvanized steel wire, both selected for ductility and stiffness. No copper-covered steel wire is used.

Practicality

Our wire snow guards combine strength, long service, economy and unobtrusive design.

Types of "Clason" Snow Guards

- New roofs, 1 and 2-in. points.
- Hook and friction for old roofs.
- Solder-to-metal-roof.
- Special for Spanish tile.

The "Clason"

The "Clason" has been for years the standard guard, and is the strongest guard made.

Note from the illustration that the "butterfly" loops brace and strengthen each other, while the extension brace lends additional strength.

"Clason" Snow Guard for New Roofs

Number Per Square

The following table gives the approximate number of snow guards which may be safely specified for use in each 100 sq. ft. of roof surface:

ROOF PITCH	NUMBER OF GUARDS
One-quarter	50
One-third	75
One-half	125

Towers, and steeper roofs than above indicated, may require special consideration.

How to Specify

Apply to all pitched roofs "Clason" [for old roofs "Clason Special"] Snow Guards, as made by THE M. N. CARTIER & SONS Co., Providence, R. I. The guards to be made from pure copper [galvanized steel] wire. (Here specify the number of guards required per square, dependent upon the pitch of the roof and other special conditions.)

In applying the snow guards, the eaves course of the roofing material shall be laid as usual, but the next course shall be laid with the joints slightly open to receive the shank of the snow guard.

After striking the line for the third course of the roofing material, place the guards in the joints, with the loop just below the lap of the course, and drive the prong into the roof decking; then lay the course, leaving only the loop exposed.

Care must be used to insure having the shank well sunk into the joints, so that the following course of roofing material will lie flat and not bear upon the guard.

(Note: The architect or engineer may omit at his discretion the method of application of the guards.)

HAWTHORNE ROOFING TILE

MANUFACTURED BY
HAWTHORNE ROOFING TILE CO.

HAWTHORNE ROOFING TILE CO. OF NEW YORK
507 Fifth Avenue, New York, N. Y.
SOUTH HILLS HARDWARE CO.
1018 W. Warrington Avenue, Pittsburgh, Pa.

Hawthorne Roofing Tile—A National Product

HAWTHORNE Roofing Tile offers the architect a permanent tile roof at a moderate cost. It is a perfected product, always true to shape, that can be applied to any sloping roof.

No longer need motives of economy spoil good design by substituting inferior roofing. HAWTHORNE Tile has taken beautiful and permanent roofs out of the luxury class.

HAWTHORNE Tile is permanent. It is made of concrete by a unique patented method on automatic power machines producing a tile at reasonable cost, superior in strength, imperviousness and beauty. The tile is colored with pure metallic oxides

William F. Higginbotham Public School, Detroit, Mich.
N. CHESTER SORENSON & Co., Architects

that are integral with the tile and are guaranteed not to craze, dust or fade.

HAWTHORNE Tile is beautiful. It is made in two styles, Spanish and French. Our Los Angeles plant is also manufacturing the popular Cuban Tapered Mission tile with the hand finished effect. The impervious surface is always clean; rain washes the dirt off and not in. The tile is produced with an exceptionally pleasing matt finish in thirteen colors.

Bright red	Standard green	Yellow
Dark red	Light green	Chocolate
Orange	Dark green	Slate gray
Tan	Bright blue	Natural gray
Purple	Velvet blue	

The wide range of color tones enables the architect to obtain any color blend effect he desires.

HAWTHORNE Tile is economical. The roof costs but very little more than a cheap, perishable roof. It costs much less than any other type of permanent roofing. Maintenance expense is eliminated and re-roofing problems never arise when HAWTHORNE Tile is used.

HAWTHORNE Roofing Tile provides perfect roof protection. It is weatherproof. Extensive laboratory tests made by the

Residence, Kenilworth, Great Neck, L. I., N. Y.
GEORGE BARNES, Architect

Lewis Institute Laboratories, Chicago, prove that HAWTHORNE Tile is waterproof and practically non-absorbent.

Because of the form of HAWTHORNE Tile and interlocking method of laying, it is impossible for wind to dislodge or loosen any of the tile. On the other hand, expansion or freezing does not produce cracking. It lies so closely and so tight that water and snow can not be driven underneath.

HAWTHORNE Tile provides exceptional roof insulation. The method of laying HAWTHORNE Tile, on battens raising the tile well above the felt, provides an enclosed air space giving a thermos bottle effect to the roof. This exceptional insulation feature makes for cool, comfortable upper chambers during the heat of midsummer and also makes possible a substantial saving in winter's fuel bills. HAWTHORNE Tile supplies ample roof insulation without the use of any further insulating medium in the roof construction.

Messiah Evangelical Lutheran Church, Los Angeles, Cal.
RUDOLPH MEIER, Architect

The Logical Method of Laying Roofs

A HAWTHORNE Tile Roof is a roof without nails.

The tile are so designed that they interlock, securely, tightly and firmly in place. It is impossible for them to be loosened by wind or vibration. Unlike other tile, slate, or rigid shingles, HAWTHORNE Tile can not break because nailed too tight, nor can they loosen or cut the nails through wind action or vibration.

The average roof of other tile, slate, or rigid shingles, requires from 7000 to 10,000 nails, and it is not possible for any man to drive all these nails just right; anything else spells loosening or breakage.

HAWTHORNE Tile are absolutely secure. Each tile is held securely, interlocked with its neighbors at sides, above and below. Thus there is no chance for loosening. By means of this approved, advanced method of laying a roof, loss through breakage due to poor nailing is entirely overcome, and it is a

Edgebrook Country Club, Chicago, Ill.
HALL, LAWRENCE & RATCLIFF, INC., Architects

simple, easy matter to replace an accidentally broken tile, without loosening or disturbing all the tile around it. And new tile so placed is as secure as the original.

Hawthorne Tile Used from Coast to Coast

The geographical location of HAWTHORNE Tile plants ensures quick delivery of all orders, large or small, with minimum of transportation expense, to all parts of the country.

Suggested Specification Clauses for Use of Architects Specifying Hawthorne Roofing Tile

All sloping roofs shall be covered with Red (or other color) French [Spanish] HAWTHORNE Roofing Tile of shade approved by the architect and finished with HAWTHORNE special tile at ridges, hips and gables (and eaves in Spanish tile). Specials to be nailed with copper nails. All to be laid in accordance with the Standard Practice of the HAWTHORNE ROOFING TILE CO.

Before laying the tile, roof sheathing is to be covered with an approved slater's asphalted felt weighing not less than 30 lb. per square, securely nailed with flat headed nails, lapped not less than 3 in. at intersections, and doubled at valleys, hips and ridges. All flashings to be installed before tile is laid, and all stucco work, pointing or other finish on dormers and other vertical surfaces that rise above roof to be completed before tile laying is started.

Standard Practice of Hawthorne Roofing Tile Co. for Laying Hawthorne Tile Roofs

Roof framing should be of sufficient strength to support roof tiling. Weight of tile as laid on roof is not more than 8½ lb. per sq. ft. In residence construction 2x6-in. rafters, 20-in. centers are sufficient to support HAWTHORNE Tile on ordinary spans; but, in cases where 2x4-in. rafters are used, it is recommended that collar beams be used to stiffen the roof. It is important that valleys and headers should be of ample size and securely framed together. Rafters should be covered with close sheathing.

As total thickness above roof sheathing to under side of the tile is about 1¼ in., it is necessary to place gable rake boards so they project about 1¼ in. above roof boarding to receive the gable tile, as shown on detail drawings. Total width of this board may be 4, 6 or 8 in., to suit design of roof.

The best method of finishing eaves for French tile is to place a tilting fillet 2 in. high under the first roof board. The lowest tile will then lay right on the roof boarding and set snugly in the gutter. A more common practice is to lay sheathing just as for other roofs; the roofer then sets his lowest furring strip on edge in order to give proper tilt to the tile. This results in the tile showing a little higher above the edge of the gutter. This is not objectionable. In the case of Spanish tile no tilt is required, as eave closer furnished with the tile finishes edge.

Felt—Over the sheathing roofer will lay slater's asphalted felt weighing at least 30 lb. per 100 sq. ft. Felt should be lapped 3 in. or more at intersections and doubled at valleys, hips and ridges, securely nailed down with flat headed nails. Where moulding gutters are used felt should be brought up over back edge of the gutter.

Sheet Metal Work—Before laying any tile, all sheet metal work for flashings, gutters, valleys, etc., should be installed.

Flashings of 16-oz. copper should be used. Roofers often use galvanized iron flashings and valleys, but this is not recommended, as the life of sheet iron flashings is short.

Weeper and Hanger Strips—When all flashings and felt have been laid the weeper strips are placed. They are laid at right angles to the eaves, about 2 ft. apart over the entire roof. Ordinary plasterer's lath are suitable for this purpose. They should be securely nailed to the roof boarding with ⅞-in. shingle nails.

Over weeper strips horizontal 1x2-in. battens or hanger strips are placed. They are placed parallel to the eaves and securely nailed through weepers to the sheathing using 6d wire nails.

Hanger strips must be accurately and evenly spaced in order that lines of the tile may be regular. Before laying strips, roof from eaves to ridge should be measured to determine spacing of hanger strips. Tile are usually laid 12 in. to the weather, but if distance from ridge to eave is not an even number of feet, it will be necessary to slightly increase or decrease spacing of the hanger strips from 12 in. on centers.

It is important that the lines of hanger strips should be absolutely horizontal and that spacing from eave to ridge should be uniform. Roofer usually measures the distance and marks out the lines in chalk before placing these strips.

On all hips and ridges a 1x4-in. strip is set vertically and securely nailed to the sheathing below. Ridge and hip tile are nailed to these, so that their weight does not bear on the roof tile.

In some cases where pitch of roof is very flat or very steep, a 1x4-in. strip is not sufficient to keep ridge and hip tile clear of the tile below or it may bring it too high. In this case, width of strip shall be slightly increased or decreased in order that the hip and ridge tile may set close to the surface of the field tile and yet allow its weight to be carried on the strip.

Tile Laying—Tile are laid in horizontal rows starting at lower left-hand corner; lugs of the tile hook over the hanger strips. Each succeeding tile interlocks with the preceding tile. Upper rows of tile overlap the row immediately below by not less than 2½ in. Gable starters and finishers are used on all gable rakes. If length of roof is not an even multiple of 8 in., the last tile nearest the gable finisher may be cut to fit and gable finisher bedded with cement mortar on to it.

Tile should be neatly and carefully cut to fit hips and valleys. Tile on either side of valleys should be cut so that they show straight parallel lines. Rough and unsightly edges should not be permitted. Edges should be 6 in. apart at all points except in the case of very long slopes (30 ft. or more), in which case width at eaves should be slightly increased and gradually tapered to 6 in. at top.

Hip and ridge tile should be nailed to the 1x4-in. strip and bedded and pointed up with colored cement mortar, using the same color as that used in the manufacture of tile. With Spanish tile, ridge closers and eave closers are used to finish tile at ridges and eaves; pointing at ridges is unnecessary.

Note: The above practice does not apply to the installation of Mission tile as manufactured by the Los Angeles plant. The office of the Los Angeles plant will be pleased to furnish architects with complete details and specifications for laying this tile.

First Baptist Church, Pittsburgh, Pa.

Lock Joint of Hawthorne French Tile

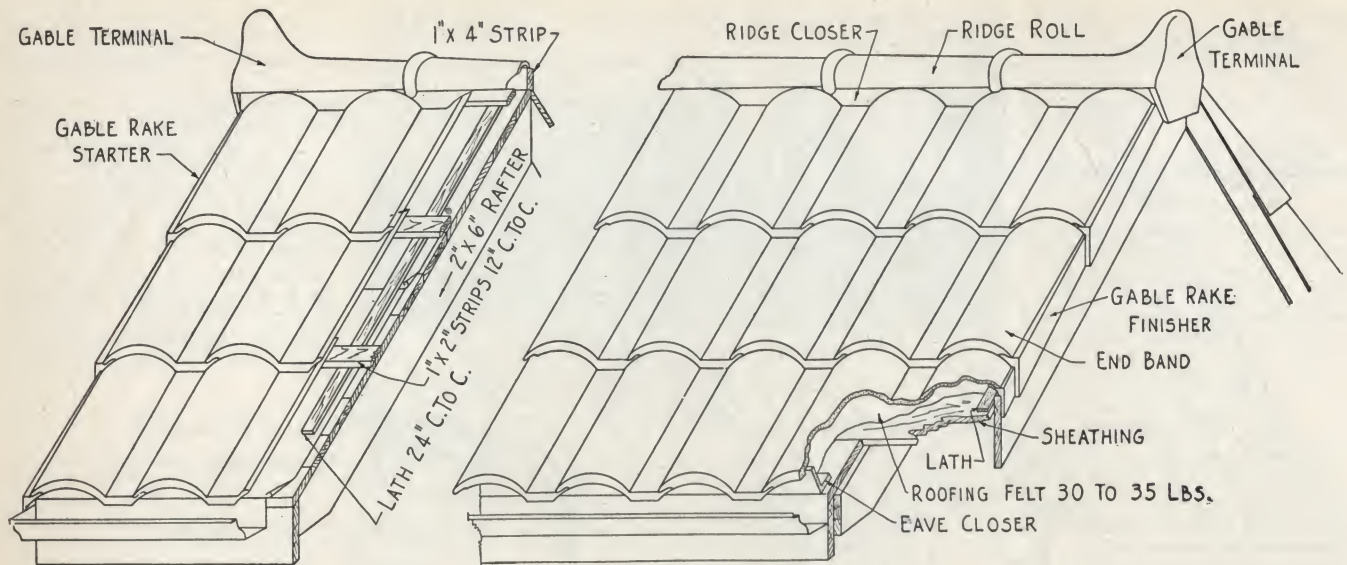

Hawthorne Special Tile for gable rake starters and finishers, ridge and hip rolls and terminals, illustrated on second page following.

Also manufacturers of Brick for all architectural and structural uses; Fireplaces, Steps, Briquettes, Landscape Tile, Garden and Terrace Tile, Heavy Traffic Tile, Non-slip Ramps, Brick and Stucco Inserts, Chemical Stoneware, Cylindrical Spiral Ring Tower Packing.

For Floor Tile, see page B1497.

Mission Tile

"Riviera"—A true reproduction of the old Spanish Mission roof tile as seen along the Mediterranean, produced in a soft mingling of fire flashed (autumn foliage) shades and also rugged enough in manufacture to relieve the mechanical straight line and painted color effect of ordinary red tile.

Mission tile is made in 15-in. lengths, 11-in. exposure to weather. Can also be laid in random courses with varying weather exposures.

Specials—Eave closures, starter tile, and eave pan tile with water opening for concealed gutter. Regular field tile is used for saddling hips and ridge. No terminal pieces are used unless specified.

Textures—"Riviera" is manufactured, either in the smooth or vertical combed rough texture.

Body—Made from shale and clay, hard burned and well vitrified.

"Habana"—A straight barrel mission type like "Riviera" in size and shape, but especially made of a porous terra cotta clay and shale body, in a very soft

range of pastel shadings from light buff, through the reds to dark chocolate browns; to simulate the color and texture of the old handmade Cuban Tiles.

Texture—One texture only, a dull, die surface, non-reflecting.

Special Fittings—Same special fittings as used for "Riviera."

"Habana Tapered"—A tapered mission tile like old handmade Cuban tapered, manufactured in full range of soft weathered shades like colors of Habana Straight Barrel Mission.

Texture—One texture only, a dull surface, non-reflecting.

Body—Terra cotta clay, and shale.

Shingle Tile

"Sussex"—Smooth, flat English shingle; shale body; hard burned; same fire flashed colors as "Riviera"; 9x12 in. (See chart for data.)

"Devonshire"—Rough combed texture. Otherwise same as "Sussex." (See chart for data.)

"Normandy"—Smooth, flat shingle; clay and shale body; colors same as "Habana" Mission. Made of same material; 6x13 in. (See chart for data.)

"Interlocking"—Smooth, flat rib, light weight shingle for cheap residence or commercial use.

American "S" (or Spanish "S")

Pan and roll in one piece; shale body; red and fire flashed colors; smooth or rough texture. (See chart for data.) All standard fittings also furnished. A commercialized imitation of true Spanish Mission.

DATA CHART—ROOF TILE

Name	Kind	Body	Size, in.	Texture	Exposure to weather, in.	Pieces per square	Weight per square, lb.	Weight each, lb.
"Riviera"	Mission	Shale and Clay	8x15	Smooth Rough	11	230	1400	6
"Habana"	Mission	Clay and Shale	8x15	Smooth	11	230	1400	6
"Habana Tapered"	Mission	Clay and Shale	7½x15 7x18	Smooth Smooth	12 15	250 225	1250 1350	5 6
"Sussex"	Shingle	Shale and Clay	9x12	Smooth	4½	370	1700	4½
"Devonshire"	Shingle	Shale and Clay	9x12	Rough	4½	370	1700	4½
"Normandy"	Shingle	Clay and Shale	6x13	Smooth	5	500	1625	3¼
American "S"	Pan-roll	Shale	10x13	Smooth Rough	10½	180	900	5

For Decorative Faience Tile, see pages B1438-1439.

Face Brick

Sizes—The size of wire cut brick is $2\frac{3}{8} \times 8\frac{3}{8} \times 3\frac{7}{8}$ inches, and of pressed or enameled brick $2\frac{3}{8} \times 8\frac{3}{8} \times 4$ inches.

Styles—*Wire Cut Brick, Smooth Texture*—In buff, gray, old gold and various tones of flashed.

Rough Texture—Ruffled (horizontal texture) and rug (vertical texture) in a wide variety of colors.

Dry Press—Buff, cream, gray, old gold and red.

Enameled—White, ivory, granitex, pulsichrome, mottled, red, green, black and blue.

Architectural Terra Cotta

We are prepared to handle contracts for architectural terra cotta of any size, in any desired texture or color.

Roofing Tile

This company manufactures a very wide variety of patterns and colors in roofing tile.

Colors—The Spanish, Italian and Shingle are made in the various shades of red only. The Mission and Granada are made in shades of red, also old gold, purple,

and gunmetal, mixed with red (known as "Varicolor").

Trim—Hips, hip starters, ridges, finials, rakes, eave enclosures and end bands are made in various styles to fit the different designs of tile.

Fire Clay Refractories

Machine and hand made standard sizes.

Special shapes of any kind made to order.

We also furnish fire clay and grog.

Hollow Tile

Sizes— $2 \times 12 \times 12$ in. to $12 \times 12 \times 12$ in.

Load-bearing type in Heath Unit tile.

Promenade and Palacio Hand Made Floor Tile

Uses—These quarry tile, because of the great variety of patterns, sizes and shapes, adapt themselves to every use, indoor and out.

They are in use in living and dining rooms, halls and sun parlors in residences; in corridors and lobbies of hotels; in commercial offices and showrooms; in terraces and garden walks, on treads and risers of stairs and around swimming pools.

Sizes—*Palacio Hand Made*— $2\frac{3}{4} \times 2\frac{3}{4}$ in., $4\frac{1}{2} \times 4\frac{1}{2}$ in., 5×11 in., 6×6 in., $6 \times 12\frac{1}{4}$ in., $7\frac{3}{4} \times 13\frac{1}{2}$ in.; diamond, $4\frac{1}{2} \times 13\frac{1}{4}$ in.; elongated hexagon, 9 in.; hexagon 9 in.; octagon 12×12 in., $12 \times 12 \times 2$ in., 12×14 in., $12 \times 14 \times 2$ in., 12×18 in.

Palacio Hand Made Floor Tile are approximately $1\frac{1}{4}$ in. thick.

Diagonal halves are available for the following sizes: $2\frac{3}{4}$ in., $4\frac{1}{2}$ in., 6 in. Hexagon long halves and shorts, 9 in.

Promenade Tile— $2\frac{3}{4} \times 2\frac{3}{4}$ in., $2\frac{3}{4} \times 6$ in., $2\frac{3}{4} \times 9$ in.; elongated hexagon 3×9 in., 3×12 in., $4\frac{1}{2} \times 4\frac{1}{2}$ in., $4\frac{1}{2} \times 9$ in. 6×1 in., 6×6 in., 6×9 in., $6 \times 12\frac{1}{4}$ in., 9×9 in.; also 9-in. hexagon, 9-in. hexagon long halves and 9-in. hexagon short halves; 12×12 -in. octagon.

Promenade Tile are approximately 1 in. thick.

Diagonal halves for the following: $1\frac{3}{4}$ in., $2\frac{3}{4}$ in., $4\frac{1}{4}$ in., 6 in., 9 in.
